Must Motor Cycles Carry Rear Lights?

SOMETHING like a bombshell was dropped upon the heads of motor cyclists last week, the explosion of which may reverberate far and wide for some time to come. The facts are briefly that a motor cyclist was recently summoned before the Epping magistrates for failing to show a warning rear light and was convicted under the Motor Car Act, 1903, and fined. An appeal was lodged and came before the Divisional Court last week before Justices Bailhache, Ridley, and Scrutton. In the end the two former judges upheld the decision of the magistrates, and the appeal was therefore dismissed by a majority of the judges, Mr. Justice Scrutton not concurring, as he considered that a motor cycle was a cycle or velocipede under the Local Government Act, 1888, and therefore need only carry one light, which the Motor Act, 1903 ordains should illuminate one number, and this is usually the front. But it may be mentioned that if it be established that it is compulsory to light the rear of a machine, motor cyclists will prefer to illuminate the rear number, which is clearly permissible under the Act, 1903, and it will then be no longer incumbent upon riders also to illuminate the front number. There is this consolation that it will, under these conditions, be possible to have the front numbers attached in a more sightly position than at present.

The situation thus created is somewhat piquant, for it shows up several curious defects in our legal system. Here we have the fact that for ten years motor cyclists have been allowed to proceed peacefully about after dark with only a front lamp, and now, suddenly, a chance prosecution brings the apparant wrongdoing of a decade ago to a head. The Motor Car Act, 1903, is often described as the most loosely drawn up Act on the statute book, and if it is possible, as is said to be the case, to drive a horse and trap through any Act of Parliament, it is surely easy to drive the largest limousine through this Act without danger of scraping the sides.

Of course, things cannot remain in the present *impasse*. Some authoritative and final statement must be issued, and that without delay. Either we must, or need not, carry tail lamps and already we note that the large motoring organisations such as the A.C.U. and the A.A. and M.U. have got into touch with the Local Government Board, and it is hoped and expected that that department will lose no time in settling the matter in dispute.

There are urgent reasons why they should do so, for even if motor cyclists wish to obey the law as it stands under the Divisional Courts' ruling, they really cannot do so, as there is no suitable lamp on the market at the present time. Several manufacturers have stated their intention of marketing such an accessory with the least possible delay, but doubtless they will hold their hands pending the result of the Government decision.

We ourselves confess to little sympathy with the necessity of carrying a rear lamp, but we think that the best class of reflex red light is a most useful and desirable fitment, which has over and over again proved its utility. There appears to be an unfortunate feeling against these warning devices among cyclists, but if only one of first-class manufacture is fitted, the results given are excellent. It is the cheap imitation brands that are practically valueless.

But, as a matter of fact, the necessity of rear lights on motor cycles is hard to establish. Probably there is no vehicle upon the roads in less need of them. Cars carry rear lights mainly to illuminate their registration numbers. On motor cycles this is done by the front lamp. As we have time and again pointed out, it is the slow moving vehicles, the drover of cattle and the cyclist who are in danger, and a danger themselves to the faster travelling traffic propelled by motors. Make rear lights compulsory for all and sundry road users and we have no complaints to make, but to pick out the fastest traffic for this distinction is ridiculous. Meanwhile motor cyclists are continuing to use their machines at night time without rear lights and are still unmolested so far as we can ascertain. The Auto Cycle Union has decided to defend any motor cyclists against whom proceedings are taken.

If this matter achieves nothing else it has shown up the absurdities of the Motor Car Act, 1903. We often hear of a spasmodic effort to get it amended. Perhaps politicians will now spare the necessary time to the repeal of this Act, and the passage of another in its place more liberal in its ideas and more literal in its wording. Motoring and the motor movement have progressed a good deal since the dark ages of 1903, and we think we are entitled to pursue our motoring pleasures and business under a more liberal *régime* than at present obtains.

The 1914 Watford Speedometer.

THE Watford motor cycle speedometer is one of the most popular on the market. It is exquisitely made, very accurate, and wonderfully steady, and, consequently, our readers will not be surprised to learn that in the instrument itself very few alterations have been made. One of these, however, is the provision of an adjustable ball bearing, shown in fig. 1, for the top of the governor spindle, which has a cone-shaped end. As in last year's model, the bottom end of the shaft still runs in a similar type of bearing. The brass block, indicated in fig. 1, which is split, is screwed on to the plate which carries the mile registering mechanism, and the extension of the cup runs through this plate into the hole in the block. To adjust the bearing it is only necessary to loosen the screw in the split end of the block and push the bearing on to the coned end of the spindle.

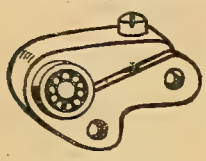

Fig. 1.—Adjustable ball bearing top of governor shaft of the 1914 Watford.

Fig. 2 shows the new driving gear box, which is half the size of last year's pattern and half the weight, and a remarkably neat job. Another innovation is the introduction of spirally cut teeth on the driving ring and pinion. This Messrs. Nicole, Nielsen and Co. find quieter than the model with the straight cut teeth, and also if the driving gear box bracket becomes loose, the tendency is for it not to be thrown into the spokes of the wheel, but in the reverse direction. Messrs. Nicole, Nielson and Co. have been experimenting with this gearing for some time, and have practically decided on its final adoption.

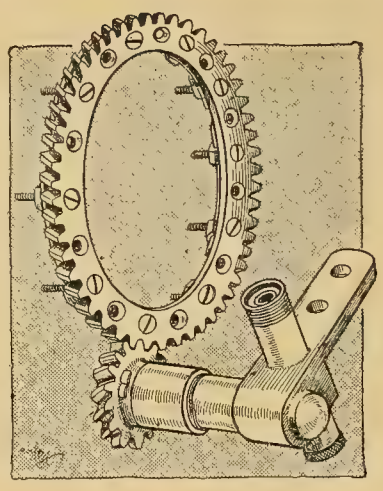

Fig. 2.—Skew gearing and gear box.

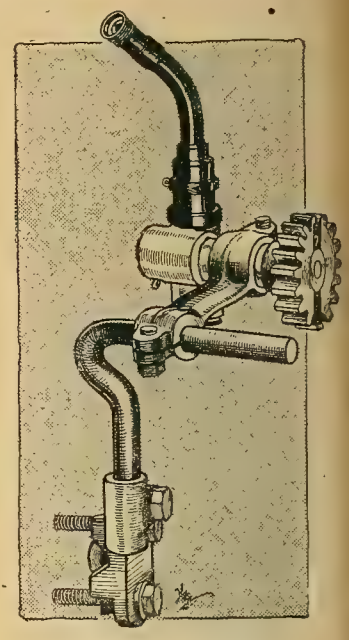
Fig. 3 illustrates the new driving gear box and bracket for cycle cars. The clip at the bottom is designed to be attached to such awkwardly shaped steering arms as the Chater-Lea, which is tapered, and other patterns are made suitable for other cycle cars. From the accompanying drawing it will be seen that the gear box may be fixed in any position as a universal movement can be obtained. To obviate trouble which occurred occasionally in the older pattern through the cable breaking near the joint, a short piece of pipe, capable of movement in any direction, is now fitted to the driving gear box, which contains a short piece of cable, terminating in a joint, to which the flexible cable is attached. This is a particularly neat fitting, and quite a clever piece of design.

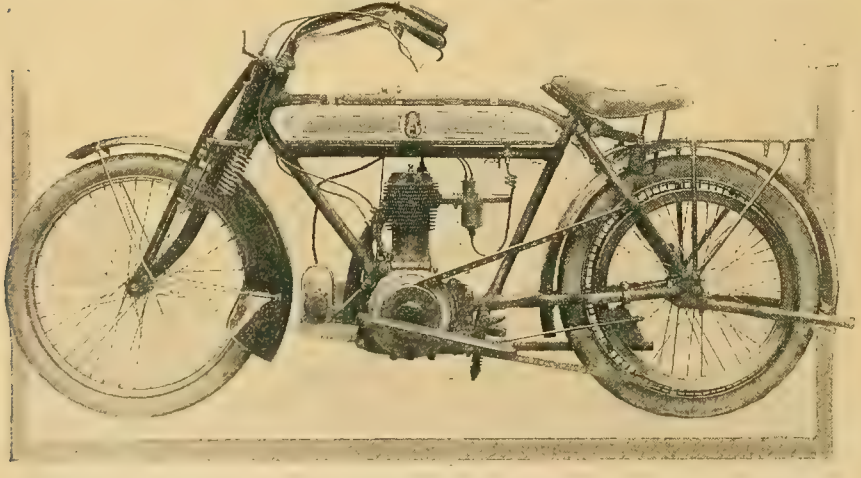


New bracket for the cycle car pattern 1914 Watford speedometer.

The Over-Seas Motor Cycle.

A NEW company has just been floated in Birmingham called the Over-Seas Motor Co., Ltd., for the manufacture of a motor bicycle for the overseas trade. The offices are at 1a, Johnstone Street, Ladywood, Birmingham, and the machine, which we illustrate, has been designed by Mr. W. J. Lloyd, the original designer of the Quadrant motor cycle. Mr. Sparke is associated with Mr. Lloyd in the production of this machine, and both are managing directors.

The machine, which we had the pleasure of inspecting last week, is a 3½ h.p. single-cylinder, 85 mm. × 88 mm. bore and stroke, with ball bearings t main shaft, roller bearings to connectin rod big end, and is provided with decompressor. The lever operating th decompressor moves the exhaust rocke on to another cam when the decom pressor is in action.



New "Over-Seas" model, which, as its name implies, has been specially designed for colonial and foreign markets. The standard type has a 3½ h.p. single-cylinder engine, but no pedalling gear. Starting is facilitated by means of a decompressor operating on the exhaust valve.

A Sound Specification.

The specification of the machine in cludes Druid spring forks, Bosch mag neto, 1914 B. and B. carburetter, 2½in tyres, Lyso saddle, 1in. belt, spring footboards, long tube silencer, spring-u stand, tubular carrier, and pannier bag on the carrier sides fitted in meta holders. It is sold at the very moderat price of £39, and fitted with Sturmey Archer three-speed hub the price is £49 When a change speed gear is supplied a handle starting device is fitted on the off side of the rear forks. The engine has 5in. clearance from the ground, and well-fitted brakes are provided, the rear brake being operated by the heel and acting on the belt rim, and the front brake is a Bowden.

The Over-Seas Co. has been formed to save Colonial importers the trouble of assembling machines from fittings. Every care has been taken to include standard parts where possible, but it is not intended to make the slightest departure from the standard specification.

OCCASIONAL COMMENTS

BY "IXION"

An Ingenious Cycle Car.

The other day we illustrated a cycle car which I should advise all passenger enthusiasts to study very closely, first on paper, and later—if they get the chance, as they surely will—on the road. I refer to the 8 h.p. Jackson (see page 1349, issue of October 16th). It was a lingering reminiscence that drew my eye to its details, for did I not drive many a mile in the old Eagle tandem, which was its great grandmother eleven years ago; but my eye, once drawn, simply glued to the page. Here we have a genuinely light vehicle, with springs which look as if they do what so few springs can effect, and hold the road without a lot of weight on top of them; an engine that is cheap to make and promises to combine high efficiency with ladylike demeanour, and a chassis all a-bristle with ingenious details, not the least of which is a charming seat-engine-starter. I like the one-piece body, too; the member of the staff who described the Jackson has evidently sampled a wood-cum-steel lightweight body after its ten thousandth mile. Mine has bits of rubber tacked in cunning corners all over it to keep the squeaks down. Mr. Jackson has evidently digested the motto which brought success to the Scott and Douglas and many another, "Why be conventional?"

Re-starting Classes in Hill Climbs.

I am always a little sorry that the winner in the re-starting tests at a crack hill-climb is the man who accomplishes the fastest time. Indeed, I think that as at present conducted these classes are worse than useless, for we all know that any low-geared free-engined machine of 500 c.c. or over can start on any gradient. Therefore these classes serve to provide a spectacle, not to furnish information. And what is the spectacle? A man comes tearing up the hill as if he were out to win the fastest time of the day medal. As he nears the first fateful white line across the road he slows down; there is probably a horrid squeaking of brakes, a violent skid, and he comes to rest with his engine kicking up a pretty din between the two limit lines. A brief interval is occupied by the rider's haggard stare at his wheel position, his threatening concentration on the officiating marshal, and hustling of the spectators by two or three amateur policemen who are trying to keep the road clear. Suddenly the rider makes a few lightning movements of the hands, and leans sideways in the saddle as though his hips were paralysed, while simultaneously his engine emits the most fiendish uproar imaginable. Fortunately, however, his left leg is not paralysed, and with the aid of a few thrusts from it he manages to get his machine in motion. To all appearance he suddenly becomes concerned about the amount of water in his generator, for he leans flat forward and peers into it anxiously as the engine accumulates its revolutions up the rest of the hill. This alarming exhibition is supposed to illustrate the beautiful convenience of the modern three-speeder when one is stalled by a sheep on a severe gradient. Could anything be more absurd? The prize ought really to go to the smoothest and neatest restart, quite irrespective of pace. The awards might be awkward for a mere man to make under these conditions, and it might be wise to entrust them to a committee of ladies. But no! Some of our crack riders are as distressingly handsome as others are repulsive (I am thinking of them, of course, as grimed with oil and perspiration after a hasty tune-up and reluctant start). I think the ideal judge would be some corpulent old buffer from the audience, who is seriously thinking of purchasing his first motor bicycle, but is nervous about that awkward hairpin bend in his front drive.

Hub Gears Again.

I have no idea who "L.A.," who complains of a two-speed in our issue of October 16th, may be, but I should deem it a very grievous injustice if his experiences were regarded as representative. I have personally covered a distance of over 20,000 miles on three-speed hubs of modern design, and during that distance the sole replacements I have required were a minute bell crank stamping forming part of the control, and a threaded and milled piece used for adjusting the rod from the lever to the hub. I trod on the bell crank when it was detached during a tyre change and bent it, afterwards breaking it in my attempts to straighten it, and the milled adjuster snapped when I was tightening it owing to a flaw in

A SIDECAR AT A CARNIVAL.

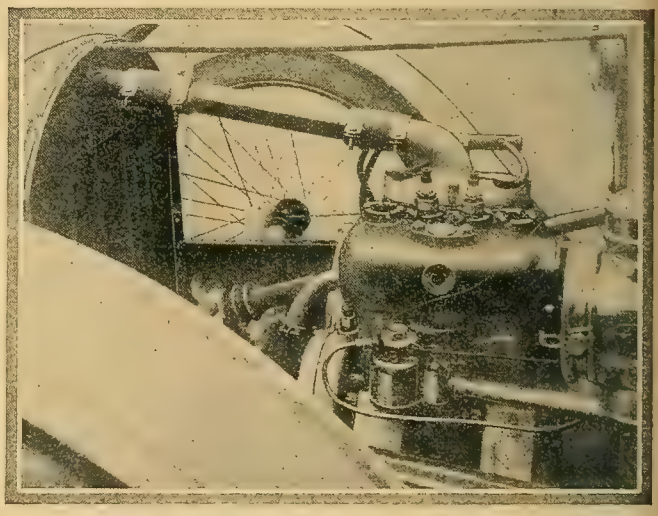
A New Imperial Jap with Bramble sidecar decorated for the Aberdare Football Carnival. The tableau was named "Our Empire," St. George and Dragon being mounted on the machine with Britannia in the sidecar.

A group of members of the Pontardawe A.C., all mounted on Matchless machines of various types supplied by H. Francis and Son.

the casting. My expenditure on spares has thus been limited to the not excessive sum of 3d. I have never had to walk a mile through any defect or breakdown in these three hubs. Further, friends riding three-speed hub machines must have covered well over 200,000 miles in my company if I compute the mileage done in the company of squads of clubmen, etc., and not one of these companions has ever been stranded or put to any expense in connection with his hub whilst in my company. This is a pretty good testimonial to their average reliability. Isolated cases of sheer misfortune or of careless usage ought not to be taken too seriously. I think the advice not to use the clutches in these hubs is a trifle misguided. I can only say that all my friends and I have used our clutches whenever we felt inclined to be lazy, and we have had no trouble with them. Indeed, my memory holds numerous instances of minor troubles with the old type of hub disc clutch (single-geared) and none at all with the clutch of a three-speed hub. Stay! I forget one humorous instance. A *very* crack rider of my acquaintance came in one day cursing the Sturmey hub by all his gods because the clutch was afflicted with incurable slipping. When we made a careful diagnosis it turned out that he had removed his wheel to change a tyre, and that he failed to notice that the three legs of Man on the tiny adjuster fitting were of different lengths, so he had refitted it in the wrong position and thrown his clutch out of adjustment. We took off the three legs and replaced them at a different setting, when the clutch stuck to its job like a bailiff. It says something for the clutch that he had worn out a heavy Kempshall cover before he had occasion even to inspect the clutch adjuster.

Timing Gear Troubles.

In the course of a year I receive a great many complaints from the less experienced type of motor cyclists, and I am bound to say that I discount the vast majority—they are so obviously ascribable to the most egregious lack of ordinary commonsense on the part of the complainants. But when I was destroying a long file of such letters the other day, I happened to be struck by the preponderance of grumbles anent timing gears, and, sorting out the letters in question, I found I had received eleven letters from owners of 1913 machines whose timing gears had collapsed on the road, and that in four cases the wheels were not marked to assist re-engagement. This is a tolerably disgraceful state of things for the year 1913. Motor bicycles are now being ridden by enormous numbers of unmechanical persons; we may not be able to protect them against an occasional broken valve or sheared cotter, but any maker should be able to ensure that such a baffling and complex disaster (for this type of rider) as a deranged timing gear should never occur. Stripped pinions, broken rockers, broken keys, etc., are all easily preventable by well-known means, and the occurrence of such a breakdown is simply unpardonable. I can boast that I have not been afflicted by a broken down timing gear since the year 1906, but I was considerably taken aback at the start of a big trial not so very long ago when a rider in the employ of the firm who make the machine I then bestrode slipped a package of pinions and rockers into my hands at the start and said, "These may come in useful; we've had a good few break lately!" The maker who was the culprit in this incident has overcome his troubles, but I know another of equal reputation who has not, and my post-bag suggests in no uncertain fashion that one or two others whom I have not patronised lately are equally callous or stupid. Some of our engineers have no imagination. They construct their engine with nobody but the Brooklands knut in their mind's eye, and think it worth while including a light and flimsy detail for the sake of a few extra revolutions per minute on the track, remaining utterly oblivious of those numerous riders who could only sit down and cry if they fractured a valve rocker. Till the maker can absolutely trust his valve gear his only honest plan is to send out a spare set of rockers and pinions in every tool-bag, so clearly stamped that the veriest novice could hardly make a mistake in fitting them.



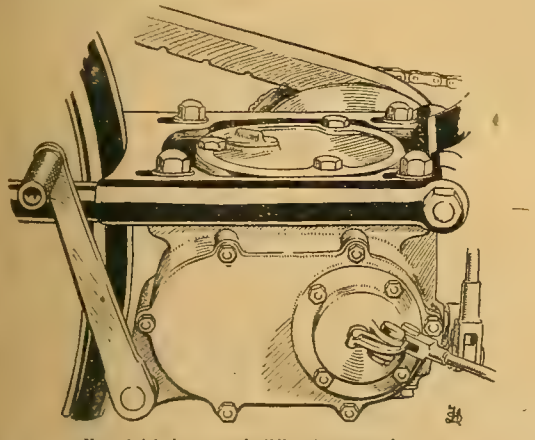
Twin-cylinder engine of the Adamson cycle car, showing position of carburetter, radiator, etc. (This vehicle is described on page 1401.)

To North Wales on a 1914 Ariel.

SOME weeks ago we received an invitation to test the 1914 single-cylinder Ariel as soon as it was ready for the road with a new counter-shaft gear, and it was on Tuesday, 21st, that Mr. F. C. North arrived at our offices with a forerunner of the new 3½ h.p. model and announced that all was ready for a start. It was arranged that we should head for the valley of Dinas Mawddwy that day, and on the morrow climb the celebrated Bwlch-y-Groes and return—quite a busy day-and-a-half trip. It was nearly one o'clock when our examination of the new mount was complete and we set out from the city of the three spires.

The New Ariel Gearbox.

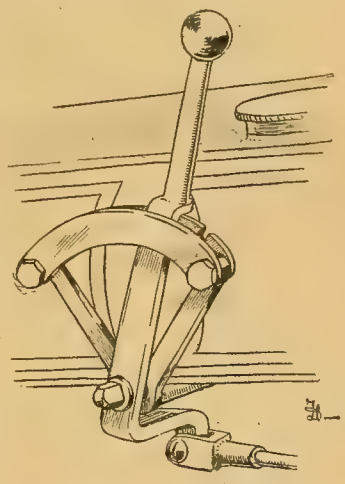
With the exception of a new three-speed counter-shaft gear the Ariel is but little altered, other changes consisting of improved lugs and butted frame tubes, and provision for removing the cylinder without the necessity of a detachable lower rail. The transmission is by chain to a cork insert clutch, having two cork plates, thence through the gear box, which is of the sliding type, having for engagement purposes two pairs of dogs and one pair of gear wheels, and finally by belt running over large pulleys. The standard gear ratios will be approximately as follows: 5.3, 8.7, and 15.3 to 1, but the machine on test had somewhat



New Ariel three-speed sliding type gear box.

higher ratios, as there was one tooth more than usual in the driving sprocket.

Our first stop was outside Castle Bromwich, where we had lunch and a welcome warm up at the Parson and Clerk. On restarting we changed places with the driver, and were soon bowling along the Holyhead Road at a smart pace. The machine starts perfectly with the kick starter and decompressor, is easy to control, and gear changing is simple, though it is found advisable to use the clutch as in car-practice. The run was without incident until Shrewsbury was reached, where a traffic stop on Wyle Kop made a good opportunity for a test of re-starting. The start on the gradient was, however, accomplished with ease.



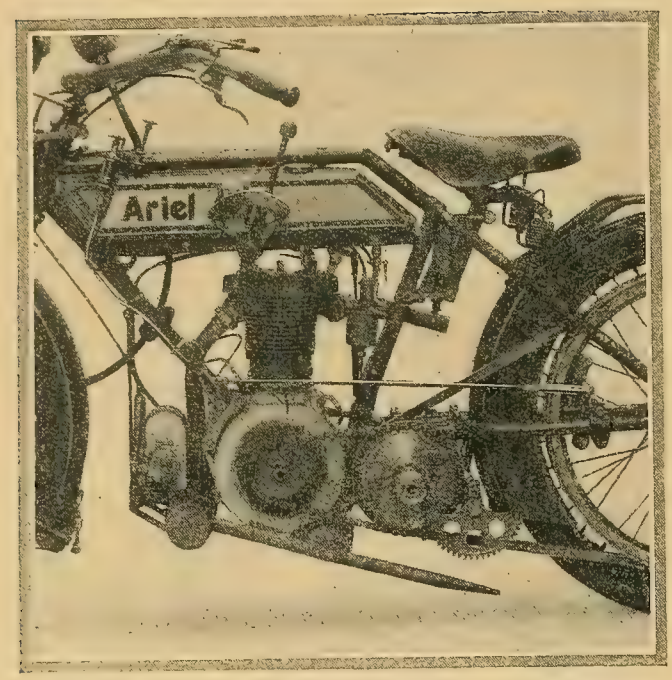
Striking lever of Ariel three-speed counter-shaft gear.

At the top North again took control, and our next incident was a stop for lamp charging at Welshpool. About eight miles out of the town we missed a left-handed turning and went several miles out of the way. The cross roads by which we regained the route were so rough and narrow that we lost much time, and almost decided to stop the night at Cann Office. However, we determined to push on over the last section. The roads now became narrower and undulating, and we ran into a sharp rainstorm, but it was not long before we were on the long down grade, and crossing the Dovey, pulled up at the Buckley Arms at Dinas Mawddwy. Here we had an excellent supper and recounted the day's run over a pipe before turning in.

The Ascent of the Pass.

The following morning broke clear and frosty, and after changing a plug which had shown signs of intermittent misfiring, and blowing up a rather slack tyre, we set off in search of petrol, and finally procured a gallon of No. 2 for 2s. Now came the real work, and we wound our way through narrow and greasy lanes, in which we met many carts going to the Dinas Fair, towards Bwlch-y-Groes. At length the famous pass came in sight, and with a well warmed engine the climb was begun. The acute right-handed hairpin at the foot was taken close in over the steepest pitch, but the engine never faltered, and shortly afterwards we were once more in second gear. The ratio, however, was slightly too high, and first was used for a longish stretch. On this gear the engine played with its load, and only a small throttle opening was required to keep up a steady pace. The second gear was used for one more stretch, and then came the crux of the climb. Fortunately the gate was open and changing

To North Wales on a 1914 Ariel.—



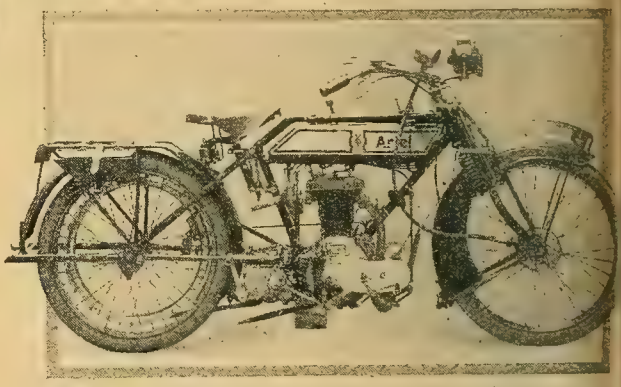
Power unit and new counter-shaft three-speed gear on the 3½ h.p. Ariel. Observe belt and chain drive, kick-starter mechanism, and gear change lever mounted on the tank.

into first the throttle was opened and the machine roared away over the steepest part of the hill with plenty of power in hand and not a sign of overheating. At the crest of the hill after congratulating the driver we enjoyed the scenery for a few moments before starting the descent. The "Pass of the Cross" is close on two miles long, in which distance the road rises 1,750 feet, and the surface is of small loose shale. The gradient is really severe for the whole length of the hill, and it was up this climb that the sturdy 500 c.c. Ariel engine had pulled a fairly heavy sidecar with a driver and passenger weighing 21½ stones. Added to this were heavy overalls, a complete equipment of tools, spares, lamps, speed indicator, etc., the only missing part being the sidecar mudguard, which had been damaged before the start of the run. Surely this is a fine performance if ever there was one, and 1914 Ariel riders need have no qualms about the hill-climbing capabilities of their mounts. The hill was taken on the run, and the engine was absolutely standard. No trick driving was done, and the passenger remained normally seated throughout.

A Further Climbing Test.

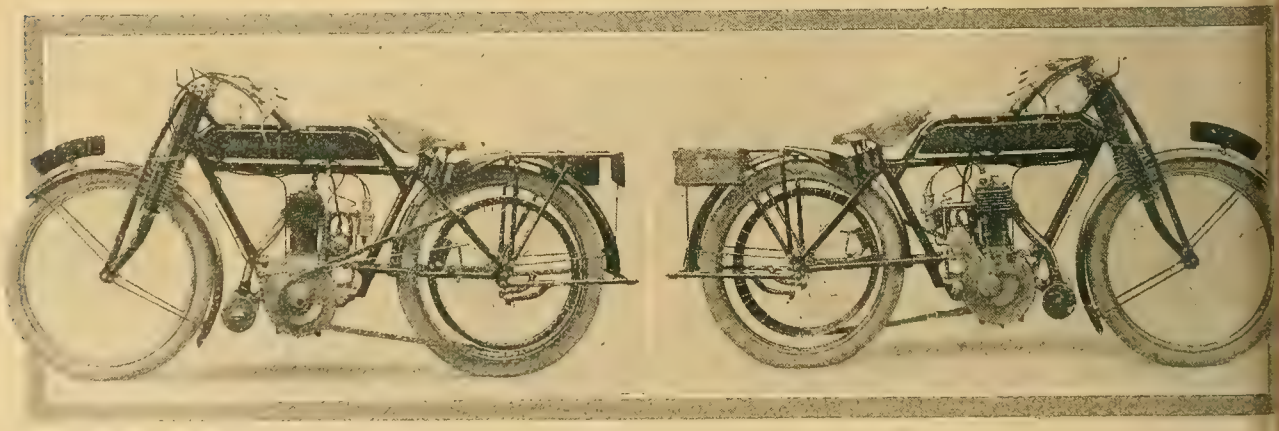
The descent was safely accomplished, and we set out for the pass to Dolgelly, which is so often confused with the real Bwlch-y-Groes. Dinas Mawddwy is the hill on which so many failed (including ourselves) in the Shrewsbury six days trials less than five years ago, and yet we climbed it almost all the way on middle gear. Our task was now accomplished, and after a hearty lunch we started for Birmingham at a smart pace. The return journey was uneventful, but we were forcibly struck by the wonderful way in which the engine may be driven on nearly full throttle for mile after mile without showing a sign of overheating.

We reached Birmingham in good time, and so ended a pleasant trip and a most successful test. Components, Ltd., are to be thoroughly congratulated on their gear, which renders the 3½ h.p. machine a go-anywhere sidecar mount. There never was any doubt about the efficiency of the engine, which seems capable of pegging away indefinitely. Our adjustments on the road were nil, and the new Pedley belt was never touched, nor were the Liberty tyres except for a few strokes of the pump in the garage.

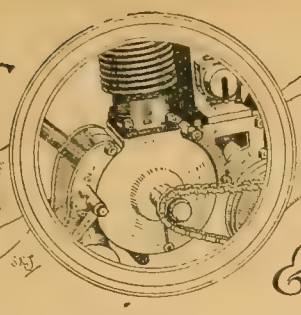


Valve side of the 3½ h.p. Ariel-showing kick starter and spring seat-pillar.

A SINGLE GEARED TOURIST ARNO.



A new model 3½ h.p. T.T. tourist Arno, which is finished throughout in red and sells at a very moderate price. The head and seat lugs are formed in one piece.



QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Baldock (Herts.) to Bournemouth.

I shall be much obliged if you could tell me my best route from Baldock to Bournemouth *via* Farnham.—T.A.P. (Baldock).

Your best route would be as follows: Baldock, Stevenage, Welwyn, Hatfield, St. Albans, Watford, Rickmansworth, Uxbridge, Staines, Chertsey, Weybridge, straight on past Brooklands Track, round to the left as if you were going to Cobham, then the first on the right which will take you on to the Portsmouth Road, which follow through Guildford, then continue through Farnham, Alton, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, to Bournemouth.

The Moment of Maximum Pressure.

I should be very glad if you would kindly answer the following questions for me, relating to a 90 mm. × 90 mm. motor cycle engine. (1.) How far down the firing stroke is the piston at the moment of maximum explosion pressure? (2.) What are the factors which determine the position of the piston at the moment of maximum explosion pressure, *i.e.*, does this position depend on—*(a)* The design of valves and ports? *(b)* The revolutions per minute? *(c)* The size and capacity of the engine; that is, would it be the same for a long stroke and a short stroke engine, developing the same h.p.? *(d)* Would the fact that the engine was *désaxé* affect it? *(e)* Would the fuel affect it; that is, would it be the same for petrol as for benzole? In all the above, assume the spark to be set as far advanced as possible without causing the engine to knock.—D.P.C.

(1.) It is impossible to give you the exact position of the piston at the moment of maximum explosion pressure, as it depends on so many variable features. We would recommend you to "The Petrol Engine," by Dugald Clerk, which is a good work, including this subject. (2.) This position, as you suggest, does depend to a certain degree on design of valves and ports, and, under certain circumstances, to the revolutions per minute, the pressure increasing as the r.p.m. fall off. At the same time, the position of the piston and the maximum pressure should be the same regardless of r.p.m. The capacity of the engine will not vary the position except for varying the bore and stroke ratios; the fact of the engine being *désaxé* would certainly affect it and also the fuel used. Benzole gives more even and gentler explosions, so that the piston would be somewhat further down its stroke at the point of maximum pressure.

Excessive Tyre Wear.

I wish to ask your opinion with regard to trouble I have had in connection with my motor cycle. Last Easter I took delivery of a 2¾ h.p. machine. Within 500 miles I had numerous punctures, and by 800 miles the back cover was worn in places down to the canvas. I sent it to the makers and obtained a new one at a special price. Meanwhile I fitted another make of tyre which has given me very good service on former machines. I have now ridden it 400 miles, and the beads already show signs of considerable wear. Seeing this, I naturally began to suspect that the wheels were out of alignment, but I have tried every conceivable dodge and can find no error in this respect. The rear wheel appears to be slightly to one side. This error, however, if it exists at all, is very slight, and I fail to see how that could cause excessive tyre wear, as it would not make the tyre drag. There is also a very minute wobble in the wheel. An agent tells me that these two faults are fairly common, and would not produce the effect of which I complain. I am therefore at a loss, and shall be interested to know if you can suggest anything which has escaped me. Another proof that the wheel is not out of alignment is that the belt was perfectly true and shows no sign of wear, being untouched in 1,250 miles.—A.G.M.

It is very difficult to give you any precise answer as to your trouble without examining the machine; but, generally speaking, it would appear that you are committing the fault of not sufficiently inflating the tyres. Particularly should tyres be well inflated if the machine is fitted with a hub gear, as the additional weight of this in the back wheel is considerable. You also do not mention the size of tyres fitted, but we should imagine that they would be 2¼in.; they should certainly not be less, and, if your rim will take it, we should advise the new 2⅜in. cover to be fitted when you next purchase a cover. The numerous punctures you complain of would not, of course, be caused by any slight misalignment of the wheel, but the second tyre which you say has given you general satisfaction would be most unlikely to go at the beads in such a short space of time unless insufficiently inflated. We need hardly point out to you that it is essential, if satisfactory results are to be obtained from tyres, that the wheels of the motor cycle should be correctly aligned, and although a slight amount of misalignment is met with in many machines, it does not follow that this is correct, and you should certainly take steps to have even the smallest fault in this respect remedied by a competent man. We note, however, that you say at the end of your letter that the belt is running perfectly true, and, therefore, if the pulleys are set correctly, the wheel must also be in line. Have you correctly examined your back wheel to see that it is not slightly buckled?

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate 1/6 post free; mounted, 1/9 post free. Thirteen to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

Cheshire to Olympia.

As it is my intention to visit the Olympia Show by motor and sidecar, I should be glad if you would advise me as to the least congested route to approach the place from Alderley Edge. I am not particular to going a few miles out of my way if this will attain my object of avoiding traffic.—R.F.

Your best route from Alderley Edge to the Olympia Show is Alderley Edge, Congleton, Leek, Ashbourne, Derby, Castle Donington, Loughborough, Leicester, Market Harborough, Northampton, Newport Pagnell, Woburn, Dunstable, St. Albans, Barnet; entrance to London by the Edgware Road, cross Oxford Street at Marble Arch, go down Park Lane, turn to your right at Hyde Park Corner, and through Knightsbridge, Kensington High Street, Olympia. None of this is really very difficult traffic riding, but great care must be exercised at the turn from Park Lane into Knightsbridge, where the traffic is usually very thick and comes from several directions at once.

B. F. G. Fowke (3½ h.p. Blackburne) starting from Leaves Green, near Keston, for the Single Gear Club's run.

A Question of Reliability.

Whilst riding a motor cycle through a village I suddenly observed a cow some thirty yards away charging towards me at a big speed, with a dog running alongside and barking at its head as though trying to stop it. I saw it would be very risky to attempt to pass, so I pulled up. Although I was only running at eight to ten miles per hour at the time, the cow drew abreast of the front wheel just as the machine had come to a dead stop and I had dropped my feet on to the ground. The dog at that moment succeeded in diverting the cow's direction, with the result that the animal came right across the front wheel, upsetting both myself and the machine. Luckily, I was uninjured, but the front of the machine was badly damaged. From enquiries I made it appears that the cow was being driven with others, from the village, and that it was running back to its cowshed. Is the owner of the cow liable for the damage?—E.H.D.

We have submitted your query to our legal adviser, who replies as follows: "Your correspondent does not say whether the owner of the cow is also the owner of the dog. If he is the matter is somewhat simplified, but if he is not, then the question arises as to which was the primary cause of the mischief, the dog or the cow. Evidently the cow was not under proper control, but to recover damages I think your correspondent would have to show that the owner of the cow knew of its mischievous propensity. If the cow and the dog belong to different owners, there would be very great difficulty in getting compensation from either."

A Scored Cylinder.

I have a 1912 3½ h.p. motor cycle, the cylinder of which is scored rather badly on both sides due to the gudgeon pin working loose. This scoring causes the engine to lose compression. You will greatly oblige me by answering the following questions: (1.) Would it be the best plan to have a new cylinder? (2.) Or would it be as good to have the present cylinder rebored and ground, and fit new piston and rings. I may state I have only had this new piston about six weeks. Should I send this piston up to the firm and have a cylinder to fit it? (3.) I have rather a nasty bulge in the left-hand side of the tank. Could this be taken out? If so, please advise me how it can be done. (4.) The back rim is flattened in a few places where the bead of the tyre fits the rim. Kindly advise me how I can remove these flats.—B.V.M.

(1.) No; we do not think this necessary. (2.) We should think that you could have the cylinder reground and a new piston fitted. A new one should not be necessary. It is absolutely essential that a new piston should be fitted if the cylinder is reground. (3.) It would be very difficult to get the dent out of the petrol tank. Probably it would entail it being taken to pieces, and this is not a job which you could do yourself. (4.) The flats in the back rim could be taken out by hammering the rim up against a hard piece of wood with a wooden mallet.

Liability with regard to Stored Machines.

I shall be glad to have your opinion on the following: On August Bank Holiday last two cycles were stored by two gentlemen, for which they paid the usual charge. On returning to claim the machines the same evening, it was discovered that two lamps, alleged to have been fixed on the lamp brackets at the time of storing, had disappeared. The cyclists now claim the price of the lamps. Will you kindly state if any liability rests on the storekeeper as regards the lamps, and whether there can be any legal claim?—W.C.B.

Our legal adviser writes as follows: "In order that the cyclists can claim for the value of the lamps which had disappeared, they must show that there was some negligence on the part of the storekeeper or his employés. For instance, if the storekeeper left the cycles in a position easily accessible to the public, or negligently left the place unattended, then the cyclists could recover. It is not quite clear whether your correspondent is one of the cyclists or the storekeeper. If he is the latter, I should recommend him to have a notice conspicuously posted up showing that he does not hold himself responsible for damage by theft or fire, and also to have a small receipt book printed with similar words printed thereon, and which receipt he would hand to the customer when the cycles were stored, in cases where payment is made in advance."

Shortening Magnets.

I am changing my ignition from accumulator to magneto. Unfortunately, the magneto is too high to fit in behind the cylinder—the place I had intended to put it. Would it matter if I cut one inch off the magnets, which are fairly long?—M.A.G.

Personally, we should say that it would not much matter if you cut a little off the magnets. The magnets, however, would require to be re-magnetised after the process, and another effect might be to reduce slightly the power of the current produced by the magneto.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"J.B." (Newmarket). — Bramptor variable gear on 3½ h.p. sidecar machine

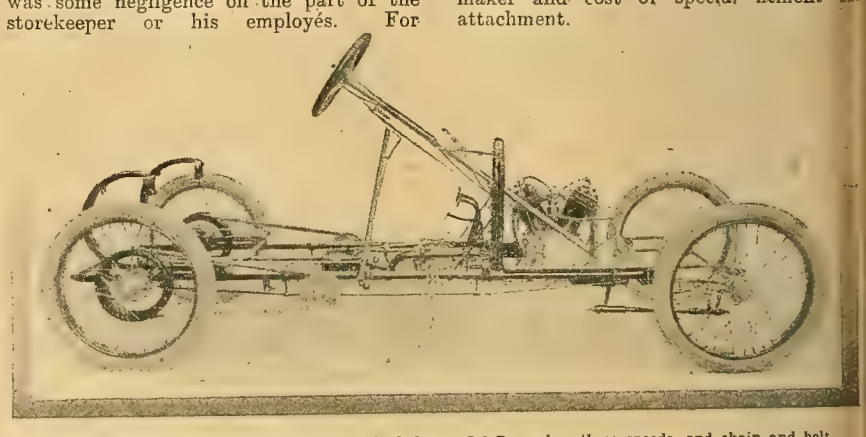
"A.S." (Dorset).—3¾ h.p. Scott. Reliability, hill-climbing, consumption, life of chains, and speed.

"A.A.P." (London).—Scott and 7 h.p Indian, solo and sidecar on same gear Vibration, reliability and durability.

"E.H.M." (Perth).—New type Bink and Lukin carburetters on 1913 Scot and sidecar.

"J.M.S." (Plumstead). — 3½ h.p single Indian with sidecar, in hilly district. Also 7 h.p. Indian as genera solo mount in traffic.

"C.L.S." (Bedford Park). — Binks Lukin, and Senspray carburetters wit 1913 2½ h.p. Douglas. Also name o maker and cost of special fitment fo attachment.



AT THE PARIS SHOW. The Jouve, which has a J.A.P. engine, three speeds, and chain and belt transmission. The front axle only is sprung.

Merry Miles—

every one of them—when your saddle does its duty by you—

MERRY MILES—when the road shock is successfully absorbed and the rebound modified—

MERRY MILES—when your comfort is ensured through the medium of the

BROOKS—

The Saddle with the Compound Springs.

These are an exclusive feature of the BROOKS and, being so, the advantages which follow are equally exclusive.

Each consists of a spring within a spring—the outer one is long and supple, and within it is another short and stiff—these act in perfect unison in the absorption of the initial shock yet check each other in the after movement and—never "toss you in the air."

MERRY MILES—and, when you think of all the weary ones which the saddle with the "simple" spring has given you, you desire those "merry miles" exceedingly—

Then let your agent introduce you to the BROOKS, but first write us for the book that tells you all about it.

Sustains

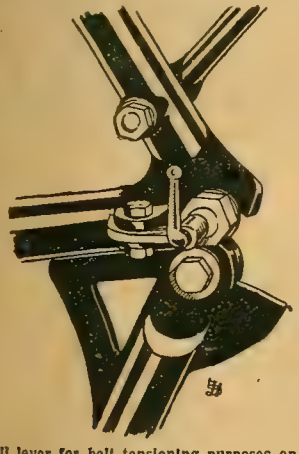
The 1914 Rudge Motor Cycles.

Features: Large fuel capacity; 650 × 65 mm. tyres on car type rims; foot-operated oil pumps; special belt tensioning device.

THERE are no really startling changes to record in the Rudge machines for 1914, but that must not be taken to mean that progress is absent. Far from it, for, although to the eye the machines are much the same as the 1913 models, there are a great many minor detail improvements which go towards making a thoroughly satisfactory and dependable mount. The main features of these always distinctive machines have been retained, namely, the multi-gear, the engine-shaft clutch, quick detachable wheels, all-black finish, and overhead inlet valve. The motors will, as heretofore, be of two sizes, the 500 c.c. and the 750 c.c., the latter being primarily designed for sidecar work. There will be a slight reduction in price of the multi-gear models.

Plenty of Fuel and Greater Silence.

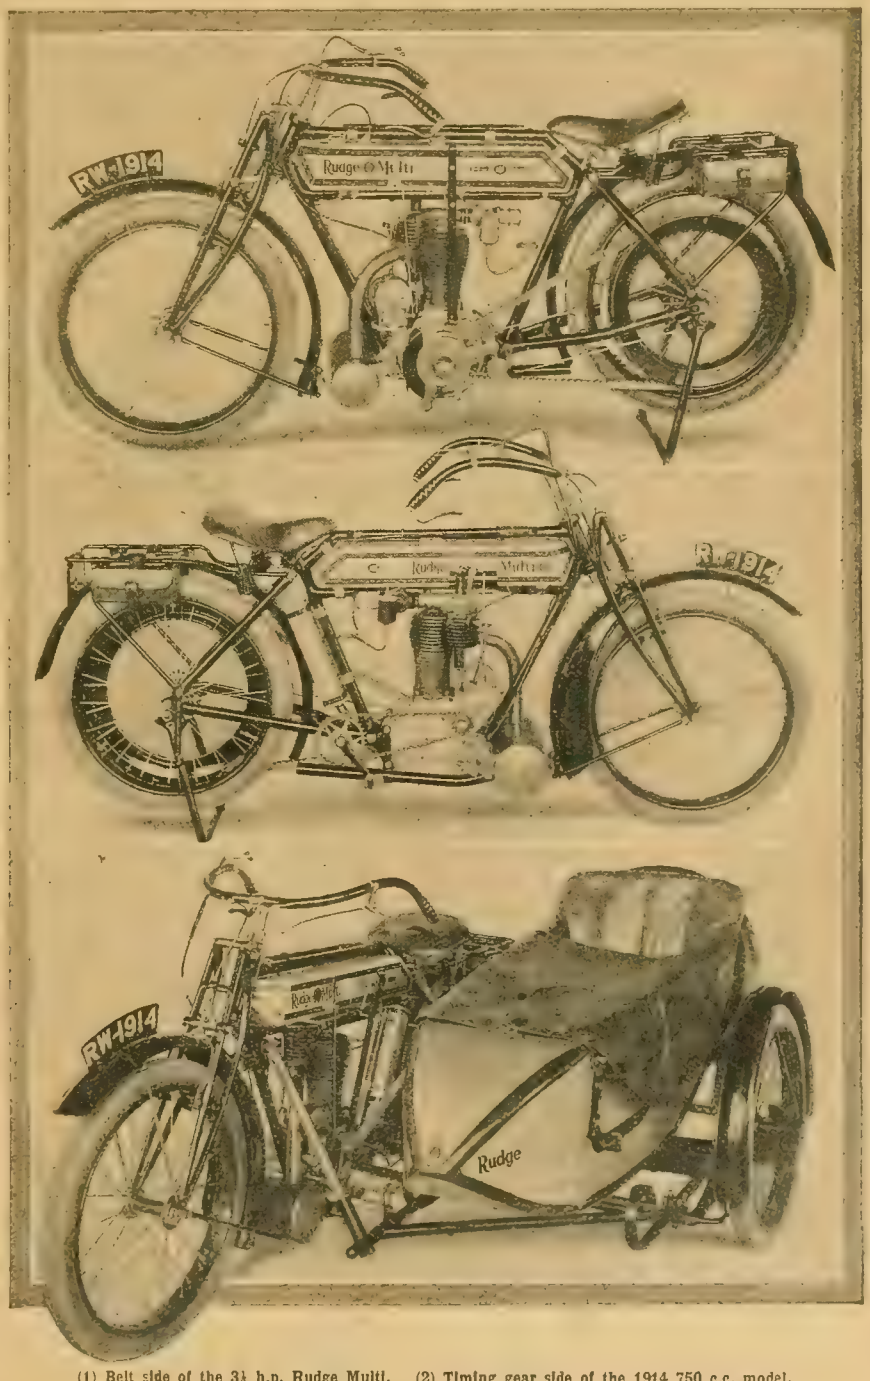
The improvement which catches the eye immediately on the T.T. and the 750 c.c. models is the provision of a separate oil tank fixed to the tube from the saddle to the bottom bracket, thus leaving the tank proper to carry petrol only, the result being that nearly two and a half gallons of petrol and five pints of oil can now be carried, a highly desirable state of affairs which *The Motor Cycle* has never ceased to urge.



Small lever for belt tensioning purposes on the 1914 Model Rudge machines.

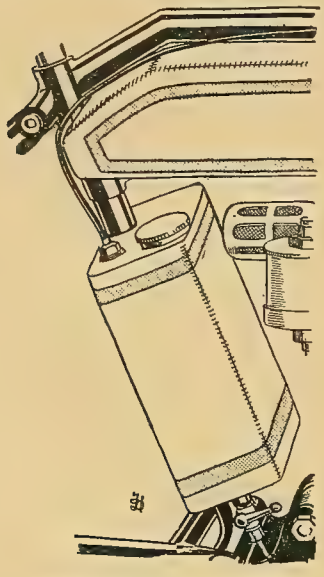
The oil tank is neatly fitted, and at the same time is readily detachable if necessary. Oil is forced into the motor from the oil tank by a foot-operated pump worked by a Bowden wire, on the touring model by pressure of the rider's heel and on the racing machines by the toe. Another considerable improvement will be found in the design of the silencer, which is now of very large size, with a pipe to the rear wheel. The cubical capacity of the expansion chamber is five times greater than that of the cylinder. This silencer is the result of a very careful study of the A.C.U. silencer test report, and should go far to do away with any backslidings which this make has committed in the past in the matter of noisiness. But if silence has not hitherto been an outstanding feature of this make, a supply of wonderful efficiency has been the lot of Rudge riders, and now, for next year, we are promised a combination of these two virtues.

Starting at the front of the machine, the wet-excluding front hubs, which have proved so satisfactory this season, have been retained. The design of the front forks and steering head remains unaltered, and Rudges have long been famous for



(1) Belt side of the 3½ h.p. Rudge Multi. (2) Timing gear side of the 1914 750 c.c. model. (3) Three-quarter front view of the complete 5-6 h.p. Rudge Multi sidecar outfit.

The 1914 Rudge Motor Cycles.— their perfect steering qualities. An improvement is the fixing of greasers to the shackle bolts. The ignition is by Ruthardt magneto, carried on a platform cast integral with the base chamber. Most exhaustive tests have been made with this magneto, out of which, we



Oil tank fitted to the Brooklands model Rudge.

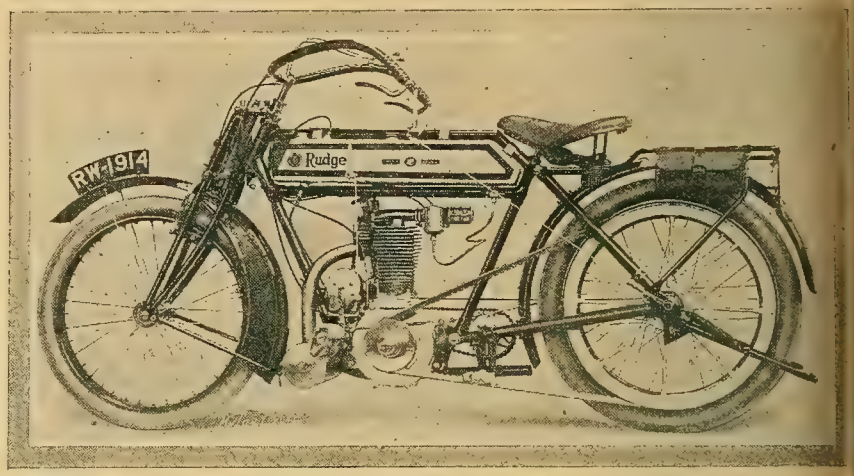
are informed, it has emerged with flying colours. In the engine an extensive use is made of roller bearings, the main shaft and the big and little ends of the connecting rod being so equipped; in fact, the Rudge designers are evidently enthusiasts for this form of carrying the load, and declare that tests have shown them that it is the most lasting method obtainable, one of the main reasons given being that oil finds its way into roller bearings with greater freedom than into any other kind. On the new models the rear pulley flange is built up with the rim, the spoke nipples taking the drive. Ribbed pattern tyres of 650 × 65 mm. section are adopted for the first time as standard, fitted to rims of the beaded edge car type, conforming to S.M.M.T. gauges.

Belt slip should not in future worry users of the multi-gear. A very neat little screw adjustment, which we illustrate, is used to tension the slack of the belt if this becomes excessive. This is done by screwing together the flanges of the rear pulley, which, of course, tends slightly to raise the gear ratio. This simple device enables a rider to get home when he would otherwise have to stop and tighten his belt, an annoying performance if the weather is wet or the roads muddy.

Rudge engines are vigorously tested both on the bench and on the road before delivery.

The Rudge Sidecar.

The coachbuilt sidecar made by this firm is specially designed for use with the 750 c.c. multi. It is very roomy, beautifully sprung, and wonderfully comfortable. A special point is the construction of the wheel, which has the outside set of spokes flared outwards from the rim to the hub at a considerable angle, as in the Rudge-Whitworth car wheels. This gives great strength, and collapse of a wheel when sudden severe corner strains are thrown upon it is practically impossible. Rigidity is an outstanding feature of the sidecar, which has four-point attachment, and is constructed of straight tubes throughout. A double bracket for lamp and generator is provided. The upholstery of the sidecar is carried out in a very thorough manner, and a serviceable storm apron is supplied, which may be used as a cover when the sidecar is not in use. The price of the sidecar is sixteen guineas.



The above 3½ h.p. Rudge, with Sturmey-Archer gear, has been added to the Rudge range for 1914.

New Records by the Calthorpe.

The 10 h.p. four-cylinder Calthorpe (62 mm. × 90 mm.) was successful in breaking seven records at Brooklands on Thursday, October 23rd. On the whole, it put up a particularly good performance, for during the first part of the time the fog was thick and materially affected the carburation. During the latter half the petrol tank was leaking rather badly, and this leakage caused several stops for petrol. Each back tyre was changed once. One was punctured about the twenty-eighth lap; the other had two nails imbedded in the tread.

Non-stop Engine Run.

The engine ran non-stop for six hours. It ran on Vacuum Mobiloil (B.B.) and Pratt's spirit. Palmer tyres were used, and the fact that the front tyres were untouched and showed no appreciable wear at the end of the day reflects very creditably upon the makers.

We examined the car at the end of the day and noted that part of the exhaust pipe was lost; that the petrol tank was leaking in several places; and that the starting handle was broken off.

It was certainly dogged perseverance that caused the ultimate success of the Calthorpe, for, as will be noted below, no records were broken till the car had run for nearly four hours. The drivers showed themselves thorough sportsmen, since they had to put up with very cold weather and fog, a puddle of petrol to sit in, and several other minor troubles.

The times were as follows:

Hours.	Miles.	Yards
1	66	1117
2	129	1737
3	196	1581

The undermentioned are records:

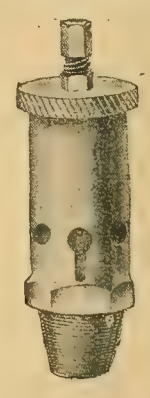
Hours.	Miles.	Yards.	m.p.h.
4	263	878	65.87
5	330	919	66.10
6	393	450	65.54

Miles.	h.	m.	s.	m.p.h.
250	3	51	8⅗	64.89
300	4	30	38⅕	66.51
350	5	18	27⅘	65.94
400	6	6	37	65.46

It was decided to attempt the short distance records as soon as the conditions were favourable.

AUXILIARY AIR INLET.

Messrs. Brown Bros., Ltd., Great Eastern Street, E.C., have introduced an exceedingly ingenious and well-designed extra air inlet. The method of its working is clearly shown in the accompanying illustration. The chief point about its design is the fact that the valve bottoms on a cone seating, so that in the closed position no air leak is possible. Some of the air holes are shaped like a keyhole so that when the valve is slightly opened only a small amount of air is admitted.



AVON

An ENDURING Non=skid.

THIS AVON Combination Cover, with its clean-cut bars of thick rubber alternating with steel studs, is rapidly acquiring a unique reputation in cycle car work. It combines the road-gripping qualities of the fully-armoured type with the durability of an all-rubber tread, and stands up to the severest work with remarkable vitality.

A.J.S. & Six Days' Trial.

Messrs. A. J. Stevens and Co., Ltd., Wolverhampton, writes:

"There has long been a need for a tyre to fit to the driving wheel of a passenger combination, and we think you are the first to supply that one. Some time ago we gave one of your combination tyres a thorough test, and we were so satisfied with its behaviour that our Mr. A. J. Stevens decided to use one in the Six Days' Trial. For the first time he was able to go through the whole Trial without having to change the driving tyre.

"It would perhaps be as well to explain that the necessity for changing tyres in the previous Trials was not because the tyres wore out, but because the non-skid properties entirely disappeared in about three days, and a new tyre would be necessary, to prevent slip when climbing very steep hills. In the case of your tyre, however, its non-skid properties were as good at the end of the Trial as at the beginning.

"We have recommended your combination tyre to many of our clients, and in every case they have been well pleased with the result."

Every motor cyclist should carry a shilling box of KURKUT (Cure-cut), a handy stopping for the instant "healing" of cuts and gashes. KURKUT is the "stitch in time that saves nine."

The LIGHT CAR 1D.

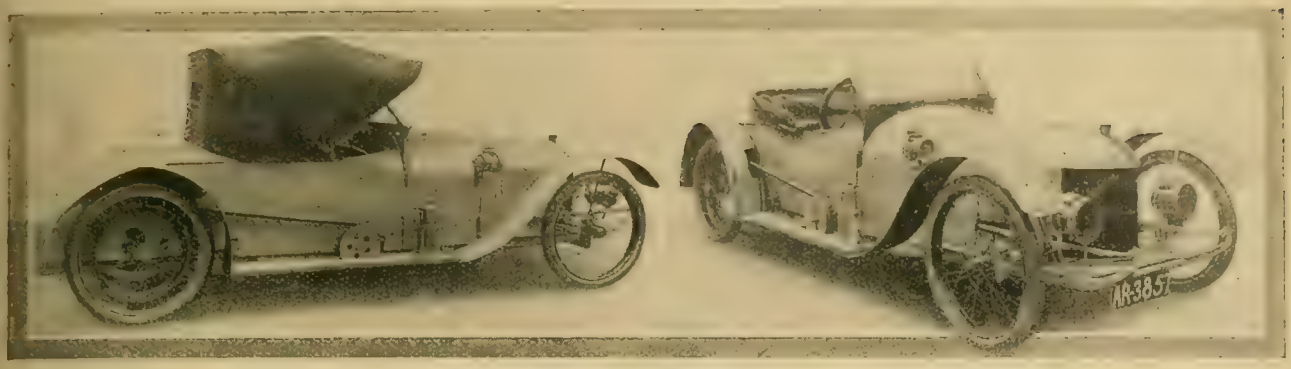
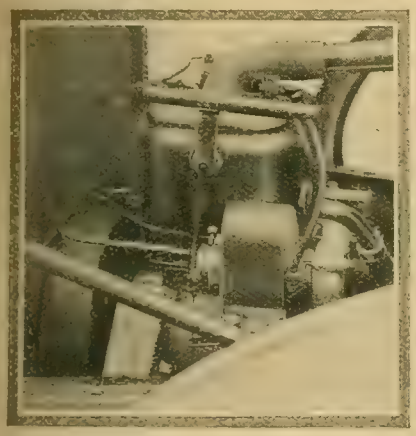
The 10 h.p. Adamson Cycle Car.



Two aspects of the twin-cylinder Adamson, which has an underslung frame, belt drive and water cooling.

THE 10 h.p. Adamson is the production of a firm of engineers, Messrs. Barton, Adamson and Co., Enfield Highway, whose business is general engineering and the running of motor lorries. The vehicle being belt-driven, having a chassis weight of 4½ cwt. and a complete weight of 7¾ cwt., may be called a true cycle car. It possesses many original features which show careful forethought. The chassis is of pressed high-tensile steel narrowed in front and carried first down and then upswept at the rear. It is underslung, and suspended on very long semi-elliptical springs. The engine,



Magneto side of the water-cooled Adamson power unit.

which is bolted direct on to the chassis, is a 10 h.p. Alpha, 85 × 95 mm., 1,099 c.c., and fitted with a Solex carburetter. The camshaft is driven by gearing, but the magneto is chain-driven, the chain being enclosed. The valves are also covered in and adjustable tappets are provided. Apart from the method of springing the chassis, the most interesting portion of the vehicle is aft of the clutch, and the general arrangement is clearly shown by the accompanying drawing. The male member of the clutch is kept in engagement with the female portion by means of long flat springs, which terminate in shackles from which pins run through the edge of the flywheel, and are secured by nuts and lock nuts, by means of which the tension of the springs is adjusted. The forward part of the short shaft between clutch and gear box has a castellated end, while the rearward end is fitted with a leather disc type universal joint. The gear box is carried on a detachable inner frame.

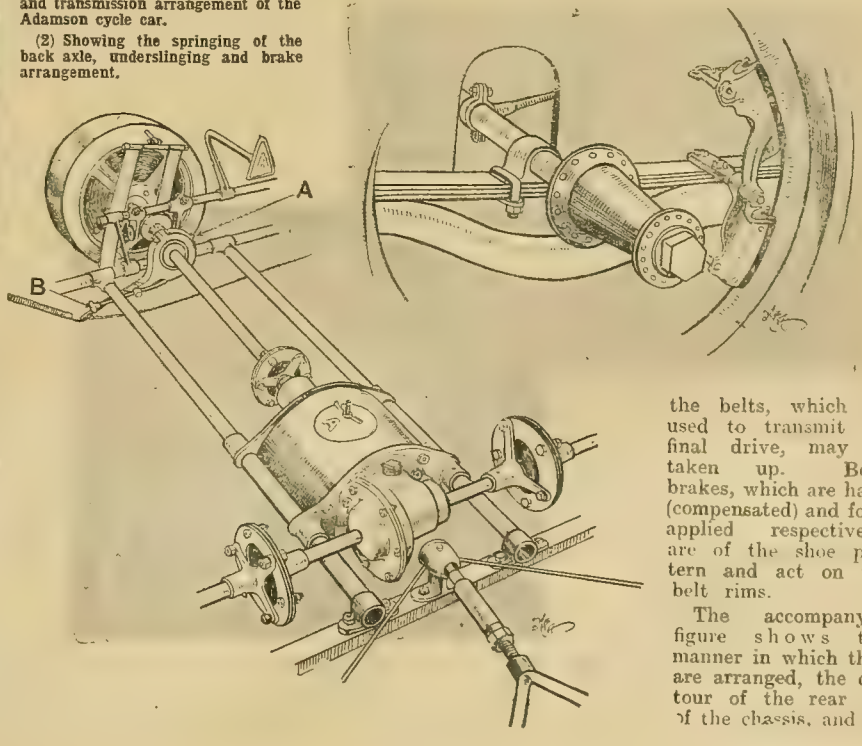
Engine Started from the Seat.

But before dealing with the former, reference must be made to the starting device, which is worked from inside the body. This is a ratchet and pawl arrangement surrounding the short shaft, and marked A in the drawing. Connected with the arm is a wire cable passing through pulleys attached to the body and not shown in the drawing, and ending in a handle conveniently placed near the driver's hand.

Injury through a back fire is impossible, as should this occur the arm of the starting device is flung back against the adjacent member of the inner frame, which is struck first by the trigger B, which immediately releases the pawl and throws the starting device out of action. The gear box, which contains three speeds and reverse, the change of which is effected through a gate, is cylindrical in shape, and consists of two cheeks of aluminium, which are the end plates, filled in by an 18-gauge steel tube. The top speed is direct and the gears slide on castellated shafts. Motion is transmitted to the counter-shaft by means of a bevel, and this counter-shaft, it will be noticed, is provided with two leather disc pattern universal joints so as to allow for any whip in the frame. Each end of the counter-shaft, to which large diameter pulleys are fixed, runs in ball bearings carried in brackets. A V-shaped distance rod runs from the gear box to the rearmost cross member of the chassis, which ends in a ball joint and an adjusting screw, by means of which any slack in

(1) Clutch mechanism, seat starting, and transmission arrangement of the Adamson cycle car.

(2) Showing the springing of the back axle, underslinging and brake arrangement.



the belts, which are used to transmit the final drive, may be taken up. Both brakes, which are hand (compensated) and foot-applied respectively, are of the shoe pattern and act on the belt rims.

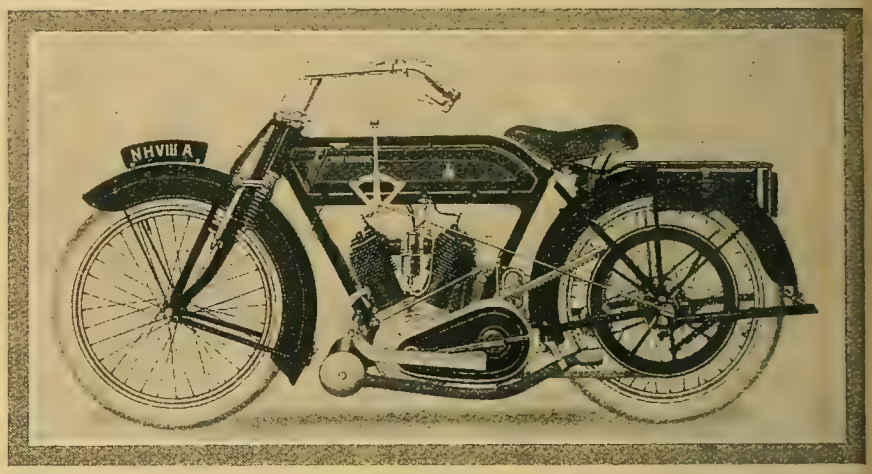
The accompanying figure shows the manner in which these are arranged, the contour of the rear end of the chassis, and the

The 10 h.p. Adamson Cycle Car.—way in which the back axle passes through the body. The tubular front axle passes also over the chassis just behind the radiator. Wire steering is fitted, and the cable employed is of larger dimensions than is commonly found in vehicles of this type. The steering swivels are supported on ball bearings above and in steel bushes at the bottom. The body, it will be noticed, has particularly pleasing lines, is provided with running boards, and has a large-sized locker at the rear. Taken altogether, the Adamson is one of the best examples of the belt-driven type of cycle car we have yet seen, and should prove very popular.

The New Hudson 6 h.p. Twin.

FEATURES: Chain and Belt Drive; Large Petrol and Oil Capacity.

The general lines of this machine do not differ materially from the 3½ h.p. model. The frame is similar, but is strengthened throughout. The countershaft drive, giving the advantage of a large pulley, is retained. This is driven by a chain from the engine-shaft, while a belt transmits the power to the Mark VII. Armstrong three-speed hub, which gives gears of 5, 7½, and 12 to 1, and contains a multiple plate clutch of large area. The engine has a bore and stroke of 76 × 85 mm., and the cylinders are set at 50°. The lubrication is by drip feed; the tank is of large capacity, being capable of holding two gallons of petrol and half a gallon of oil. The wheels have small car rims fitted with extra heavy Dunlop 650 × 65 mm. tyres as standard, with a choice of Palmer cords, Kempshalls, or Hutchinsons. The back part of the rear mudguard is made detachable to facilitate tyre repairs. It will be noticed that the magneto is placed in a rather unusual position behind the down tube, where it should be well out of the way of dirt. The footboards are sprung at the rear, turned up and pivoted in front. The machine is finished in the usual New Hudson style, which is too well known to need any further description. The machine is said to have attained a speed of 55 m.p.h. with a sidecar attached and, of course, carrying a passenger.

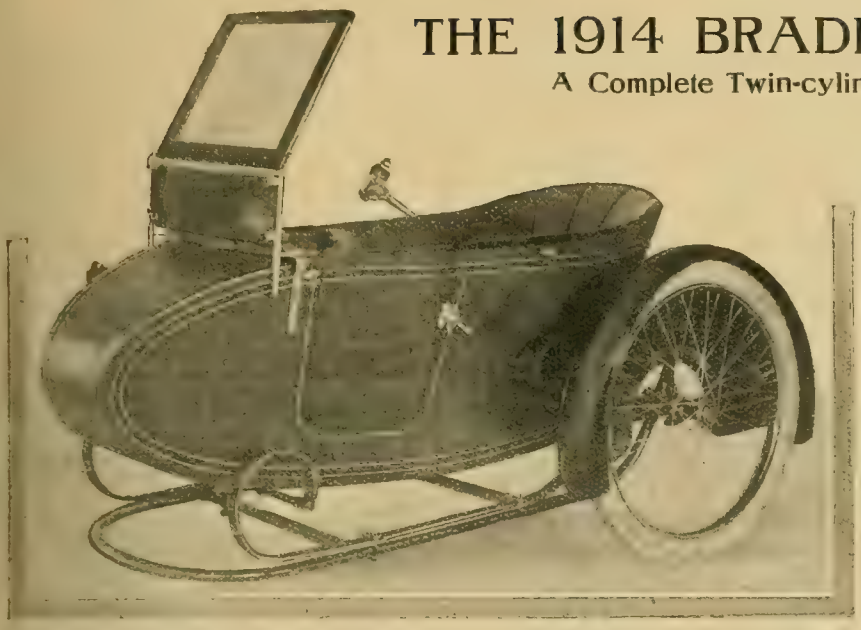


Transmission side of the 1914 6 h.p. three-speed New Hudson. The Mark VII. Armstrong gear is employed with chain-cum-belt drive.

APPROACHING THE MEMBERS' BRIDGE.
An impressive group of sidecars and cycle cars in the hour race of the B.M.C.R.C. at Brooklands.

THE 1914 BRADBURY MODELS.

A Complete Twin-cylinder Sidecar Outfit.



The attractive coach-built sidecar introduced by Bradbury & Co.

TWO outstanding features of the Bradbury programme for next year are the production of a very fine twin-cylinder three-speed machine specially designed for sidecar work, and a luxurious sidecar specially designed for use with this machine. The 3½ h.p. single-cylinder machine is now fitted with comfortable footboards, a kick starter in the counter-shaft, and direct belt transmission. A Sturmey-Archer three-speed gear is fitted.

A Powerful Sidecar Machine.

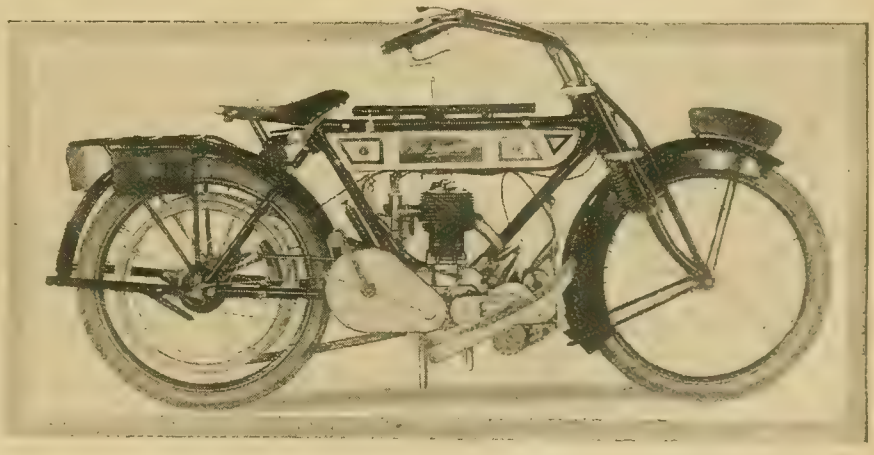
The 6 h.p. twin is a fine example of a powerful motor cycle. The transmission is by chain throughout, the chains being entirely enclosed. A well designed three-speed gear box is fitted, on the counter-shaft principle, the gears being of the sliding type. The gears are changed by a large lever working in a quadrant on the right-hand side of the tank. Ample sized footboards with deep heel pieces are fitted. The engine is of 750 c.c. capacity, the bore and stroke being 74.75 × 86 mm. respectively. The cylinders are held down by long rods to the base chamber, joined by a yoke over the cylinders. A feature of the machine is the excellently large toolkit leather box situated on the top tube of the frame, which is, we consider, the ideal position for the kit to be carried.

Luxurious Bradbury Sidecar.

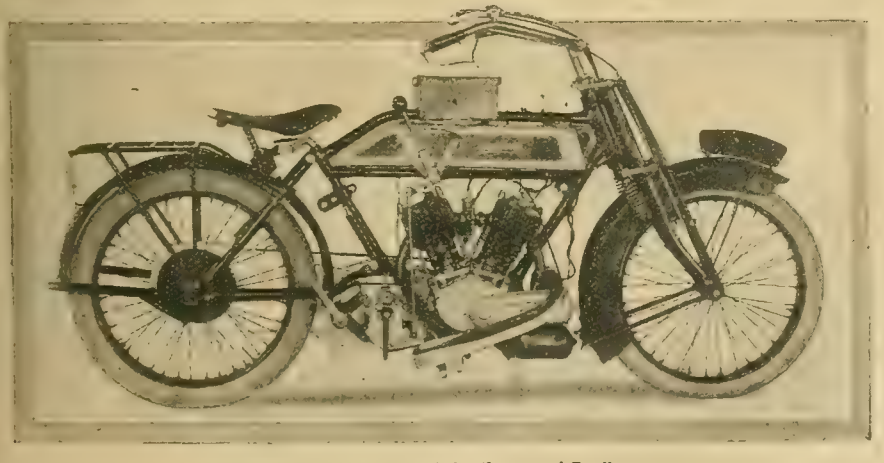
The sidecar is a wonderfully roomy and well designed attachment. It is coachbuilt, and entrance is gained by a very wide door. The chassis is underslung, and a feature to be noticed is the admirable way in which the sidecar wheel is mudguarded. An adjustable wind screen is fitted and a hood can be supplied if required.

One of the best features of this sidecar is the excellent length for tall riders. The chassis is carried well to the front of the body.

This sidecar is specially designed for use with powerful machines, and with the twin Bradbury in particular.



A 3½ h.p. single-cylinder Bradbury.



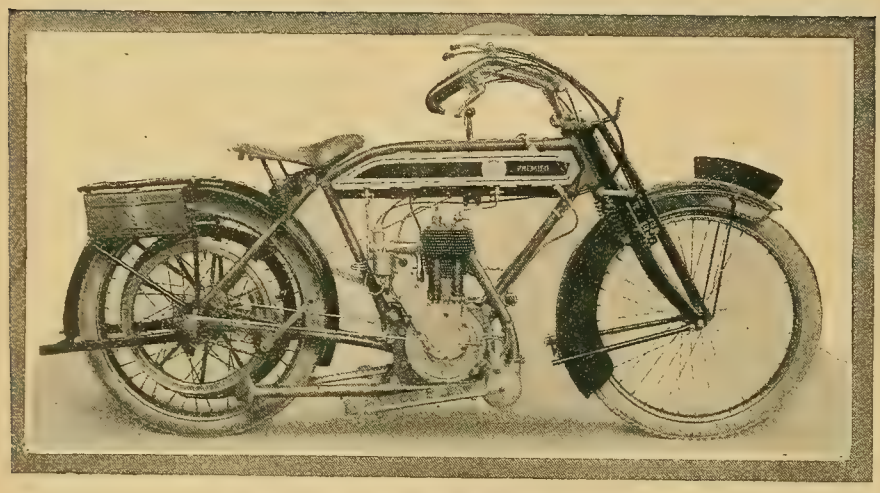
The new 6 h.p. twin-cylinder three-speed Bradbury.

A NEW FEATHERWEIGHT CALTHORPE.

A Two-speed Machine under 100 lbs.

This machine, which will be known as the "Calthorpe Minor," is a replica of the high powered machine of the same make as regards frame construction, carburetter, ignition, etc. The power is obtained from a 1¼ h.p. Precision 60 × 60 mm., 179 c.c.; this engine is said to produce 3 h.p. at 5,000 revolutions per minute, which is quite credible, as the Dendy Marshall formula places the h.p. at this speed at 3¼ approximately. The two-speed gear is incorporated in the crank case and operated by dog clutches worked by the foot; the gear ratios are 6 to 8 to 1 on top and 12 to 16 to 1 on low. The Calthorpe Minor should appeal to a large number of people who have no wish to use a heavy motor cycle.

The Latest 3½ h.p. Premier.



A new 3½ h.p. Premier with footboards and kick-starter.

Our illustration depicts an attractive model just produced by the Premier Cycle Co., Ltd. The power unit is the well-known 3½ h.p. Premier motor with the auxiliary exhaust device. Druid front forks are fitted, and the mudguards have been extended to give greater protection. Comfortable footboards are fitted, and an enlarged silencer with pipe to the rear is supplied. The drive is by belt to an Armstrong Mark VII. three-speed hub of the latest design, and a kick-starter is provided. A new departure is the colour of the tank, which is enamelled bronze instead of aluminium. A very low saddle position is given, and the shape of the handle-bars has been greatly improved. Altogether this machine looks very serviceable.

We regret that last week we inadvertently gave the address of Alfred Roberts and Sons, Ltd., as St. Mary Street, Birmingham. The correct address of this firm is Gripwell Works, St. Mary's Row, Birmingham.

Motosacoche 1914 Models.

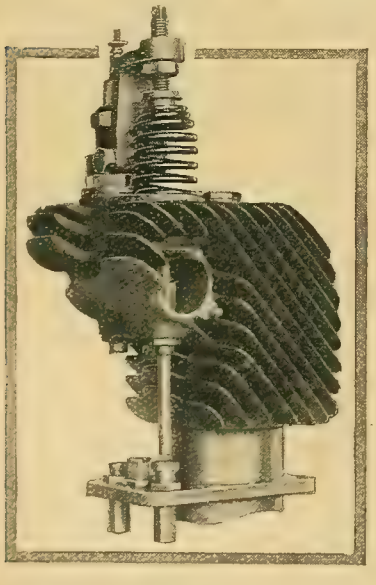
THE 2½ h.p. single-cylinder Motosacoche and the 3½ h.p. twin of the same make will be supplied with or without Mr. De Lissa's patent valve, which will not, however, be fitted to the 6 h.p. twin sidecar model owing to the overhead inlet valves which are a feature of the M.A.G. engine on this model.

The Sidecar Model.

The details of the 2½ h.p. and 3½ h.p. are unaltered, and the specification of the sidecar model is, 6 h.p. V twin-cylinder M.A.G. engine, overhead inlets, Enfield two-speed counter-shaft gear, chain transmission throughout, and a cushioning device in the drive to the rear hub. The front fork is a Druid, and the forks are made sufficiently wide to take the whole width of the mudguard without trapping. An automatic drip-feed lubricator is employed.

The sidecar chassis is very strongly built with three cross tubes connecting the side members, and can be fitted with any type body.

We had a short run in a sidecar fitted to a 3½ h.p. twin which Mr. De Lissa uses, and found the speed of which this engine is capable quite surprising; it was fitted with the patent exhaust valves to which we refer above. This valve has been previously described in *The Motor Cycle*, but its advantages are not fully understood; it will, therefore, be of interest to refer to it again, as it will be a Motosacoche fitting next year.



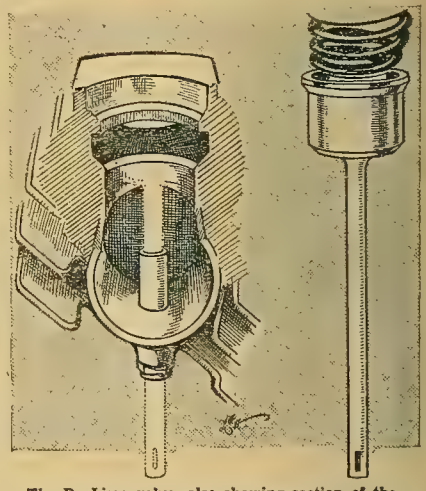
The De Lissa valve as fitted to a Motosacoche cylinder.

The De Lissa Exhaust Valve now Standardised.

The illustrations explain the working, and it will be noticed that the greatest advantage is the exposure of the valve head to the air, which keeps it remarkably cool, and the absence of internal pressure on the head. An ordinary exhaust valve has to lift against a strong pressure in the cylinder varying with the throttle opening; in the De Lissa valve this pressure acts on the sides of the valve, and it is claimed that it assists in lifting it, the only negative work done being to open the valve against the pressure of the coil spring. Another advantage is that the head cannot break off, and a valve breakage is unknown. The ordinary valve spring tends to drag the stem from the head, because it pulls the valve back to its seat and exerts a hammering action which tends to break off the head. In the De Lissa valve the stem only acts as a tappet, and the valve will work if the stem were cut off below the exhaust port and that amount of length added to the usual tappet. The coolness of the valve after running is notable, as oil, which in the ordinary case gets burnt off the seat and head, remains liquid on the De Lissa valve.

How the Valve is set.

In setting this valve a strong spring is necessary to prevent it rising too early, as it will do if the spring tension be slackly adjusted. The spring is screwed down until the sound of the explosion getting away through the seating is inaudible, with throttle fully open and ignition advanced. "Knocking," as ordinarily known, is with this valve absent, because, should explosions occur too early for the speed of the engine, the valve lifts slightly and acts as a decompressor. We had ocular proof of the coolness of the cylinders, as, after running a few miles, we laid the business ends of some ordinary wood matches on the cylinder heads, and they failed to ignite, whereas matches held near the exhaust pipes blazed up almost before they touched the pipe.



The De Lissa valve, also showing section of the cylinder to accommodate the valve.

The 10 h.p. A.C.

FEATURES—Four-cylinder High Speed Engine; Novel Clutch and Brake; Minimum Weight.

THE well-known firm of Auto-Carriers, Ltd., of Thames Ditton, have now taken one more step forward into light vehicle production by placing on the market a small four-cylinder car, which comes within the definition of a cycle car.

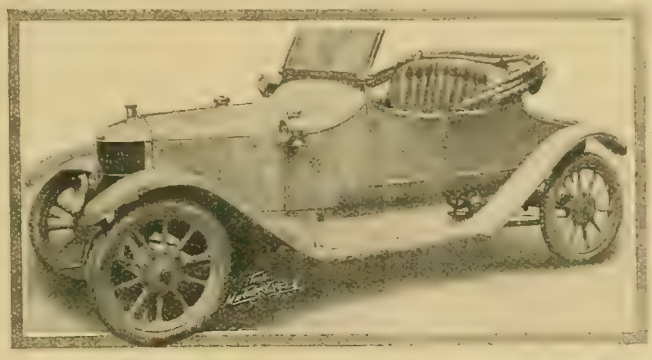
The source of power is a four-cylinder water-cooled engine of very clean appearance, having a bore and stroke of 59 mm. by 100 mm., giving a total capacity of 1,096 c.c. The valves are totally enclosed. Cooling is effected on thermo-syphon principles, in conjunction with a pointed radiator fitted with extra large oval tubes, through which air is drawn by means of a fan embodied in the fly-wheel. The Bosch magneto, which is driven through a flexible coupling, takes up an accessible position on the off side, the near side being reserved for the Zenith carburetter controlled by an adjustable accelerator pedal, operating in conjunction with a hand control on the steering column, the latter being used to set the engine at the minimum speed required. An automatic pump forces lubricant to the main bearings, other moving parts relying on splash troughs placed under the big ends, and should any obstruction or leakage occur a tell-tale indicator on the dash notifies the driver of such a crisis. The crankshaft runs on two journals, and the engine can turn round at a maximum of 2,500 r.p.m., thus giving the vehicle a really creditable speed on top gear.

Details of the Transmission.

The clutch is quite a new departure, a Ferodo covered flat ring replacing the usual cone. Much experimental work was carried out in this direction, resulting in a very sweet acting mechanism. A gate change allows for the selecting of the gears, performed by a lever, which is a neat steel stamping, whilst the power for sliding the gears is transmitted to the striking forks by neat rods passing along on either side of the torque tube which encases the propeller-shaft.

It should be explained here that the gear box casing is cast in one with the torque tube and extends into a further compartment, housing the worm and differential, thus allowing the whole unit to be encased on one large chamber.

There are one or two very neat details concerning the gear changing parts, which are worthy of attention. Great ingenuity has been displayed in devising a means for locking the striking rods in position. This consists of a ball and spring placed in an eccentric casing, which can be rotated, thus performing the required adjustment, its final position being fixed by a set screw. A double ball journal in a steel housing is provided for the engine shaft, the layshaft running in a similar type but with single balls. Three speeds forward and a reverse sum up the changes, the gears being $3\frac{3}{8}$, 7, and $12\frac{1}{4}$ to 1, with direct drive on top.



The 1914 model A.C., which has a four-cylinder water-cooled engine.

Great trouble has been taken with the mounting of the worm shaft, and the bearings are most substantial.

It would be as well, perhaps, to describe this rear brake now, since its design is a unique and rigid structure. Its action is similar to that of the clutch, because a plate is used instead of the usual shoes working in a drum. A stationary disc faced with Ferodo is brought up against a plate fixed firmly to the worm shaft, which is splined, the direction of the thrust being opposed to that exerted by the worm in propelling the car. Being an overhead drive the worm wheel hangs below in two brackets, large duplex ball thrust bearings, placed in pressed steel casings being responsible for the support. The bevel differential is of generous dimensions, splined axle shafts forming the attachments for the bevels, a very commendable refinement. At the wheel end of these shafts, brakes are fitted and arranged to work right in the centre of the hub. Therefore, with Sankey wheels, the general appearance is greatly enhanced as well as the whole mechanism being weatherproof.

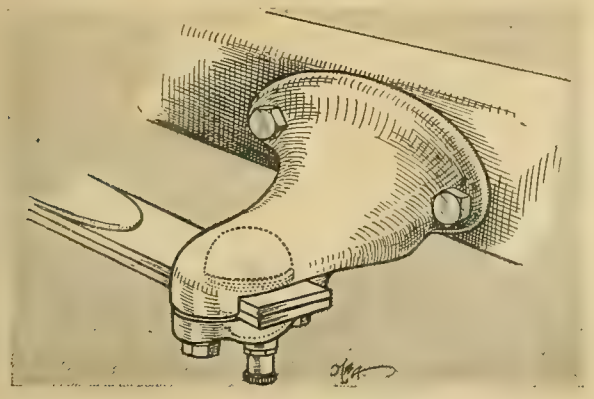
Grasshopper springs provide the suspension at the rear; transverse springs, lubricated by greasers, make it possible to in-sweep the front end of the chassis frame, giving at the same time exceptional lock to the steering. A great deal of useless weight has been disposed of in designing the frame, pressed channel steel giving the required lightness with the maximum of strength. Its actual length is 6ft., but the type of rear springing adopted makes the wheelbase 8ft. $5\frac{1}{2}$in.

Comfort in the Coachwork.

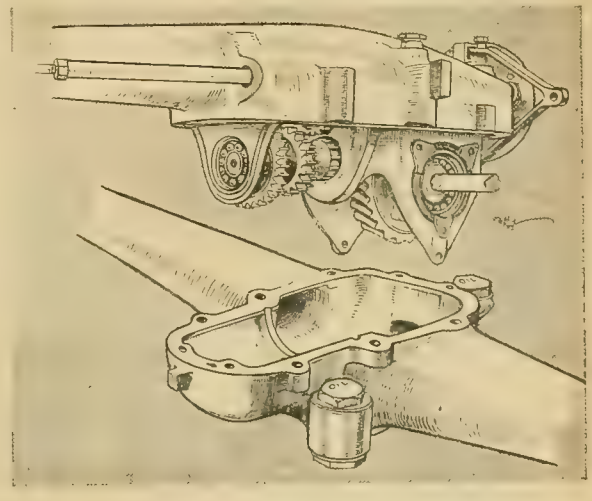
A very neat coachbuilt body, constructed on streamline principles with tulip dash, gives ample seating accommodation. Care is taken to have the cushions at the angle of greatest comfort.

It is impossible to do justice to such a fine piece of engineering in so short an article, but the main factors can be summed up in the following:

Steel stampings are used in every possible case, accessibility is always kept to the fore, highest grades of material, only, are utilised, and further the price complete, including heavy car Clincher tyres 700 × 80 mm., hood, glass windscreen, large kit of tools, three lamps, horn, tyre pumps, jack, etc., is £175.



Spring bracket on the new A.C. showing ball device, allowing end of rear spring universal and sliding movement.



A.C. rear axle showing arrangement of gear box, also brake on end of worm shaft.

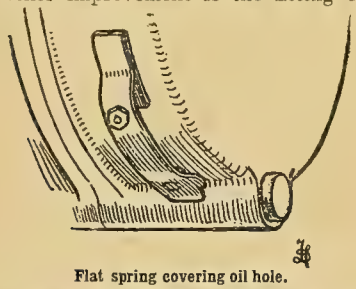
The 10 h.p. A.C.—

The other model marketed by this firm is furnished with the well-tried single-cylinder engine used in the three-wheeled sociables. A dummy radiator is made in one with the bonnet, its shape being similar to that of the larger model. Two speeds forward and a reverse comprise the reduction gears, which are epicyclic. The final drive is by a single enclosed chain to a solid axle, one wheel being fitted with a slipping clutch in place of a differential. Grasshopper springs form the rear suspension, transverse springs the front. We have no hesitation in saying that the value of the car at £100, with complete equipment and ready for the road, is wonderful.

TRIUMPHS IN 1914.

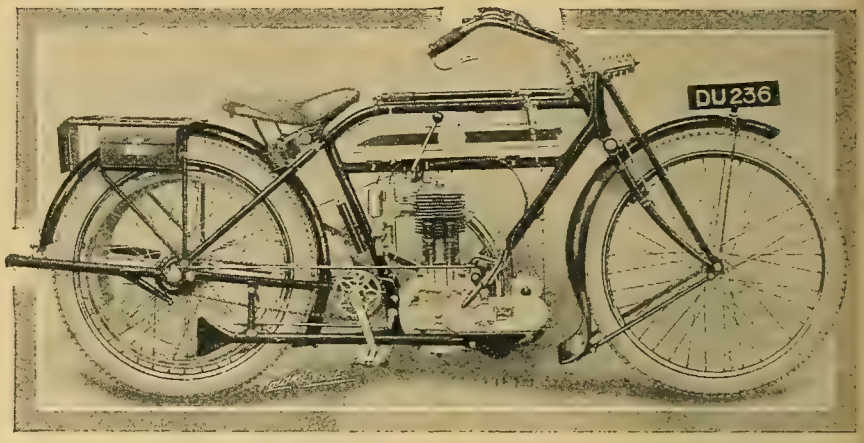
Features: Dropped Frames, Semi-automatic Lubricator.

WE are able to illustrate this week two of the new model Triumph motor cycles as they will be exhibited at Olympia. It will be observed that a dropped top tube has been adopted (this is common to all types), giving a lower riding position. Another improvement is the fitting of a

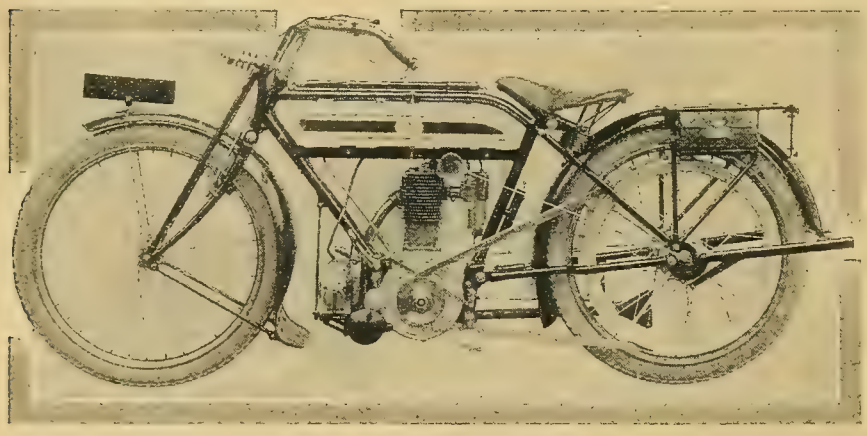


Flat spring covering oil hole.

Best and Lloyd semi-automatic drip feed lubricator, the pump being arranged in an inclined position as usual to render its depression an easy operation whilst sitting in the saddle. There are, of course, many detail improvements on the new Triumphs, but these must form the subject of an article in our next issue, when we purpose dealing with an entirely new single-cylinder mount the Triumph Co. will market in 1914, and, it is expected, exhibit at Olympia.



The Standard three-speed touring Triumph.



Belt side of the 1914 model T.T. Triumph roadster.

This machine has been kept in the background, and the news of its adoption will come as a distinct surprise. At the moment we are bound to secrecy.

Another new fitting is the flat spring fitting over the oil drain in the crank case in place of the screw plug which is liable to shake loose and be lost.

Those who have been anxiously awaiting the appearance of a twin-cylinder Triumph will still have to wait in patience, as next year this famous firm will specialise once more in single-cylinders

IVY-PRECISION.

The maker of the Ivy motor cycles (Mr. S. A. Newman, Ivy Works, Lichfield Road, Birmingham) will exhibit at the Show a 1½ h.p. lightweight Ivy. This is fitted with the Precision lightweight set, consisting of a miniature engine with two-speed gear box incorporated with the crank case. The transmission is by belt from a pulley on the half-time shaft.

Other models are the 3½ h.p. with Sturmey-Archer gear; 3½ h.p T.T., to which a larger tank is fitted; 4 h.p. twin, with new Precision engine and Sturmey-Archer gear; 2½ h.p. touring single-cylinder; and 4¼ h.p. single-cylinder sidecar combination. The latter will have chain drive and G.H. three-speed counter-shaft gear. On the change-speed hub models, the kick starting device on the offside has been improved by brazing the clip for the crank axle to the chain stays. The foot brake now has the shoe working in the groove of the belt rim, which facilitates the removal of the back wheel.

On the change-speed models this brake operates against a separate belt rim attached to the offside of the wheel, and in the single-geared models against the belt rim on the near side. Celluloid-covered handle-bars are adopted as standard on all models, and B. and L. drip-feed lubricators.

Mr. Newman also intends to exhibit a 2½ h.p. two-stroke lightweight. This machine has a 60 × 60 mm. engine made on orthodox two-stroke lines, crank case compression being employed. The magneto is mounted on a neat platform at the rear of the crank case, and an outside flywheel is fitted. Hoffmann ball bearings are fitted to the crankshaft, which is of very substantial proportions. As these bearings are a particularly good fit, it is not expected that compression washers will be required. The transmission is by belt, and the method of lubrication is to mix a certain proportion of lubricating oil with the petrol, which feeds through the carburetter to the engine. During the experiments a drip-feed lubricator was employed, in addition to the above, but it will probably be discarded on future models.

It will thus be seen that a comprehensive range is being marketed for 1914.

The Third Meeting of the F.I.C.M. in Paris.

THE third meeting since its foundation of the Fédération Internationale des Clubs Motocyclistes was held at the Automobile Club of France, Paris, at 5 p.m. on Saturday last. The following is a list of the countries represented and their delegates:

GREAT BRITAIN.—Messrs. E. M. P. Boileau and T. W. Loughborough (Secretary F.I.C.M.).

FRANCE.—MM. le Chevalier René de Kuyff, G. Longuemare, F. G. Fenton, and Charles Fourreau (Secretary Competitions Committee A.C.F. and U.M.F.).

GERMANY.—Dr. Brückmayer and Herr M. Hein.

BELGIUM.—Baron Nothomb and M. Michant.

DENMARK AND HOLLAND.—Herr N. Jamink.

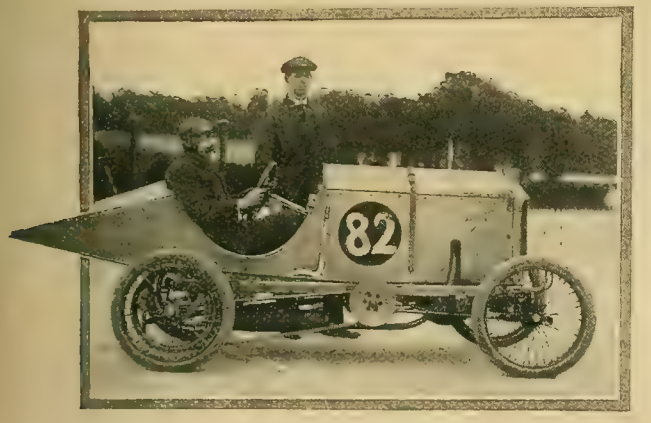
ITALY.—F. A. Head.

SWITZERLAND.—M. Mégevet.

The Chevalier René de Kuyff, who occupied the chair, called on M. Fourreau to read the minutes of the last meeting in French.

Next Year's Competition.

Mr. Boileau then read the report of the International touring trial, and after both the above had been passed, Mr. F. G. Fenton proposed that the F.I.C.M International touring competition which is to be held in France next year should start from Paris and then be held from a centre for three



THE BUCKINGHAM CYCLE CAR AT BROOKLANDS.

The designer, J.F. Buckingham, who is seen at the wheel, recently set up new 750 c.c. records for the mile and kilometre.

or four days, and should finish in the French metropolis. Several districts were mentioned, such as the Lyons district, the Auvergne, and the Vosges. He reported that on behalf of the Union Motocycliste de France, MM. Longuemare, Koechlin, and himself had been instructed to find a suitable course. This proposal was adopted. It was also decided to hold the International Touring Trial in Germany in 1915. Mr. Fenton then raised the question of international records, and after a brief discussion it was agreed that the following should be recognised as world's records: The flying kilometre and the flying mile, the flying five miles and the flying five kilometres. 10 miles and 10 kilometres, 50 miles and 50 kilometres, 100 miles and 100 kilometres, 200 miles and 200 kilometres, 1 to 6 hours inclusive, 12 hours, and 24 hours It was agreed to recommend that the A.C.U. should alter class A, for motor cycles up to 275 c.c. to read "for motor cycles up to 250 c.c." It was also decided that the same rules governing records should be adopted as were laid down by the International Association of Automobile Clubs, but that for the present short distance records need not be electrically timed. M. Mégevet was asked to submit estimates for electrical timing apparatus at the next F.I.C.M. meeting. The following proposals, put forward by the representative of Holland, were adopted: That in international trials no "secret courses" should be used; that the organisers should send to the competing clubs one month before the competition a route card, giving all particulars as to the route and hills, and that all checking stations should be marked by a banner across the road

Cycle Cars may have Three Wheels.

Mr. Boileau then made the following proposal, which was carried unanimously: "That all motor cycles with three wheels be classified as cycle cars other than motor bicycles with sidecars, that by the term 'motor bicycle with sidecar' is meant a three-wheeled vehicle, consisting of a motor bicycle to which a chassis is attached carrying a body or seat for the passenger." The original draft possessed the words "passenger or passengers," but as the last two words if included might bring about a difficulty on the question of the taxation of cycle cars which is now being considered by the French Minister of Finance, they were omitted. The result is that sidecars carrying more than one passenger must in future competitions be classified as cycle cars.

Protests Considered.

Two protests were then considered, one emanating from Switzerland regarding the question of ballast, as the competitor's machine was over the minimum weight and his weight was under the minimum allowed for its rider. The second protest was from Italy, and made on behalf of a competitor who, contrary to the regulations, removed his silencer. This was not permissible, as, curiously enough, though the exhaust may be free in speed contests, silencers must not be removed. Both protests were disallowed.

The following officers were elected to constitute the Central Bureau: President, the Hon. Arthur Stanley, M.V.O., M.P., Chairman of the Royal Automobile Club and President of the Auto Cycle Union; vice-presidents, M. Longuemare (France), Dr. Brückmayer (Germany), and the President of the Moto Club d'Italia (Italy). Mr. G. F. Sharp was elected treasurer and Mr. T. W. Loughborough secretary.

In recognition of his services to the Federation, Mr. Loughborough was granted a sum of money representing 10% of the subscriptions received.

The meeting passed very smoothly and on no single occasion had the chairman to ring his bell

A volunteer fire brigade of Green Street Green, Kent, on their 6 h.p. Enfield sidecar. (See Current Chat.)

TIME TO LIGHT LAMPS.

Oct.	30th	5.36 p.m.
Nov.	1st	5.32 ,,
,,	3rd	5.29 ,,
,,	5th	5.25 ,,

Saturday's Speed Trial Postponed.

The Herts M.C.C. flexibility speed trials at Brookman's Park have been postponed until the spring. Only fifty entries had been received for the trials, and the committee considered that sixty was a minimum to proceed with the event.

The Effect of Benzole on Tanks.

A short time ago we published a paragraph asking readers who had found benzole to have a deleterious effect upon their tanks to communicate with us. Of course it was the inside of a tank that was meant, but all those who have been kind enough to write have misunderstood us to mean the enamel on the tank. This property of benzole is, of course, well known.

Alphabetical List of Miscellaneous Advertisements.

Commencing with the next issue, the miscellaneous advertisements in *The Motor Cycle* will be classified under the various makes of machines and arranged alphabetically—a system which has so long been adopted in connection with our sister journal *The Autocar*. Nowadays a reader has usually made up his mind as to the make of machine he wishes to buy, and we feel sure the change will be appreciated. The numerous advertisements of passenger motor cycles, which have hitherto not been sectioned up, will in future be much more easy of reference, as they will be grouped under their proper heading with solo mounts.

The Robbialac Competition.

Those of our readers who took part in the great Robbialac painting competition, as well as those interested in a really capital exhibition, will be pleased to learn that the County Chemical Co., Ltd., Chemico Works, Birmingham, have arranged for the whole of the articles sent in, and their number is legion, to be on exhibition for a fortnight commencing Monday, October 27th, at Daimler House, Paradise Street, Birmingham. It is not often that such a wonderful exhibit of amateur work is staged. The number, the great variety, the ingenuity, and the high standard in most cases attained has surprised everyone who has a hand in the organisation of this competition. Once the articles are staged, the judging will be carried out as expeditiously as possible, and results published with as little delay as possible afterwards.

A Belgian Hill-climb.

We have received an interesting letter from A. J. Dixon, the well-known Singer rider, written from Liège, where he went last week to compete in a hill-climb organised by the Motor Club Liègeois. The climb was held on a hill one kilomètre in length with 150 yds. in which to get up speed, and an average gradient of 1 in 7½. Dixon describes it as a perfectly ideal hill for the purpose, and the entrants included Triumph, Singer, and Sarolea machines, but Dixon was the only English rider. He was successful in winning, doing best on time and formula. He pays a high tribute to the kindness extended to him by the Liège M.C.

Kent Firemen's Sidecar Equipment.

Green Street Green, a village near Sevenoaks, is remarkable for the fact that the village fire brigade uses a sidecar outfit to get with speed to an outbreak of fire. The machine used is a 6 h.p. Royal Enfield combination, which, in addition to carrying four men, also conveys several lengths of fire hose. The roads round about this neighbourhood are exceedingly hilly, but the Enfield manages to take its heavy load round without faltering.

SPECIAL FEATURES:

MANY NEW MODELS.

UP BWLCH-Y-GROES ON A 3½ H.P. SIDECAR.

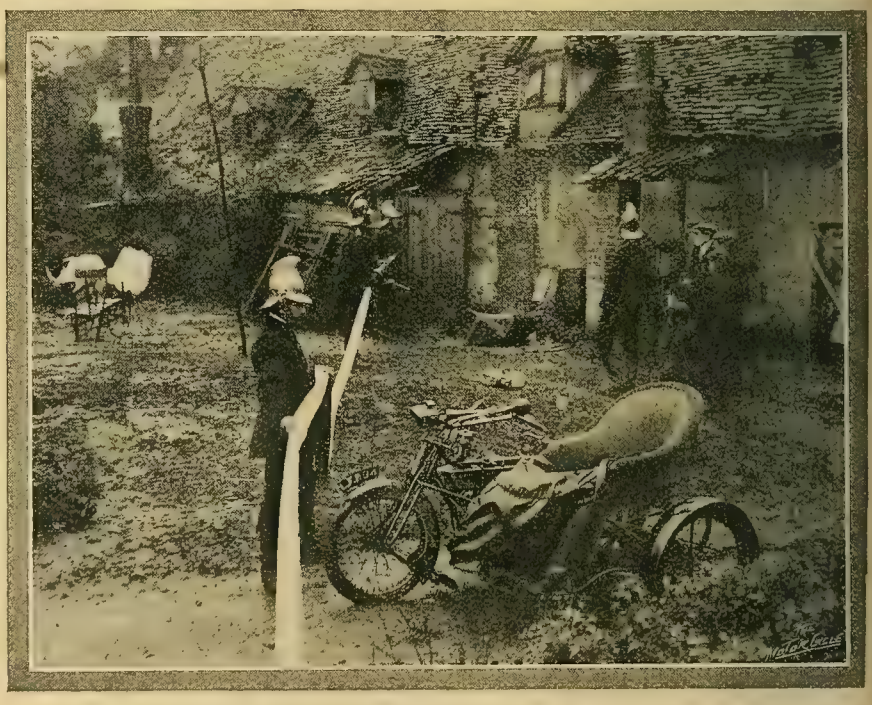
THE REAR LIGHT QUESTION.

The Flexibility Hill-climb.

We are asked to make it clear that it was a 3½ h.p. three-speed Sunbeam on which J. S. Watson made the best performance in the flexibility hill-climb of the Sutton Coldfield A.C., and not a 2¾ h.p. as stated in the official results.

Indian 1914 Programme.

Colossal extensions, both in capital and plant, have lately been made by the Hendee Manufacturing Co., makers of the Indian motor cycle, and next year, with their increased facilities for production, it is expected that no fewer than 300 complete machines will be turned out by the factory daily. In London the company expect to be in occupation of their large new premises, 366-368, Euston Road, N.W., before the Show opens at Olympia. This depot will serve as a distributing centre, not only for the United Kingdom, but for the whole of Europe.



A volunteer motor cycle fire brigade of Green Street Green, Kent, who use a 6 h.p. Enfield sidecar. Two sit in the sidecar and one on the luggage carrier. (See paragraph.)

Racing in Italy.

The Circuito Amiata, which recently took place over a course of 124 miles, was won by Baron Sergadi on a Triumph in 3h. 0m. 55s.

Road Obstruction by Traction Engine.

At the Exeter County Court, a fortnight ago, Mr. E. O. Babbington brought a successful action against the owner of a traction engine which blocked up the entire road (no look-out being kept), and consequently did considerable damage to his motor cycle and sidecar, as he was unable to pull up in time after rounding a curve. He was awarded damages to the extent of £23 18s. 8d. and costs.

Italian Sidecar Trial.

Motor cycles are gaining a strong hold on the sport-loving Italians, and last week the first sidecar trial for machines up to 1.000 c.c. was held at Perugia over a course of 160 kilometres. The competitor who reached an average speed nearest to forty kilometres an hour was declared the winner. The result was: 1, Sebastiani (Motosacoche), who averaged 39.994 km.; 2, Spadoni, who rode an Italian machine, a Frera, average speed 38.660 km.; 3, Bonainti (Williamson), average speed 36 km. A Singer was fourth.

Important International Competitions in 1914.

In the fixture list published by the Union Motocycliste de France, which is a similar body to the A.C.U. in England, we note the following important events:

March 18 to 25.—Paris-Nice Trial (M.C. de Nice).

March 29.—Grand Prix de Champagne (T.M.C. de France).

June 1st (week-end).—Grand Prix du M.C.M.

July 26.—International Motor Cycle Cup Race, Le Mans (A.C.S.O.).

Aug. 4 to 9.—F.I.C.M. International Competition.

British manufacturers who have felt the burden of the numerous Continental competitions this year would do well in 1914 to support only those of importance.

Trap.

We have received notification of a police trap between Ross and Ledbury, situated about four miles from Ross.

An Attractive Carburetter.

Next week we hope to publish an article describing a new variable jet carburetter, controllable from the saddle, which enables a racing twin, geared $3\frac{5}{8}$ to 1, to fire even on both cylinders whilst walking alongside. We have proved this to our own satisfaction. The carburetter will be exhibited at Olympia for the first time.

London-Exeter-London Run.

Mr. Harold Karslake, who is organising secretary of the London-Exeter-London M.C.C. Christmas run, informs us that this year the start and finish will take place at Staines instead of Hounslow, in order to avoid travelling over the bad piece of road between those places. Arrangements are going well forward, and the regulations will be issued early in November. Persons other than members desiring to enter for this event are requested to make an early application to the hon. sec., Mr. Southcomb May, 34, Gower Place, W.C.

The Strength of Wire Wheels.

The strength of a modern high-class motor cycle and sidecar is well demonstrated by the illustration which we give of a 6 h.p. Royal Enfield combination, showing it after a collision with a gate. It was being ridden by the Rev. J. Unwin, of Bordesley, Birmingham, and the accident happened at night time when he was on his way to preach at an outlying church. As he approached the gate, the road turns sharp to the right, but the lamp showed up the drive through the gate, and the rider, mistaking this drive for the road, and not noticing the gate, crashed through it, with the result that considerable damage was done. Despite the severe impact, however, none of the wheels were out of truth, which shows the strength of the Enfield.

A Warning.

Last week the Herefordshire police had a cut-out demonstration, since when they are very sharp on noisy motor cycles.

A.A. and M.U. Notes.

SPECIAL ROAD WARNINGS.—Dorset: The authorities in the county of Dorset have hitherto abstained from strictly enforcing the provisions of the Motor Car Act, but the Chief Constable informs the association, that unless complaints cease with regard to motorists driving dangerously round corners, and across cross-roads, measured distances will be instituted.

Saturday's Instructive Trial.

Saturday next is the date fixed for the novel trial to be held by the Streatham and District M.C.C. The trial will consist of an acceleration test, a reliability trial consisting of a seventy mile section before lunch, a thirty mile section after lunch, a speed trial on Brooklands, and a stopping and starting test which will take place on a gradient (the last-mentioned feature is one which has always been recommended by *The Motor Cycle*). The start will take place at eight o'clock, and competitors sign on at the Clayton Arms, Godstone, before 7.30 a.m., or they will not be allowed to start.

A Flexibility Hill-climb.

The Purley and District M.C.C. ran off their annual flexibility hill-climb for the Edge Cup, on the 25th inst., with the following results:

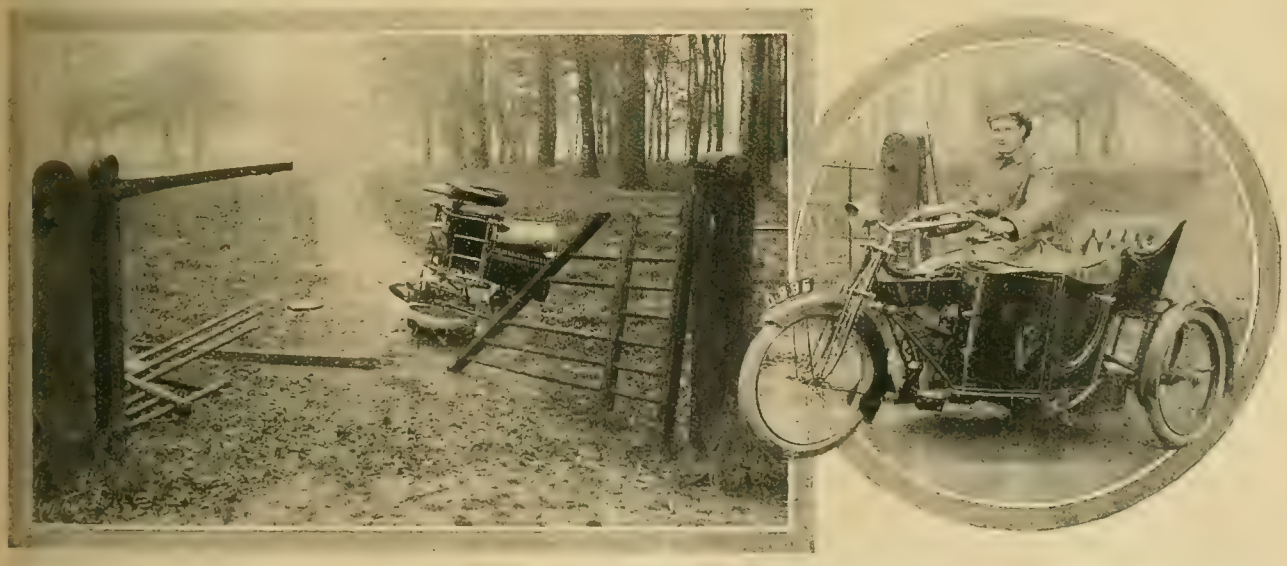
Class I. (up to 350 c.c.)—1, S. J. Taylor ($2\frac{1}{2}$ A.J.S.); 2, C. A. H. Mason ($2\frac{3}{4}$ Douglas).

Class II. (350 to 600 c.c.)—1, C. W. Meredith (Bradbury); 2, M. C. Breese (B.S.A.)

Class III. (over 600 c.c.)—1, E. J. Webster (8 Matchless); 2, R. G. Charlesworth (6 Zenith).

Class IV. (passenger machines, any capacity).—1, C. W. Meredith (Bradbury sc.); 2, W. G. Fowler (8 Morgan).

Webster wins the Edge Cup for best result of the day.

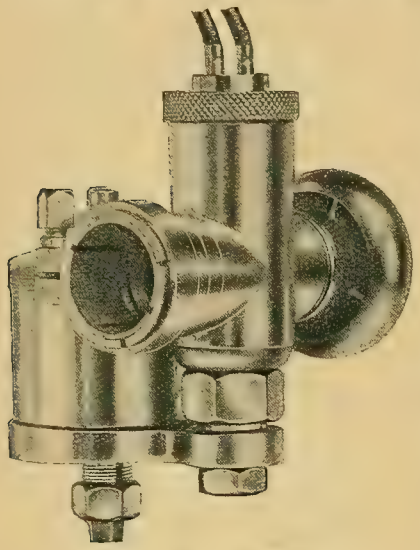


The Rev. J. Unwin and the gate through which he crashed late one evening without seriously damaging his 6 n.p. Enfield sidecar. (See paragraph.

Improved Amac Carburetter.

A Shield to Prevent Blow-back. Neat Double-clip Attachment.

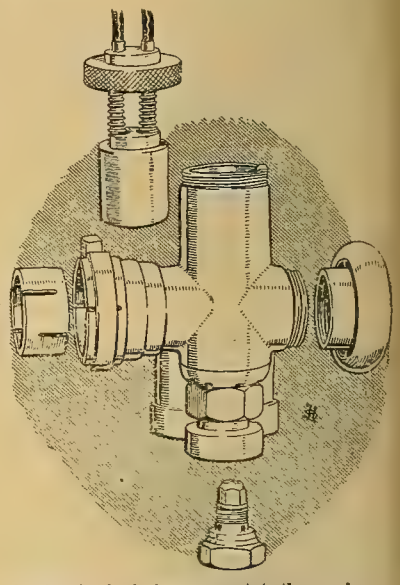
THE following definite alterations and improvements have now been decided upon in connection with the Amac standard carburetter for 1914. The base, to which the float chamber and vaporising chamber are attached, is now a gun metal casting, as also is the vaporising chamber. The float chamber lid is screwed on in place of the spring catch arrangement previously fitted, and the jet is removable from the base without disturbing any other portion of the carburetter. To compensate for the different sizes of jets which may be employed, and to improve vaporisation, air enters at the base through small holes in a cup, which can be changed for other cups with smaller or larger air holes. The effect of this is to give a correct mixture for slow running even when a large jet is used for maximum power. Previously, if the jet were changed no variation could be made in the air supply induced except by the position of the air slide, which acted, and continues to act, as a variable choke. A slight alteration to the interior of the carburetter now enables a clearer straight-through passage from the main air inlet to throttle.



The 1914 model Amac carburetter.

On the main air inlet is fitted a shield or cup arrangement which catches any petrol which may be blown back from the vaporising chamber, and thus economises petrol consumption. We illustrate the new clip attachment, by which it will be seen that no air leakages can take place, owing to the sawed clip being double, the saw cuts being spaced out so that the slots do not come together. This new attachment will be supplied in about two or three months At present the nut fixing is standard.

At the Olympia Show the Aston Motor Accessories Co., Ltd., Aston Cross, Birmingham, will show a carburetter designed for cycle cars of the automatic type, and will be sold at a price which will enable it to be used on low-priced small cars and cycle cars.

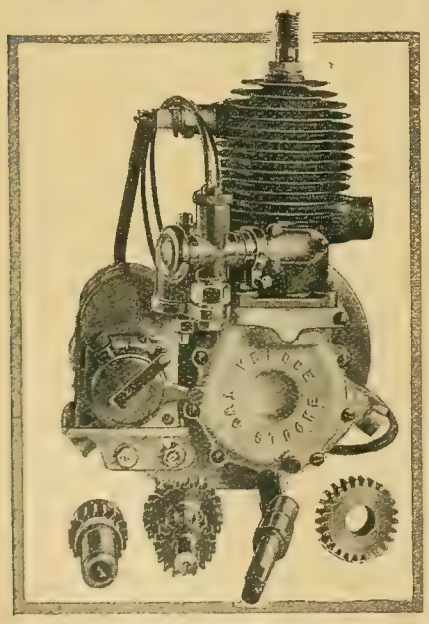


Showing clearly the improvements to the new Amac.

A New 2 h.p. Two-stroke.

A Departure for Veloce, Ltd. Mechanical Lubrication.

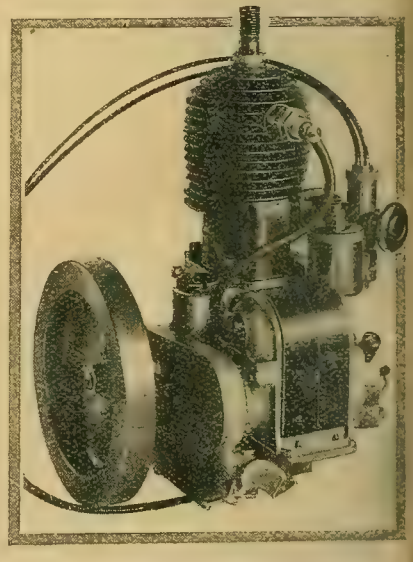
Among the many firms who have lately been experimenting with two-stroke engines are the Veloce, Ltd., of Birmingham. Their experiments have led them to prepare for the market the neat little power unit shown herewith. The engine is of the three port type, and has a bore of 60½ mm. and a stroke of 73 mm., the piston having one broad ring only. The cylinder is offset ¼in. and the crankshaft is made in such a way as to enable a solid big end bearing to be used. A very simple form of lubrication is used in conjunction with an oil sump and chain, the oil being led through the crankshaft to the big end. The chain adjustment for the magneto has been made particularly simple. A two-speed countershaft gear can be supplied at option and is constructed on the sliding dog lines, all parts being solidly made. The engine is designed for cheap but sound construction, and we hear that a single-geared model will sell for 25 guineas. Another model, with the two-speed gear in the bottom bracket and chain drive throughout, will be listed at 30 guineas.



Another view of the single-cylinder two-stroke Veloce from the carburetter side.

A NEW MODEL ARNO.

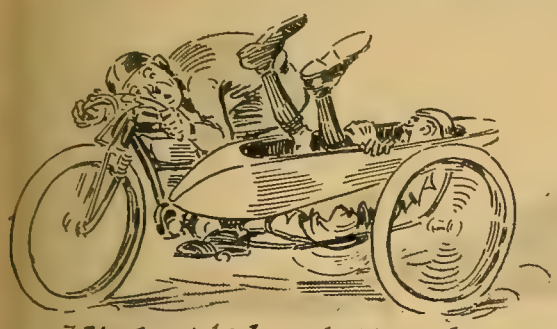
A new model Arno is now ready for the market. It is built on the well-known Arno lines but with a shorter frame The 500 c.c. engine carries the magneto on an extension of the crank case behind the cylinder. The engine unit is suspended on platforms and is very easily detachable. The usual Arno head and seat pillar lugs are retained, and Druid forks are fitted. The whole machine is finished in red, and with a complete equipment of tools, etc., sells at an attractively low figure.



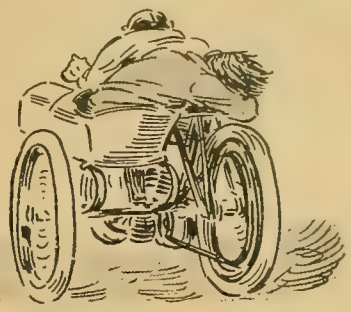
New two-stroke Veloce. Back view showing magneto, transfer port and oil filler.

THE RACING SIDECAR BECOMES MORE AN OBJECT OF INTEREST EVERY DAY.

Our artist who attended the last Brooklands meeting has put on paper his impressions of existing conditions, and ideas of possible future developments in racing sidecar design.

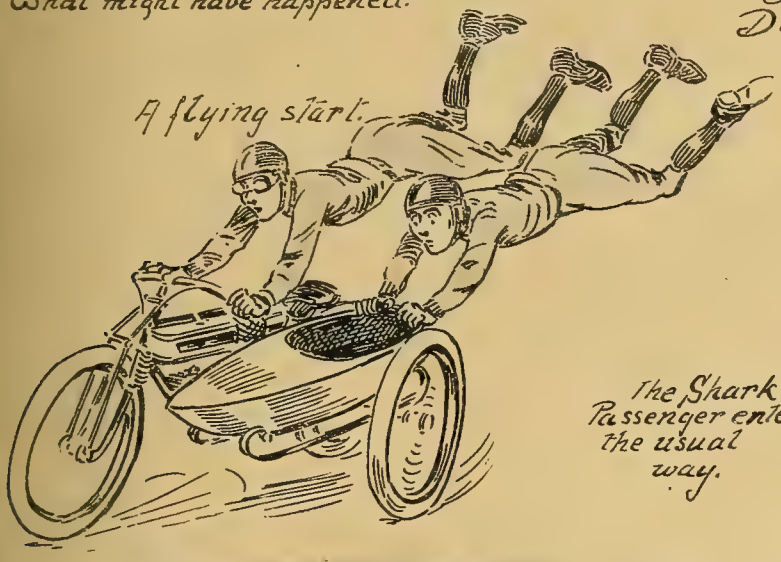


What might have happened.



One way of doing it.

Sidecar Designs



A flying start.

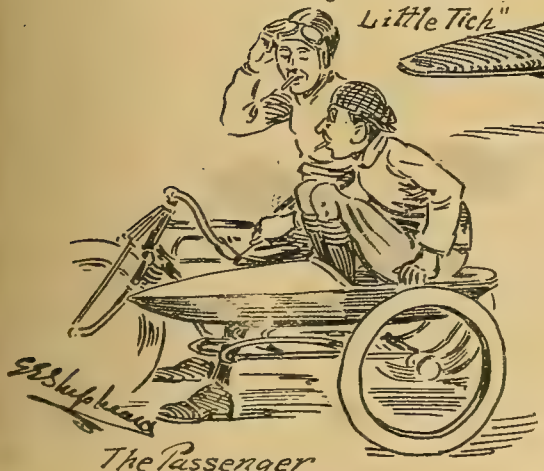
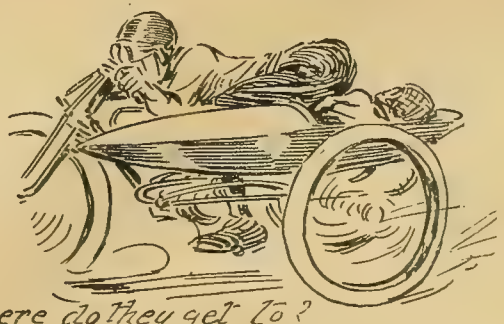
The "Sahol" Sidecar and passenger to match.



The Passenger Problem.



or where do they get to?

New Bowden Two-speed Counter-shaft Gear.

THE new Bowden two-speed counter-shaft gear, made especially for sidecar work by Messrs. Bowden Wire, Ltd., 37-41, Pratt Street, Camden Town, N.W., is a fine piece of workmanship.

The drive employed is, as usual, by chain from engine-shaft to counter-shaft, thence by belt to the back wheel. The diameter of the belt pulley on the counter-shaft is 8in., and the reason for this is to prevent belt slip.

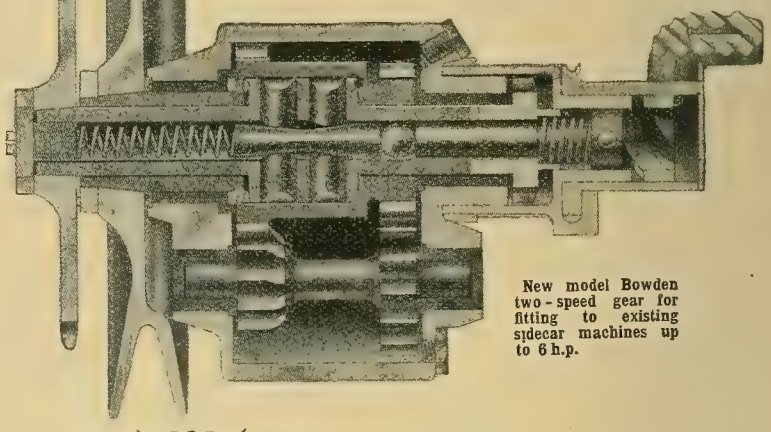
The working of the gear is comparatively simple, and, briefly, is as follows: There is a hollow shaft which carries high and low gear clutches, and which has a double taper wedge. There are two slots through the centre of the shaft, in which are fitted two sets of clutch blocks. The clutches are turned slightly oval internally, and either the high or low gear blocks are forced up by a taper wedge into the oval clutch that receives them.

The wedge is in the form of a spindle with flats milled upon it in such a manner that when forced in either direction it expands the blocks. To change gear, it is necessary to pass through the neutral position, so that both gears are unable to be in mesh together.

Direct drive is on top gear. The low gear is transmitted through a layshaft. Gear changing is effected by either foot or handle-bar control

All gear parts are strengthened. The clutches and big end bearings are of larger diameter. The gear wheels on the layshaft have wider teeth. All gear parts are of a finer pitch, which give sweeter running. The clutch blocks are interchangeable. The casing is greatly strengthened, especially round the kick-starter spindle.

The spiral sleeve has an improved method of fixing. The kick-starter is geared slightly lower. The kick-starter stop is now incorporated in a bracket to which is anchored the spiral sleeve to the case. The thrust between the wedge and operating plunger is taken by a ¼in. ball, instead of the ⅜in. as formerly. The device is light and easily fitted.



New model Bowden two-speed gear for fitting to existing sidecar machines up to 6 h.p.

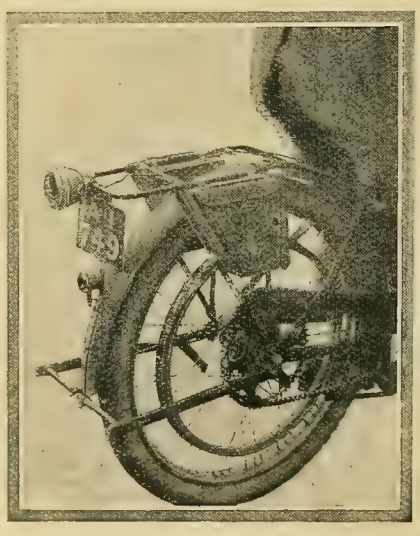
Samples of Rear Lights for Motor Cycles.

A Neat Acetylene Tail Lamp.

In view of the recent decision of the Divisional Court with regard to tail lamps for motor cycles, several new lamps are coming on the market for this purpose. A neat little acetylene lamp is being marketed by Messrs. Welté and Owens, Ltd., Colquitt Street, Liverpool, and is known as the Gemco, which we illustrate. The body is of aluminium, and very light, and fitted with a suitable burner of a small capacity. A swivel bracket enables the lamp to be fitted in various positions, such as on the carrier, number plate, mudguard, or on the sidecar. The head lamp generator is used to supply the necessary gas to this tail lamp, and the connection between the tubing from the generator is made by means of a small brass "Y" piece, distributing the gas from one branch of the "Y" piece to the head lamp, and from the other branch to the tail lamp.

Dunhill's Tail Lamp.

Messrs. Dunhill, Ltd., 359-361, Euston Road, N.W., the well-known accessory dealers, have sent us two specimens of tail lamps which they have got out in reply to the recent decision. These can be used either with acetylene or electric light, and can be attached to the carrier and connected either to the generator by a Y piece or to a battery. The lamps are strongly made, and of a shape easily cleaned, an important point to be considered when the exposed position of such a lamp is remembered. A good point about these Dunhill lamps is the insertion of a glass in the side to allow the lamp to throw a side beam, by means of which the rider can see if it is alight by slightly turning his head.



Dunhill's rear red light for attachment to the carrier of motor cycles.

A Standard Miller Lamp.

This well-known Birmingham lamp-making firm inform us that they have for some time past marketed a lamp known as the "Rearlite," but they are now re-designing this lamp, and hope to have it ready, in an improved form, for exhibition at the forthcoming Olympia Show.

A Dry Battery Tail Lamp.

Messrs. A. H. Hunt, 115-117, Cannon Street, E.C., who are sole agents for Hellesen dry batteries, send us particulars of a neat dry battery-fed tail lamp. This can be supplied from stock, and has the advantage of being perfectly clean and free from any liquid in the battery. Such a battery with ordinary use would last a year before renewal was necessary. The lamp itself is much on the lines of a dashboard inspection lamp so often used on motor cars, and can be attached to the carrier.

Brown Bros.' Acetylene Rear Lamp.

Messrs. Brown Bros., Ltd., Newman Street, Oxford Street, W., have sent us a small rear lamp for inspection. It fits on to a bracket which is attached to one of the rear stays, and the gas is supplied to it either from the head-lamp generator or an auxiliary generator. The method of attaching the burner is novel. It is screwed into the base, which is made detachable by means of a bayonet joint. The glass prism for the rear light is fastened in the door, which is hinged to the body, and fastened by means of a spring catch.

Harrogate and District M.C.C.

The cross-country run, held last week, provided some excellent sport and included the fording of two deep water-splashes with mountain tracks and stiff hills. Special prizes were given to novices, who had to cover the route at a rate of 15 m.p.h. Result of ordinary class: W. E. Grange (3½ Bradbury sc.), lost no marks; W. Fawcett (6 A.J.S.), lost one mark. Novices class: P. Hill (3½ Triumph sc.), lost seven marks; C. Falkingbridge (2¾ A.J.S.), lost eleven marks.

Lincolnshire A.C.

A hill-climb was held on Bunkass Hill, near Louth, on Saturday, the 18th inst., on *The Motor Cycle* formula. The results are as follows:

CLASS I.—Under 350 c.c.

		Fig. of Merit.
1.	J. H. Brookes (Douglas)	39.5
2.	J. Ward (Douglas)	41.6
3.	Mrs. Jennison (Douglas)	47.1

CLASS II.—Under 600 c.c.

1.	J. B. Drakes (3½ B.S.A.)	36.5
2.	A. Readhead (3½ Rudge)	40.8
3.	E. Kemp (4¼ Campion)	44

CLASS III.—Over 600 c.c.

1.	J. E. Harston (6 Campion)	34.5
2.	S. E. Sandars (9 Indian)	40.2
3.	W. Copley (6 Rex)	43.7

Fastest time of the day, S. E. Sandars (9 Indian).

Leicester and District M.C.C.

A hill-climb was held on the 18th inst. at Slawston, on a hill which appears to be in every way perfect for such an occasion, dead straight, a good surface and gradient, with the minimum of traffic. Mr. G. W. Hillyard, the president, who had given a silver cup for competition for the best sidecar performance on formula, competed in this class on his Zenith, but did not subsequently weigh in, or he would have gone very near to winning his own prize. Results:

LIGHTWEIGHT CLASS.—1, H. Leich (Douglas); 2, H. Woodgate (Douglas); 3, H. Bowerman (Connaught).

BIG TWIN TOURING CLASS.—1, S. Briggs (8 Campion-Jap); 2, E. Goodin (6 Clyde); 3, W. Lee (6 Rex).

T.T. CLASS.—1, M. H. Simpson (Rudge), time 33⅖s.; 2, Jim Simpson (Rudge), 35⅖s.; 3, C. Harrison (Ivy-Precision), 35⅘s.

OPEN CLASS.—1, S. Briggs (8 Campion-Jap), time 30⅖s.; 2, M. H. Simpson (3½ T.T. Rudge), 32⅖s.; 3, Jim Simpson (3½ free engine Rudge), 35s.

HANDICAP CLASS.—1, M. Gotch (Premier); 2, H. Bowerman (Connaught).

SIDECAR CLASS (Silver cup presented by the president, Mr. G. W. Hillyard, for best performance on formula).—1, H. Petty (Singer), time 52s., formula figure 209; 2, S. Briggs (8 h.p. Campion-Jap), 39⅕s., 224; H. Leich (2¾ Douglas), 62⅘s., 262.

Liverpool A.C.

A petrol consumption trial, with the ascent of Altybady, was held recently. The results were as follows:

		Fig. of Merit.
	CLASS I.—Solo machines to 600 c.c.	
1.	J. Green (3½ New Hudson)	337
	CLASS II.—Solo machines over 600 c.c.	
1.	N. Brown (7 Indian)	521
	CLASS III.—Any sidecar machine.	
1.	H. Coopland (7 Indian sc.)	525

Malvern and District M.C.C.

There was a large entry from the Malvern, Cheltenham, Dudley, and Kidderminster Clubs for the speed trials held on the 18th inst., and many spectators. The distance was just under the half-mile, flying start. Results:

CLASS I.—Up to 350 c.c. (on time).

1.	Corbett (2¾ A.J.S.)	19⅘s.
2.	Gibb (2¾ Douglas)	22⅕s.

CLASS II.—500 c.c., any machine (on time).

1.	Harrison (3½ Triumph)	20s.
2.	Corbett (2¾ A.J.S.)	20⅘s.

CLASS III.—500 c.c. standard touring machine (on time).

1.	Wynn (3½ Rudge)	21⅕s.
2.	Bladder (3½ Rudge Multi)	21⅖s.

CLASS IV.—Up to 1,000 c.c. (on time).

1.	J. Gibson (8 Zenith)	17⅖s.
2.	Nickson (3½ Rudge)	20s.
2.	Humphries (6 Bat)	20s.

CLASS V.—Up to 1,000 c.c. (on formula).

		Fig. of Merit.
1.	Corbett (2¾ Douglas)	349
2.	Curtle (2¾ A.J.S.)	451

CLASS VI.—Sidecars and cycle cars up to 1,000 c.c. (on time).

1.	Gibson (8 Zenith sc.)	21⅖s.
2.	Morgan (8 Morgan runabout)	22s.

CLASS VII.—Sidecars and cycle cars (on formula).

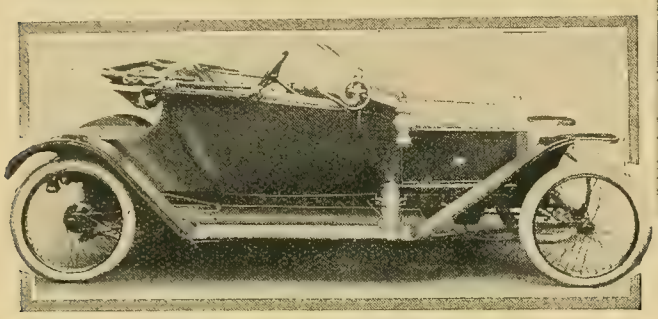
		Fig. of Merit
1.	Corbett (2¾ A.J.S. sc.)	375
2.	Morgan (8 Morgan runabout)	518

Group of competitors in the Cross-country Trial of the Harrogate and District M.C.C.

The Latest Pattern Winco.

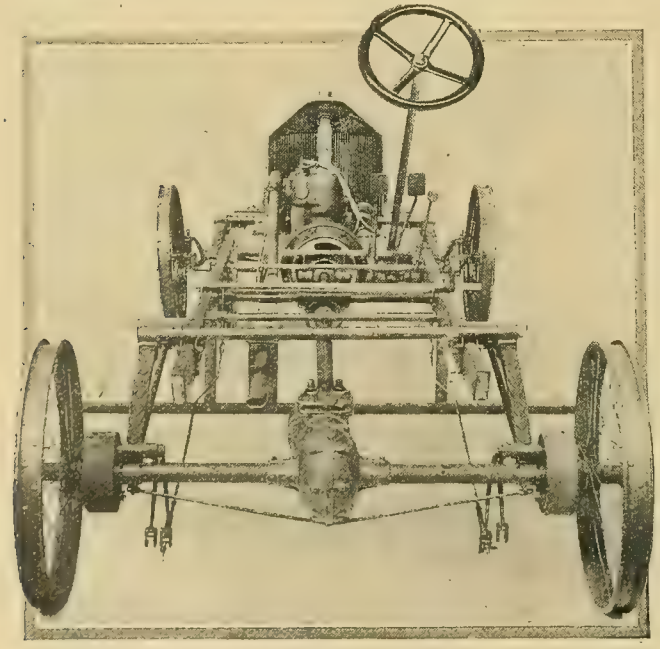
MESSRS. Stringer and Co. (Sheffield), Ltd., have slightly modified their attractive cycle car, the latest model of which we illustrate. The makers are large producers of steel parts for motor cars, such as crankshafts, etc., and the material and construction of the machine should be all that can be desired.

The engine is a twin-cylinder water-cooled 86 × 92 mm. bore and stroke, giving a capacity of 1,068 c.c. Several features of the machine stand out prominently, the most striking part of the design being the back axle, which embodies the gear box, affording three speeds and a reverse, which are situated in a casting just fore of the differential case, the propeller-shaft being carried in a long torque tube. The whole construction is exceedingly neat and well carried out. The springing is by inverted

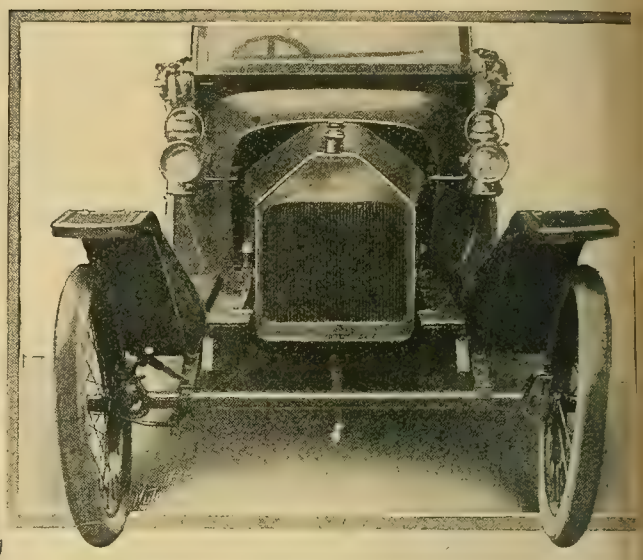


Broadside view of the new twin-cylinder Winco.

semi-elliptic springs, pivoted in the centre, and with the extremities attached to the cross members of the ash and steel plate frame and the axles. Both brakes are of the internal expanding type, and are placed side by side in the drums on the rear wheels, which are wire and are shod with 750×85 Clincher light car tyres. An exceedingly neat radiator is fitted. The coachwork and wings are very well carried out, and the lines of the *carrosserie* are exceptionally graceful for a vehicle so moderate in price, which is £137 for the chassis and tyres, and £165 complete with body, hood, screen, five lamps, generator, and horn. The whole finish is admirable



Rear view of the chassis showing ash frame, springing, gear box and back axle unit.



Front view of the new 8 h.p. Winco cycle car.

A CROSS-COUNTRY RUN.

SATURDAY'S closing run of the Coventry and Warwickshire Motor Club developed almost into a motor steeplechase. Among the competing machines were several new models—a Cumbria belt-driven cycle car, the water-cooled Humber sidecar we described last week driven by F. G. Edmond, a Lea-Francis with sidecar driven by G. I. Francis, two big single Excelsiors, several Rudges and Triumphs (including J. R. Haswell, who thoroughly enjoyed the sport), a couple of new 5-6 h.p. Rex sidettes with 1914 improvements, a Williamson, and a new Hazlewood sidecar owned by H. D. Teage.

As is usual, a paperchase speed-judging contest was embodied with the run, and Mr. S. Wright, the hare, led off on his Humberette, first along the London Road and then over by-roads, along disused roads with deep ruts, through countless gates (which the competitors who had drawn different speeds to average were always careful, one by one, to close after them), over grass-grown tracks, across fields, by farmyards, and up one or two really severe hills. In one field two bullocks jumped a hedge at the sight of the motor vehicles. Some of the two dozen or so competitors would have given up the chase but for fear of getting lost.

The trial culminated in an ascent of Newnham Hill, where Mr. Geoffrey Smith took the times, the distance covered measuring twenty-nine miles. All were agreed that the run would be an ideal test for any Colonial mount.

The results were subsequently announced by Mr. Holroyd at the Peacock Hotel, Daventry, where over fifty sat down to tea:

MOTOR BICYCLES.—S. A. Rowlandson (3½ Rudge), 2m. 34s. error.

SIDECARS.—A. N. Barrett (5-6 Rudge sidecar), 3s. error.

CARS.—D. J. Corser (12 Rover), 16m. 53s. error.

THE MOTOR CYCLE SHOW NUMBERS.

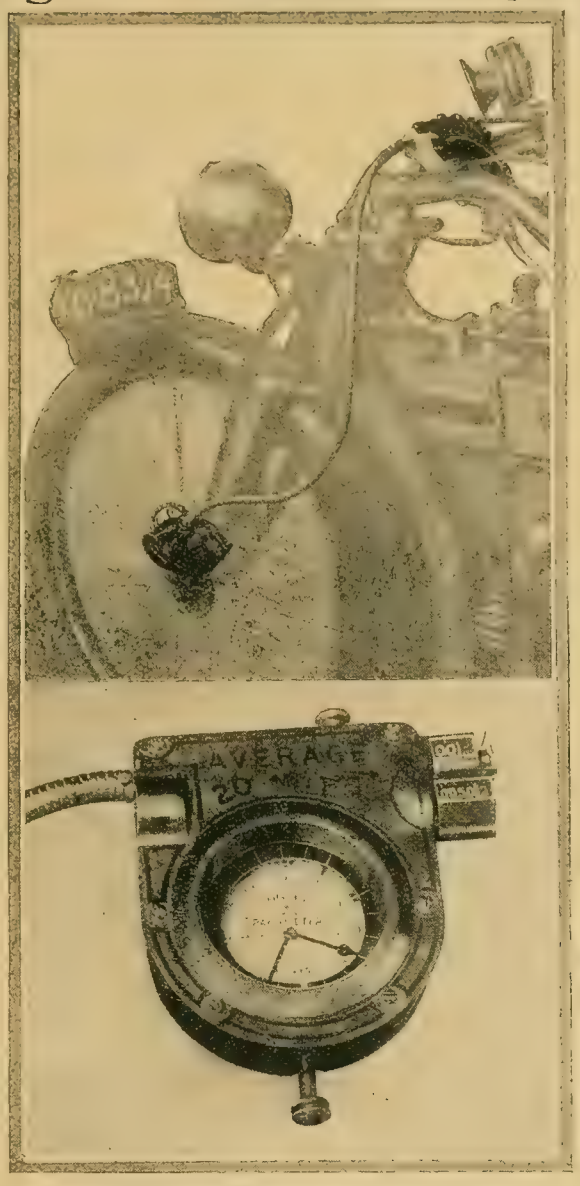
OLYMPIA, 1913.
THREE SPECIAL ISSUES
will be published as follows:
NOVEMBER 13th—
Passenger Machines of all Types
NOVEMBER 20th—
Buyers' Guide of 1914 Models.
NOVEMBER 27th—
Complete Show Report.

Riding to Schedule Simplified.

JUDGING by an examination we made a few days ago of an ingenious pacometer which has been invented by Mr. J. Ridley, of Springfield Terrace, Coventry, riding to schedule with or without a watch and speedometer has been reduced to a very simple process. Ridley's Pacometer is an instrument for indicating a pre-determined average speed, including stops, the time of day, the total mileage travelled, and it also acts as a trip recorder. Our illustration shows an experimental instrument which has been constructed for one speed only, namely, twenty miles per hour.

The instrument consists of a clock with a minute hand painted red (black in the illustration), immediately above which runs a dial driven from the machine and arranged to make one revolution every twenty miles. This dial is graduated from 0 to 220 in twenties, and in one position is a red spot which can be brought directly over the minute hand of the clock, the dial being immediately adjustable by means of the knurled thumbscrew.

To average twenty miles an hour the driver has simply to drive the machine so that the red spot on the dial keeps level with the red minute hand, and if stops are made the minute hand will advance leaving the spot behind, so that on resuming the journey it is very easily seen how much has to be made up to regain the predetermined schedule. Of course, the instrument does not appeal only to a rider who wishes to keep to an average speed of twenty miles an hour. It can be arranged for an average considerably in excess of this, and it is also possible to make it adjustable for any average speed. It would then be of great service for racing or record breaking at Brooklands. For instance, if a certain record had to be beaten, and to secure it an average of sixty miles an hour had to be kept up, the instrument would show immediately when the record breaker lagged behind, and when of necessity he stopped for replenishment or adjustment the minute hand would show exactly how much had to be made up to get within the record.



A novel instrument which enables a rider to average any pre-determined speed by recording when he is late or early.

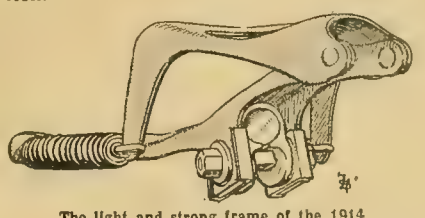
THE CUT-OUT NUISANCE.

Although motor cyclists generally realise that the recent Act with reference to the use of a cut-out is intended to be enforced, there still appear to be some who think a long tube without any expansion chamber is all that the law requires. This is not so, and recently a conviction on this very point was registered at Croydon, and although the fine inflicted was lenient, motor cyclists should see to it that their silencing arrangements comply with the law.

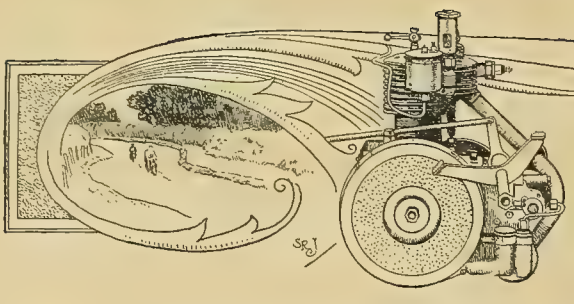
A NEW TYPE OF XL'ALL SADDLE.

Unlike the type of saddle with which the name Xl'All is so closely associated, a new model has been brought out without the parallel motion. This new saddle has the usual comfortable and well-padded seat, and is mounted on a very simple and light frame. This frame is of pressed steel, and, though light, is extremely strong. It consists of two main portions hinged together at the nose, the rear ends being held together by two tension springs similar to those in use on previous types of the same make. The saddle should be very easy in action, and it is possible to fit it so as to give an extremely low riding position.

Views of the new Xl'All anatomatical shaped saddle.



The light and strong frame of the 1914 pattern Xl'All saddle.



An Ingenious Method of Lubrication.

The Oil taken to all Bearing Surfaces by Spring-operated Pumps.

THE question of lubrication is ever before us, so that we were extremely interested in a device which was shown to us at a recent date by Mr. Rendile Lisle, of the Poplars, Anerley Park Road, Anerley. Mr. Lisle's machine is driven by a 650 c.c. single-cylinder engine, with the magneto placed high up on a platform behind the cylinder. Below this

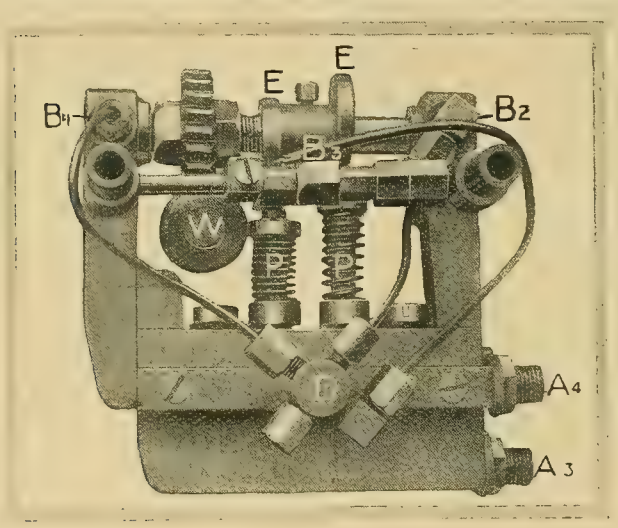


Fig. 1 — The Rendile oil pump.

platform is mounted the oil pump mechanism, which consists of two eccentric operated plunger pumps, the plunggers having a bore and stroke of ¼ × ¼in. The eccentric shaft is driven by chain and a worm reducing gear at 1 to 44 engine revolutions.

It will be realised that the oil supply is taken at low pressure to the distributing box, and thence by leads to all important bearing surfaces. As there is no return pipe the pressure is necessarily low, so that just enough oil reaches each wearing part. The inventor remarks that he does not believe in lubricating flywheels, and from the wonderful results he has achieved it is obvious that there is something in his system. For instance, we are assured that the machine has run 912 miles on 2½ pints of Vacuum B1 oil since the installation of the pump, though before this it would only do 190 per quart. The motor cycle to which the system is fitted has many unusual and interesting features, notably the spring forks, which are on the cradle principle.

In the first illustration W is the worm driven off the magneto-shaft; this rotates the gear wheel, seen on top, which revolves the eccentrics E, which in their turn depress the plungers P. The oil is taken in at port A3 and discharged at A4. The union D has three pipes, two leading to the plain pump bearings, the third to the plain bearing at the other end of the worm spindle; the driven end of that spindle runs on a ball bearing. Thus it will be seen that the pump is self-oiling and never requires touching.

Description.

Taking the second illustration, the circulation is as follows: From the tank through an adjustable sight feed regulator A1, along the copper tube A2, into pump at A3, then under pressure from A4 into union box A6 (entering the box at A5), along F1 into cylinder, gudgeon pin, and small end; also along F2 directly on to the steel axle in the main bush, on the valve side.

Also along pipe F3 into the union leading directly on to the other axle, and by by-pass up the hill again by the pipe to be seen under forward end of magneto platform in the photograph, then into the jet playing on the big end.

The amount of oil is controlled at A1, and the springs on the pump plungers are of such a strength that they will take all the oil they can get when the pump is going full speed. If their supply of oil is restricted they do not rise to the full extent allowed by the eccentric, consequently there is no internal pressure tending to jam the actuating gear.

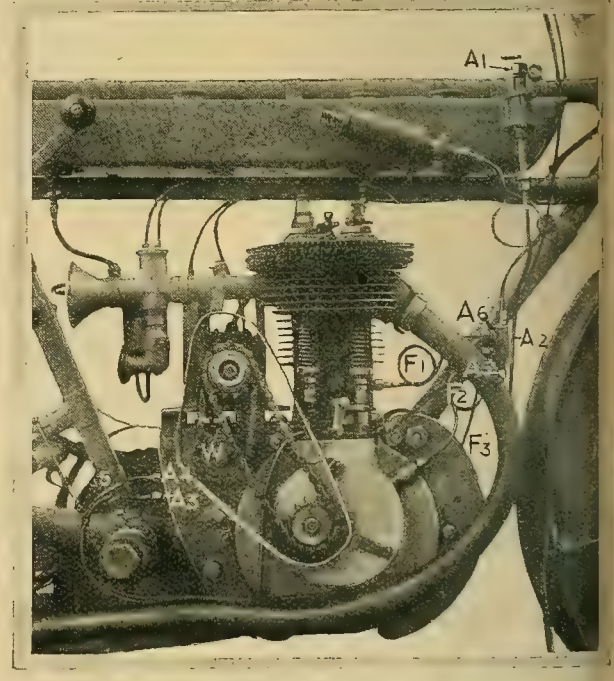

Fig. 2—Showing the driving mechanism of the Rendile mechanical oil pump.

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Leaking Water Jackets.

Sir,—In reply to "Two Years Ahead," *re* leaking water jackets on his 1913 Scott. I had this trouble, but I took the rings off the cylinder heads and made joints of Waterite and have had no trouble since.

I am using a 1914 Binks carburetter on my Scott, and it is really splendid for slow running and acceleration Also fuel consumption is fully 25% less. JAMES ST. JOHN.

Self-lighters.

Sir,—At this time of the year, when a considerable number of motor cyclists are still enjoying Saturday afternoon jaunts, and who do not arrive home until after dark, thus finding it necessary to light-up, I am inclined to think it would be a great convenience to them if motor cycle acetylene lamps were fitted with self-lighting attachments, such as are fitted to many pedal cycle lamps, and that at only an extra cost of about 1s. 6d.

Within the past two or three weeks I have noticed several motor cyclists, standing straddle legs across the front wheel, striving to light their lamps with matches, much to the amusement of children and country yokels, who gather round.

As for myself, although I only ride a pedal cycle, whenever I find it necessary to light-up, I simply turn on the water, wait a couple of minutes, and, stretching my arm over the handle-bars, pull the "trigger" of the self-lighter attachment, and the trick is done, without so much as dismounting.

It may be the practice of some lamp makers to fit self-lighters to their motor cycle lamps, but, up to the present, I have found this fitment conspicuous by its absence on all the lamps of the motor cycle class, which I have seen.

A PEDAL CYCLIST.

The Question of Rear Lights for Motor Cycles.

Sir,—I understand that in future motor cycles will have to carry a rear light, so that now all motor vehicles, or fast-moving vehicles, are to carry rear lights, whilst the horse drawn or slow-moving vehicles are only compelled to carry one light at the front.

Now I contend that the slow-moving vehicle is being constantly overtaken and passed on the road, whilst the fast-moving vehicle is very rarely overtaken or passed, so that there is much greater need for rear lights on the horse-drawn vehicle. Also a motor cycle can be seen quite distinctly from behind as a shadow against the light from the head lamp, but can a farm waggon be seen by means of the light thrown on the road from its head lamp?

Also how many of your readers have experienced the shock of finding a flock of sheep or herd of cattle across the road on a dark night? Would it not have been better to have gone into this question of rear lights generally and made a law compelling all vehicles to carry rear lights! Also a law to compel cattle drovers to carry a green light! But then Mr. Justice Bailhache refers to motor cycles as a *terror!*

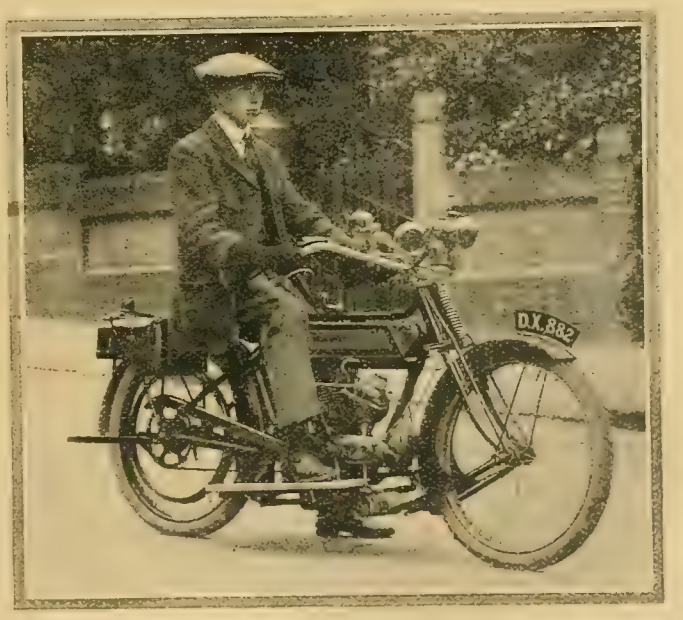
I am not protesting against the decision that motor cycles should carry rear lights, but I fail to see that if they are necessary on motor vehicles why they are unnecessary on horse-drawn vehicles.

I trust that you will bring your influence to bear upon this important matter, and most especially with regard to lights for cattle drovers. HARRY O. EYRE.

Some Advantages of a Twin.

Sir,—With respect to the relative merits of twin and single-cylinder engines, I have an idea that my experiences with an up-to-date twin might interest some of your readers My mount is a 3 h.p. two speed Enfield, and I have been about 2,500 miles, mostly on the worst roads that it is possible to find in Great Britain, namely, those of East Anglia, and have never yet had a serious involuntary stop while travelling. My only trouble has been a sparking plug, which gave out after seventy miles, and I once broke the kick starter through advancing the spark and then trying to start up.

And the forced lubrication system—what a relief it is not to have the worry of pushing the old-fashioned hand pump every few miles or so, and wondering if the engine has too much or too little oil. The bearings, too, seem to like it better. I had the engine down recently and it showed no trace of wear at all. I never have to use the low gear, save for traffic, as it goes singing up hill and down dale alike.



The 3 h.p. twin-cylinder Enfield referred to by "Twin Enthusiast."

The low humming of the twin, cheerful and contented as a child at play, contrasted with the resonant booming of the single, is in itself a great factor, for comfort on a long run.

The machine takes me up Malden Hill with plenty to spare on the high gear, and although I have ridden singles till this year, a season's riding of a twin has convinced me that I should be an apostle of Wamba were I to go back to the heavy 3½ h.p. single again.

Needless to say I have no connection with the Enfield people.

I enclose a photograph of the machine in question.

TWIN ENTHUSIAST.

A Novel Sidecar.

Sir,—I beg to contradict the statement of Mr. W. E. Manning, sidecar manufacturer, of 85, South End Road, Hampstead, contained in your issue of the 23rd inst., at the foot of page 1390, wherein he informs your readers that the sidecar—Knut's Egg—attached to my 1913 Douglas (illustrated in your issue of the 9th inst., page 1308) is of a design registered by him. This is not so. Mr. Manning's sidecar is entirely different throughout, and I challenge him to prove his statement. F. FLETCHER.

Petrol Consumption Tests.

Sir,—I was glad to see Mr. Howard Smith's and other letters in your paper, *re* the remarkable figures in the petrol consumption test of the Sutton and Mid-Warwickshire Club a short time ago.

I should be pleased to turn out again at quite a short notice on an attempt to equal or improve my result, viz., 192 m.p.g. on my 2½ h.p. Levis.

What this is over average riders' usual consumption is accounted for by a high gear, a heavy flywheel, and the careful tuning of a good engine and carburetter. H. Newey, on a similar machine, won the distance prize last year with 190 m.p.g. The nearness of these figures will be noticed.

I may add that on my machine I had fitted an auxiliary round tank which ensures filling up without air locks.

This would make a big difference in a square tank, especially if the collar is deep or a gauge filter used.

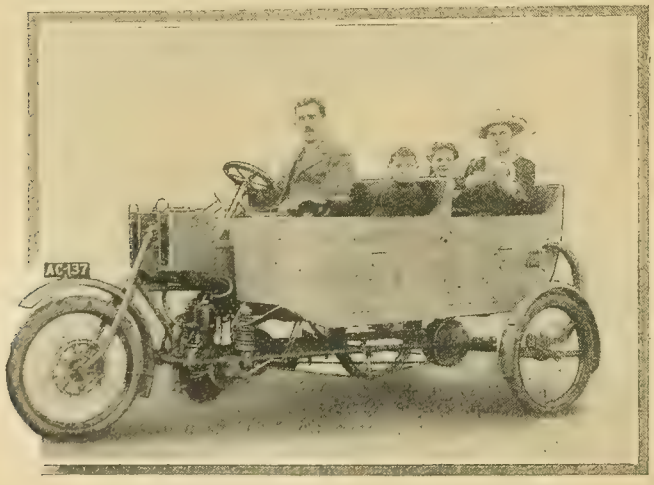
ARTHUR BUTTERFIELD.

A Home-made Three-wheeled Cycle Car.

Sir,—I enclose a photograph to show a single front wheel cycle car made by myself. In reality it is a converted Cunard tricar. The single-cylinder water-cooled engine has a bore and stroke of 80 mm., and through a cone clutch on the engine-shaft drives a chain to the two-speed gear box, and then by another chain to the back axle which has a differential. The gear ratios are 6½ to 1 and 14½ to 1. The tyres are 26in. × 2½in., and there are two band brakes—one on the front wheel and the other on the differential, both actuated by strong Bowden cables.

As will be seen, the body is sprung on coiled springs at the front and C springs at the back. The body itself is made from ash and pine framework and covered with three-ply maple and comfortably upholstered, and, it will be noted, is divided in the front part to pass over the centre frame. At the steering column there is the customary worm and sector, and at the end of the lever there is a ball joint joining on to the steering rod, as seen in the photograph, and which is connected at its other end to the fork crown.

The machine has not yet run a great distance, but it is quite capable of touching the legal limit if necessary. It, however, was specially made for short trips on half-holidays, and I do not desire to exceed 10 to 12 m.p.h. W. ELLIS.



A three-wheeled family cycle car. (See letter from W. Ellis).

Why More Air with Benzole?

Sir,—Some time ago I read in an article on benzole in a motoring paper that the reason why the extra air port of a carburetter requires to be opened wider for benzole than for petrol is mainly a matter of the relative volatility of the two fuels: that because benzole has a very low latent heat it gives a very rich mixture, and therefore requires much dilution with air. And now we are informed by "Chemist" in your issue of October 9th that the true reason is because of the higher proportion of carbon to hydrogen in benzole.

I regret, Mr. Editor, that I must record my absolute inability to believe either of these expert statements. First, with regard to volatility: if we alter a little the mixture of substances called petrol by adding a small percentage of paraffin, which has a high latent heat or low volatility, then we lessen the average volatility and increase the latent heat of the mixture, and the result—according to the first expert—would be a weaker mixture requiring less air; but it is a matter of common knowledge that a mixture of petrol and paraffin requires more air than petrol alone.

Then with regard to "Mr. Chemist's" explanation: I suppose that he will admit that enough air should be present for perfect combustion and no more, or at least that air in excess of that is useless as far as the combustion is concerned. In that case, if I may rely on the elementary chemistry I learned in my boyhood, twelve grains of carbon require thirty-two grains of oxygen for complete combustion, while two grains of hydrogen require sixteen of oxygen: that is to say, as carbon requires less oxygen for combustion than hydrogen does, the more carbonaceous the fuel the less air it will require for complete combustion—the direct opposite of "Chemist's" facile statement.

Not being an expert, it is with fear and trembling that I advance any explanation of my own, but I suppose it is "up to me" now to present a target for others to shoot at, so here goes. I understand that certain factors in the flow of a liquid along a tube (*i.e.*, fuel along a jet) are represented by the equation $\frac{P}{d} + \frac{v^2}{2} = a$ constant, k, neglecting the effect of gravity and the resistance of the walls, which would be almost the same for the two fuels, v being velocity of the liquid at a certain point, P the pressure at that point, and d being the density or specific gravity of the liquid. We have then $v^2 = 2\left(k - \frac{P}{d}\right)$ from which it is evident that the velocity of the fuel from the mouth of the jet, besides increasing as pressure, P, is lessened, *i.e.*, with opening of the throttle or increase in engine speed, also increases as d is increased, *i.e.*, by using a heavier fuel. The volume of fuel escaping from the jet on each charging stroke is proportional to the sectional area of the jet × velocity of fuel, and the weight, or amount, of fuel per charge proportional to this × specific gravity of fuel. Hence it is obvious that, other things being equal, the richness of the mixture increases very much with the density of the fuel, and therefore with heavier fuels, such as paraffin and benzole, one requires to lessen the amount escaping from the jet, either by using a smaller jet or by diminishing the suction on the jet by opening wider the extra air ports.

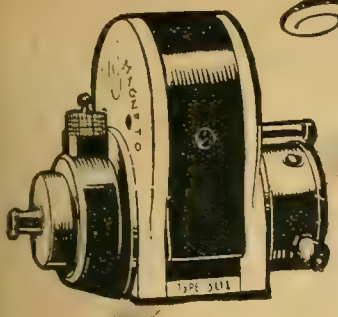
CAMERON GIBSON.

[It is probable the specific gravity has much to do with this matter, as our correspondent suggests.—ED.]

Carbon on Sparking Plugs.

Sir,—I was much interested in Mr. J. F. B. Carslake's suggestions in his letter on "Carbon on Sparking Plugs," which appeared in a recent issue, in which he mentions a shunted "capacity." Being anxious to carry out his ideas, I installed a variable air vane condenser on my carrier, suitably controlled from the handle-bar by Bowden wire. Judge of my astonishment when I found that by obtaining "resonance" my whole framework began to "brush" in a most spectacular manner, rendering my powerful headlight almost unnecessary, and completing the reformation of a belated reveller who was slowly working his way homewards. I would also suggest that rubber trousers should be worn for such experiments.

JABEZ HYDE-THOMSON.



The C.A.V. Ruthardt Magneto

Sheffield & Hallamshire Hill Climb · Oct. 11—1913.

"On Saturday, Oct. 11th, 1913, the 3½ Norton made the first and second fastest time of the day. Formula results, 3½ Norton first and 3½ Norton second; in the Sheffield and Hallamshire Hill Climb, using the C.A.V. Ruthardt Magneto."

The Magneto that is Fool, Dirt, Damp and Water Proof.

It is the first self-contained type, gives a lively spark even at a walking pace, and never fails to give satisfaction.

Ben Lomond (3192 feet high) climbed on an N.S.U.

Marvellous hill-climbing feat by a 3 h.p. Twin-cylinder N.S.U.

ridden by Mr. T. Walkinshaw, of 493, Dumbarton Rd., Dalmuir, who writes:

"*Dear Sirs,* "*October 17th.*

"*On Thursday, October 16th, I was successful in climbing Ben Lomond, 3,192ft., on my 3 h.p. twin N.S.U. I cycled home this morning, and my machine was working beautifully. Of course, the clutch has had to stand a fearful strain, and will need adjusting. The path, if it can be called by that name, was under water in many places, and boulders were numerous, but the engine being in a loop frame was saved many a smash.*

"*The weather was the worst I have ever experienced during my many years of motor cycling. For two days my cycle was left on the mountain side lost in the mist, and when I started again the engine purred away beautifully.*"

This performance is confirmed in a letter from our Glasgow Agents: Messrs. The North British Machine Co.

PALMER

CORD CYCLE CAR TYRES

On Thursday, October 23rd, at Brooklands Track, Messrs. F. Burgess, and J. Wetton, driving a 10 h.p. Calthorpe Cycle Car, fitted with 3in. PALMER CORD TYRES, succeeded in establishing the following—

SEVEN WORLD'S RECORDS.

TIME RECORDS.			
			SPEED PER HOUR.
4 hours	263 miles	878 yards	65·87
5 ,,	330 ,,	919 ,,	66·1
6 ,,	393 ,,	450 ,,	65·54
DISTANCE RECORDS.			
			SPEED PER HOUR.
250 miles	3 hours 51 minutes	8⅖ seconds	64·89
300 ,,	4 ,, 30 ,,	38⅕ ,,	66·51
350 ,,	5 ,, 18 ,,	27⅘ ,,	65·94
400 ,,	6 ,, 6 ,,	37 ,,	65·46

(Subject to confirmation.)

The above records are overwhelming proof of the durability and efficiency of the scientifically constructed Palmer Cord Cycle Car Tyre, which is an exact miniature of the famous Cord Tyre for Motor Cars. For reliable and satisfactory service this tyre cannot be equalled by any other tyre on the market.

Cycle Cars.

Sir,—Allow me to thank you heartily for the strong position you have taken up with regard to the true cycle car. I have long felt that the competition of the miniature motor car is strangling the true cycle car, and unless the A.C.U. alter the definition so as to exclude the former, there is grave danger of the latter following the old and useful tricar to oblivion.

Keep pegging away and you will do the movement real service. E. A. LAMBERT.

[The above is but one of many letters we have received couched in much the same terms, but that published will suffice.—ED.]

Leather Belts.

Sir,—Reading "Ixion's" "Occasional Comments" of last week, I notice that he says one disadvantage of leather belts is their habit of wearing a shoulder on the pulley. I have always preferred leather belts to rubber ones, and get over this difficulty by riveting a piece of clutch leather about ⅛in. thick on the pulley. This was quite successful, besides giving the belt a better gripping surface, but I cannot say how long the leather would last without renewal, as I got rid of the machine after about 1,500 miles running like this, and my present machine is chain-driven, but, judging by the appearance of the leather, it would last a good many thousand miles.

I think this tip worth trying. HAROLD HOUGH.

What the Show will Reveal.

Sir,—With reference to your article on "What the Show will Reveal," I note your remarks on the "big singles." As an old rider, and one who has owned a few "big singles," I can bear out all you say in praise of this class of engine. I own a 600 c.c. engined machine that has hauled a sidecar for many thousands of miles in the hilly parts of England and Wales. I have plenty of power, and, with the exception of cleaning away the carbon, this engine has never been touched by a spanner. For a rider who has little time for tinkering, this seems the limit of no trouble, with a fairly constant power.

I—and several other riders I know—have been waiting years for the machine fitted with a "big single" and good counter-shaft variable gear. The 1914 Zenith seems to give all but the "big single" engine. When the makers fit this latter, I, for one, am a certain buyer.

In conclusion, I should like to add an appreciation of the 4¼ h.p. Precision, for, as a real power unit with some wear in it, I have yet to find one to beat it. SINGLE.

An Undesirable Practice.

Sir,—Having read the various letters on the subject of pillion riding published in *The Motor Cycle*, I should like to warn your readers of the danger of so carrying passengers on machines fitted with "live" back axles.

Miss Bertha Greaves, of Sheffield, on her 3½ h.p. Calthorpe sidecar. This lady is equally well known in local bowling and musical circles.

I ride a machine so fitted, and a short time ago was starting off for a run with my brother seated on the carrier, when suddenly the leg of his trousers was caught by the axle.

Luckily I was able to pull the engine up sharply, but even so his leg was badly torn and the trouser had to be cut away before he could be freed. This before the machine had proceeded two or three yards.

What the result would have been had we been travelling at a fair speed I do not care to imagine. I have now fitted a sidecar. STANLEY HUTCHINS.

Sir,—Allow me fully to endorse the letter of Harry Spencer on carrying a passenger on the carrier. The law should most certainly prohibit carrying the fair sex in this manner, but the sidecar is not in it with the pleasure of riding on the carrier *straddle legs* and with your feet comfortably resting on the back footrests. Corners are negotiated and vehicles are passed more easily; wind resistance is lessened, and the passenger has (like the driver) that exhilarating feeling of being part and parcel of the steed. R.W.G.

Sir,—I have read with much interest the controversy on carrier riding, and it is a letter from "Maxime" in *The Motor Cycle* of October 9th, which makes me somewhat indignant. It distinctly hints that motor cyclists who indulge in this "undesirable practice" are incapable of controlling their machines, and should not be allowed at large. Now I also speak as one who has had experience, for I have ridden hundreds of miles with a passenger, and to say "it is hopeless to argue that a machine steers well with a passenger on the back" is to my mind a hopeless proposition to make. We are given an unfair example, for I should certainly say the rider who startled "Maxime" with his "death yell" was incompetent under any conditions. For who—I ask all motor cyclists—finds cause for anxiety when negotiating a "slight bend," or even a bend, with a passenger on the back? I have found that if your passenger sits close up to you the steering is not affected in any way, and I can take any corner without the aid of "spasmodic efforts." When taking the fair sex on the carrier the balance is somewhat affected, and calls for more careful driving, but to say that you are a danger to the public under such conditions is going from one extreme to another. AN UNDESIRABLE.

Sir,—I notice your correspondent L. J. Mann in his letter of October 9th refers readers to the B.S.A. Co.'s booklet, with the intention no doubt of persuading readers that motor cycle manufacturers as a body regard the practice of carrier riding as quite a natural and proper method of using one's machine.

Following are a few *facts* which I believe will prove to a person of average commonsense that even a machine designed and built to stand the strain of sidecar work is not intended by the makers to drag an average weight of about ten stone about on a carrier intended for light luggage, etc., even when driven with sidecar detached. The Singer Co. in their booklet write, "We do not recommend the carrying of a passenger on the carrier of a motor cycle." The Scott and N.S.U. Co.'s class the taking of passengers on their machines (without sidecar) under the term "misuse" in the guarantee given with their machines. Yet all three companies make and recommend models for sidecar work.

With regard to "L.J.M.'s" remark, that a man may take risks with his life if he chooses. A man's life *is not* his own that he may *wilfully* flirt with death, so to speak. In the case in question your correspondent declares his right to "ride as I please," as long as he does not endanger the public.

Can any person drive a motor cycle in the manner in question (in which there is, beyond doubt, a risk), and yet not put the lives of other users of the road in danger? I think most readers will admit that there is overwhelming evidence available to prove the utter failure of the defence of the "ride as you please" policy.

One thing more (perhaps a little personal). If I were to read a leading article, in a first class journal of course, which did not quite meet with my whole-hearted approval, it would not necessarily follow that the author was incompetent or a lay contributor. No, unfortunately, even journalists have not yet reached that state of perfection, when one person can satisfy everyone in matters of opinion. H. DIXON.

The Lubrication of Timing Gears.

Sir,—As a rider of a 1913 two-speed Douglas I have been trying to improve the lubrication of the timing gear on my machine.

This gear is, of course, more or less lubricated by oil from the crank case, but as I am of opinion that more efficient lubrication would be obtained by running it in grease, I have been trying various greases with a view to obtaining a lubricant which will stand a high temperature.

I find the most suitable grease is that known as Ambroleum 3011, as made by the Stern Sonneborn Oil Co., as it is not affected by the heat and retains its lubricating properties.

I also use another brand of Ambroleum for my two-speed gear, and find it gives better results than ordinary grease, as it clings to the wheels.

The usual disclaimer applies. AC 3519.

Petrol Gauges.

Sir,—As the inventor and introducer of the sunk in pattern of petrol gauge for motor bicycles to which "Ixion" submitted meekly for years, I would like to reply to his remarks, as they are calculated to give a casual reader the impression that this is one of the tried and found wanting devices, an idea which tens of thousands of satisfied users disprove.

This statement that it registers fairly accurately is misleading. In point of fact it simply depends upon the law that fluid finds its own level, and if there is any more dependable or accurate action in nature than this, I do not know it. I would therefore amend the statement and say it registers perfectly accurately.

His second objection that one has to dismount to see the gauge is only partially correct. If the glass is fixed at an angle towards the rider, the level, owing to a rather peculiar refraction by the glass, can be seen by moving the head about 8in. to one side, and even if fixed vertically it can be seen with a little more exertion. As regards the dial with float and spiral I am in agreement with "Ixion," having seen this type revived and dropped several times.

With respect to the partition in the bottom of the tank, "Ixion" could have had a "warning tap" substituted for the ordinary one, and this would stop the engine temporarily when the petrol had got down to about two pints, a quantity ample to take the machine to another source of supply.

A. C. DAVISON.

The Testing of Lubricants.

Sir,—A great deal of attention is just now being bestowed on the subject of testing lubricating oils with a view to ascertaining their degree of suitability for their respective purposes. The subject is one which seems to elicit opinions from a wide variety of contributors to, and readers of, the recognised trade journals.

In view of the interest which is undoubtedly being shown at the present time, we ask the courtesy of your columns in order to point out the futility of the rough and ready methods of oil testing which are so frequently recommended. But small benefit is likely to result from the use of such methods, which are misleading, and, in any case, of small practical value in the absence of any standard to which to work.

A good many years ago we recognised the necessity of being able to test the values of lubricating materials under actual working conditions, and the importance of standardising the results obtained. The Sternol oil testing machine is the outcome of our efforts to produce a comparatively simple, practical, and reliable apparatus.

This machine is capable of reproducing the exact working conditions of any machinery, steam, gas, and oil engines, including load, speed, cylinder pressure, temperature, etc. By its means we are able to pronounce with certainty as to the suitability of an oil or grease for any given purpose, and also to prepare charts showing the comparative efficiency of various qualities.

The machine is installed on the premises of the Stern Sonneborn Oil Co., Ltd., Royal London House, Finsbury Square, London, E.C., where tests are carried out daily. Any samples submitted are tested free of charge, and, if desired, an appointment will be made so that the tests can be done in the presence of any person representing the firm by whom the samples are submitted.

THE STERN SONNEBORN OIL CO., LTD.

A Problem.

Sir,—With reference to the above, I beg to thank Mr. Philip Bailey for his suggestion. I am glad "Ixion" was interested in my letter, and regret that it did not contain sufficient information for him. I should, of course, have mentioned that the gear ratio was 5⅛ to 1, but perhaps I ought to be given credit for some commonsense. Surely the expressions "climb" and "pick up" are self-explanatory, and if "Ixion" will read his own notes he will find that he unconsciously describes both terms to a nicety.

The machine in question has done just over 1,000 miles, measured by speedometer, driven from the front wheel and not from the magneto chain sprocket. Also I have wasted no money on carburetters (two having been borrowed), and I suppose even "Ixion" will allow that some carburetters will suit a particular engine better than others, the best results in my case being obtained with a Senspray fitted with a 44 jet.

As the engine will start easily with the air lever slightly opened, it does not appear that there are any air leakages to speak of, and, as to the moving parts being tight, I might mention, just to show how great minds think alike, that the pistons, which were rather tight, have been eased.

Now that "Ixion" has all the particulars before him, any suggestions from either him or any of your readers will be much appreciated by TWIN JAP.

Hub and Counter-shaft Gears.

Sir,—Anent the interesting letters on gears appearing in your valuable journal, I notice that some of your correspondents who have used hub gears seem to have been so singularly unfortunate that I dare venture to suggest that their care, or rather lack of it, has had some considerable say in the matter. They, however, have immediately taken up their pens and added insult to injury by belabouring the poor unfortunate hub gear and all its ways, and one feels almost inclined to apologise for being such a "fool" as to use such a piece of mechanism. Nevertheless I boldly stand forth as one of the "fools" who, strange to relate, has actually used one of these gears fitted to a heavy 557 c.c. single-cylinder machine, over 5,000 miles of road and, I might add, track. Neither the West Coast roads of Scotland nor the hills of the Lake District and Surrey have been able to lay it low, even though for over 2,000 miles on one trip along some of the worst roads and hills in the United Kingdom the load was about a quarter of a ton all on. True, on one occasion only, the clutch slipped a bit when not asked to do so, but the cause was immediately traceable to my own fault in over-oiling. A bath of paraffin, a few drops of thin lubricating oil to follow, and the clutch said good-bye to unasked slipping.

Difficulty in removing the back wheel is urged against it, but personally I quite fail to see this. As a newcomer to the ranks of motor cyclists, I have changed covers, mended two punctures, put on a large canvas patch, and been ready for the road again in one hour and forty minutes. Considering it was the first time I had undertaken the operation, I think it is good testimony to its simplicity and ease. I do not think a "counter-shaftite" would do much better on an ordinary touring machine with impedimenta. The counter-shaft gear will find me no enemy, and in my humble opinion it is a good gear in the right position. It lacks, however, one very great advantage possessed by its rival, the hub gear, in that this latter can be changed instantly, while one has to declutch before changing on the counter-shaft; this is not always easy to do in a sharp emergency.

So much confidence have I in my gear that I am casting wishful eyes upon Norway as the scene of a future jaunt, where I surmise the roads and hills should be of a really sporting character. Perhaps some of your readers know them and could give me a tip or two.

I add the usual disclaimer. A HUB GEAR USER.

SUMMARY OF CORRESPONDENCE.

THE LIVERPOOL A.C.C. TRIAL.—We have received three letters, which we should print, but for the fact that they are signed with *noms de plume* only, pointing out that W. Heaton made clean ascents of every hill in the recent trial in North Wales held by the Liverpool A.C.C., while J. B. Sproston failed on Altybady, yet the latter rider won the Reliance Cup, in consequence of the rule which allowed one failure on a hill without any penalty. They think Heaton's performance the better one and should have won him the cup.

The New Model 1914

Bowden

Two-Speed Countershaft Gear will be shown at Olympia, Stand No. 211.

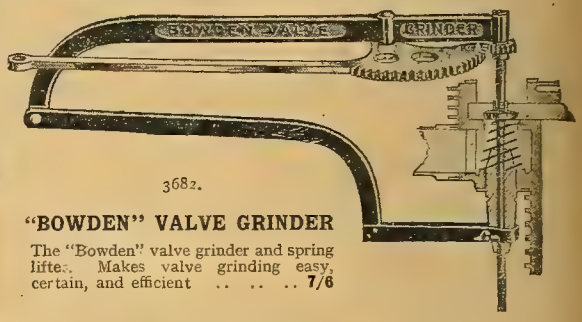
ACCESSORIES INDISPENSABLE

Our stock of accessories represents the pick of the market. Everything that the motor cyclist requires for his equipment is to be seen at its best in our Showrooms, and purchasers have the Dunhill guarantee of satisfaction.
We illustrate only a few of the many interesting accessories shown in our M.C. catalogue, a copy of which should be in the hands of every well-informed motor cyclist.

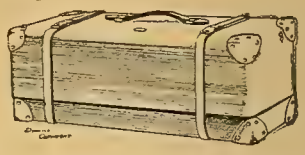
2526C.
"KING DICK" SPANNERS
Strongly made in leather of best quality. Wallet contains No.'s 0, 1, 2, "King Dick" Spanners in a compact form **12/-**

Dunhill's Sole Agents.
"Lukin" Carburetter
Absolutely Automatic. No delicate mechanism. The last word in economy & efficiency, **55/-** Write for particulars.



3682.
"BOWDEN" VALVE GRINDER
The "Bowden" valve grinder and spring lifter. Makes valve grinding easy, certain, and efficient **7/6**

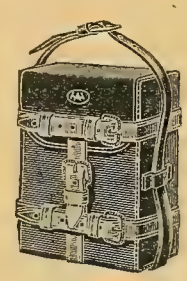
TYRE LINER
Renders tyre completely puncture-proof and lengthens its life .. **1/3**



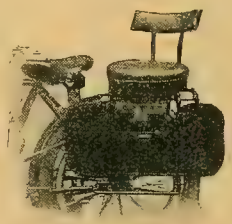
"KENNARD" VALISE
Expansive, smart, and indestructible **22/6** Absolutely dustproof.

2187.
"Demon" Wrist Siren
Always ready for use, and gives piercing sound.. **3/3**
Without Strap **2/3**

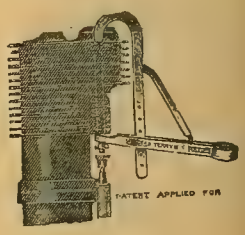
3765A.
FLASH BATTERY
6/6



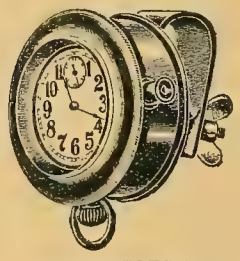
3740.
CASE for BATTERY
3/6 and **6/6**



5448.
V.M. PILLON SEAT and BACK REST
By this fitment safety is assured from spokes; specially suitable for ladies .. **£1 9 6**



5499.
M.C. VALVE SPRING LIFTER
Fits any engine. Price **1/6**



M.C. WATCH
3320.
First-class Motor Cycle, splendid movement **10/-**
Cheaper qualities from **4/9**

AMONG THE ACCESSORIES.

Tormo Specialities.

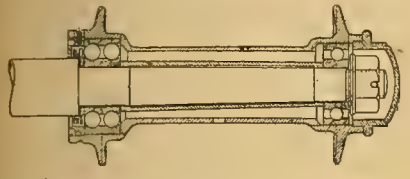
Next year the Tormo Manufacturing Company, 67-68, Bunhill Row, E.C., will be marketing three types of Sarolea engines, the 3½ h.p. 85 × 88, a 2½ h.p. and a new 6 h.p., of which we hope shortly to give details. One of the most

Tormo F. and S. ball bearing cycle car hub.

noticeable features of these engines is the excellent exterior finish and the beautiful casting of the radiator fins.

The Tormo Manufacturing Company are also agents for the well-known F. and S. Ball bearings.

The accompanying illustration shows the latest type of cycle car hub, which is a particularly fine piece of work. The



Section of F. and S. ball bearing cycle car hub.

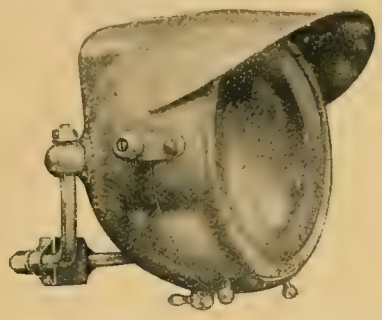
sketch shows this in section. On the end nearest the chassis it has a double row of ball bearings and a single row on the outside end. Particular care has been taken to render it dust and waterproof.

Useful Lamps at Brown Bros. Ltd.

A firm which is always to the fore with motor cycle accessories is Messrs. Street, E.C. Dealing primarily with Brown Bros., Limited, Great Eastern lamps, we would call our readers' attention to the new form of Autoclipse, which type of head light is an old favourite with

Autoclipse lamp showing accessibility of burner.

motor cyclists. The latest pattern, it will be noticed, is a great improvement upon former models, its chief feature being the wonderfully smooth exterior, which is a real departure and enables it to be cleaned easily and quickly, as there are few crevices in which the metal polish can collect and which a rag can catch. This is of the lens mirror type, while the front glass is an additional lens.



The latest pattern Autoclipse lamp. The clean exterior design is a striking point.

The Eisemann Waterproof Magneto.

The 1914 Eisemann magneto has not undergone any startling alteration since last year. We illustrate, however, one of the latest type machines, showing how the waterproofing arrangements have been carried out. It will be noticed that the end plates abut on an inner dome of aluminium, which fits inside the magnets, and these end plates are a dead accurate fit, no packing being employed, as it has been found that the packing harbours moisture. It will also be noticed that the special spanner supplied with each magneto machine has attached to it a gauge for testing the opening of the contact breaker points and a screw-driver for adjustment purposes.

Component parts of the 1914 Eisemann waterproof magneto.

The Optalyte Lamp.

On the occasion of a visit to the showrooms of Messrs. Optalyte, Ltd., 129, Oxford Street, W., we had an interesting demonstration of the light given by the company's latest pattern motor cycle lamp.

The Optalyte lamp. The model shown is for use with cycle cars, but a similar model is supplied with lugs for fitting to motor cycles.

All the lights were turned out, and an ordinary type of acetylene motor cycle lamp was lighted and placed on one side of the room; while on the other the Optalyte lamps were lighted in succession. The five inch lamp (shown in the photograph) easily outshone the acetylene. The seven inch lamp, for cycle car or motor cycle use, gave an excellent light also.

A neat focussing device is fitted to these lamps. A winged nut when undone enables the focussing tube to slide backwards or forwards to any desired position.

Also the lens is a special feature. It is constructed of glass of great thickness and is silvered on the inside

The lamps are easily cleaned both inside and outside. Other advantages claimed by the makers are (1) No dust on the inside, and (2) no condensation.

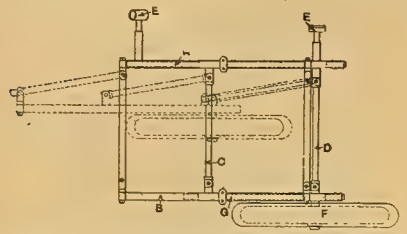
Special bulbs are fitted and are constructed so that the filament is as near the centre of the bulb as possible. This prevents blackening. The weight of these lamps is very moderate.

Everything for the Motor Cyclist.

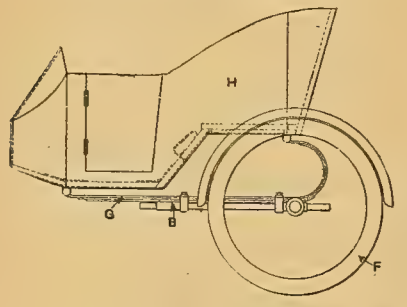
Passing Gamages' recently, we entered and inspected a very attractive collection of accessories. We also noticed a Singer light car, a B.S.A. motor bicycle, and several sidecars, pillion seats, etc. Altogether, it was a very fine show.

A Folding Sidecar.

The frame comprises four main tubes A B C D, which are connected together by the knuckle joints illustrated, so that



when in the extended position the members cannot move beyond the correct location. The member A carries joints E for attachment to the motor cycle, whilst the sidecar wheel F is mounted on an axle carried by the tube B. Upon

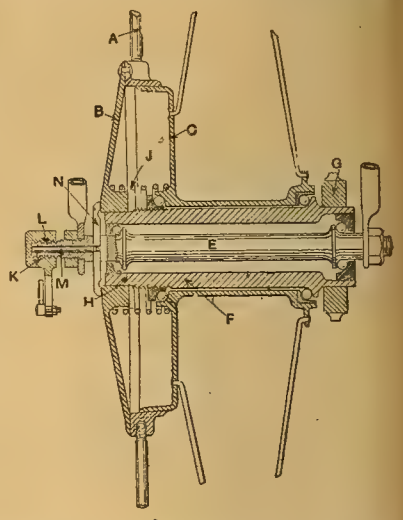


the tubes A and B are bolted the leaf springs G supporting the body H, which comprises side and rear members connected by hinges. The base of the body also is hinged to the sides, and serves to keep the whole secure when in use. By removing the base of the body the complete sidecar can be collapsed from the position shown in full lines to that shown dotted.—G. and T. F. Watson, No. 16,875, 1912.

PATENTS by Eric W. Walford A.C.I.P.A.

A Free Engine Clutch.

This clutch is of the cone type, and is arranged at the hub. The belt pulley is carried by spokes A connected to the female cone member B, with which co-operates a male cone C carried by the wheel hub. Around the fixed spindle E is mounted on ball bearings a sleeve F, which at one end carries the pedalling free wheel G, and at the other end is formed with a square at H for the reception of the clutch member B, which is a sliding fit thereon. A spring J normally moves the member B away from that C, bringing the conical surfaces into engagement. Withdrawal of the clutch is effected by the operation of the lever K, working on a thread L on the spindle, which presses



upon a push rod M, which in turn actuates a cross bar N, forcing the clutch member B inwards, and so disengaging the surfaces.—G. E. Rigby, No. 12,094, 1912.

F.R.S. Lamps.

Mr. G. T. Collis, 57, Hatton Garden, E.C., has been appointed London representative for the manufacturers of these well-known motor cycle lamps.

Good Value in Tyres.

The low price of Michelin tyres enables voiturette covers, 650 × 65, to be sold at as low a price as 29s. 9d. This should appeal to those of our readers who have voiturette rims on their motor cycles, or who use cycle cars. The patterns of Michelin motor cycle tyres will not be altered for 1914.

Advertising Matter Wanted.

Messrs. A. P. Rey, the well-known motor cycle dealers of Heath Street Motor Works, Hampstead, and 173, Great Portland Street, W., inform us that they have now taken extensive premises at 378-384, Euston Road, N.W., and would be glad if manufacturers would supply them with posters, etc., relating to the motor cycle and cycle car trade, as they have very considerable wall space available at their new premises.

A Double Purpose Cap.

A fortnight ago we illustrated the Anti-glare Visor cap produced by Bramco, Ltd., Coventry, to safeguard motor cyclists and cyclists against the dazzling rays of the powerful motor car head lights at night. The photograph showed the screen quite dark, but, to remove any possible misapprehension, we should explain that the dark effect is due to the non-actinic colour used. The screen is, of course, transparent, and not opaque as might be supposed from the illustration.

Jackson Cycle Car Ignition.

In our description of the clever two-stroke Jackson cycle car which we published last week, we should have stated that the magneto fitted was a U.H.

Brooklands Achievements.

G. E. Stanley, on the 18th inst., made the best performance in four events in the time trials, broke the existing hour record, and made a wonderful exhibition in the five-lap championship race up to 1,000 c.c., while H. V. Colver set up the hour record in the sidecar combination event. Both these riders were using C.A.V. Ruthardt magnetos.

Continental Tyres in 1914.

The chief feature of next season's Continental tyres is a reduction in price and no alteration either in pattern or quality. The new tyres will be constructed in exactly the same manner as those fitted to Godfrey's Indian, which won the T.T. in 1911, and Applebee's Scott, which won this classic event in 1912, and on which Green won the Grand Prix this year. A novelty will be an Autobi 650 × 65 cover (to fit voiturette rims) for the rear wheels of heavy sidecar machines, and a similar 75 mm. tyre to fit 65 mm. rims.

A Durable Tyre.

Palmer tyres were used on the Calthorpe cycle car which annexed seven long distance records at Brooklands last week.

Tyres at Brooklands.

We are informed that E. B. Ware, who was the winner in Class D in the Sidecar Hour Race at Brooklands on the 18th inst., and who performed remarkably well throughout the meeting, was using Clincher tyres.

Steel Pistons.

Messrs. Brown Bros., Ltd., advise us that they have been appointed sole agents for London and district and selling agents for the Colonies for Simplex steel pistons and the Duplex patent piston rings.

The "Reliable" Belt.

Messrs. Lycetts, Bromley Street, Birmingham, makers of the combined leather and rubber "Reliable" belts which performed so successfully in the A.C.U. Six Days' Trial, inform us that they are now in a position to supply this type of belt in 1¾in. size.

A Satisfactory Lubricator.

We are informed by Messrs. Best and Lloyd, Ltd., Birmingham, makers of the well-known drip lubricator, that already over 25,000 of these fittings are on order for various makes next year, and that, among others, these useful fitments will be found on Lea-Francis, B.S.A., Bradbury, Scott, Hazlewood, Humber, Norton, and A.J.S. machines next year. Messrs. Best and Lloyd state that these lubricators are so successful that there is no single instance of a firm once having adopted them giving them up.

FOR EVER—

will the **MOTOSACOCHE,** with M.A.G. engine, give you service.

FOR EVER—

will it run just as sweetly and just as swiftly—whether it is a

2½ h.p. MOTOCYCLETTE or a

(The Gentleman's Machine)

AGAIN AMONGST THE RECORDS

EQUIPPED WITH THE **ZENITH** GEAR THAT NEVER FAILS

"The Summit of Ambition"

At the A.C.U. Championship Meeting held by the B.M.C.R.C. at Brooklands on Saturday, Oct. 18th, the ZENITH and sidecar made (subject to confirmation) 5 new RECORDS.

Class H. E. B. Ware } 6 h.p. ZENITH { Flying Kilo. 59·18 miles per hour. Flying Mile 58·82 „ „ „

This ZENITH also won the ONE HOUR SIDECAR RACE with a RECORD distance of 56 miles 542 yards, setting up two new RECORDS for 50 miles (classes H. and I.) en route.

(Note that this machine was only of 6 h.p. yet it made RECORD in the 1000 c.c. Class and covered nearly two miles more than a machine of another make in the bigger class.)

ZENITH MOTORS, LTD., WEYBRIDGE, - SURREY. — *Illustrated catalogue sent on request.*

Stand 93 Olympia—REX Stand

Next year is universally acknowledged will be a Sidecar Year.

Before making your decision, see STAND 93 at Olympia, between November 24th and 29th.

Ask any rider of a present-day Rex Sidette his opinion. We have no fear as to the verdict.

Features—6 h.p. engine, flexible, silent, power unsurpassed.
Gear—Absolutely foolproof.
Frame—Detail and riding position second to none.

Write us for Catalogue giving full particulars, and 1912 Booklet of 'Tales of the Road.'

"An Engine with Excellent Features and Splendid Workmanship." —*The Cyclecar.*

"Preston to Carlisle over Shap Fell on Top Gear."

Dorman Twin-Cylinder Water-cooled Engine

GREAT SPEED ON THE LEVEL.

GREAT HILL-CLIMBING POWER

writes:—

"The Engine ran in a magnificent way. She turned over without a tremor, and accelerated very nicely indeed. I think she put up a very marvellous performance, considering she was practically straight from the shop. You need not show this to the authorities, but between ourselves she did not do anything less than m.p.h. between — and —."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

THE BIG CLEARANCE CONTINUES AT

Every make famous for speed, reliability, and all-round satisfaction, will be found on offer at greatly reduced prices at

G

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry," or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

Get the "DRUID" fitted to your mount NOW!

—it can easily, quickly, and economically be effected by any experienced Motor cycle Agent.

—The "DRUID" will enable you to ride in perfect comfort—at highest speeds—with less wear on your tyres—and in absolute safety.

—The "DRUID" *completely* eliminates vibration, bouncing and road shocks—ensures perfectly true steering—admits of no side-play whatever—and ensures luxurious riding, always.

—The "DRUID" is the *only* Spring Fork that alone makes possible these *ideal* riding conditions—hence its supremacy, and adoption on the leading machines of the day.

—If you would know more about the "DRUID" write for our "Booklet," which gives full particulars, TO-DAY.

A. DREW & Co., Leopold St., Birmingham.

COMFORT AWHEEL

Fitted on the WINNING machine in the 1913 JUNIOR T.T. RACE—and on the majority of WINNING machines in the A.C.U. 6 Days' Trials.

Hopwood Lane, HALIFAX

£10-10-0

Ten guineas is all it costs to bring your mount up-to-date by the addition of the

1913½ ROC Reverzer SIDECAR PATTERN

Two-speed Gear.

(6 Days' World's Sidecar Record type)

The 1913½ big clutch type has been designed expressly for passenger work.

It solves all gear worries and guarantees you satisfaction.

The 1913 Roc gear was already recognised the last word in motor cycle gears for solo use.

The 1913½ big clutch type is just what thousands of "sidecarists" have awaited and expected.

The Roc gear was the first of all motor cycle gears—it is the first to-day. Nothing could be smoother, easier to operate, or be more reliable.

No better investment for the money is possible than in this 1913½ Roc dependable gear, fitted complete for ten guineas.

Write for particulars, stating make and h.p. of your machine.

No delay in delivery.

ROC GEAR Co.,

SECOND-HAND MOTOR CYCLES.

1427. 1913 **RUDGE** Multi, 5 h.p., scarcely used £48
1435. 1913 **DOUGLAS** Model S, one week old £45
1446. 1913 **LEA FRANCIS-J.A.P.**, 3½ h.p., chain drive, F.R.S. lamp, generator, horn, tools, and spares £52
1457. Model **"A" HENDERSON**, 4-cyl. 7 h.p. F.E. £55
1458. 1913 **MATCHLESS**, 5 h.p., O.H.I.V., like new £50
1459. 1913 **A-C. SOCIABLE**, in beautiful order, side and tail lamps, large headlight, speedometer, watch, horn, tools, and spares £68
1327. 1912 **BRADBURY**, 3½ h.p. £35
1342. 1912 **ZENITH**, 6 h.p. £48
1283. 1912 **ZENITH**, 3½ h.p. £38
1285. 1912 **CLYNO**, 6 h.p., 2-speed £46
1338. 1912 **BRADBURY**, free engine £36
1362. 1912 **RUDGE**, free engine £35
1395. 1912 **J.A.P.-CHATER**, 6 h.p., free engine, and Sidecar with child's seat £42
1406. 1912 **A.J.S.**, 6 h.p., 2-speed, post horn, Jones' speedometer, mirror, watch, Miller lamp, P. and H. generator, etc £46
1412. 1912 **HOBART**, 2¼ h.p. £22
1426. 1912-13 **F.N.**, 4-cylinder, 2-speed £36
1428. 1912 **TRIUMPH**, free engine, Cowey, etc. £39
1430. 1912 **F.N.**, 4-cylinder, 2-speed, and cane Sidecar £42
1432. 1912 **NEW HUDSON**, 2¾ h.p., 3-speed £35
1433. 1912 **REGAL-PRECISION**, 4½ h.p., 2-speed, and Sidecar £34
1449. 1912 **TRIUMPH**, 3½ h.p. £34
1452. 1912 **ARIEL**, 3½ h.p., 3-speed £35
1455. 1912 (early) **CLYNO**, 6 h.p., 2-sp., kick starter £36
1456 1912 **ENFIELD**, 6 h.p., 2-speed, and Enfield cane sidecar £49
1332. 1911 **ZENITH**, 6 h.p. £42
1442. 1911 **TRIUMPH**, 3½ h.p. £28
1282. **BROUGH**, 5 h.p., twin cylinder £22

'PHONE: MAYFAIR 5767

157, GREAT PORTLAND STREET, W

MOTOR BICYCLES FOR SALE.

4-CYL. 4½h.p. F.N., drop frame, cylinders, pistons, valves, connecting rods, magneto, and transmission all new, tubular carrier, and kick-up stand, plating and enamelling good; £17/10.—Conductor, Theatre Royal, Pontypool, Mon. [3190

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants, and Channel Islands.

SCOTT, latest 1913 model, brand new; £58, great bargain.—Ginger, Motors, Banbury. [X1881

2½h.p. Werner, mag., 1913 Senspray, good condition; £10.—62, Bicester Rd., Aylesbury, Bucks. [X4740

OFFERS wanted for 2¼h.p. twin Moto-Reve, in good condition.—Rowland and Sons, Salisbury. [X4915

JAMES, latest 1913, 3-speed, chain drive, Canoelet sidecar, unscratched.—Hucclecote Lodge, Gloucester. [X4840

BAT, 3½h.p., 2-speed, and sidecar, sound, reliable, efficient; £20.—Fears, Optician, Kingswood, Bristol. [X4783

LAYTONS.—Douglas, 1913, model O, shop-soiled only; £42, catalogue price £48.—Laytons, Bicester. [X4812

1910 Enfield Twin (lightweight), splendid running order, reliable; £15, bargain.—6, Manor Rd., Oxford. [3311

1913 Rudge Multi, 3½h.p., shop-soiled only; to clear at £52.—R. A. Stone and Co., motor cycle agents, High Wycombe. [3187

4h.p. Bat, spring frame, new belt, perfect, £9/10; sidecar, 25/-.—Alexander and Co., Electricians, Fishponds, Bristols. [X4785

LAYTONS.—Douglas, 1913, model N, single speed, used 500 miles only; cost £44, price £35.—Laytons, Bicester, Oxon. [X4813

LAYTONS.—Triumph, 1913, 3-speed model, shop-soiled only; £51, catalogue price £59/15.—Laytons, Bicester, Oxon. [X4814

LAYTONS.—Triumph, 1912, clutch model, good order throughout, lamp horn, speedometer; £34.—Laytons, Bicester, Oxon. [X4820

3½h.p. Triumph, 1913, 3-speed. July model, perfect, run 1,000 miles; price £44.—Whitehouse, 45 Grosvenor Rd., Aldershot. [3332

BRADBURY, 1912, 2-speed, lamp, horn, mirror, and spares, hardly soiled, privately owned; £42.—Adkins, High St., Aylesbury. [X4580

HARTWELL'S Garage, Chipping Norton.—Triumph and Douglas agents; also agents for Swift cycle car for Banbury, Burford, and Chipping Norton.

THREE Special Bargains to Clear.

DOUGLAS, model O, not ridden 50 miles; best offer above £40; perfect and genuine.

TRIUMPH, 1912, free engine, in fine order, just overhauled and rebushed, lamp, horn, and tools; best offer above £30.

LEVIS, 2-stroke, ridden 60 miles, with horn, beautiful machine, only wants seeing; £29 to clear. [1786

F.N. Lightweight, 1910, 2-speed, shaft drive, replated and enamelled, fitted with 1913 improvements, had very little use, and is a bargain; £19.—Also

1907 Triumph, as above; £18 or exchange with cash for combination.—15, Church St., Wolverton. [X4797

TRIUMPH, 1911, clutch, first-class condition, little used, Lucas lamp set, all spares, belt, tube, etc.; £34.—Barrett, fruiterers, High St., Cheltenham. [X4864

DOUGLAS, 1913, model O, last Easter, lamp, horn, speedometer, back-rest, done 1,300 miles, Max rear tyre uncut; £38/10.—Boevey, Fort Albert, Alderney. [3219

1912 Clutch Model Triumph, in good running order, brand new, belt and back tyre (Clincher); £33.—Box No. 4,368, *The Motor Cycle* Offices, Coventry. [X4688

LAYTONS.—Zenith, 3½h.p., 1913, first-class order throughout, complete with nearly new sidecar, lamp, horn, etc.; £48, without sidecar £43.—Laytons, Bicester, Oxon. [X4815

LAYTONS.—Douglas, 1911, 2-speed, free engine model, engine just overhauled, whole machine in good order, lamp, horn, etc.; £26/10.—Laytons, Bicester, Oxon. [X4816

TRIUMPH, 1908, speedometer, lamp, horn, tools, new cylinder, piston, and carburetter, 1912, excellent running order; £22/10, or offer.—Halsted, Tournay Barracks, Aldershot. [X4685

LAYTONS.—Ariel, 1913, 3½h.p., 3-speed, kick starter, decompressor, 2½in. tyre, complete with sidecar, first-class order guaranteed; cost £67, offered at £45.—Laytons, Bicester, Oxon. [X4819

SECOND-HAND Motor Cycles.—We have a large stock of machines in excellent condition at very low prices to clear; send us your requirements and we will guarantee to satisfy you.—The Morris Garages, Oxford. [0314

3½h.p. De Dion, 1912 carburetter, overhauled, rebushed, etc., low frame, spring forks, fast and powerful, carry passenger; bargain, £10; exchange 5-6 h.p. twin, cash adjustment.—Fanner, Mount Lodge, Shanklin. [3362

Is the Supremacy of the 500 c.c. Engine Waning?

FOR the last few years no type of motor cycle engine has held such undisturbed sway among the mass of riders as the 500 c.c. single-cylinder. The sales of such a type of machine have probably been enormously in excess of all other types combined, and, despite the great improvements in twin-cylinder engines and the considerable popularity which such engines have lately enjoyed, there is really no serious diminution in the number of single-cylinder engines of 3½ h.p. met with on the roads. Even the tremendous and still growing popularity of the luxurious type sidecar has not shaken its position up to the present, and the successful application of the three-speed hub to motor cycles has probably vastly assisted it to retain its hold on the market, as it has been the means, at a comparatively slight extra cost, of enabling thousands of riders to fit passenger carrying attachments to motor cycles when otherwise they would have been almost forced to purchase a more powerful engine. There appear to be few limitations to the abilities of an efficient 3½ h.p. motor to haul a light sidecar and passenger, for the really remarkable displays put up by some of the best known long distance trials riders with such a type of machine show what can be done with careful handling, and even with ordinary intelligent driving a 3½ h.p. three-speed outfit can do yeoman service on average roads.

Why, then, readers may ask, should any interference with the design of this type of machine be meditated? As a matter of fact, excellent as are the results obtained, there are conditions such as heavy roads, head winds, or hilly country, that throw a great strain on so comparatively low-powered an outfit. And, further, an engine working at its limit for long periods is apt to fall off quickly in efficiency. Now, the difficulty manufacturers have to face is that it is desirable for them to market a machine that is a happy compromise between a sidecar and a solo mount, and 500 cubic centimetres capacity can be looked upon as thoroughly satisfactory for solo riding and, under fair conditions, for sidecar work; but what is wanted is something even more desirable—a machine that should be thoroughly satisfactory for both kinds of service without heed to weather or road conditions. Designers, therefore, have aimed at producing engines which, while not unwieldy or unduly heavy for solo work, are capable when required of hauling the extra load of a sidecar and passenger without the necessity for specially delicate handling, and to do this a good deal of quiet experiment has been going on by a number of manufacturers with single-cylinder engines exceeding 500 c.c., and we may look next year for a considerable number of such power plants in makers' lists.

The Desirability of a 600 c.c. Class.

THE interesting point now arises as to whether the 550 or 600 c.c. engine will eventually displace the present popular 500 c.c. motor, and if it does or even gains the preponderance in numbers on the road, what is going to become of the 500 c.c. class as regards competitions? The Tourist Trophy Races, A.C.U. trials, hill-climbs, and Brooklands all have established classes for engines of this size, and it may be an interesting problem for the authorities of the sport to decide in the near future as to whether a change may not soon have to be made in competition ratings. Already it is known that three or four firms will not standardise a 500 c.c. model next year, but instead offer a single of slightly greater capacity.

Special models would, therefore, have to be built for competition work, unless some change in the regulations for important competitions be made. From all we hear and know of the trend of single-cylinder design for the future, we believe that it will be imperative for the A.C.U. to institute an official 600 c.c. class in the more important competitions at an early date, and, on the whole, we should welcome such a change because we think that it is good for the industry and for the riding public that manufacturers should not get into grooves. The 500 c.c. engine has had a magnificent innings, and we do not suppose for one instant that its sphere of usefulness is over, but we do think that there is likely to be an enormous demand in the near future for engines up to 600 c.c., brought about chiefly by the wonderful increase in popularity of the sidecar, and we should like to see encouragement given to such a type of engine.

We have not dwelt upon the possibility of the twin-cylinder of 500 to 600 c.c. We are fully aware, however, that such engines are being rapidly improved, and may possibly in time even seriously threaten to capture the market, but we do not believe that the simple and highly efficient single-cylinder engine is finished with for a considerable time to come, and we are sure it will appeal to the vast majority of riders entirely on account of these two particular virtues.

The Depreciation of Cycle Cars.

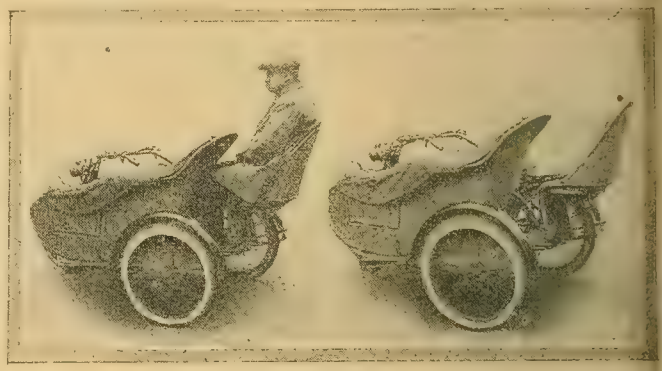
Lay journals may be pardoned for publishing statements to the effect that early model cycle cars can be run for a total outlay of three halfpence a mile, but any technical journal lending its authority to such gross under-estimates deserves no mercy. A study of the prices of second-hand motor vehicles shows that depreciation alone may form an item exceeding 1½d. a mile. For instance, £25 is a comparatively small amount to drop on the sale of the less successful types of 1913 cycle car, and it works out at 2d. a mile on a mileage of 3,000, or of 1d. a mile on a mileage of 6,000. When petrol, oil, tyres, taxes, garage, and licences are included, it is plain that the running expenses are considerably higher than some over-sanguine enthusiasts estimated twelve months ago.

Why Sell?

Owners of 1913 cycle cars who are thinking of selling should consider very carefully whether it may not be better worth their while to keep the vehicle and run it to destruction. Of course, if it be a "dud," the owner will probably decide to cut his loss and realise the best figure obtainable without delay. But if the machine has given good and faithful service, the owner should realise that his impending loss is very largely a matter of fashion. It is said that over 150 different makes of cycle cars were constructed during 1912-1913, and of these scarcely more than a dozen can survive in their original form. This wholesale changing of designs, patterns, and specifications puts last winter's cycle cars hopelessly out of fashion—they are *démodé*, so to speak, with a few regal exceptions, for just as diamonds are always in fashion, so a few makes of cycle cars I could name will undergo precious little change for next season. Consequently, Tom, Dick, and Harry will jump to the conclusion that nearly all the 1912-1913 cycle cars are worth but £70 or so apiece—just as their wives would refuse to pay a good price for one of last spring's hats. But many owners have 1912-1913 cycle cars in their stables which are as good as ever they were from a running point of view. I admit that these machines may be almost unsaleable by the end of next year; but if there is still three or four years' good running in them, they may be worth keeping. And here I have a special word of advice to offer. I have known many owners have great difficulty in selling motor cars, motor bicycles, and cycle cars even at a ridiculous price. But I never knew a motorist who kept his machine smart, clean, and in good tune ever have to go begging for a buyer. Only the other day I heard how one of the less meritorious cycle cars built last autumn realised £85 after it had done 15,000 miles in the hands of its first owner. He tuned it up, he kept it clean, everybody saw it daily doing hard work and doing it well; and when its owner's random fancy turned to something new, there were plenty of eager applicants ready to offer it a kind home at a decent price. *Verb. sap.*

A Sidecar Dickey.

I illustrate herewith a novel method of accommodating an extra passenger on a sidecar outfit produced by J. L. Butler, of 261, Kirkstall Road, Leeds. I cannot say I am particularly smitten with it personally, for I do not believe in overloading a machine, nor does its distribution of the weight appeal to me as ideal, but then I detest the popular pillion riding (by the way, I saw another couple come a fearful purler last week!), so I can quite believe that this sidecar dickey may become immensely popular.



A sidecar dickey made by J. L. Butler, of Leeds.

The Nailsworth Ladder.

I recently spent an instructive afternoon on the ill-famed Nailsworth ladder, which is alleged to possess much gradient worse than 1 in 3, and the sidecarist who endeavoured to ascend it with a three-speeded 6 h.p. sidecar outfit, geared 13½ to 1 on bottom, departed a sadder and a wiser man; indeed, he was the wee'est shade fortunate to depart at all in one piece, for the machine certainly got away with him when he was descending after conking out on the topmost bad knuckle, and only the easier stretch lower down enabled his cool head to make the brakes and compression on bottom gear once more operative. The afternoon provided an interesting commentary on the A.C.U.'s desire to see sidecars climb freak hills with the passenger "seated in a normal position," for his repeated failures were solely ascribable to lack of adhesion on the part of the driving tyre. The surface of the ladder is not loose; it varies from a kind

Occasional Comments.—

of hard, impromptu macadam to naked reefs of knobbly rock. He was using a non skid Kempshall—to my mind quite one of the most adhesive tyres on the market; but when this tyre hit one of the reefs, it spun round ineffectually and the engine raced furiously; if the impetus jumped the tyre over the reef—sometimes it did, sometimes it didn't—the effect was similar to letting in the clutch with a bang, and the engine didn't like it a little bit, and either conked out incontinently, or slowed its "revs." down to such a point that failure on the next knuckle was assured. Success or failure was thus purely a matter of tyre adhesion. I am of opinion that the machine would have gone up well with a passenger on the carrier; but the frightful rocking of the outfit and the absence of any cushion deterred the hardiest spectator from offering to lend his weight.

Another Problem.

The driver of this Nailsworth sidecar outfit propounded another problem of diagnosis, which up-to-date has completely stumped the clever owner, and several quasi experts. If he is rounding a corner on middle gear, well throttled down, and opens his throttle to tackle a succeeding gradient, the engine stops as if it had been shot. If he changes down on to bottom gear or up on to top gear, the engine leaps into full song again immediately. None of the control gear can possibly create a short circuit under these conditions, and though he cannot trace or remedy the trouble, he is convinced that the cause is connected with the carburetter. The engine will "rev" on middle gear on the straight flat quite as obediently as upon top or bottom. Will some expert oblige us with a solution?

Chronic Conkitis.

Many letters which I receive are difficult to answer, but few more so than one from a reader who owns a machine of comparatively unknown make. It behaves tolerably well in respect of power and reliability, but its paces are disfigured by an inveterate habit of knocking, which is shared by all the other engines of the same make within his acquaintance. It knocks whenever it is asked to pick up after a slow, and the conking is especially pronounced on hills. He asks how to cure this unpleasant feature, and how to render his engine the equal of other 500 c.c. engines of greater renown and ability. As it happens, I have never sampled an engine by this particular maker, who turns out so few that I had almost forgotten such an engine existed, and his own suggestion is that a different valve timing might improve matters. One would be more inclined to suppose that he has had the misfortune to purchase an engine well below the average in efficiency, and that no alternative valve timing will improve matters. In any case, the expense of experimenting with a speculative series of specially made cams and pinions is too great to be justifiable.

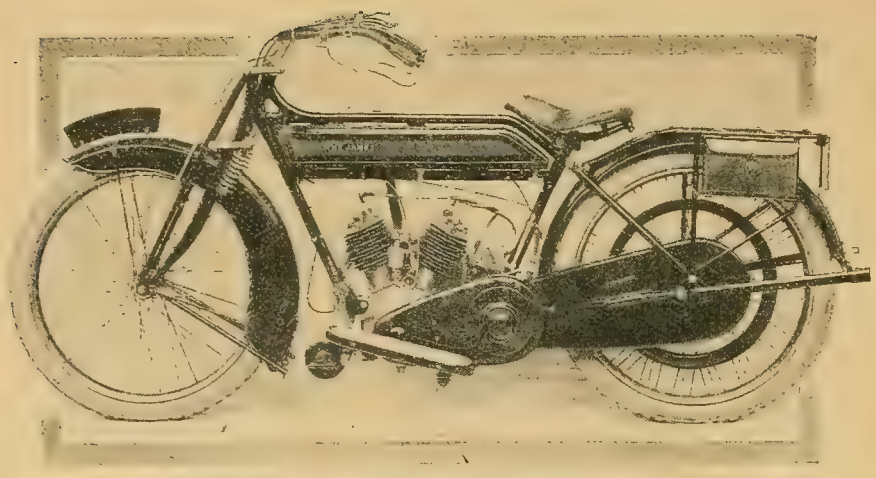
Reducing Transmission Friction.

If, as alleged, all the engines of this make knock under no very extraordinary inducements, one of two things is certain; either the engine cannot develop sufficient power to propel a sidecar smoothly, or else its compression is too high. It is a cheap and easy matter for an amateur mechanic to lower the compression ratio; he should experiment with washers of different thicknesses between the cylinder and crank case, lengthening the valve tappets to suit, either by home-made tin caps, or by the Service adjusters. This is the most promising region for experiment. In addition, it would be well to make sure that there is no undue friction in the gear box and back wheel bearings, that the engine's moving parts are all nicely free, that the silencer is clean, that the ignition is not timed over fast, and that there are no air leaks between the carburetter and the inlet valve. It is further possible that the engine is over-geared; many 500 c.c. engines will never take a sidecar at all nicely on a higher gear than 5 or even 5½ to 1.

Finally, it is conceivable that the carburetter fails to supply a sufficient volume of adequately rich mixture at low speeds. In this case he should slip a lining tube in the funnel or choke round the jet; if this reduces the knock, it should be worth while trying a two-jet carburetter or a by-pass attachment. An engine that accelerates badly cannot suck enough gas from a simple carburetter at low speeds to enable it to get away; and such engines are improved by an auxiliary jet set within a choke tube of very narrow bore.

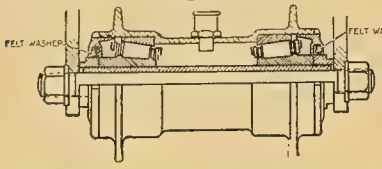
Group of Members of the Wrexham and District M.C. taken outside the Royal Hotel, Llangollen, where the president of the club, Mr. Noel Soames, entertained the members to luncheon on the occasion of this club's first run.

The 1914 James Models.



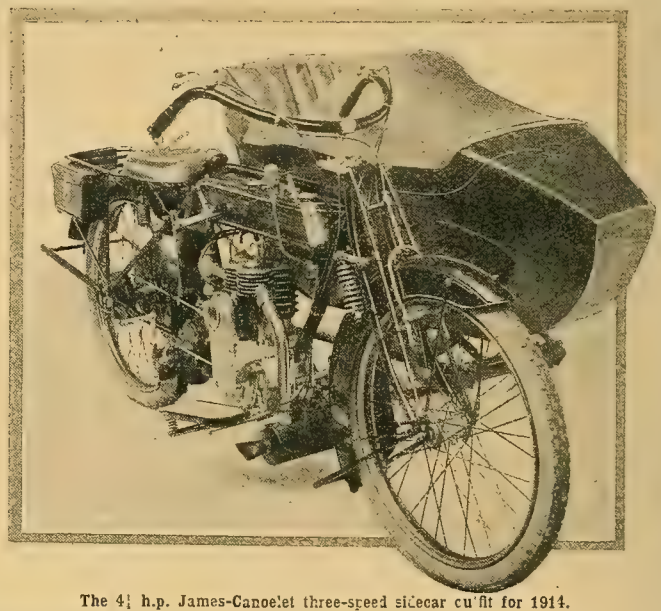
1914 model 3½ h.p. twin-cylinder three-speed chain-driven James.

FOR some time past the James Co. have been experimenting with a 3½ h.p. twin-cylinder model which has from time to time appeared in open competition. The fruits of these experiments are now ready for the market in the form of a very attractive machine, fitted with a three-speed bottom bracket gear and enclosed chain drive throughout.



Part section of the James front wheel hub, showing the Timken roller bearings which have been adopted to take side strain caused by the sidecar.

The engine is a 50° twin, having a bore of 64 mm. and a stroke of 77 mm. (496 c.c.), the cylinders being interchangeable and the radiating fins being staggered on the well-known James lines. Great care has been exercised in the design of the valve ports, and they are so arranged that air circulates freely round them. As regards the internal arrangements of the engine there are no great deviations from standard practice, but the steel flywheels are a fine piece of work. The magneto is chain driven, and lies high up behind the engine, where it is well out of the way of mud and wet.

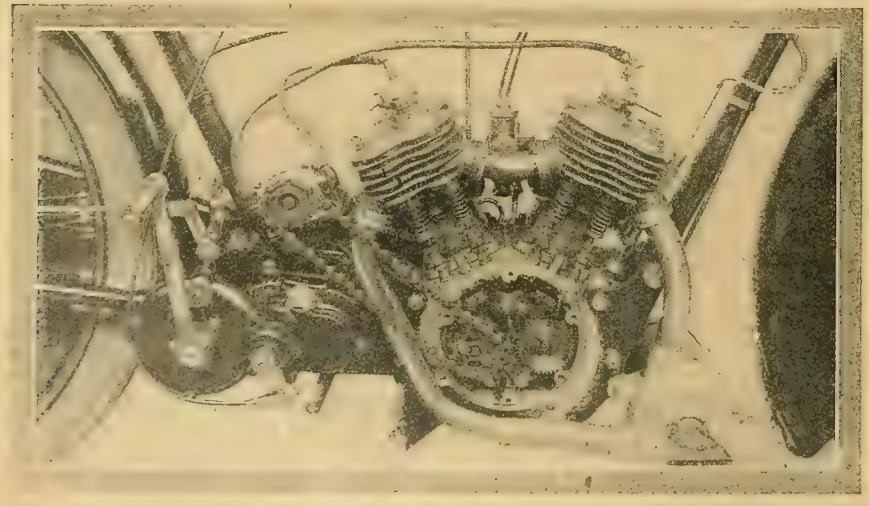


The 4½ h.p. James-Canoelet three-speed sidecar outfit for 1914.

Details of the Transmission.

The three-speed gear is a redesign of the usual James box, but although the wearing surfaces remain the same the actual gear box has been considerably reduced in size, and the standard ratios will be 4½ to 1, 7 to 1, and 11 to 1. An excellent feature is the enclosed kick starter. Both front and rear driving chains are carefully enclosed in stamped steel cases, which are split vertically and give easy access to the chains for adjustment or lubrication. To ease the shock of the drive a very neat spring cushion is enclosed in the rear sprocket and consists of a series of compression and recoil springs interposed between the driving member and the hub. A multi-plate clutch is fitted on the main gearshaft and is controlled from the handle-bar, though pedal control can be arranged if desired. The control of the gears is by a long flat striking lever working in a quadrant on the tank.

A strong frame supports the engine and carries a full complement of fittings, including sprung footboards and two stands. The toolkit is well stocked and the finish is excellent.



Timing gear cover of the 3½ h.p. James removed to show method of adjusting the magneto timing. Observe also neat fixing of gear box and kick-starter.

The Big Single Cylinder.

The big single-cylindered sidecar model has undergone no very great changes, though the engine has been increased in size to 86 × 103 mm. bore and stroke, giving a capacity of 599 c.c., and the air passages round the valve ports have been improved. A new piston is now used, having one ring at the top and one at the bottom end.

Hyatt roller bearings are now fitted to the front hubs to assist in taking the thrust on the front wheel when a sidecar is in use. This is a refinement which is well worthy of notice.

This single-cylinder is primarily a sidecar machine. While it is impossible to obtain such sweetness or refinement of running with this type of motor as with a twin of even larger capacity, it has the merits of simplicity, reliability, and great efficiency, qualities which will always weigh with a large number of buyers.

Strenuous Trial at the Cape Peninsula.

AT the break of dawn on Wiener's Day (October 6th, a local holiday), twenty-five motor cyclists assembled outside the City Hall, Cape Town, to compete in the 200 miles reliability trial for the Barling Cup, open to members of the Cape Peninsula M.C.C. A South African winter is notorious for heavy rains with flooded rivers and soaked roads, and under such conditions, for it had been raining for days, the men set off at intervals. The time allowances and distances between controls were :

Cape Town to Wellington	45	140m.	130m.
Wellington to Worcester	36	160m.	140m.
Worcester to Villiersdorp	29	110m.	90m.
Villiersdorp to Sir Lowry Pass	50	210m.	180m.
Sir Lowry Pass to Cape Town	40	130m.	120m.

G. H. Jones (2½ F.N.) was the first to leave Cape Town, at 5.47 a.m., followed a few minutes later by F. J. Smuts on a 3½ P. and M., the last man leaving town being C. H. de Krielen, at 7.2 a.m., whose 7 Emblem, however, was the first to fall out through side-slipping on the treacherous surface of the muddy Paarl Road, thus causing his retirement.

After signing in at Wellington, the riders had to climb Bains Kloof, the first steep hill on the journey.

F. Barling (the donor of the cup) had to stop his 6 Enfield and sidecar; so also had V. Cardinal, who, riding the same make, came to a standstill near the top, forcing G. H. Jones, who was close behind him, to charge the bank and turn a complete somersault, dislocating the carburetter controls.

A USEFUL PASSENGER.
A competitor's sidecar being towed across one of the many streams.

Something like a Water Splash.

Coasting down from the top competitors were faced with the Breede River, which was flowing with considerable force across the main road.

F. J. Smuts was the first man to arrive at the river's side, and unhesitatingly plunged into the roaring torrent, only the handle-bars of the machine projecting above the surface. He had very hard work to push the machine through, and magneto troubles naturally were legion. W. Herbert (6 Clyno sc.), after successfully having pushed through the current, worked with his passenger for fifteen minutes to get rid of the water which found its way into the carburetter, magneto, and cylinder. While righting matters they saw O. J. Prillevitz (6 Enfield sc.) descending and forthwith crossing the river. As the current pressed the outfit dangerously towards the big boulders they shouted to him to turn the wheel and head the current; he did so in the nick of time. His was a remarkable performance, as he got his machine to fire within half a minute, and consequently was the first man to enter the Worcester control.

At another splash an enterprising farmer offered to carry across on his waggon mounts and riders for a consideration of five shillings a time. Some of the coachbuilt sidecars acted as boats and floated, but many were upset.

On to Worcester, where a big crowd had gathered to see the "two hundred milers" pass through, and here an exciting incident befell Thornton, whose sidecar connections came adrift while going all out, the outfit capsizing and the occupants being thrown in the mud, resulting in black faces, but luckily no injury.

A Novel Exhaust Pipe.

Three drifts had to be crossed before reaching the Upington Bridge over the River Zonder End on the commencement of the home journey, and R. C. Woodville's four-cylinder F.N. fired immediately on reaching the other side, while Garlick's Enfield fired all the time during the wheeling through process, the exhaust being conducted through a 3ft. tube to above the saddle.

Then came a still more difficult task—coasting down from a tremendous height over a rough surface, with many crossgulleys and numerous bends, towards "Boontjes kraal," a distance of about ten miles, where the main road from Caledon to Cape Town is joined.

The End of the Struggle.

After stopping at Hounhoek for the purpose of signing their names, the men, who, by the way, were far apart, steered their mounts over Sir Lowry Pass, through the control at the village, and *via* Somerset Strand, towards Cape Town.

A large crowd welcomed O. J. Prillevitz, who looked the fittest of all, at the City Hall, followed by F. Barling, with W. Herbert the next arrival.

One by one the competitors arrived, and it speaks volumes for the stamina of the riders and the reliability of the modern motor cycle that of the twenty-five entrants who started seventeen completed the course. Of these eight managed to come in before night fell, the last man signing in at 11.10 p.m.

The results are as follow :

1. O. J. Prillevitz (6 h.p. Enfield sc.)
2. W. Herbert (5-6 h.p. Clyno sc.)
3. W. H. Eastoe (7 h.p. Indian sc.)
4. F. Barling (6 h.p. Enfield sc.)
5. E. W. Watts (6 h.p. Enfield sc.)
6. G. H. Lunt (2¾ h.p. Douglas).
7. D. Garlick (6 h.p. Enfield sc.)
8. F. J. Smuts (3½ h.p. P. and M.)
9. R. C. Woodville (5-6 h.p. F.N.)

ARNOLD KEYZER

THE MOTOR CYCLE SHOW NUMBERS.

OLYMPIA, 1913.
THREE SPECIAL ISSUES
will be published as follows :
NOVEMBER 13th—
Passenger Machines of all Types
NOVEMBER 20th—
Buyers' Guide of 1914 Models.
NOVEMBER 27th—
Complete Show Report.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Storing a Motor Cycle.

Now that the winter months are fast approaching, I am anxious to store my machine for the winter. Will you please tell me the best way?—F.B.

The best plan is to jack up both wheels so that the tyres are not on the ground, store the machine in a dark but dry place, and smear all bright parts with vaseline.

Swaffham to Birmingham.

Please let me know the shortest route from Swaffham (Norfolk) to Birmingham.—C.P.

Your best route would be as follows: Swaffham, Downham Market, Wisbech, Peterborough, Oundle, Market Harborough, Lutterworth, Coventry, Meriden, and Birmingham. The distance is approximately 128 miles.

Difficulty with Piston Rings.

I have a 1911 single-cylinder machine, and in January last when I was overhauling the machine, I was recommended by an engineer friend to fit wider rings to my piston. The grooves were widened on the lathe, and new rings fitted. Since then I have had five broken rings, on one occasion both rings snapping, and I am at present waiting for some new ones, as the trouble has occurred again. On every occasion except the last (when I had to leave the machine at a garage), I have fitted the new rings myself, and was very careful to see that they were not too tight. The engine is always well oiled. I should be much obliged if you would suggest a possible cause and remedy for this trouble, of which I am becoming rather tired.—L.H.

It is very difficult to give you an answer as to the cause of your piston ring trouble. The mere fact of having widened them should not necessarily make them liable to break, and we are rather inclined to think that the fit of these rings cannot be as good as you think, and should advise you to seek the advice of a competent engineer on the matter, as we gather from your remarks that you are not yourself an engineer. The rings, of course, should be an easy fit in their slots. Are you quite sure that you have not got carbon deposit in the slots behind the rings, as if there is much of this it is quite likely to force out the rings and lead to breakage? We advise you to look carefully to this point. If you are satisfied the rings fit properly and carbon is not present, and the trouble still continues, the only course is to fit a new piston. We do not think you were well advised to alter the original rings, as it is reasonable to presume the makers know what sizes are required.

The Question of Desaxe Cylinders.

(1.) Can you please let me know what the bore and stroke should be for a side by side twin engine of approximately 4½ h.p.? (2.) What would be the approximate compression space above the top of the stroke? (3.) Is there any advantage in having the cylinders *désaxé*? If so, how much would be correct to give the best results from the vertical centre line? (4.) Would not compression be retained longer, and more even wear of cylinder walls be obtained, if one ring top and bottom were fitted instead of the usual method of all at the top?—C.A.H. (Baluchistan).

With regard to your first question, a 4½ h.p. twin-cylinder engine would be approximately 650 c.c. capacity, and this, of course, could be made up by various sizes of bore and stroke, but taking 70 as a bore, you could get a combination of 70 × 78 up to about 7[illegible] × 75 to give you this power, though, as a matter of fact, the power of such an engine would be in all probability more than 4½. (2.) The compression space is roughly a quarter of the cubical contents, but this varies with the compression employed. (3.) The question of setting a cylinder *désaxé* is that the thrust of the piston on the walls is said by some designers to be slightly less than with the cylinder in a vertical centre line. The advantages or disadvantages, however, are more or less problematical, and we do not think there is very much in it either way. It is also claimed by some engineers that the thrust at the top of the piston when the explosion occurs takes place over a greater portion of the serviceable period of the stroke, on the same principle that if you mount a bicycle by the pedal you start with the pedal over dead centre. (4.) The number of the piston rings and the position in which they are placed depend on the design of the piston itself. Probably the best practice is three rings at the top.

A HEAVY LOAD FOR A SIDECAR.

Great amazement was created in the streets of Milan the other day by the sight of an 8 h.p. Chater-Lea motor cycle, with sidecar attached, towing a removal van, which, incidentally, was full of furniture. We are told that the motor cycle towed the van a distance of over seven miles as shown, and that the crowds who saw this strange sight could not have paid more attention if their king had been passing through the streets.

High Wycomte to Lincoln.

Kindly give me a route from High Wycombe to Lincoln, with distances.—E.T.L.

Your best route would be as follows: High Wycombe, Amersham, Chesham, Tring, Dunstable, Ampthill, Bedford, Eaton Socon, Buckden, Stilton, Peterborough, Market Deeping, Boarn, Falkingham, Sleaford, to Lincoln. Be careful of police traps in all the Huntingdonshire villages. Distance approximately 134 miles.

A Question of Balance and Cams.

I should be much obliged if you would inform me: (1.) If, when testing the balance of a single-cylinder motor, it is necessary to hang a weight equal to the whole of the reciprocating masses on the flywheel or only a weight equal to the half of them? I quite understand the means of doing it, but do not know which is the proper weight. (2.) Do you think it would improve a new motor cycle that seems to knock very easily on hills, and which has at present a very slow cam action to the valves, so to alter them that they opened quicker and consequently had a longer time wide open?—A.R.

In answer to the first question in your letter, it is necessary to hang a weight equal to half the whole of the reciprocating masses in order to test for balance. With regard to your second question, it is quite impossible to answer this without inspection of the machine. You do not even say what make of machine it is, but if of a standard make, in all probability the makers have settled the valve and cam action to their satisfaction, and it is highly probable that the best results have been arrived at, and without further particulars we should certainly hesitate to advise you to make any alterations but to look to other causes, verify the timing of the ignition, and set the spark to occur as the piston reaches the top of the stroke. Also see that your carburetter jet is quite free.

Questions from the East.

I shall be greatly obliged if you could tell me how to set my 1913 three-speed Rover motor cycle to racing pitch? Also, whether you advise one of the variable carburetters that are on the market, and what make will be most suitable? At present I have a B. and B. 1912 pattern. Shall I have to raise the compression ratio (at the time of tuning), and how much is necessary? Why I ask these questions is because I was in possession of a 1912 Rover single-speed which used to travel at 45 m.p.h. on the road, so I naturally would like this three-speed one to travel equally as fast, if not faster.—G.M. (Bombay).

In answer to your queries *re* tuning up your Rover you must not expect to get greater speed because you have got a change-speed gear fitted. As a matter of fact you are not likely to get such high speeds as regards maximum, but you will be able to keep up a much higher average than with a single gear. Tuning a machine up for a race does not mean structural alterations: it simply means seeing that every part is adjusted to the best possible position and in perfect working order. The carburetter you have fitted to your machine will give quite as good results as any other on the market, if it is properly tuned up. These are general rules: The compression must be perfect, valve springs of good strength, jet of larger size with air openings increased to suit, and an earlier magneto timing.

EXPERIENCE WANTED

"H.R." (Exeter).—Four-cylinder F.N. Reliability and economy.

"W.M." (Portsmouth).—Reliability of Paragon, or any other folding or collapsible sidecar.

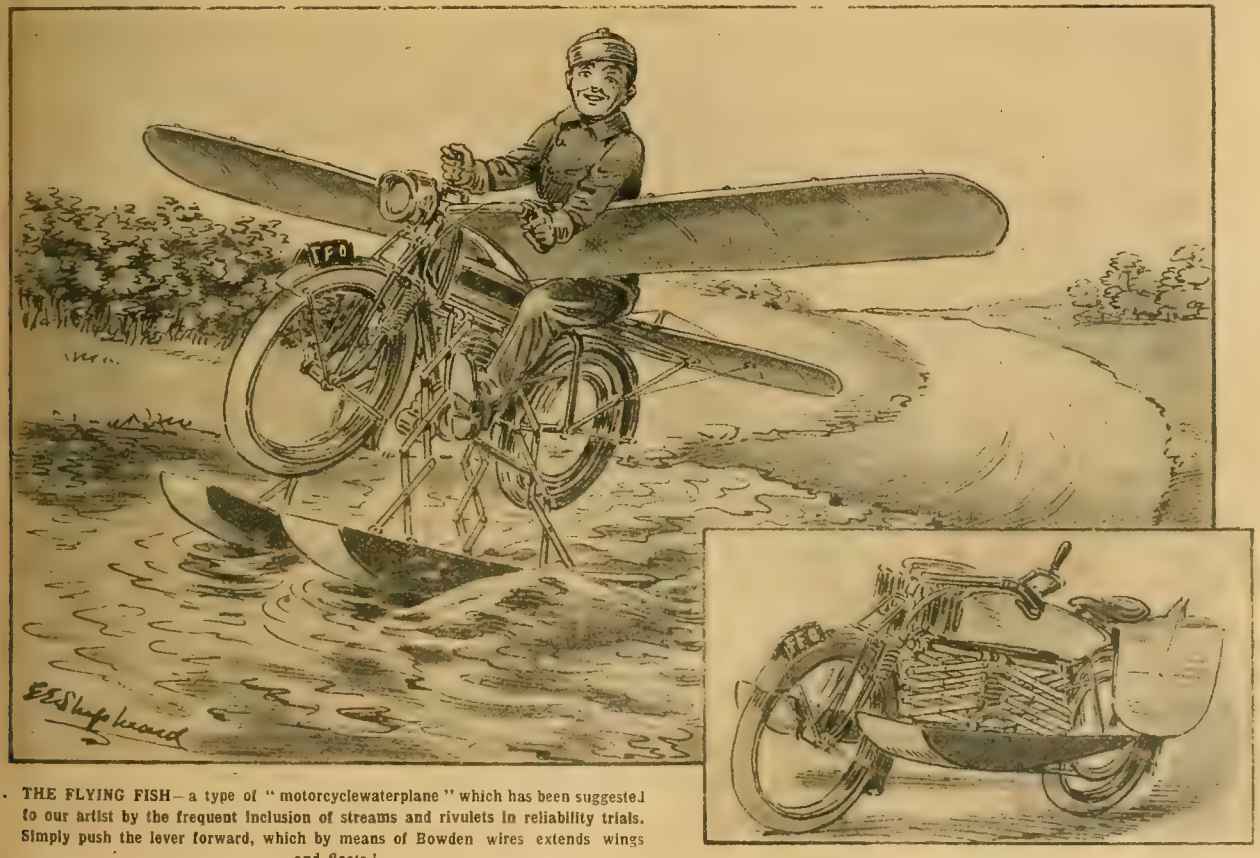
"R.A.D.H." (Stourbridge).—3 h.p. Enfield. Ease of starting, controllability, and efficiency of forced lubrication.

"A.C.H." (Burnham).—Benzole with 1912 2¾ h.p. Douglas, standard carburetter. Size of jet, and whether any alterations necessary to carburetter.

"W.M.J." (Coatbridge).—3¼ h.p. twin Lea-Francis, solo and with sidecar. Consumption, reliability, durability, and hill-climbing. Also dynamo lighting set.

"F.C.M." (Edinburgh).—Morgan Runabout. Wear, reliability, hill-climbing, consumption, maximum speed, ease of cornering. General comparison with sidecar.

"C.J.H." (London).—8 h.p. Williamson, air and water cooled, solo and sidecar, lubrication, cooling of rear cylinder, flexibility and durability. Also durability of Lomax bands.

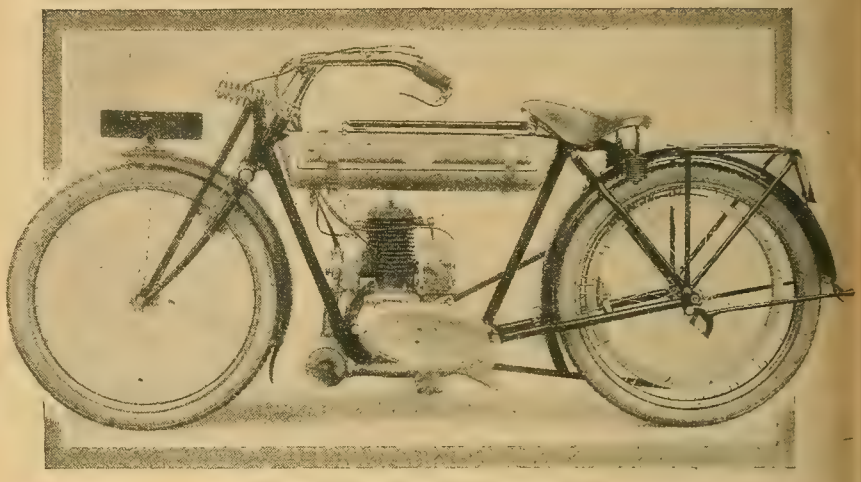


THE FLYING FISH—a type of "motorcyclewaterplane" which has been suggested to our artist by the frequent inclusion of streams and rivulets in reliability trials. Simply push the lever forward, which by means of Bowden wires extends wings and floats!

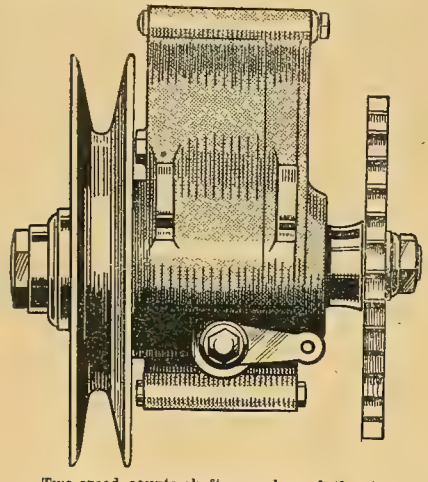
A Two-stroke Triumph.

Latest Addition to the Triumph 1914 Range. Companion to 4 h.p. Long-stroke Single-cylinder Mount.

LAST week, in dealing with the new 4 h.p. single-cylinder Triumph machines, we announced that the Triumph Co. would this week spring a surprise upon the motor cycling public, and that surprise is in the shape of a 2¼ h.p. two-stroke Triumph, which we now illustrate. This little machine is very attractive in appearance, and appears to be thoroughly workmanlike in its character. We tried it on the road, and, thanks to its two-speed counter-shaft gear, we found it possible to turn in an ordinary roadway, and start by sitting in the saddle and paddling along a yard or two. Nor is there any exertion in this mode of starting, seeing that the machine, fully equipped with petrol and oil, weighs only 125 lbs. It is well known that the Triumph Co. have been experimenting with different models all the year, and, as Mr. Schulte pointed out to us, what the Triumph designers have aimed at throughout their experiments was simplicity and reliability. They, too, desired to concentrate their attentions to one or two models at the most, as by so doing manufacturing costs were minimised.



The new 2¼ h.p. two-stroke two-speed Triumph.



Two-speed countershaft gear box of the two-stroke Triumph showing chain sprocket and belt pulley.

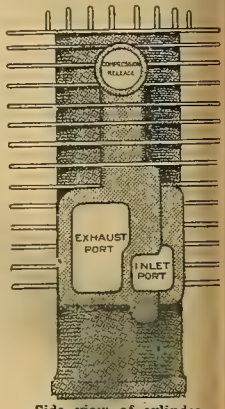
Some Mechanical Features.

The latest two-stroke Triumph has not been on the road long, and for that reason it is impossible to describe the engine in detail in this issue, as several patents are pending, but the brief specification is as follows: Two-speed dog clutch counter-shaft gear (no friction clutch provided), with handle-bar control throughout, including the gear. The engine, gear box, and magneto can be easily detached in one unit. At present 24in. wheels are fitted, but these may not be finally standardised. The height from saddle to the ground is 28½in.

A cylindrical tank is used on the new baby Triumph, which practically envelops the top tube, to which it is clipped by metal bands.

The transmission to the gear box is by enclosed chain; thereafter the drive is by belt on the right-hand side of the machine, the pulleys being of large size.

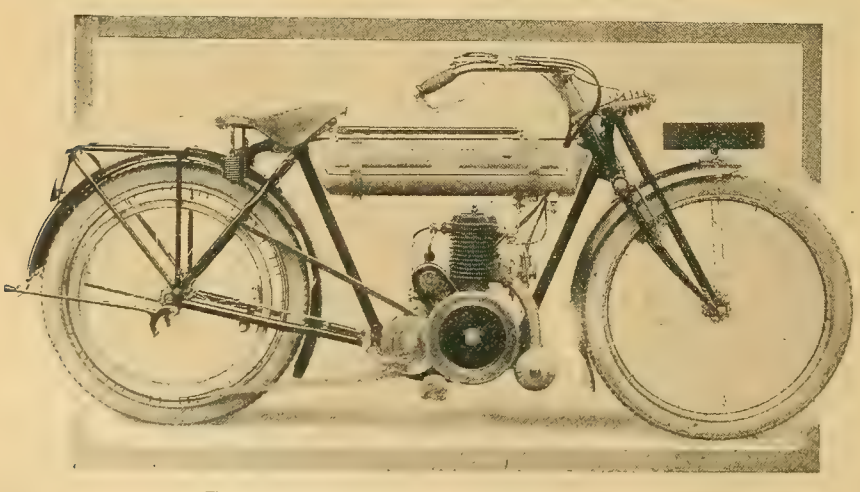
Naturally, one may expect novelty of design about any Triumph production, and these are most noticeable in the design of the engine. One of the most commendable points is the arrangement of the compression release valve, which, when in action, allows the gases to escape by a special passage to the exhaust port, thus obviating any escape of oil, which usually results in an oily cylinder, not to speak of sprayed overalls. The transfer port is a wide oblong passage. The exhaust and inlet ports are placed side by side in front of the engine; this arrangement not only enabling the burnt gases to warm the fresh charge, but, contrariwise, allowing the cool inrush of gas to lower the temperature of the cylinder at this point. The shape of the exhaust outlet is worthy of note, for the gases are shot down obliquely, like a coal shoot. It would hardly be possible for the exhaust to have a more easy flow. The piston is of the usual design, with two rings, and has the orthodox deflector on top.



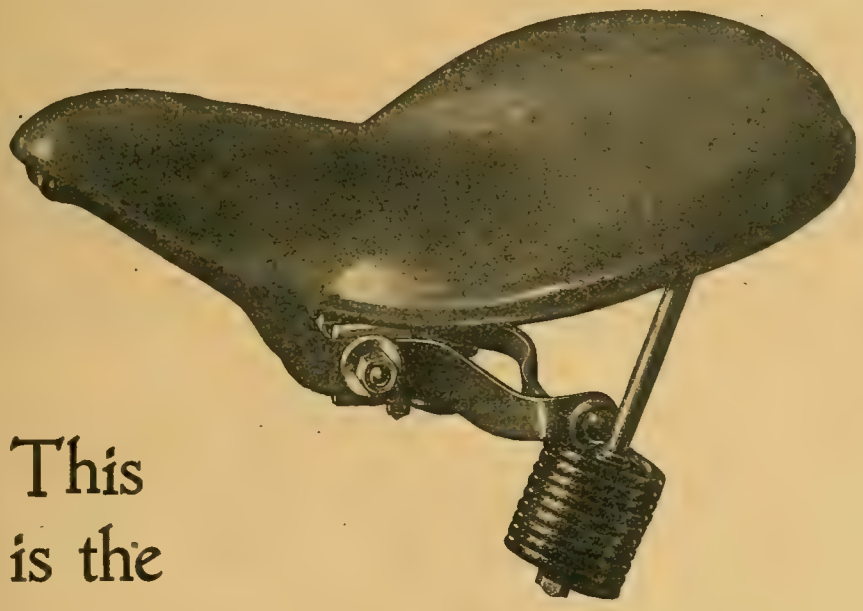
Side view of cylinder showing inlet and exhaust ports, and hole for compression release valve.

The Lubrication System.

One of the most interesting features of the machine is the lubrication system employed. There is no pump to the engine, but oil is carried in a forward compartment of the tank in the usual



Flywheel and belt side of the two-stroke Triumph for 1914.



This is the

BROOKS B170

the saddle with the Patent Compound Spring—

the saddle which, by reason of its commanding superiority in design, material, and workmanship, is universally recognized as best—the saddle that Experience always chooses and is, invariably, the ultimate selection of the novice, whatever he may tolerate at first—the saddle that is backed by the BROOKS reputation!

You may see it at

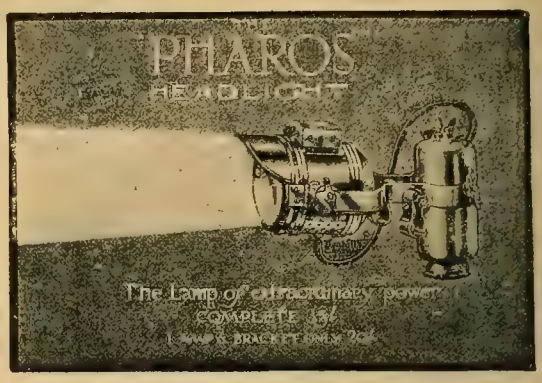
The 'Pharos' Headlight

The 'Pharos' motor cycle headlight is a lamp of exceptional power, and its unique method of construction places it at once in the forefront of anything yet manufactured. The lamp is made of stout gauge metal, heavily nickel-plated. Every joint and attachment is strongly riveted. The reflector is of the lens type and is reinforced by a strong lens which takes the place of the front glass, thus giving a long and powerful beam. The DUNHILL adjustable bracket enables the lamp to be always regulated to the point of maximum advantage.

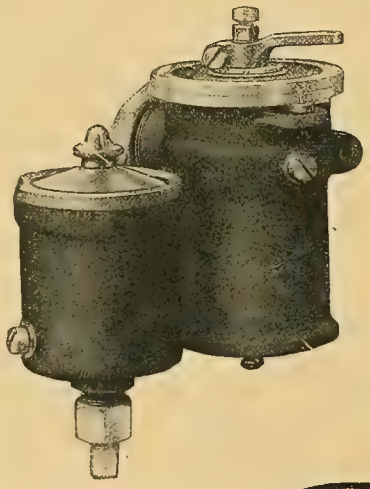


DUNHILL'S NEW M.C. OILSKINS

Undoubtedly the smartest and most serviceable oilskins on the market are the new Dunhill pattern here illustrated. These oilskins, which consist of a comfortable full jacket and trouser overalls with seat, are made in a new material of dark green colour, and are beautifully soft, flexible, and light in weight. Motor cyclists will find the new oilskins a valuable part of their equipment.

Price 33/6 complete

— Have you a copy of —
THE MOTOR CYCLE LIST?



The 'Lukin' (Patent) Carburetter

(Dunhill's Sole Agents).

The 'LUKIN' has the throttle on the atmospheric side, and NOT on the engine side, thus ensuring a correct proportion of petrol and air before they are mixed. The vacuum in the mixing chamber increases as the throttle is closed, providing a medium for the instant volatilization of the petrol when it is most needed. The 'LUKIN' Carburetter has no tuned jets, but it is tuned for every speed by means of a shaped valve. There is but one moving part. Needles, dash pots, tuned springs, and other delicate mechanisms are entirely dispensed with. Suitable for every make of Motor Cycle. It is a petrol saver, of unique value, and will save its own price in a month.

Price of Carburetter - - - 55/-

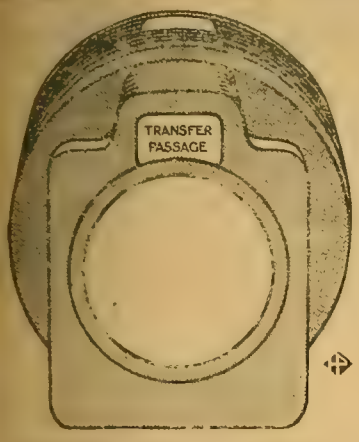
The Two-stroke Triumph.—

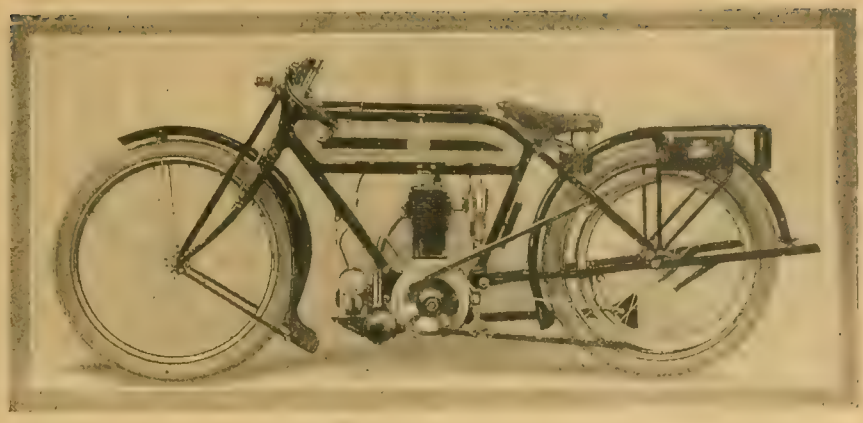
way. Embodied with the petrol filler cap is a small metal measure, which is used to draw off the oil from the front partition, and it is then mixed with the petrol to the extent of one-sixteenth of a gallon of oil to a gallon of petrol. The main advantage of this system is that the oil is drawn into the engine with the petrol, and therefore it is supplied in exact relation to the amount of petrol consumed, which is as it should be, for the wider the throttle is opened the more work the engine is doing; consequently the more oil it necessitates. The crank is thus revolving in an oil



Underside view of the cylinder of the 2¼ h.p. Triumph.

fog, and, contrary to what might be expected, during our trial of the machine we did not observe any suspicion of smoking, which may have been due to the large sized expansion chamber and the small flattened-end pipe which extends to a line with the gear box.

The magneto platform is cast in one with the crankcase, and the magneto can be slid freely along slots provided to take up chain stretch.



A sporting mount the 4 h.p. T.T. Triumph for 1914.

A point about the valveless Triumph is its ability to run at extremely slow speeds, and yet fire regularly every revolution. Many two stroke engines have a habit of four stroking immediately the speed is cut down, but the Triumph designers seem to have effectually overcome this trouble. Several carburetters have been tried, and the best results obtained from the Amac, which was fitted to the machine we rode.

An Absence of Vibration.

The Triumph is beautifully balanced, and the riding position with the footrests in the middle of the machine is a perfectly natural one. Vibration in the handlebar is almost entirely absent. Messrs. Hathaway and Hulbert described it as the most comfortable machine they had ridden. The spring forks, brake work, and such like details, are similar to the 4 h.p. model.

The valveless Triumph is not a potterers' mount, although it is bound to appeal to that very large section. It is even recommended for serious touring. Whilst inspecting the machine Mr. Schulte whispered to us that his 1914 mount was to be a 4 h.p. model. "I must go up hills fast" he added with feeling and a twinkle in his eye "and keep up with the rest of them."

The 4 h.p. Single Cylinder.

The Triumph standard models will in future be rated at 4 h.p., the stroke having been lengthened to 97 mm., the bore of 85 mm. remaining the same. The capacity is therefore 550 c.c. During the year single cylinders of 550 and 600 c.c. capacity have been exhaustively tested by the Triumph Co., and it was unanimously agreed that the 550 c.c. was the ideal double purpose mount, i.e., for solo or sidecar work.

We outlined most of the improvements in our last issue, the alterations apart from the longer stroke, being in detail only. Decompressors will be fitted to all engines in future, and other alterations include; new clutch control, giving free engine, 19in. belt drums, ⅜in. seat pillar bolts suitable for use with sidecars and new pattern handlebar. The price remains the same as in 1913.

As regards competitions, the Triumph Co., will refrain from competing except in more important events, unless of course the class definition is altered. For the Tourist Trophy Race they will build up several 499 c.c. engines

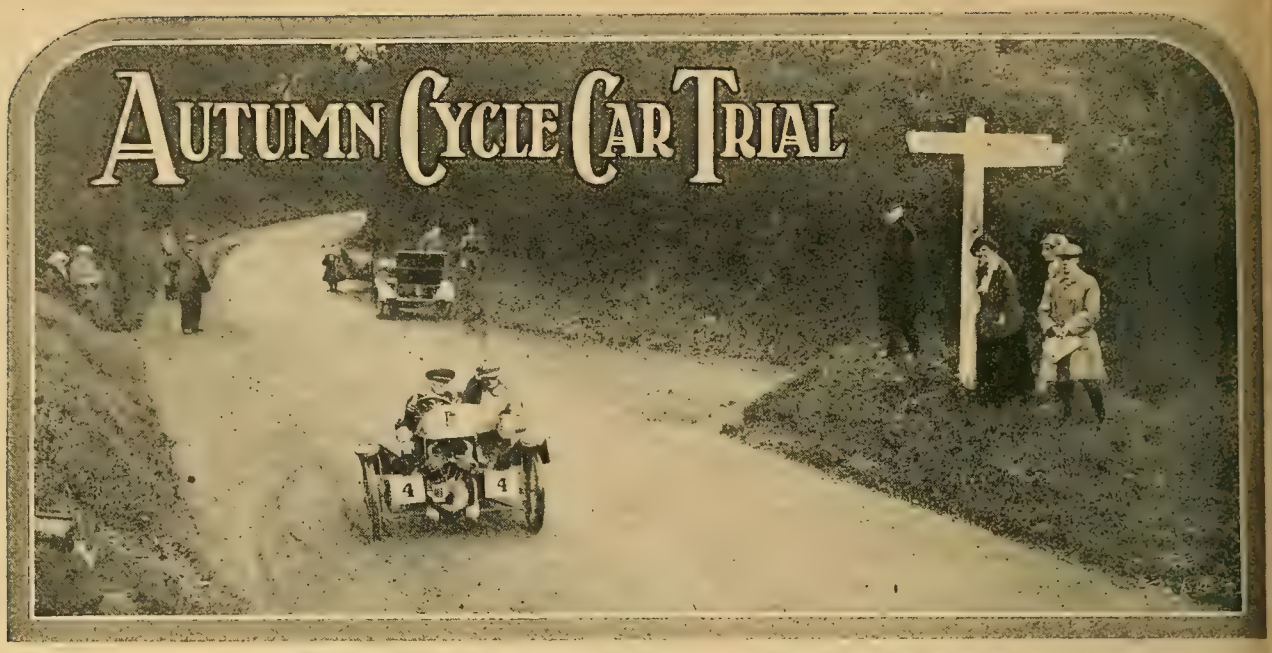
THE TWO TRIUMPHS FOR 1914.

Left, the 4 h.p. three-speeder. Right, the 2¼ h.p. two-speed two-stroke model. Both riders are of approximately the same height. Mr. Schulte, the managing director of the Triumph Co., is seated on the 4 h.p. model.

TYRE SIZES IN 1914.

Next year will undoubtedly see an increase in tyre dimensions, particularly on standard makes of machines with engines of 500 c.c. and over. In this connection it is interesting to note that the Dunlop Rubber Co., Ltd., Aston Cross, Birmingham, are introducing, in addition to the new motor cycle tyre illustrated in last issue, a 3in. motor cycle tyre to fit two and a half inch motor cycle rims, an innovation which will be acceptable to sidecar owners. The motor cycle tyre department of the Dunlop Rubber Co. is engaged at the present time in revising its existing range of patterns and bringing them up to the present exacting conditions of motor cycle work which, with the always growing popularity of sidecaring, are becoming daily more strenuous to tyre life. For sidecar use with a powerful engine the 650 × 65 mm. Dunlop grooved small car tyre is being used with conspicuous success.

AUTUMN CYCLE CAR TRIAL



AN AWKWARD CORNER. L. W. Spencer joining the main Portsmouth road near Hindhead.

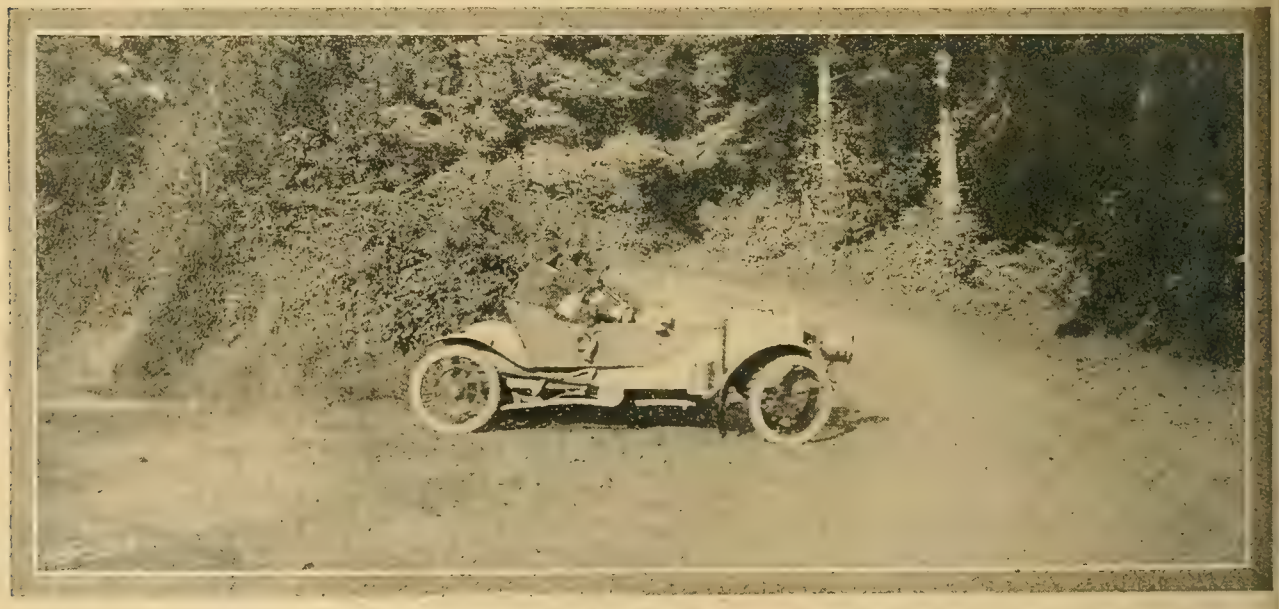
LAST week's cycle car trial of the Auto Cycle Union, extending to 108 miles, could hardly be termed a complete and searching test, but in that comparatively short distance many tricky hills were included, and the casualty list was, therefore, fairly lengthy. There were thirty-four entries in all, though three did not start. The most popular machines were A.C.'s and Morgans, represented by four each, G.W.K.'s, Humberettes, and G.N.'s each having a team of three.

Wednesday morning opened bright and fine, and an hour before the start many competitors were present busily putting finishing touches to their mounts, whilst officials doled out the petrol. We noticed that the Morgans were practically all of different type, some with side-by-side valves, others overhead, and two were water-cooled. Spencer's radiator had developed a slight leak, to which he applied much soap with good effect. The Ranger had bad luck in being prevented from starting owing to timing gear trouble. Martin's 10 h.p. Singer had been got into the cycle car definition by dispensing with the reverse gear and free use of a drill. Maitland turned up with his Beacon a minute or two to eight-o'clock, and after hurriedly filling up was despatched by Mr. Ebblewhite, only to take a wrong turning.

Early Adventures.

Wray Lane, leading to the top of Reigate, was the first ascent, and thus early three lost their non-stops, Parnacott's 499 c.c. F.N. motor bicycle engine, geared 38 to 1 on the low, having to give in, with the added handicap of brakes binding. Bryan (G.N.), too, unaccountably came to a standstill.

Thereafter undulating roads led through picturesque country and leafy glades in their autumn tints to Bore Hill, where it was arranged the stopping and starting test should be held. The gradient was between 1 in 10 and 12.



A. B. Phillips (8 h.p. Warne) negotiating the hairpin on Tanhurst Hill. He was one of the 19 to gain non-stop certificates.

CHARLES H. PUGH, Ltd., Whitworth Works, BIRMINGHAM.

Autumn Cycle Car Trial.—

J. T. Wood (h.p. G.W.K.) ascending Bowler's Green Hill.

S. Wright (Humberette) led, and made a very neat restart, as did Wood (G.W.K.) and Busby (Morgan), who, by the way, had a four-speed gear, *i.e.*, a separate two-speed gear box in addition to the usual Morgan gear. Keiller and Wilberforce (G.W.K.'s) did well; Godfrey (G.N.) was noisy, but restarted successfully. Thomas (friction-driven Pyramid) ran past Mr. Loughborough and his red flag, but restarted readily on a steeper gradient; A. B. Phillips (Warne) did very well; Spencer (Morgan) ran back a little, hesitated, and slipped his clutch to the summit. The Chater-Lea had its water boiling, but got away very nicely nevertheless. Pressland (Crouch) was good, also Cooper (Humberette). The Pyramid, driven by Payne, emitted a grating noise. Gibson (Morgan) did well, and Dew (Dew monocar) restarted with a grinding noise; his observer, on an 8 h.p. Chater-Lea sidecar, who pulled up behind and followed his man as if he were being towed, made as neat a restart as any cycle car. Maitland (Beacon), who was in trouble nearly all day, had to request his passenger to dismount, Bryan (G.N.) ran back and then got away well, whilst Browncott (A.C.) showed up splendidly. Adamson, on the low-built four-wheeler bearing his name, unfortunately put two gears in at once and caused some damage thereby

A few miles further the sharp rise on Tanhurst caused the competitors some anxiety, as well as the hairpin which followed. Pressland (Crouch) came to a standstill, also Maitland and Bryan again stopped. At the hairpin McMinnies seemed to misjudge the corner on his Grand Prix Morgan, for he ran wide on the grass, and though he tried to regain the road, his engine stopped with a grunt. He complained that he saw no arrow. Then followed a rough descent over stony surfaces. We passed Godfrey (G.N.) repairing a puncture, and later Portwine (A.C.) crawling along with his observer standing on the running board peering below deck, the floorboard being up and the tool box open. Portwine managed to keep going, so this was quite a sporting investigation into a strange noise.

More Hills.

After Godalming the ascent of Charterhouse Hill was encountered, and here the judges, Messrs. E. P. Greenhill and Glynn Rowden, were stationed. Most did very well, once a group of half-a-dozen appearing together, and the drivers naturally had little spurts among themselves, the Wilton in one case showing up well. Bradley, whose Duo won the palm for being the noisest in the trial, stopped on the bend owing to insufficient lock, and, after reversing, got away again. He baulked Panling's Swift, but the latter had no difficulty in restarting on the gradient. Gibson had meanwhile been delayed by a puncture. Passing through Milford, Bowler's Green Hill was climbed, and here those who had been showing up well on previous test hills again reproduced their good form. A lightning ascent was made by Martin on the Singer; Dew and McMinnies also went up well, too fast in fact for their observers, who lagged behind considerably. Higgs (G.N.) made an easy climb, also Pressland (Crouch). Spencer stopped for an unknown cause (presumably an air lock), for his engine restarted immediately. After the hairpin leading to Hindhead he was pulled up again with a puncture.

SCENES ON HASTE HILL.

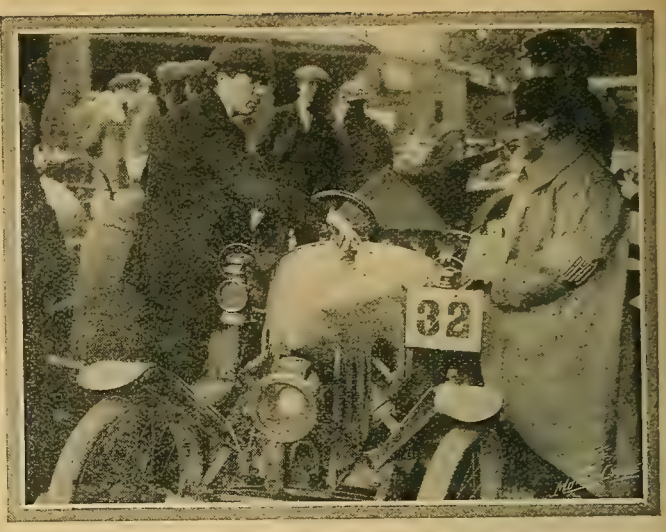
(1) C. F. Halsall (10 h.p. Wilton) rounding the corner. (2) J. Chater-Lea (8 h.p. Chater-Lea) nearing the summit.

Autumn Cycle Car Trial.—

Lunch was taken at the Royal Huts Hotel, for which 1½ hours were allowed. Petrol was checked into the tanks again. The afternoon course led up Haste Hill to Fernhurst. Haste Hill was no test for the majority, many going up on middle gear—indeed, both Martin (Singer) and S. Wright (Humberette) assured us that they had no occasion for their lowest ratios on any of the hills. Several simply played with the gradient, but the way they dashed round blind corners without slowing suggested an acquaintance with the hills. Portwine (A.C.) stopped with what he imagined was plug trouble, but eventually retired. Back to Hindhead, *viâ* Liphook, the route home led through Seale, Guildford, and Effingham. And then, as if to render the test more complete, the rain obligingly came down, beating on to the drivers and passengers of hoodless machines like hailstones. Soon the roads were muddy and the efficiency or otherwise (mostly otherwise unfortunate to relate) of the mudguards was demonstrated. The A.C.'s, G.W.K.'s, two of the Humberettes and Higgs' G.N. we singled out at the finish for special cleanliness. Quite the worst of the three hairpin bends came after Leatherhead, known as Headley corner, Keiller fouling his running board on the inside, and Panling being hindered once again.

The Willing Petrol Measurers.

At the finish the machines were ranged up in line in a by-street, and subsequently Dr. Low and his assistants for the third time checked the petrol consumption by filling the tanks up and measuring the amount used, which is a good, rough and ready method, but such details as the ground not being level and a couple of men standing on one side of the car were ignored. Just why the competitors were allowed to replenish at Hindhead we cannot explain—surely a hundred mile run should be possible without replenishments. Anyway, it enabled the officials to show their energy by checking the petrol into the tanks three times, and they seemed to like the job, judging by the time they took. Bradley's Duo finished on one belt, the other having disappeared during the morning, but he couldn't very well stop to pick it up. The Wilton, we were told, never fired on more than three cylinders at a time, but one could hardly credit it from the way it climbed the hills. We were, indeed, pleased to note that the lighter type vehicles were in no way overshadowed by the larger vehicles. The two A.C. Sociables, for instance, both ran faultlessly throughout; the Morgans were unlucky with tyres. The Pyramid—of which there were two examples, both of which made non-stops—is a comparatively



Dr. A. M. Low filling up the tank of H. R. Godfrey's G.N.

unknown cycle car. It is propelled by an 8 h.p. J.A.P. engine through a four-speed friction gear and a belt on either side. The friction gear is notable for the fact that the outer edges of the disc are bevel shaped.

The trial altogether was a great success; it certainly might have been a little more severe and longer, but that will come in time. Personally, we always think that a single day trial should be at least as bad as any one day in a six days event, but in this case it was fifty per cent. less severe. One or two drivers of cycle cars of proved reliability thought it a picnic, but that was going too far.

The complete results are given overleaf

J. T. Wood was one who looked upon the trial as no real test for his G.W.K. He started from home at 5 a.m., and covered fifty miles before the start, returning after the trial.

One or two competitors were bespattered with mud when they finished. The mudguarding problem is almost as difficult on light low built cycle cars as on motor cycles.

Rex Mundy (8 h.p. Humberette), followed by H. C. Munday (5-6 h.p. A.C. Sociable), climbing the High Street, Guildford, in the rain. Both made non-stop runs.

Autumn Cycle Car Trial.—

S. Wright's Humberette covered 250 miles in getting to the scene of the trial and home again. After the official trial of 108 miles he started for Coventry, reaching there at 11.20 p.m., after a non-stop run throughout.

A very neat dynamo lighting set was fitted to Victor Wilberforce's G.W.K.

The consumption of the Beacon is somewhat remarkable when it is considered that it covered more miles than it is credited with, owing to going off the course at the start. It may be added that the Beacon cycle car was made in eight days, and was not completed until the morning of the event, which accounts for its late arrival at the start. There is some excuse therefore for its failure on the hills.

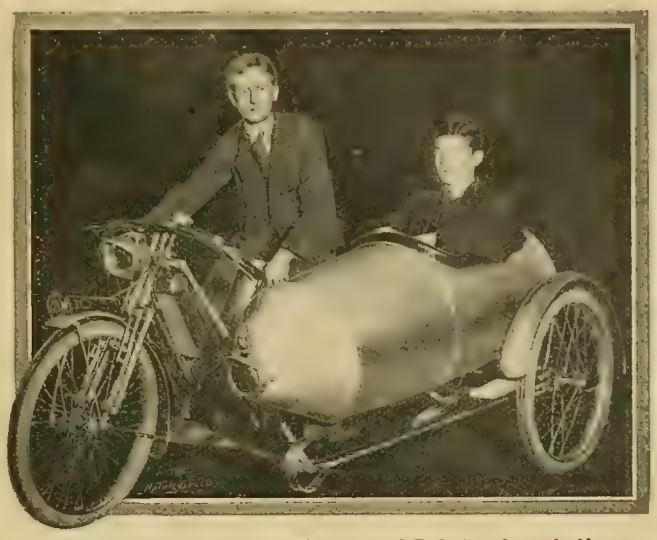
Tyre troubles were rather prevalent, especially considering that cycle cars are generally supposed to be less addicted to the puncture fiend than motor bicycles.

A number of competitors who were anxious to do well on consumption seized every opportunity of free-wheeling down hills, with the throttle dead closed.

The speed of Martin's stripped Singer on several hills approached 40 m.p.h. Professor Sharp, the observer on this car, looked none too comfortable as he shot past.

To our mind, Bradley and his Duo is just as much entitled to a non-stop certificate as McMinnies, as both did the same thing, viz., stopped on one of the bends. We witnessed both stops, and, as a matter of fact, the engine of the Duo was kept running, whereas the Morgan was stopped accidentally in the deep ruts at the roadside.

The Premier which was entered is a new pattern of much improved design with water-cooled V-type engine, three-speed gear box, and shaft drive to a worm driven axle. It was withdrawn a few days before the trial.



Norman Longfield and his unique silver plated T.T. Scott and novel sidecar constructed by himself. The entire outfit is plated, and, as may be imagined, it presents a most striking appearance. We are not told how it appears after a long run in the rain or how much metal polish is required to restore its pristine glitter.

TABLE SHOWING COMPLETE RESULTS AT A GLANCE, GEAR RATIOS AND ENGINE CAPACITIES.

Driver, H.P., and Machine.	Gear Ratios. Highest	Gear Ratios. Lowest	No. of Cyls.	Bore and Stroke.	Capacity.	Miles per Gall.	Remarks.
CLASS H.				mm.	c.c.		
J. Munday (6 A.C.)	4.5	11.5	1	95 × 102	723	52	Non-stop

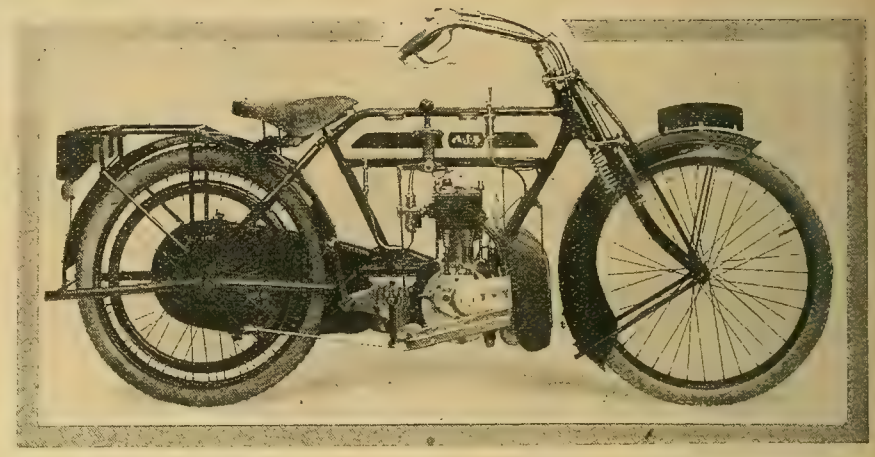
1914 MODELS.

ADVANCE DETAILS & ILLUSTRATIONS OF NEW DESIGNS.

A.J.S. Improvements: New Design Cylinder, more Efficient Lubrication System.

THE A.J.S. machines have been altered in a few details for 1914, but outwardly the design remains practically unchanged. On the 6 h.p. twin sidecar model, the detachable cylinder head has been done away with, but the swinging holding down bolts anchored to the crank case are retained. On the new cylinder casting the valve port and fins only hold the valve chamber to the cylinder, so that there is an air passage all round the valve chamber between the cylinder and the valves. The only reason for discarding the loose head is that inquisitive owners were always detaching it, whether it were required or not, with the result that when replacing it they seldom secured a compression-tight joint. Trials with the new cylinder have proved that it does not distort, and as it is more reliable from a perfect compression point of view the old style has been given up. The lubrication is by B. and L. spring fed drip from the oil tank, which is now in the centre of the petrol reservoir. The oil passes down a pipe which is branched as it approaches the crank case, and one lead goes to the near side pulley bearing, lubricating the crankshaft. For this purpose a groove is turned in the bush; the oil then passes along a hole in the crankshaft, and up another passage drilled in the web of the near side flywheel to the crank pin. After lubricating the crank pin the oil flows out of three oil ways drilled in the pin, which register with holes in the big end of the connecting rod, and so drops into the base. The other lead of the pipe goes direct to the crank case. Engine cradle plates are fitted at the rear of the crank case, as well as in front, thereby holding the engine more firmly in the frame.



Valve side of the 1914 pattern 2¾ h.p. A.J.S., showing kick-starter and change-speed gear lever.

The frame is strengthened by fitting a longer steering head, this being now eight inches long, fitted with larger ball races and lubricators to enable these bearings to be oiled—earlier models had no such provision. The down tube is 1⅜in. diameter, 10 gauge, and for eight inches below the socket lug a ⅜ vertical steel liner is fitted; the lug itself is carried lower and notched at the end to render this portion less subject to breakage from crystallisation. The chain stays are stronger than previously.

The tool case in rear of carrier is now superseded by two cases attached to the sides of the carrier and fitted in metal holders.

The rear mudguard is seven inches wide and the front guard is fitted with wide metal valances and a horizontal metal mud deflector.

The stop for the front brake on the front of the spring fork is lowered, so that this part will not foul a large lamp when it is carried low down on the steering stem. The guides for the front brake are now brazed to the fork tubes and a new front hub is fitted, this being both dust and mudproof.

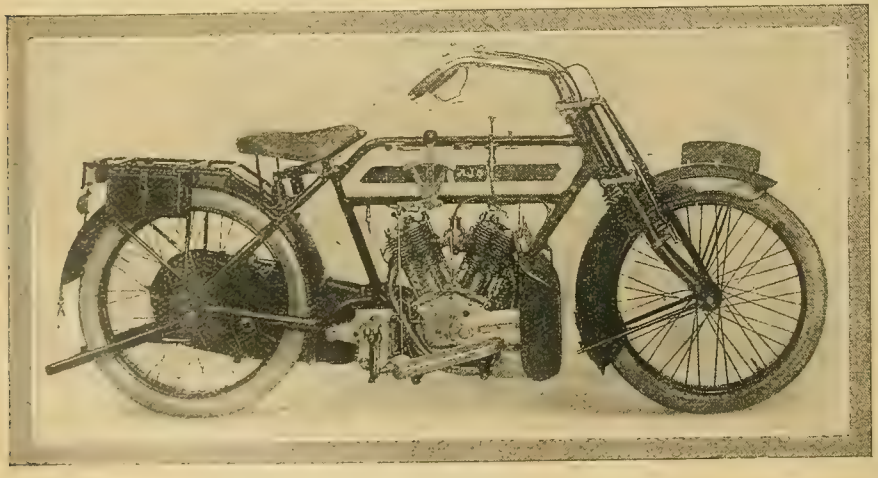
The Change-speed Gear.

In connection with the change-speed gear the following refinements are provided: the lever for changing gear is hinged on a bracket fastened to the bottom rail, the lever is of flat spring steel and works in a gate—it is sprung sideways to bring it out of the notches.

The kick-starter shaft is now carried in a bearing cast on an extension of the gear box, and sliding inspection windows are fitted to the chain cases for verifying chain adjustment. The footboard mats are much thicker, the mats being ⅝in. thick from the top of the pyramid pattern to the base, and the footboards are in a more comfortable position.

The sidecars will be exhibited in two models, both with the same chassis, which has an improved dropped frame, and is lighter than before. The bodies are boat shaped in wood and metal, and convenient cupboards are provided.

The improvements to the single-cylinder machine are that the one piece cylinder is fitted, the valves are enlarged to the size of those used on the twin, and the mudguarding is similar.



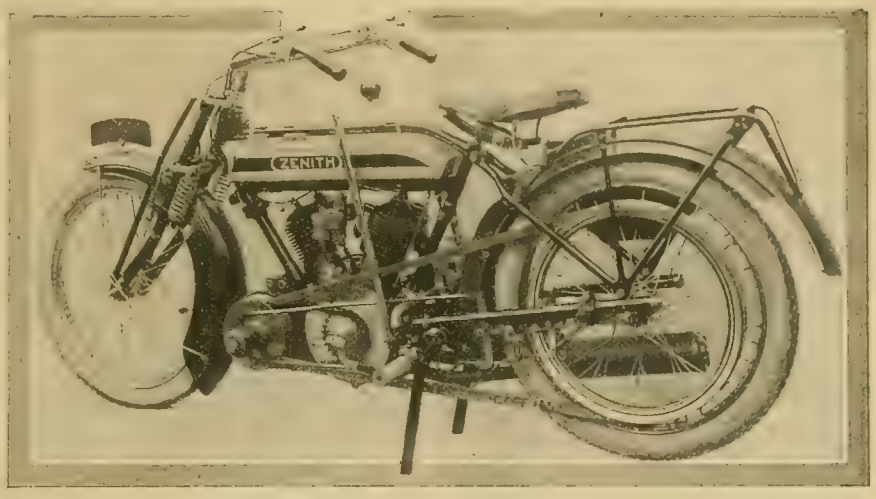
The latest model 6 h.p. three-speed A.J.S. sidecar machine.

The New 6 h.p. Zenith.

Counter-shaft Gear Providing Ratios between 4 and 11 to 1. A Long Belt Drive.

ON October 2nd we outlined the improvements to the new Zenith machines, and announced the policy of the firm for 1914. We are now able to reproduce illustrations of this popular motor cycle. The photograph of the complete machine gives an excellent idea of the general arrangement of the new counter-shaft drive and the length of belt employed, while the new and practical shape of the rear mudguard will also be observed. The latter was formerly of ample width, but it has now been improved by the addition of an extra wide lip designed to catch the mud thrown up by the belt rim. This lip extends almost from the end of the mudguard to the back stays, after which it is turned back, thus preventing wet from dripping on the belt. In the new models the rake of the front forks has been increased, while another improvement we may mention is a slight modification in the construction, the exact details of which we are not at liberty to mention, which permits the cylinders of the 8 h.p. model to be dismounted, while the rest of the engine remains *in situ*.

Zenith frames are built up with extraordinary care, and though we do not as a rule refer to factory details and tools, we cannot refrain from stating that Messrs. Zenith Motors, Ltd., possess a universally adjustable jig, used in the construction of frames, which is one of the most ingenious things we have ever seen.



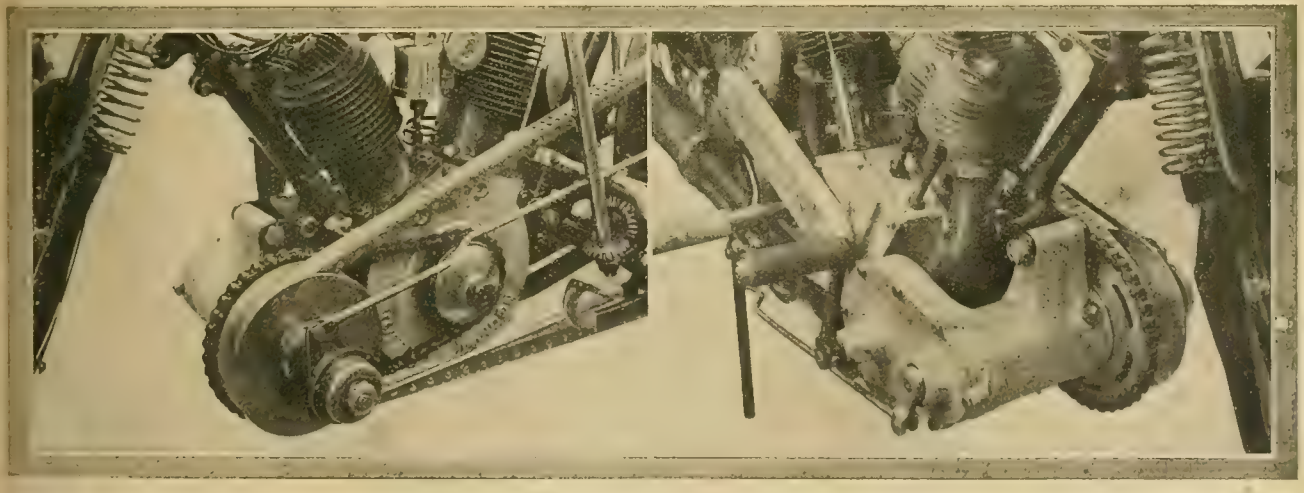
The latest model 3 h.p. Zenith, showing the improved rear mudguard and new system of transmission.

The Counter-shaft Gear.

The chief item of interest in the 1914 model is the new method of transmission by means of a chain to a counter-shaft placed forward of the crank case, and thence by belt to the rear wheel, which not only allows a larger belt pulley to be employed, but also affords a lengthy belt drive, both of which improvements place the belt under the best possible conditions. In the past Zenith machines have suffered for the want of a low ratio. Now, however, by the adoption of the counter-shaft drive ratios ranging from 4 to 1 to 11 to 1 may be obtained. It will be seen that with the exception of the chain the clutch and kick starter mechanism are entirely enclosed, but to protect the chain and belt still further an extra guard is being fitted.

Yet another excellent feature of the new system of transmission is that it may be fitted to both the 1912 and 1913 models. Inside the aluminium case is an outer shell running on ball bearings, to which the chain sprocket is attached. Inside it are two feathers which fit into grooves on a phosphor bronze piece, the inside of which is cone shaped, and forms the female portion of the clutch. The male cone, which is of steel, slides on a square shaft, at one end of which the belt pulley is fixed. The main clutch spring abuts against the thickest end of the steel cone, while against the thin end is a light spring pressing against a star piece, designed so that its arms drop into corresponding notches on a cap screwed on to and running solid with the outer shell, while behind it is a ball thrust. The object of this device is that on the slightest slip in the clutch being experienced the arms of the star piece drop into the notches, and both portions of the clutch are positively engaged. The clutch is put into action by means of a pedal just visible in the accompanying illustration behind the kick starter. The actual operation of declutching is brought into play by means of a quick pitch screw. The whole device reflects the greatest credit on the ingenuity of Mr. F. W. Barnes, who has brought the Zenith to the high state of perfection it has now attained.

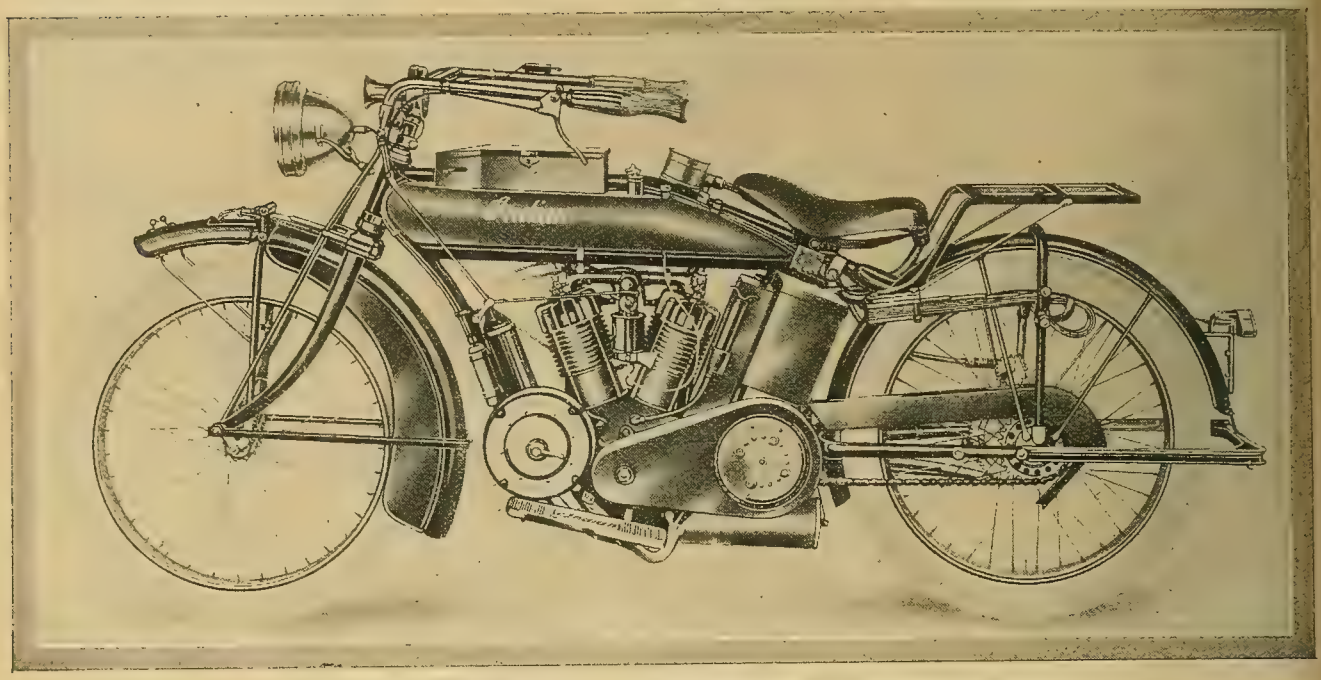
There will be three Zenith twins in 1914, the 3½, 6, and 8 h.p.



The 1914 model 6 h.p. Zenith has a counter-shaft Gradua gear in front of the engine. The drive from the engine is by chain and thence to the rear wheel by belt. The kick-starter is seen in the right hand illustration.

Indian Innovations for 1914.

Fully Equipped Machines; Electric Starting and Lighting Plant.



The 1914 model 7 h.p. Indian with electric self-starter and electric lighting outfit, including a rear lamp.

THE innovations introduced by the Hendee Co. for next year are, to say the least, startling in their novelty.

Four models will be produced, three of which—the Hendee Special, the twin standard model, and the road racing machine—will have the 7 h.p. engine; the other will be fitted with the 3½ single-cylinder power unit. Both these engines are already well known, so we can pass on at once to the 1914 improvements.

Every machine will be sent out fully equipped with everything that is necessary for the road; all will have Corbin-Brown rear-driven speedometers and two-speed gears. These gears have been strengthened and improved; a sector plate with adjustable notches, heavier control rods, and a declutching lever with a continuous plate to fit a foot of any size, have been adopted.

The road racing model will be provided with speedometer only, as speed work, it is pointed out, is carried on only in daylight, and consequently a lighting outfit will not be required.

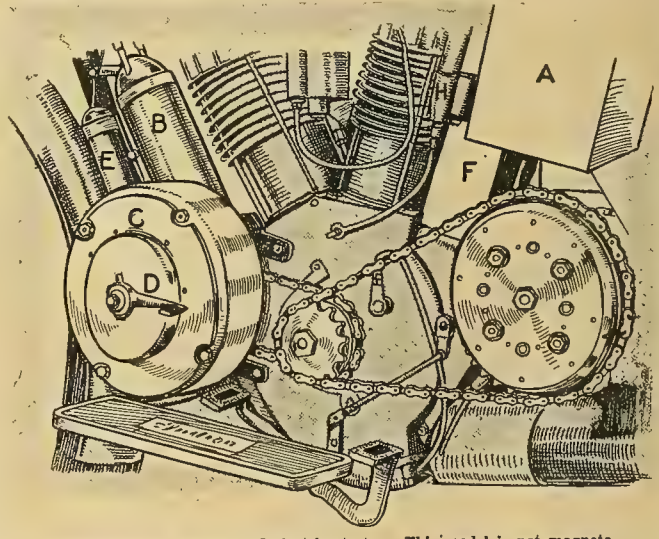
Complete Electrical Equipment.

The standard models, both 7 and 3½ h.p., will be fitted up with a complete electrical installation consisting of head light, said to be capable of throwing a powerful beam five hundred feet, rear light, showing a red light to the rear and a white light on the number plate, as in car practice—this is interesting, in view of the recent decision of the Divisional Court and the possible developments therefrom—and an electric horn. Two storage batteries are supplied, so that one may be charged while the other is in use. The carrier is now arranged to get the benefit of the rear springing; the kick-starter has been improved, and all models will carry front wheel stands. Indian machines are already noted for their silence and the ease with which they can be controlled—thanks, partly, to the pilot jet which is incorporated in the carburetter.

Electric Starting Device.

For the greatest novelty, however, we must turn to the Hendee Special, which is not only equipped with the lighting plant already described, but also boasts an electric starter, which works as follows:

The motor dynamo, of the multi-polar type, having four poles and four sets of brushes, is fitted in a weather-proof casting just in front of the engine—the place usually occupied by the magneto. As a motor it develops approximately 1½ h.p. As a generator it begins to charge the accumulators, which are fixed directly over the gear box, at 12 m.p.h. on high gear and 8 m.p.h. on low. The charging of the accumulators is regulated by a magnetic regulator attached to the dynamo. The entire system is fully protected by means of a magnetic cut-out.



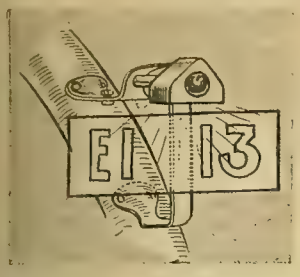
Indian lighting dynamo and electric starter. This model is not magneto ignited.

A. Battery case containing unspillable accumulators. B. Induction coil.
C. Electric starter. D. Dynamo starting pedal. E. Automatic cut-out switch or dynamo governor. F. Oil reservoir. H. Hand oil pump.

The starter has a high over-load capacity, and immediately the engine begins firing the starter automatically becomes a generator, and charges the batteries. The generator is always running while the engine is firing, but automatically cuts and charges the batteries become fully charged.

For starting, the motor, which is geared approximately two to one on the main shaft, takes the current from the accumulators, and when the engine is cold will start it firing in a few seconds. When the engine is warm it will commence firing almost the instant it

is started. Should the motor cycle be laid aside for a period, there will, it is said, always be enough current in the accumulators to furnish regular ignition, and the machine can be started by pushing off. As soon as the engine starts running the accumulators are quickly recharged by the dynamo. The whole system is exceedingly simple, and is one which has been used successfully on motor cars for some years past.



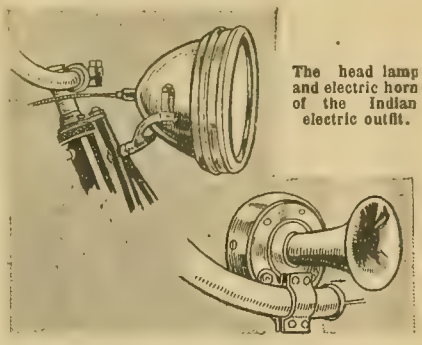
Rear light of the new Indian, which shows a red light rearwards and also illuminates the number-plate.

Minor Improvements and Prices.

We have been aware for some time, as our readers know, that electric lighting by means of a dynamo must come into use, and we congratulate the Hendee Co. on being the first to fit this desirable feature as standard, and also on going farther and providing an electrical starter.

With reference to the frames, the fore and aft springing, by means of laminated leaf springs, has been retained, and for sidecar work a light reinforcement in the lower down tube has been added, which prevents the frame from twisting or being thrown out of alignment.

The prices are: Hendee Special £77, Standard 7 h.p. twin £70, Standard 3½ h.p. £60, in every case complete.



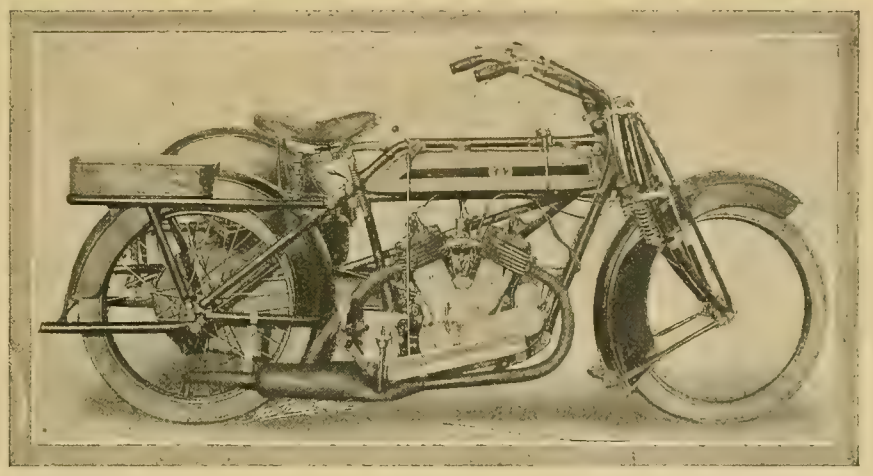
The head lamp and electric horn of the Indian electric outfit.

New Three-speed Twin-cylinder Rex.

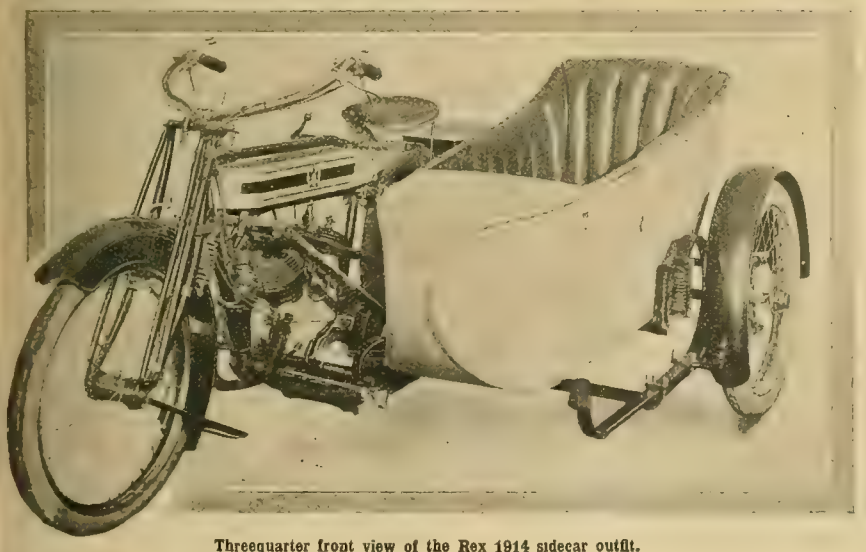
Chain or Belt Drive; A Larger Engine of Improved Design.

CONSIDERABLE alterations have taken place in the twin Rex engines for the 1914 season, and the new features are carried out on somewhat unusual lines. The cylinders project deeply into the base chamber and are surrounded by an oiltight pocket formed by the crank chamber casting. Oil is fed directly into this space and passes directly on to the pistons through ports in the cylinders; thus both front and rear cylinders are equally well lubricated. The dimensions of the engine are 80 × 95 mm., 952 c.c., and the cylinders are each held down by two long bolts to the head only. The crank case design is neat and clean. The timing case is circular and the tappet guides are mounted in flat cases, which have detachable extensions covering the valve gear. Roller bearings are fitted to the big ends, and the usual Rex eccentric rim flywheels are retained. The magneto has been placed between the front cylinder and the down tube and is chain-driven.

The drive is by chain to a three-speed sliding gear box carried in the counter-shaft through a cork insert clutch. The final drive is also by chain and the kick starter and transmission are totally enclosed.



Valve side of the 6 h.p. 1914 chain driven Rex showing valve-covers, new-change speed gear in the counter-shaft, tool box on the carrier, and large expansion chamber.



Threequarter front view of the Rex 1914 sidecar outfit.

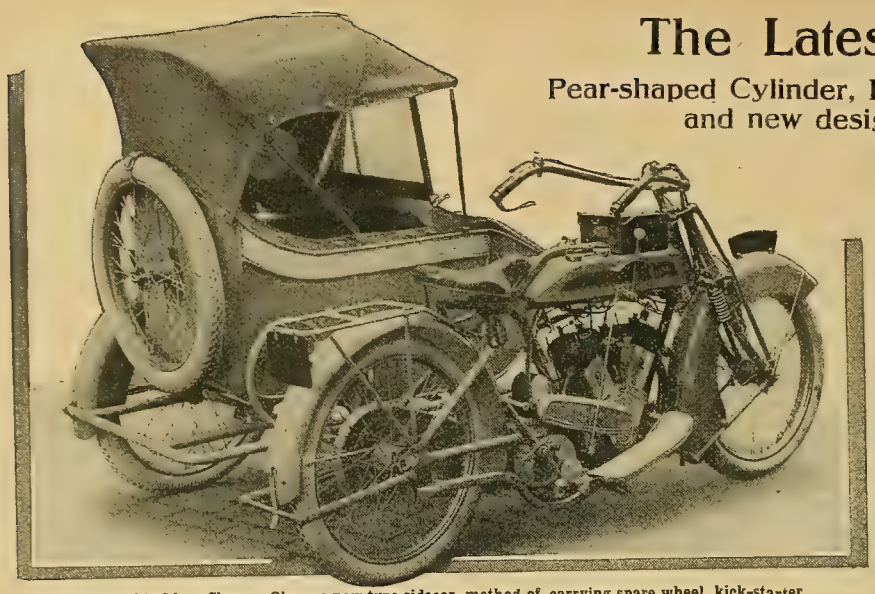
Transmission Details.

Neat rubber-covered footboards are fitted. The new silencer is of large dimensions and has a gradually tapering tail pipe extending to the rear spindle. The frame design remains practically unaltered except for the carrier, which is rather lower than usual and has fixed to it a large metal box lined with felt, which provides ample accommodation for tools and spares and has a specially strengthened lid to carry luggage or heavy weights. The front hubs are now fitted with larger bearings and waterproof washers. The tank retains the distinctive Rex features, and has hinged glass-topped filters and sight feed drip lubrication.

We also inspected a belt-driven model which, except for the transmission, is identical. The Rex-Roc gear is used, and it is fitted with a simple kick or hand starter, which works on the ratchet principle.

The Latest Clyno.

Pear-shaped Cylinder, Improved Lubrication, and new design Sidecar.



The 1914 5-6 h.p. Clyno. Observe new type sidecar, method of carrying spare wheel, kick-starter, change speed gear, and footboard.

THE Clyno Engineering Co. have obtained a reputation second to none for their sidecar models, and next year the added refinements will keep this machine in the forefront for passenger work.

The main alterations in the engine, which is a 50° twin-cylinder, 76 mm. by 82 mm. bore and stroke, giving a capacity of 744 c.c., is the casting of the cylinders pear-shaped for next year's machines, for the purpose of more perfect radiation. It also has the advantage of giving a very neat-looking cylinder. An alteration has been made in the design of the crank case, whereby an equal supply of oil is assured to both cylinders. The neat valve stem covers are retained. A new pattern of front chain case has been adopted, and the foot brake has been improved in detail.

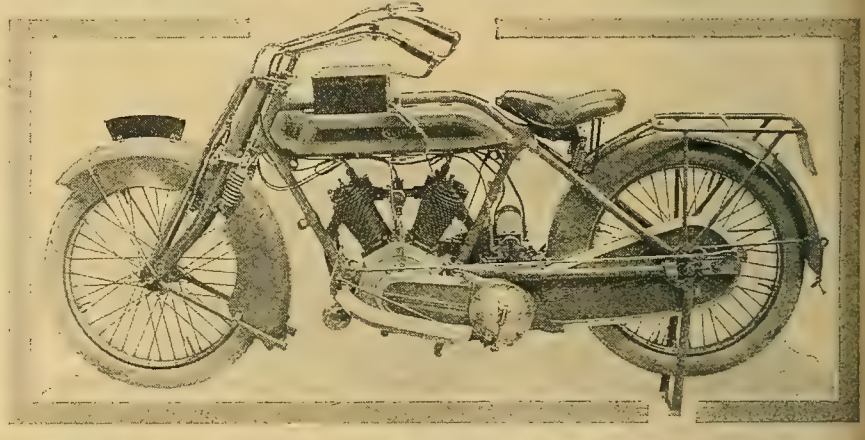
An excellent feature is the provision of large fuel tanks; two and a quarter gallons of petrol can now be carried.

The Detachable Wheel.

Of course, the detachable wheels to both machine and sidecar are retained, and probably no feature has gained such universal popularity among riders. It is literally but a moment's job to take out and replace any of the three wheels, the spare being carried on a dummy hub on the sidecar rear panel. A slight reduction has been made in the total weight of the machine. A minor improvement is the use of inverted levers for front brake and exhaust lifter control. The three-speed car type counter-shaft gear box is a really fine piece of work, with its six-splined mainshaft. The whole box is mounted with great rigidity, and the transmission is particularly sweet as a result. The ratios provided are 5, 9, and 15 to 1. On the top of the gear box the magneto is fitted, driven by an enclosed chain, easy adjustment being afforded by sliding the magneto.

The New Sidecar.

Comfort, combined with a handsome appearance, is the keynote of the very fine sidecar for 1914. As already stated, the wheel is of the Clyno patent detachable type, and the spare is neatly mounted on the rear panel on a dummy hub, and supported by a bracket. A complete measure of protection is provided for the passenger by a really well fitted hood with side curtains and an adjustable screen. When all is "storm rigged," the occupant is almost as well protected as if in a car. An attractive panel of canework runs along the sides of the coachwork. The design of the sidecar body is a new one for the Clyno firm, and is, we think, an improvement as regards appearance on the 1913 models. Altogether, these passenger outfits are among the finest to be met with on the road, and their wonderfully successful appearances in the big trials prove them to be as reliable as they are handsome.



Showing the clean lines of the 1914 Clyno. It will be noticed that the radiating fins extend the whole length of the cylinder.

The 2½ h.p. Puch Motor Cycle.

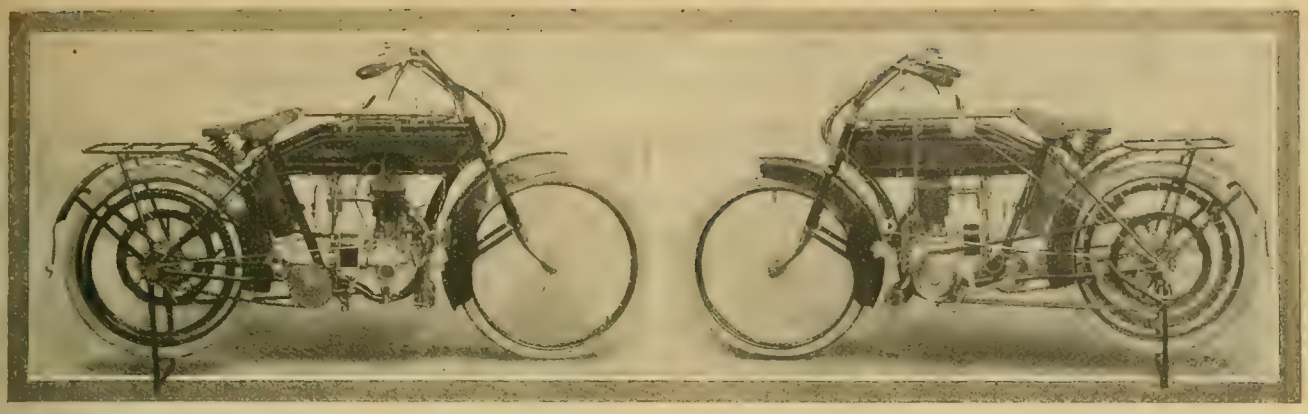
A 2½ h.p. single-cylinder model of this attractive little machine had just been uncrated when we examined it recently. The machine was finished in green.

It was fitted with an Armstrong three-speed hub, a Bosch magneto, and a B. and B. variable jet carburetter. The device by which the pulley is geared down is retained, also the belt tensioning device, which, on the model we examined, was operated by a handle attached to the top tube, similar to the N.S.U. two-speed gear. The petrol tank is fitted with a sump and filter. The toolbag is fitted under the saddle between the rear frame member and the back mudguard. There is no front wheel brake, but a brake lever attached to the handle-bar operates independently upon the brake rim. The magneto is driven by skew gear off the camshaft and is situated behind the engine. The spring forks are of simple design, having enclosed springs. There are inspection windows on the timing gear case and crank case.

Transmission is by belt. The pulley is approximately seven inches in diameter and the belt rim fourteen inches. The belt, of foreign manufacture, is of rubber with a leather back. Pedalling gear is fitted, and a spring stand operated by the heel of the rider. The back mudguard is hinged. Pirelli tyres are fitted.

REX-JAPS FOR 1914.

The Rex-Jap for 1914 has been greatly improved. In future this machine will be made throughout at the Aston Road Works of the Premier Motor Co., Ltd., and next year it will be entered in all the large competitions. The main improvements are enclosed chain drive, neat counter-shaft three-speed gear and kick-starter. The whole machine is exceedingly well finished and of most robust construction.



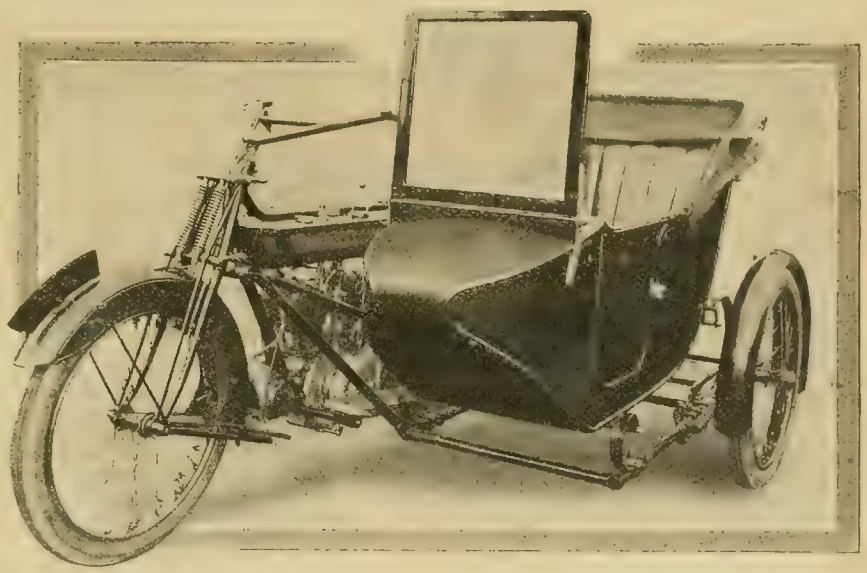
The latest model Puch single-cylinder mount, which is fitted with Armstrong three-speed gear, under-geared drive, and Bowden controls.

Enfield Improvements for 1914.

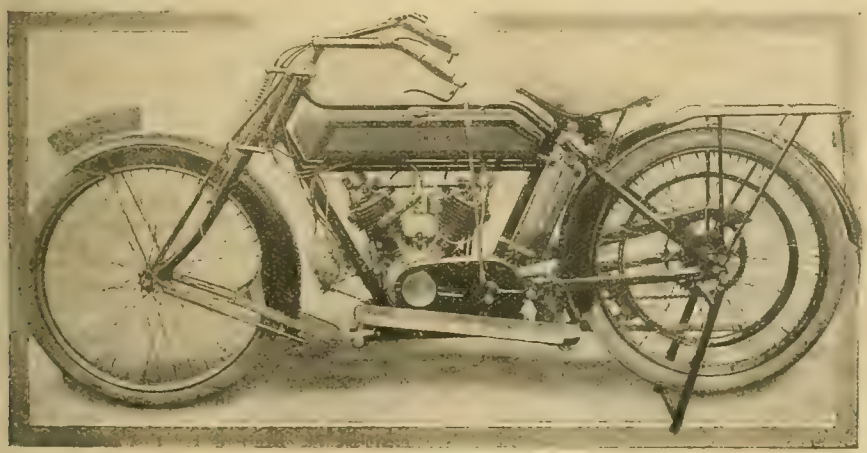
THE 6 h.p. sidecar model Enfield has been so successful, both in competition and in the hands of private owners during the past year, that the company have not considered it necessary to make any great changes.

The first point to attract attention is the substantial cast aluminium casing which now encloses the two engine chains and the selective clutch mechanism. The case is split horizontally and is rigidly attached to the frame so as to prevent rattles, and, at the same time, it leaves plenty of clearance inside so that the chains cannot hit. The handle starter chain passes through slots in a boss at the back of the case, and has been fitted with an improved starting clutch, while the handle itself, when out of action, is held in a neat spring clip in such a position as to be out of the way of the rider. The hand oil pump is fitted with a two-way tap, one lead being taken to the engine and the other to the gear, so that the latter may be lubricated from the saddle. Plating has been dispensed with wherever possible, and the all-black finish on the handle-bars and hubs looks smart and workmanlike.

650×65 Palmer cord cycle car tyres are fitted all round, and these, with the two springs, which will be a feature of the new spring forks, give somewhat increased comfort, added to which a very neat spring handle-bar may be obtained as an extra. XL'All saddles and Amac carburetters are to be standardised on this model, and probably the footboards will be sprung at the front end.



Enfield sidecar combination, with smart coachbuilt sidecar equipped with windscreen.



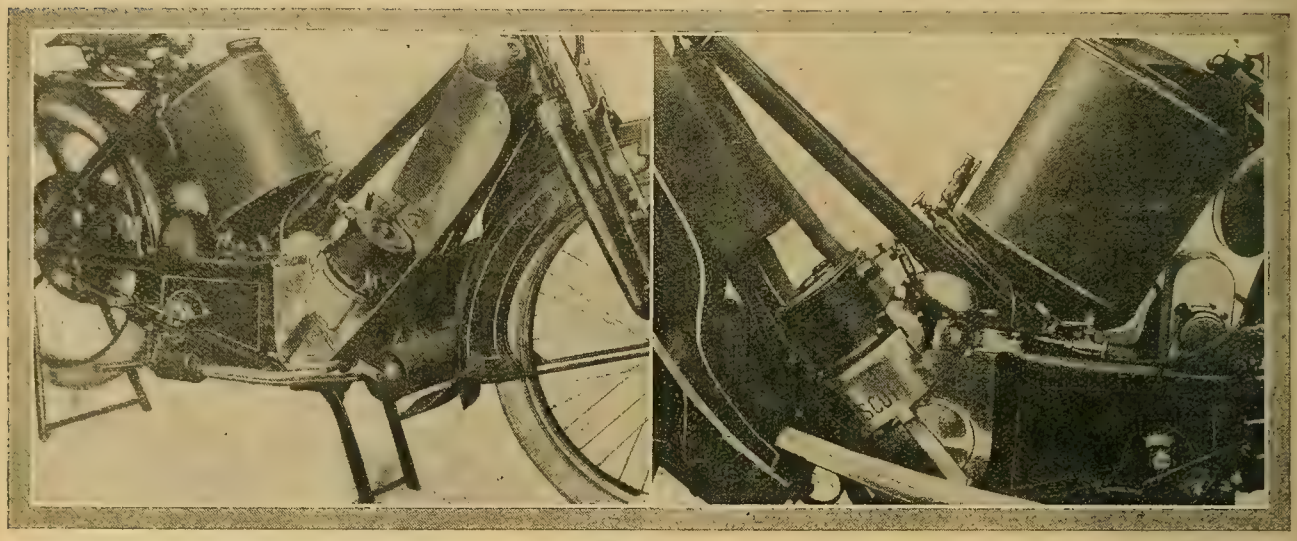
The latest design 3 h.p. two-speed Enfield.

Passengers are, of course, thoroughly well catered for in the large and comfortable sidecar fitted. Choice is made of either art cane sidecar body or coachbuilt body, and a special Colonial sidecar in art cane, giving exceptional clearance between the chassis and the ground, is a model which will doubtless appeal to overseas riders.

The little 3 h.p. model will, in future, have a chain-driven magneto placed in much the same position as before, and the kick starter has been changed over to the near side and now acts direct on the crankshaft. Other Enfield features remain the same. The usual smart green and black finish will remain the same, and the all-black finish will not be standard for the 3 h.p. model. It is not generally known that the Enfield Company have a private testing track, and it was interesting to watch two of the 6 h.p. models going through their paces, for, besides having a good turn of speed, they are capable of crawling round the track.

The New Two-stroke Scott.

Features: Drip-feed Lubrication; Increased Ground Clearance.



Power unit of the 1914 Scott, showing water-cooled cylinders, new sight feed lubricator and general arrangements.

THE general outline to the eye of the 1914 two-cylinder two-stroke Scott will be substantially the same as it has been this year, but beneath the surface there lies a really large amount of original and sound detail improvement. Not merely changes made for the sake of changing, but because those changes will undoubtedly make the 1914 Scott an even sounder and more reliable a mount than ever. It has never been the aim of the Scott designers to aim at quantity production, and no effort will be made next year to secure a record output from the works at Shipley, efforts being concentrated on making each machine despatched individually as perfect as can be. Needless to say, the general principles and lay-out, which has made the Scott so distinctive, will be fully retained.

Some New Mechanical Details.

The chief alteration will be the use of a drip feed lubricator, by means of which a more constant and better regulated supply of oil can be fed to the engine, and it will be found that the presence of this lubricator will greatly diminish the quantity of oil used. It may safely be asserted that the great majority of Scott riders over-lubricate their motors, and those of us who have had much to do with long-distance trials know that these machines can be, and are, driven by experts up hill and down dale day by day without showing any more smoke from the exhaust than a four-stroke motor does. Yet many and many a Scott is seen in the hands of the public smoking briskly about the country, and this new lubricator should materially assist some of these riders to keep down their oil bill, and at the same time avoid undue carbonisation of their engines. The small silencer near the cylinder has been raised further from the ground, as it was found that occasionally the too dashing cornerist hit it against the earth.

The small driving sprocket has now been so fitted that it is absolutely impossible for it to work loose, without in any way rendering its removal difficult.

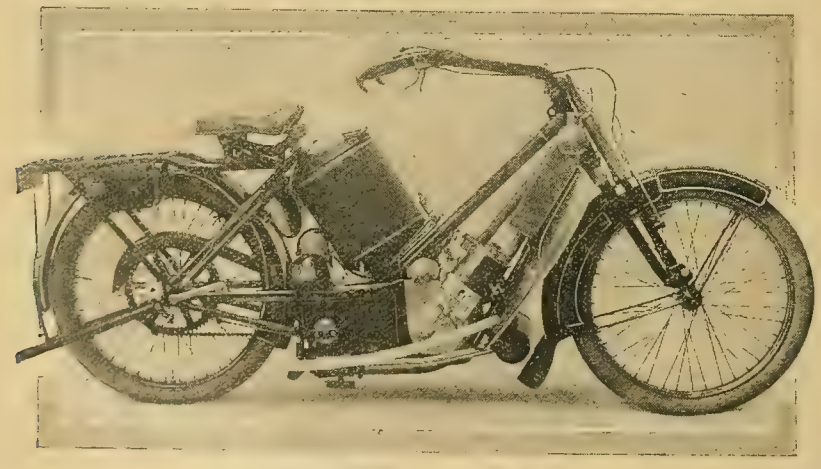
A large lubricator has been fitted to the gear box. In the former models removal of the gear shield was necessary to lubricate the gears, and many riders neglected to go to this trouble with sufficient frequency for the proper working of the change-speed mechanism. Now the laziest Scott rider can lubricate his gears as easily as he can oil his engine, even when a sidecar is attached.

The handle-bars are now covered by black celluloid: a move in the right direction towards an all-weather finish.

It is all these minor improvements that show the constant care exercised to keep the best class machines up-to-date.

Tests Before Delivery.

Every Scott engine is subjected to a bench test of 3½ hours' duration before it is sent out on the road in charge of a tester. Up to the present, if the machine came through both these tests satisfactorily it was considered ready for despatch to the customer, but in future the engine will be dismantled, examined, and all parts tested by gauges, and then reassembled before despatch. It should thus be quite impossible for a 1914 Scott to leave the work with even the slightest defect in its composition. Considerable reorganisation of the stores department has been effected in order to provide for immediate despatch of spares, if required, the idea being to make the Scott service as good as the Scott motor cycle.



Side view of the 8¾ h.p. 1914 model Scott.

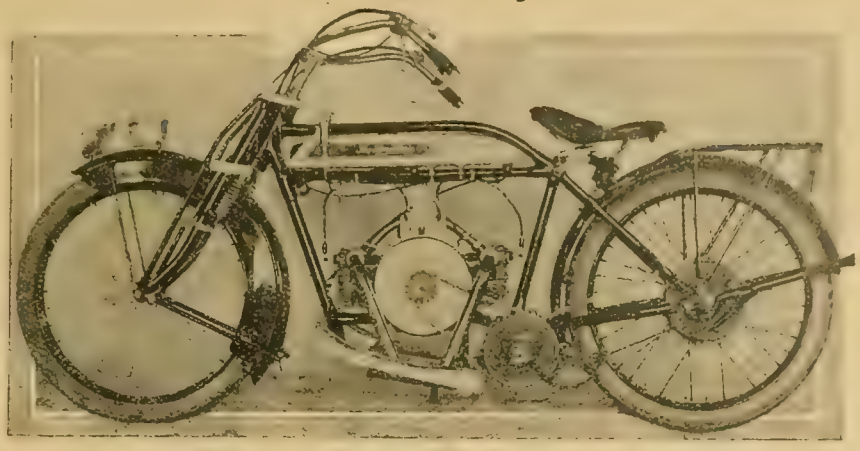
AN OVERSEAS NORTON.

A special colonial model Norton will be marketed for 1914, with a slightly higher frame, giving greater tank capacity, but at the same time low riding position is obtained by the dropping of the rear end of the top tube. The ground clearance will be 5in.

A 499 c.c. Horizontal Bradbury Twin.

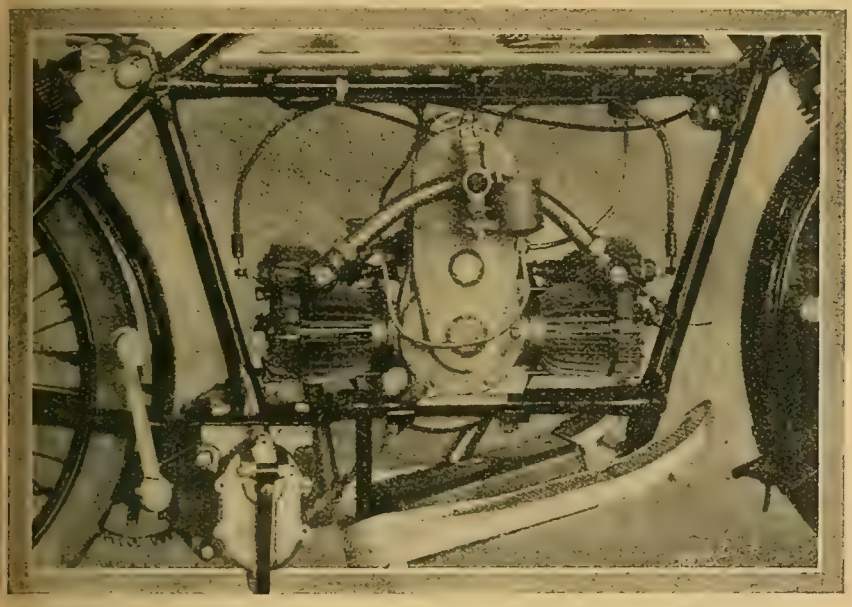
MESSRS. BRADBURY are introducing an entirely new model in the shape of a horizontally opposed twin, of which we are able to give a few particulars. The cylinders are fitted with detachable heads, which enable the cylindrical portion to be machined all over, thus ensuring an even distribution of metal, and the whole cylinder is plated to prevent rust. The crankshaft is made of high tensile steel, runs on ball bearings, and is of the three-throw type, which allows of excellent balance being obtained. The valves are side by side, and are operated by adjustable tappets. The transmission is by $\frac{5}{8}$in. × $\frac{1}{4}$in. chains, enclosed throughout.

The three-speed gear box is of the sliding dog type, provided with a kick starter and a large clutch with cork inserts, the latter being operated from the handle-bar. The gears are 4, 7, and 12 to 1 (solo), and 5, 8, and 14 to 1 for sidecar use.



The complete 3½ h.p. horizontal engined Bradbury from the flywheel side.

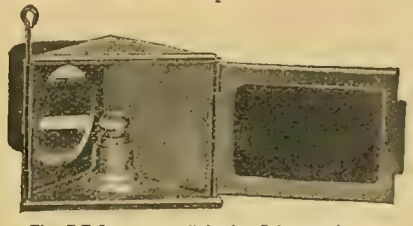
The tank is capable of holding 1¼ gallons of petrol and three pints of oil. 2$\frac{5}{8}$in. tyres are standard fittings; the rear brake is of the internal expanding type; wheelbase 54in.



Timing gear side of the new Bradbury horizontal twin, bore and stroke 68 × 68·75 m.m.

F.R.S. REAR LAMP.

Another addition to the rear lamps is the F.R.S., a neatly made lamp in the form of half a cube, divided diagonally. It is designed to be fitted to the rear number plate, and to illuminate the number, as well as throw a red light rearwards. The electric bulb takes four volts and half an ampère.

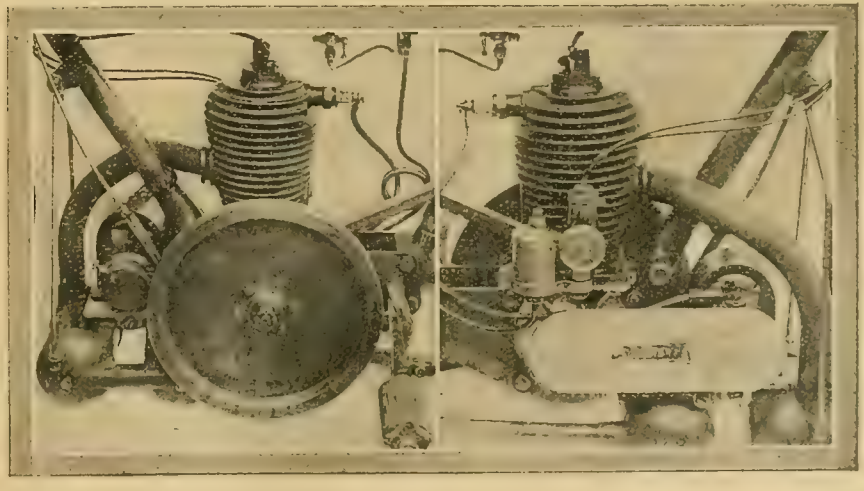


The F.R.S. rear red light for fixing to the rear of a motor cycle. At the side will be seen a plain glass for throwing a white light on to the number plate.

A VILLIERS TWO-STROKE.

A New Departure for 1914.

There have been many rumours current about a horizontal twin which was to emanate from the Villiers factory at Wolverhampton. This idea, however, has been given up, and a very neat little 2¼ h.p. single-cylinder two-stroke motor will be standardised in its place. The bore and stroke of the new engine are 70 mm., giving a capacity of 269 c.c. A roller bearing is fitted to the big end, and a large diameter outside flywheel employed. The primary compression is in the crank case, and the lubrication is centrifugal. When we saw the machine undergoing its road tests it was running particularly smoothly and silently, and it appears to produce plenty of power per size. Thanks to a large outside flywheel the engine is very flexible. It will, it is expected, appear at Olympia in a finished form.



Left and right side views of an entirely new model Villiers two-stroke engine.

TIME TO LIGHT LAMPS.

Nov.	6th	5.23 p.m.
,,	8th	5.20 ,,
,,	10th	5.17 ,,
,,	12th	5.13 ,,

Next Thursday!

The first of our three special Olympia Show Numbers. This issue, which will deal mainly with passenger machines of all types, will be considerably enlarged.

A Proposed New Club.

It is proposed to form a motor cycle club at Blackheath. Those interested should write Mr. A. J. Barnes, Senrah, Liskeard Gardens, Blackheath, for the date of the meeting, which it is intended to hold at the Swan Hotel, Old Charlton, S.E.

Brooklands.

The few weeks preceding the Show usually produce a crop of records, and already a number of riders are waiting a favourable opportunity to set up new figures. J. Cocker is at the track with a Singer sidecar, and seems fairly confident of annexing the hour record; there is the Rudge contingent too, out for the hour motor bicycle record; whilst among cycle cars, the Stellite has lately been put through its paces, possibly to provide figures for the Wolseley Company's guidance.

Choosing a Second-hand Mount.

The Motor Cycle advertisements of second-hand machines are now classified in alphabetical order, and the machines are clearly subdivided under the headings of the various different makes. The task of selecting a suitable second-hand motor bicycle or sidecar is now rendered a great deal easier, and, in view of the great increase in *The Motor Cycle* miscellaneous advertisements, the change is sure to be appreciated.

Rear Lighting.

The Chief Constable of Leeds is reported to have stated that the recent decision of the courts with regard to rear lights will be strictly enforced in that locality, unless the Local Government Board immediately issues an amending order. The Chief Constable thinks that a reasonable time has now been allowed in which to obtain the necessary lamps.

The Darlington Police are demanding names and addresses of all motor cyclists seen riding without rear red lights. A correspondent says that a somewhat amusing aspect of the case is that he was stopped on the 30th ult., and afterwards watched the same constable stop several other motor cyclists. At the same time a local car driver passed with his rear lamp extinguished, and was not interfered with. This is another proof of how difficult it is to do two things at once.

SPECIAL FEATURES:

MANY NEW MODELS.

A RACING OR TOURING CARBURETTER AT WILL.

THREE TRIALS DESCRIBED AND ILLUSTRATED.

A Show Attraction.

An attractive feature of the Sturmey-Archer exhibit at Olympia will be a huge revolving epicyclic gear, lit up by electric lamps, illustrating in a simple manner the epicyclic principle.

Villages and Roads in the United Kingdom.

At the A.A. and M.U. dinner it was mentioned that there are 45,000 villages in the United Kingdom, and 230,000 miles of roads. 20,000 miles of these are being watched over by A.A. scouts.

A Novel Match.

Mr. Rupert May, who is well-known as a rider of Triumph motor cycles, is also a keen golfer, and last week he indulged in a novel match with a fisherman named Mackinlay. The rules were that Mr. May should drive his golf ball by means of the orthodox clubs, and Mr. Mackinlay should cast a weight of 2½ ozs. by means of a fishing rod. Quite a sporting match ensued, but in the end Mr. May proved a fairly easy winner with 87 strokes against 102 casts. The match took place on the Wellington (Salop) Golf Links.

AUTUMN CYCLE CAR TRIAL. Vernon Busby (8 h.p. four-speed Morgan) in the stopping and re-starting test on Bore Hill.

Shipping to Lagos.

On October 16th we published a letter from "F.C.M.," asking if readers who had been to West Africa would let him know whether a tin-lined case was necessary. He now writes to thank those who have given him information, and mentions that his correspondents agree that a tin-lined case is an unnecessary luxury.

An Australian T.T. Race.

News has been received that the West Australian Tourist Trophy Race has been won by J. Norton mounted on a 3½ Triumph at an average speed of forty miles an hour, which, considering the somewhat rough roads in that part of the world, is a remarkably fine performance.

Electric Light and Vibration.

We are assured by the manager of an important firm making electric lighting sets for motor cars that motor cyclists need no longer fear that they will suffer with broken filaments owing to vibration. On the motor cycle lighting set which this firm has in hand the filaments will stand far more vibration than they can possibly receive from a motor cycle even on the roughest roads. Our leaderette of a few weeks ago on the subject of dynamo lighting for motor cycles was opportune, as we know of more than one firm who are either experimenting or have models ready for fitting to motor cycles.

Silencer Regulations.

Readers know that there is a good deal of doubt in the minds of the authorities as to what complies with the silencer regulations. The makers of the Clair silencer, Messrs. J. C. Lyell and Co., Ltd., 113, Great Portland Street, W., have decided in future to indemnify each user of one of their silencers against conviction. The firm are being constantly asked whether they will guarantee the Clair fully to comply with the law concerning silencers and cut-outs, and they have now decided to adopt the above course in self-defence. They point out that they reserve the right to defend any action, and in the event of conviction they would pay the fine.

The late Mr. Percy Lambert.

It is our sad task to have to record the death of Mr. Percy Lambert, who met his death at Brooklands on Friday last, through the bursting of a tyre while attempting the hour record on a Talbot car. Poor Lambert was a keen motor cyclist during the early days of the movement, and, probably, this fact accounted for his wonderful prowess in car racing of recent years, as there is no better training for this sort of work than motor cycle riding. In 1903 he was entered by Mr. F. R. Goodwin, who was then connected with the Star Company, to ride a 2½ h.p. Star-Griffon in the 1,000 miles A.C.C. trials, which started daily from the Crystal Palace. His machine had a bore and stroke of 66 × 90 mm. and weighed 110 lbs. In those days a thousand miles was no small feat, but Lambert, who was then only twenty-one years of age, got through the trial and gained an award in the second class. Next year he rode a 2¾ h.p. of the same make (75 × 80 mm.) and came through the six days in excellent form, though he suffered terrible tyre trouble, which dogged him right up to the end. In Hounslow the back tyre was past repair, so he slung it round his neck and pedalled back to the Down Street Motor House on the rim. The result was that he gained a third-class certificate. Of poor Lambert's recent performances we need say nothing, as they are fresh in the minds of everyone. He was a man whom the writer was pleased to reckon among his friends, and his popularity was in no small part due to his happy disposition and his ability to be merry and bright even when things seemed at their worst. He had long been out of touch with motor cycling matters when he had a joyous spin round Brooklands on the writer's machine only a few months ago, and could then hardly realise how great improvements had been made in motor cycle construction.

FUTURE EVENTS.

Nov. 7-15. - Motor Car Show at Olympia.
„ 24-29.—MOTOR CYCLE & CYCLE CAR SHOW AT OLYMPIA.
Dec. 26-27.—MOTOR CYCLING CLUB Winter Run from London to Exeter and back.
„ 27.—Birmingham M.C.C. Reliability Trial to York.

Triptyques for South Africa.

The Automobile Association and Motor Union has now completed negotiations with the Government of the Union of South Africa, whereby the Association can issue "triptyques" or customs permits for the temporary importation for touring purposes of motor vehicles into South Africa, without the necessity of depositing duty with the Customs at the port of arrival.

In future a member of the A.A. and M.U. can obtain before leaving England a triptyque available for six months which will enable him to take his machine into the country without the slightest difficulty.

The triptyque system has now been in operation for some years in the principal countries of Europe, and has proved a very great boon to motorists. It has simplified the once formidable customs formalities, and it is to be hoped that all countries which levy an import duty on motor cars will adopt this method of guarantee instead of compelling the tourist to deposit the duty on the frontier.

A Competition for Lady Motor Cyclists.

The proprietors of *The Ladies' Field* are offering three valuable prizes for the best amateur ideas and suggestions for a lady's motor cycle costume. The particulars should be preferably accompanied by rough sketches. The outstanding points should be practicability, simplicity, and attractive appearance.

The first prize is a 2¾ h.p. lady's Douglas, value £53. The second prize is a Wall Auto-wheel for attachment to a lady's pedal bicycle, value £16 16s. The third prize is a lady's leather coat, value £10 10s. Six motor mascots will be awarded as consolation prizes to the senders of the six next best suggestions.

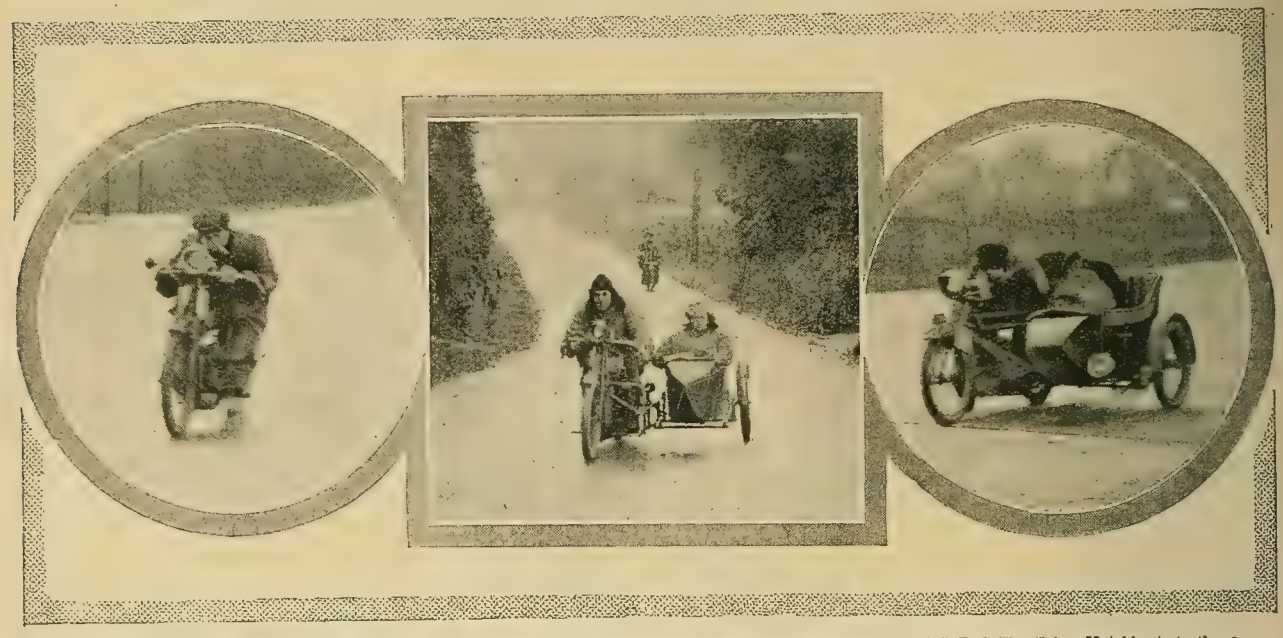
The conditions are that all entries are to be endorsed with the name and address of the sender, and to be accompanied by the heading of the current issue of *The Ladies' Field*. They are to be addressed to the Editor, *Ladies' Field*, 8, Southampton Street, Strand, London, W.C., and the word "Competition" should be written in the top left-hand corner.

Letters should reach the office of the above journal by first post Monday, December 8th.

STREATHAM M.C.C. TRIAL. G. Nott (Clyno sidecar), followed by another competitor, on Chalk Pit Hill.

Reliability, Acceleration, Speed, and Re-starting.

Ambitious Trial of the Streatham and District M.C.C.



(1) H. G. Dixon (3½ h.p. James) in the speed test on Brooklands. (2) A. M. C. Scott (Premier sidecar), followed by F. A. Applebee (Scott), on Tilberstowe Hill. (3) C. R. Collier (7 h.p. Matchless) starting for his flying lap on Brooklands.

A MOST interesting trial was held by the Streatham and District M.C.C. on Saturday last, and the results should prove instructive, as it comprised an acceleration test, a 100 miles reliability trial, a speed test on Brooklands, and a stopipng and re-starting test on a stiff gradient. A gold medal will be awarded to those who qualified in all four tests, a silver medal to those who qualified in three tests, and a bronze medal to those who only qualified in two tests. Out of an entry of eighty-six, only four failed to put in an appearance at Godstone, and just before 8 a.m. Godstone Green presented a busy spectacle, all the machines being ranged up in their allotted order along one side. Punctually as the clock struck the hour the first man was sent away on the acceleration test over a distance of fifty yards.

The Acceleration Test.

In each class the fastest average over this distance was taken as a standard, and only those who accomplished speeds within 5 m.p.h. of the standard were considered to have qualified. In practice this worked out well, and few failed to pass test except in Class III. (for solo machines between 350 c.c. and 500 c.c.), in which Crawley (3½ Triumph) set such a hot speed that eleven failed to get within the specified 5 m.p.h. margin.

Among the few who stopped their engines, Frank Smith had particularly hard luck, for his Grand Prix Clyno usually gets off the mark like a rocket. W. Cooper was allowed a re-start, as it was discovered that his petrol was turned off before he crossed the line. The following are the provisional results of the test :

Class I. (up to 300 c.c.)—Best performance, Colin Taylor (2½ Connaught). All qualified.

Class II. (from 300 to 350 c.c.)—Best performance, J. B. Sproston (2¾ Sunbeam). All qualified.

Class III. (from 350 to 500 c.c.)—Best performance, S. Crawley (3½ Triumph). The following failed : H. V. Colver (3 Enfield), L. A. Bollack (3½ Singer), J. H. Kerr (3½ N.S.U.), M. C. Breese (3½ B.S.A.), E. H. Littledale (3½ Ariel), Mrs. Hardee (3½ P. and M.), A. Roberts (3½ Blackburne), T. Pollock (3½ James), H. Collier (3½ Matchless), R. Croucher (3½ Kerry-Abingdon), and J. Gibson (3½ Triumph).

Class IV. (from 500 to 750 c.c.)—Best performance, R. G. J. Charlesworth (5 Zenith). All qualified.

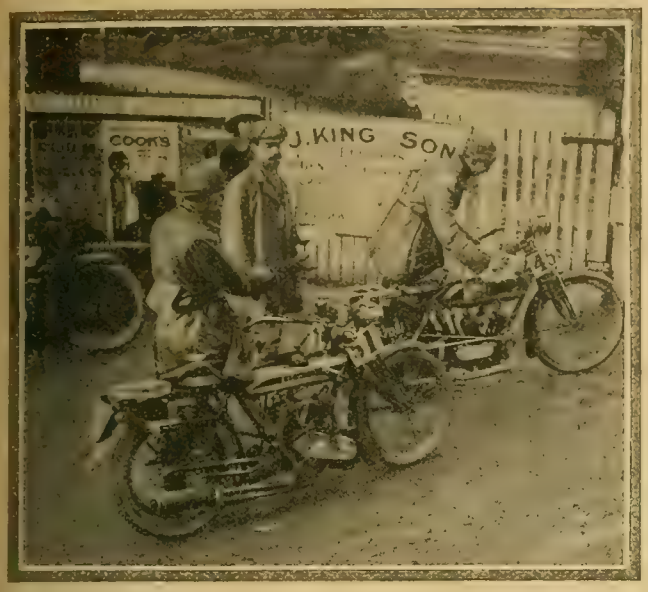
Class V. (from 750 to 1,000 c.c.)—Best performance, A. B. Wade (6 Zenith). Sydney George (7 Indian) and A. J. Luce (6 Zenith) failed.

Class VI. (machines and sc. up to 500 c.c.)—Best performance, F. J. Watson (3½ Ariel sc.) All qualified.

Class VII. (machines and sc. from 500 to 750 c.c.)—Best performance, E. B. Ware (5 Zenith sc.) George Wray (5-6 Clyno) failed.

Class VIII. (machines and sc. from 750 to 1,000 c.c.)—Best performance, E. L. Boutle (8 Chater-Lea sc.) A. C. Scott and T. S. Fordham (8 Premier sc.'s) failed.

George Wray (5-6 h.p. Clyno sidecar) ascending Chalk Pit Hill.



G. Price (3½ h.p. P.V.) and A. B. Wade (6 h.p. Zenith) waiting at the level crossing at the bottom of Pebble Hill.

CLASS IX. (four-wheeled cycle cars).—Best performance, L. Martin (10 Singer). All qualified.

CLASS X. (three-wheeled cycle cars).—Best performance, L. W. Spencer (8 Morgan). All qualified.

Tampering with the Arrows.

After the acceleration test, the first section of the non-stop reliability trial commenced, the route including such well-known hills as Chalk Pit, Polsteeple, Cudham, Brasted, thence *viâ* Oxted up Tilburstow Hill, through Nutfield, Betchworth, up Pebble Hill, Leatherhead, Cobham, to Brooklands. Considering the amount of rain that had fallen, Chalk Pit Hill was in wonderfully good condition, and caused but few failures. H. G. Bell (2½ F.N.) was stopped near the foot of the hill and came no further, and R. Abbott (3½ Bradbury) had trouble.

After Chalk Pit some of the arrows had been tampered with and quite a number lost their way. This was not the fault of the club officials, for the directions had been carried out very thoroughly, but some mischievous persons had removed some of the arrows and reversed others; in fact a pedestrian was seen walking about with one in his hand. Polsteeple Hill had a very slippery surface and caused more than one failure through rear wheel slip; also at this spot T. West (8 water-cooled Morgan), with Reg. Holloway as his passenger, broke a low gear driving chain. The surface of Cudham Hill was comparatively good, and consequently the hill presented little difficulty to the majority of riders. On Brasted Hill H. Collier had gear trouble. The surface was in fair order, and many three-speed machines sailed up on middle gear.

Slippery Surfaces and Steep Hills.

The country was beautiful in its autumn garb, but the fallen leaves and recent rains had made some of the narrow lanes so greasy that solo riders had to exercise the greatest caution over long stretches of road. At the top of Pebble Hill quite a little crowd of spectators had gathered to see the fun. We noticed a particularly fine ascent by T. C. de la Hay (6 Sunbeam sc.), and other good climbs by T. G. Meeten (3½ Rudge), J. B. Sproston (2¾ Sunbeam), A. C Scott (8 Premier sc.), and T. Silver (3½ Quadrant sc.), while A. G. Cocks, on the little Connaught, had to assist his machine slightly. On the way to Brooklands we overtook L. A. Bollack, who reported a stop for a broken belt, and shortly afterwards A. G. Cocks, who had shed the nut which holds on the driven sprocket; however, he managed to get another nut and continued again in great form. The non-stop section ended about half a mile from Brooklands, and competitors were sent on *viâ* the Byfleet Gate. On reaching the track a complete lap had to be made finishing in the straight and a minimum speed was set for each class.

Brooklands proved a surprise to many who were not previously acquainted with the track, and more than one rider found that his machine had a tendency to "dry up" in the neighbourhood of the aeroplane sheds. Three competitors had hard luck on the track, H. F. S. Morgan having carburetter trouble, E. B. Ware (5 Zenith sc.) shed a belt, and C. F. Halsall (10 Wilton cycle car) ran out of petrol. This was all the more disappointing in that all three machines are capable of high speeds and have previously shown up well on the track. A. B. Wade (6 Zenith) accomplished the fastest lap at 56.37 m.p.h., and Crawley's Triumph again proved its worth by lapping at 53.05. The following are the times of those who successfully attained their set speeds:

CLASS I.—Minimum set speed, 33 m.p.h.

R. O. Clark (2½ F.N.) ..	35.77	C. Taylor (2½ Connaught)	34.75

CLASS II.—Speed, 37 m.p.h.

J. Sproston (2¾ Sunbeam)	39.93	W. L. Barratt (2¾ Douglas)	42.94
J. S. Watson (2¾ Sunbeam)	40.77	C. Aslen (2¾ Grandex) ..	41.0
H. R. Davis (2¾ Diamond)	37.28	S. Tubb (2¾ Humber) ..	43.02
A. F. Selby (2¾ Sunbeam)	41.0		

CLASS III.—Speed, 42 m.p.h.

C. E. Noakes (3½ Sunbeam)	45.08	H. Willoughby (3½ Rudge)	50.75
T. G. Meeten (3½ Rudge)	48.48	H. G. Dixon (3½ James)	43.79
R. G. Mundy (3½ Triumph)	50.38	H. Collier (3½ Matchless)	42.85
L. A. Bollack (3½ Singer)	43.36	W. C. Drake (3½ P. and M.)	44.87
J. H Kerr (3½ N.S.U.) ..	44.03	A. V. Sumner (3½ Zenith)	50.21
C. Walters (3½ P. and M.)	43.21	R. Croucher (3½ Kerry-Abingdon)	46.81
A. C. Breese (3½ B.S.A.) ..	43.21	J. Gibson (3½ Triumph) ..	46.09
E. H. Littledale (3½ Ariel)	46.94	S. Crawley (3½ Triumph)..	53.05
J. Oliphant (3½ Premier)	47.81		
A. Roberts (3½ Blackburne)	48.53		

CLASS IV.—Speed, 47 m.p.h.

G. Price (4 P.V.)	47.58	G. T. Gray (5-6 Rudge) ..	46.44
R. Charlesworth (5 Zenith)	50.96		

CLASS V.—Speed, 52 m.p.h.

B. A. Hill (7 Indian) ..	53.22	G. Griffith (8 Zenith) ..	55.03
A. Wade (6 Zenith)	56.37		

CLASS VI.—Speed, 32 m.p.h.

F. Edmond (3½ Humber sc.)	34.28	J. E. Greenwood (3½ Sunbeam sc.)	37.10
T. Silver (3½ Quadrant sc.)	37.82	F. J. Watson (3½ Ariel sc.)	37.89
K. Holden (3½ B.S.A. sc.)	40.77		

CLASS VII.—Speed, 37 m.p.h.

A. H. Wright (6 A.J.S. sc.)	37.95	T. Stevens (3½ James sc.)	38.67
G. Nott (5-6 Clyno)	37.78	F. Smith (5-6 Clyno sc.) ..	47.12
T. C. de la Haye (6 Sunbeam sc.)	41.00	Hugh Gibson (5-6 Bradbury sc.)	43.75
G. Wray (5-6 Clyno) ..	38.13	C. Freeman (5-6 Clyno sc.)	40.35

CLASS VIII.—Speed, 42 m.p.h.

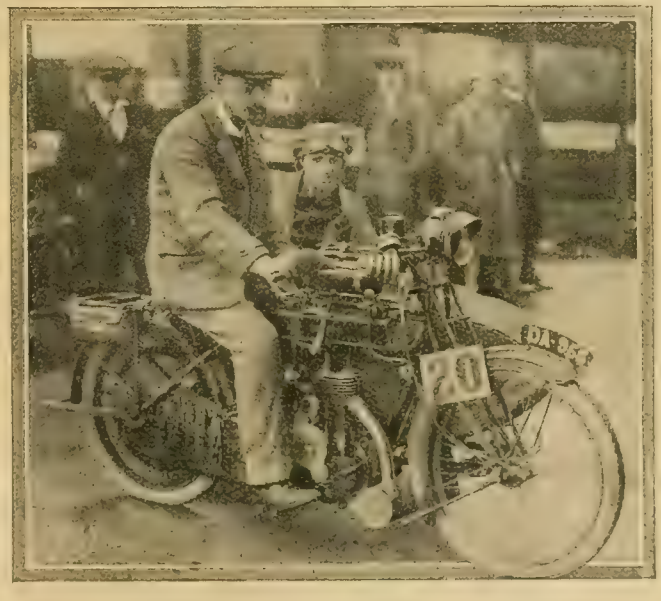
J. Woodhouse (7 Quadrant sc.)	43.87	C. Collier (7 Matchless sc.)	43.75
		E. Boutle (8 Chater-Lea sc.)	43.43

CLASS IX.—Speed, 40 m.p.h.

L. Martin (10 Singer c.c.)	52.66		

CLASS X.—Speed, 42 m.p.h.

T. V. West (8 Morgan) ..	42.75	L. W. Spencer (8 Morgan)	42.94



J. E. Greenwood, the designer of the Sunbeam, on the 1914 model 3½ h.p. sidecar machine with which he competed in Saturday's trial.

Reliability, Acceleration, Speed, and Re-starting.—

It would appear at first sight that the speeds allotted to the various classes were not too high, but it must be remembered that the machines had gone through nearly seventy miles hard work, and were in full touring trim. J. Chater-Lea, V. Busby (3½ Quadrant), and F. J. Ellis (6 Matchless sc.) all suffered tyre trouble during the morning, and H. E. Chapman (5-6 Clyno) was reported to have been involved in an accident near Redhill.

Mechanical Details.

A look round the competing machines during the lunch interval proved interesting, for there were several 1914 models taking part in the trial. Both the 6 h.p. and 3½ h.p. Sunbeams are very workmanlike-looking machines. Colver's Enfield had a chain-driven magneto, a new oil pump, an experimental inlet pipe, and the kick starter on the left-hand side. Two 7 h.p. M.A.G. engines were competing, one in a Matchless and one in Charlesworth's Zenith; both ran very quietly and smoothly. The sidecar on J. Woodhouse's Quadrant was built on novel lines, and part of the top and side hinged back to allow the passenger to enter. Ray Abbott reported that he had run out of petrol, and ascribed his run of bad luck to the fact that he had shaved off his moustache. F. G. Edmond was out on the new water-cooled 3½ h.p. Humber, which was apparently running beautifully. The new twin Bradbury and the 1914 Diamond are both fresh arrivals to competition work.

The Afternoon's Run.

After leaving Brooklands on the second part of the reliability test, a route was taken to the Portsmouth Road, which was followed past the well-known Hut Hotel, then *viâ* Horsley and up Crockmouth Hill. This slope was so slight that no machine in good trim should worry about it, but the surface was distinctly dangerous, and it is difficult to see why it should have been included, unless as a means of reaching other tests. Dorking was the next objective, and thence a long pull led up to Coldharbour. Some fine roads were found on this section, but the surface again became greasy near Betchworth, and this state of affairs continued to Reigate.

The Re-starting Test.

On turning up Wray Lane a large placard announced that the non-stop section finished half a mile away, which considerably assisted speed-judging. Further up competitors were stopped and sent up singly for the re-starting test. This took place on a gradient of, we should judge, about 1 in 7, the surface, though fairly dry, being slippery on account of its chalky nature.

There was much rear wheel slipping, and it was curious to notice fallen leaves actually smouldering after machines had passed over them with buzzing back wheels. The following made particularly fine ascents: T. C. de la Hay (6 Sunbeam sc.), C. Duplock (6 A.J.S. sc.), H. R. Davis (2¾ Diamond), T. Stevens (3½ James sc.), F. J. Watson (3½ Ariel sc.), Frank Smith (5-6 Clyno sc.), A. Roberts (3½ Blackburne sc.), Hugh Gibson (5-6 Bradbury sc.), G. Price (4 P.V.), C. Freeman (5-6 Clyno sc.), Lionel Martin (10 Singer c.c.), C. R. Collier (7 Matchless sc.), H. G. Dixon (3½ James), W. C. Drake (3½ P. and M.), and J. G. Pauling (Swift c.c.) H. F. S. Morgan was troubled with rear wheel slip, but once he got a grip he went away at a great pace. Crawley caused a sensation by his wonderful recovery after a bad skid. W. Cooper (8 Humberette) got away well, but missed gear at the top of the hill. At the first attempt, Colin Taylor (2½ Connaught) had a wonderful skid, his machine describing a complete circle; he was, however, given a second chance and got away well. After the test competitors were sent straight back to Godstone and the finish. The organisation was excellent throughout, and in spite of the large amount of work necessary provisional results were obtainable soon after ten o'clock, and subject to confirmation by the committee and the correction of time errors, the awards will be as follow:

Gold Medal Winners.

E. L. Boutle (8 Chater-Lea sc.)
C. E. Noakes (3½ Sunbeam)
T. G. Meeten (3½ Rudge)
J. B. Sproston (2¾ Sunbeam)
E. V. Walters (3½ P. and M.)
J. Oliphant (3½ Premier)
T. Stevens (3½ James)
A. F. Selby (2¾ Sunbeam)
H. Gibson (5-6 Bradbury sc.)
H. B. Willoughby (3½ Rudge)
*G. Price (4 P.V.)
C. Freeman (5-6 Clyno sc.)
B. A. Hill (7 Indian)
A. B. Wade (6 Zenith)
H. G. Dixon (3½ James)
*W. L. Barratt (2¾ Douglas)
W. C. Drake (3½ P. and M.)
A. V. Sumner (3½ Zenith)
*R. G. Charlesworth (5 Zenith)
S. Crawley (3½ Triumph)

Silver Medal Winners

G. T. Gray (5 Rudge)
A. H. Wright (5-6 A.J.S. sc.)
G. Nott (5-6 Clyno sc.)
T. C. de la Hay (6 Sunbeam)
R. O. Clark (2½ F.N.)
R. G. Mundy (3½ Triumph)
J. Greenwood (3½ Sunbeam sc.)
*J. S. Watson (2¾ Sunbeam)
G. Wray (5-6 Clyno sc.)
K. Holden (3½ B.S.A. sc.)
M. C. Breese (3½ B.S.A.)
C. Duplock (5-6 A.J.S. sc.)
*H. R. Davis (2¾ Diamond)
E. H. Littledale (3½ Ariel)
C. Taylor (2½ Connaught)
F. J. Watson (3½ Ariel sc.)
F. Smith (5-6 Clyno sc.)
A. Roberts (3½ Blackburne)
C. F. Halsall (Wilton c.c.)
R. G. Charlesworth (5 Zenith)
S. Tubb (2¾ Humber)
R. Croucher (3½ Kerry-Abingdon)
W. Cooper (Humberette c.c.)

Bronze Medal Winners.

T. Silver (3½ Quadrant sc.)
L. A. Bollack (3½ Singer)
T. Chater-Lea (8 Chater-Lea sc.)
S. George (7 Indian)
F. A. Applebee (3¾ Scott)
F. J. Ellis (6 Matchless sc.)
R. Pearson (5-6 Clyno sc.)
Mrs. Hardee (3½ P. and M.)
H. F. S. Morgan (8 Morgan c.c.)
T. Pollock (3½ James)
J. Woodhouse (7 Quadrant sc.)
C. Aslen (2¾ Grandex)
F. G. Edmond (3½ Humber sc.)
J. G. Pauling (Swift c.c.)

*Doubtful.

The Urgent Need for Up-to-date Signposts.

An A.A. and M.U. £45,000 Scheme.

BY invitation of the Committee of the A.A. and M.U. we attended the inaugural dinner held at the Savoy Hotel on Thursday evening last, when the scheme outlined in the daily press of last week by the A.A. President, Lord Lonsdale, was explained in detail by the Chairman of the Association, Mr. Joynson Hicks, M.P. Among those who supported the Chairman were Lord Montagu of Beaulieu, Sir George Gibb, Messrs. Stenson Cooke (secretary A.A.), W. Rees Jeffreys (secretary of the Road Board), and J. W. Orde (secretary of the Royal Automobile Club). *The Motor Cycle* was represented by Mr. W. Grew.

Mr. Joynson Hicks, in a well considered speech, mentioned that the idea of the committee is to start the fund with the sum of £5,000, and it has for its object the improvement of the signposting of roads in the United Kingdom. Under present conditions signposting is in about the same position as it was in the days of the coaching era, and it is the intention of the A.A., if the fund be sufficiently supported, to set an example to the local authorities in signposting main roads so that their policy will be followed on every road in the kingdom on which there is any considerable traffic. These signposts, it is suggested, should be placed in prominent positions, made easily legible, and the arms should be placed at different heights in order that they may be visible from any direction. Not only should they indicate the names and mileage distances of neighbouring places, but also the names of the localities in which they are erected.

The Chairman's speech was seconded by Lord Montagu of Beaulieu, who appealed to the Association to commence their operations on roads which had already received grants from the Road Board. He also appealed to the A.A. members to subscribe the sum of 10s. each, which would bring in a sum of £40,000, so bringing the fund up to £45,000. Lord Montagu also pointed out that if the new signs were erected in the form of a cross at dangerous cross roads and turnings, the present danger signs might be dispensed with; also, that in organising the scheme, it should be arranged for distances to be measured from one recognised centre.

The Chairman of the Middlesex County Council, Mr. W. Regester, heartily supported the scheme, and suggested that what is wanted is uniformity in signposts. He was followed by the Chairman of the Middlesex Highways Committee, Mr. Hugh Lewis, who pointed out that reform in the direction indicated was much needed. He said the Middlesex County Council had spent huge sums on the roads, but had been loyally supported by the Road Board to the extent of 75% of the total expenditure.

The Hon. Harry Lawson, M.P., proposed the health of the Chairman, and drew the attention of those present to the fact that what is required in this country is a perfect system of roads as well as signposts, not only for pleasure vehicles but for business purposes. He asked the general public to subscribe to the fund, and not leave all the spade work to motorists.

Sir George Gibb, whose speech was listened to with close attention, said that the Road Board had already discussed the question of uniform signposting, but they were not absolutely certain of their legal position; if they had legal authority to subscribe to the fund they would do so. He particularly referred to the importance of making the sign on the post lucid and legible.

The proceedings terminated about 11 p.m.

CLUB NEWS.

Motor Cycle Union of Ireland.

The annual dinner will take place at the Grand Central Hotel, Belfast, on November 7th.

Wrexham and District M.C.

The members of this newly-formed club were entertained to lunch by the president, Mr. W. Noel Soames, on the occasion of the opening run.

Maesteg and District M.C.C.

The results of the gymkhana are as follow:
Slow Race.—M. Margan (3¾ Scott).
Suffragette Race.—Chess and Wilson (2¼ Levis).
Lemon Cutting.—Will Thomas (2¾ Douglas).
Polo Competition.—Will Thomas (2¾ Douglas).
Obstacle Race.—Chess and Wilson (2¼ Levis).
Tent Pegging.—Frem Thomas (6 J.A.P.).
The special prize for the best performance was won by Will Thomas (2¾ Douglas).

Barton-on-Humber and District M.C.C.

Speed trials took place on the 25th ult. Results:

CLASS I.—For machines prior to 1910, on formula.
1. C. H. Atkinson (Rex Tricar) 28.33

CLASS II.—For motor cycles up to 350 c.c., on formula.
1. B. Hodgson (Sunbeam) 74.16
2. J. H. Furniss (Elswick) 43.26

CLASS III.—For motor cycles up to 570 c.c., on formula.
1. A. Curtis (Precision) 84.45
2. M. Wadsworth (Norton) 79.64

CLASS IV.—For passenger motor cycles, any capacity, on formula.
1. F. G. Howard (Quadrant) 65.88
2. A. Curtis (Precision) 65.34

CLASS V.—For T.T. motor cycles, on time.
1. F. Hopper, junr. (Torpedo) ... ... 33s.
2. M. Wadsworth (Norton) ... ... 34.2s.

CLASS VI.—Unlimited, on time.
1. B. Hodgson (Zenith) ... ... 32.4s.
2. F. Hopper, junr. (Torpedo) ... ... 33.8s.

Newton-Stewart M.C.C.

A hill-climb was held on the Mines Hill on the 29th ult. The hill was ascended from the Bargaly side. Results: J. F. Morrison (3½ Premier) first and fastest time; G. Taylor (3½ Rudge Multi) second; G. Cocker (3½ Rudge Multi) third.

Cheltenham M.C.C.

A passenger trial for sidecars and cycle cars was held on the 29th ult. on a route over the Cotswold Hills. Results: 1, W. B. Gibb (2¾ Douglas sc.); 2, F. W. Corbett (2¾ A.J.S. sc.).

Bristol M.C.C.

The results of the recent reliability and speed-judging competition over a secret course of about forty-five miles, including two ascents of Weston Lane, are as follows: Out of twenty-five starters fourteen made non-stops: Eric Butler (Humber), total error 1m. 20s.; P. A. Stone (Morgan), 5m. 5s.; D, L. Thomas (Douglas), 6m. 26s.; P. Grout (A.J.S.); E. Davis (Premier); P. H. A. Matthews (Swift cycle car); Rev. P. Bischoff (Clyno); M. King (Scott); G. Fry (Rudge Multi); W. H. Mogford (Zenith); F. C. Wasley (Rudge Multi); C. Selman (Premier); W. H. Shaw (A.J.S.); A. Stevens (Douglas).

Liverpool A.C.C.

A novelty was introduced into the above club's reliability trial for the Mead-Martin Challenge Cup; this was the handicapping of the competitors according to past performances. Results:

1, L. V. Barton (6 Rex), cup and gold medal; 2, J. Baker (6 Enfield sc.); 3, J. Green (3½ New Hudson).

Motor Cycling Club.

Members who are able and willing to serve on the committee, which meets fortnightly, are asked to send their names to the hon. sec., Mr. S. May, 34, Gower Place, W.C., or to submit names of suitable candidates, as there will be three or four vacancies to be filled up at the annual meeting next January.

The Committee has arranged to have a club smoker on Thursday, November 20th, at the Holborn Restaurant, at 7-30. The annual dinner will be held on December 13th, at the Trocadero.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Novel Sidecar.

Sir,—With reference to Mr. Fletcher's letter on page 1418, I fail to find any similarity between the novel sidecar he described and those illustrated in Mr. Manning's list, so perhaps Mr. Fletcher will be good enough to disclose the identity or the manufacturer of his sidecar.

W. M. PANNETT.

Some Advantages of a Twin.

Sir,—Your correspondent "Twin Enthusiast" might lead some of your readers to believe that East Anglian roads were really awful. As a matter of fact they are not too bad, and have been considerably improved of late years, probably in readiness for military operations here if necessary.

Regarding his 3 h.p. twin climbing Maldon Hill on top. I believe the top gear of his machine is about 5 or 5½ to 1. Any decent 3½ single-cylinder should climb that hill geared 4¼ to 1, with a ten-stone passenger on the carrier. I have done so repeatedly myself. Personally a 7 h.p. twin appeals strongly to me, but I should think twice before again having a lightweight twin, for the humming of the engine makes me feel positively ill after a very little while.

EAST ANGLIAN RIDER.

Rear Lamps for Motor Cycles.

Sir,—We note in last week's issue of *The Motor Cycle* in your leading article under the heading "Must Motor Cycles Carry Rear Lights?" that you state "There is really no suitable lamp on the market at the present time." We are pleased to advise you that all 1914 Indian touring models will be equipped with an electric rear light, which not only shows a red light behind but illuminates the rear number plate.

In many countries outside of the United Kingdom rear lighting on motor cycles has been compulsory for some years past, and our company has for many years been in position to supply these.

We have never fitted them in this country before, for the very reason that they did not seem to be required, but now, in view of recent legal decisions in regard to rear lighting on motor cycles, we shall supply them as part of our standard equipment. Surely there is no reason why other motor cycle manufacturers cannot do the same.

HENDEE MANUFACTURING CO.

The Liverpool A.C.C. Trial.

Sir,—I notice on page 1420 of your last issue, a small paragraph "summary of correspondence" respecting the above Club's Trial. I appreciate your reason for not publishing the letters owing to same being signed with *nom des plumes*, but I venture to suggest that it would have been considerably fairer to Mr. Sproston, who won the cup, not to have published any remarks at all. It appears to me, and to others of my committee who have brought it before me, that this is an attempt of certain interested parties to damage the performance of Mr. Sproston. It is not sporting, and I suggest that Mr. Heaton, who is one of the best of sportsmen, would deprecate this action. The cup was offered *not* for the "best" performance, under which Mr. Heaton would have won it, but for any competitor to win the cup he had to win a gold medal. The performances for gold medal awards were arranged on a sort of handicap: solo riders over 2¾ h.p. had to climb every hill, solo riders 2¾ h.p. and under were allowed to fail on one hill, sidecar machines were not taken up one hill, and whilst the larger models had to climb the five still left in, the 3½ h.p. models only had to climb four. Knowing the hills as I do, this made a very reasonable and fair handicap, and without in any way disregarding Mr. Heaton's very excellent performance, Mr. Sproston was awarded the Reliance Cup by the judge, purely on the conditions attached to the Trial, Mr. Sproston's total error for the various checks being but three minutes, whereas Mr. Heaton, who was second, was nine minutes in error. This result, I may say, was worked out without consideration of secret checks.

S. W. PHILLPOTT,
Hon. Sec., Liverpool A.C.C.

How to Test Benzole.

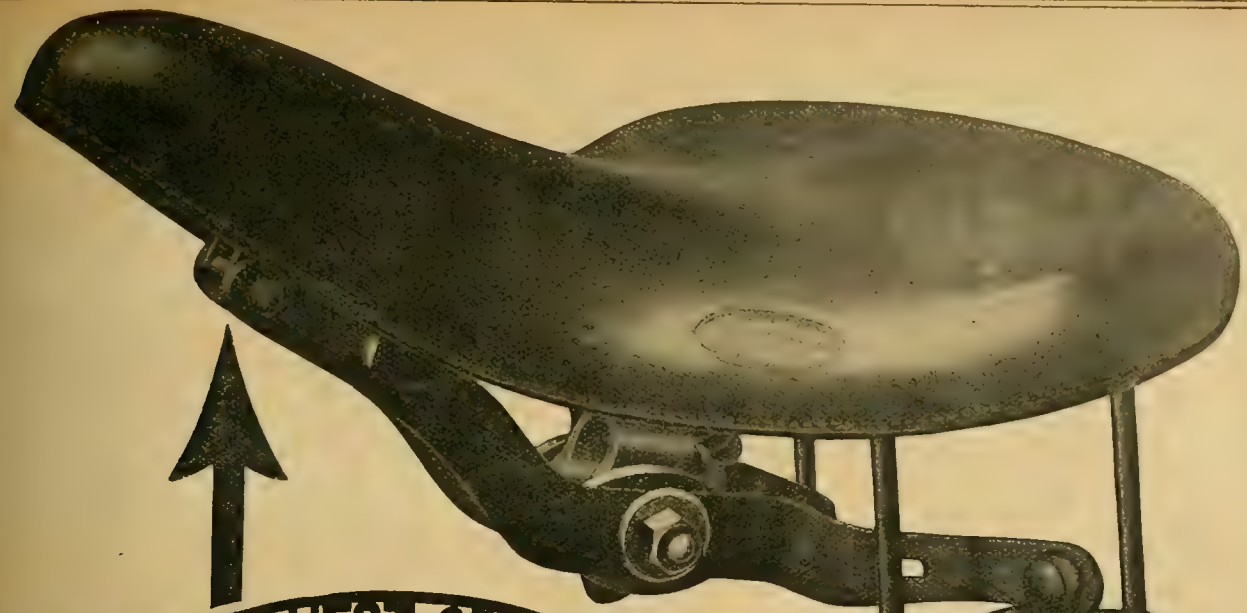
Sir,—I do not wish to take up your space on a technical matter outside motor cycling, but I still think that Mr. Thomas is wrong in advising the novice to test without a condenser. As a works manager of a tar works where some fifty samples are tested each day, and having tested some thousands of samples myself, I may claim to know something of the matter. In tendering advice of a technical nature to the novice, the human element must be allowed for, and Mr. Thomas cannot blithely say that if his details are not followed to the letter then he washes his hands of it. The fact that works exist where benzole is tested by lads according to his method proves nothing at all, except that there are works where benzole is not tested according to the standard method.

With reference to the testing of sulphur, Mr. Thomas is undoubtedly correct. Probably the best method for the novice is the sulphuric acid test described by "Chemist." This, of course, is only a test, and not an estimation.

TECHNICAL CHEMIST.

LAST WEEK'S AUTUMN CYCLE CAR TRIAL.

On the left, R. G. Thomas (8 h.p. friction and belt-driven Pyramid) at the starting point. There were two machines of this make in the trial, and both made non-stop runs.



HIGHEST-GRADE

Test the truth of this at our expense!

So confident are we that the "EMPIRE de LUXE" Pan Seat is the acme of perfect design that, to popularise it, we make an offer whereby you may obtain one advantageously.

OUR CLAIM: Consequent upon considerable exhaustive experiment we claim to have produced, in this model, a Motor saddle which affords a degree of durability, stability, and comfort, never before attained.

—and WHY: Because it gives a particularly low riding position — the seat has a strong pressed-steel base, shaped anatomically — top of finest quality leather, well-padded — and the vital and exclusive features of its design as emphasised here are:—

No. 1. Patent Swinging Link (SHOCK-ABSORBING) — gives free movement to the saddle-nose, allowing the saddle-underframe to rise slightly when meeting any obstacle, while the seat remains level in its original position.

No. 2. Patent Double Hangers (PREVENTS ROLLING) on Tension Springs. These extend underneath in tangentical position to spring centre, thus preventing all rolling or side-sway — an important point which will be appreciated by all hard riders. Its "design-principle" is *this*:—"WE MAKE THE SADDLE TAKE THE SHOCK, NOT THE RIDER" — the action of the seat is separate and independent of the frame, any vibration or shock is absorbed before it can reach the rider — the machine moves while you sit still" as in an armchair.

OUR OFFER: To prove that this IS the perfect anti-vibratory Motor Seat, we are offering 1,000 of these —

"Empire de Luxe PAN SEAT"

No. 73, regular price, 30/- — at the special price of "20/- EACH AND YOUR OLD SADDLE." Now fill up the coupon and let us hear from you.

The Leatheries, Ltd., Sparkbrook, Birmingham.

An Easily Removed Three-speed Hub.

Sir,—"Ixion" has expressed a desire to see a hub gear that can be removed easily.

I am running at present—and shall be pleased to show him—the following: 8 h.p. Matchless, Sturmey-Archer three-speed hub, and—dare I say it—the back wheel comes out after slackening two nuts (no need to run the nuts right off) and goes back again without any adjustment whatever.

The hub stands the big engine quite all right. After 15,000 miles (all sidecar work, and once towing another sidecar outfit ten miles) I have taken the clutch plates out to look at them. They are not scored at all, the simple explanation being that I have never neglected to lubricate them, and on the low gear the clutch is home in six yards.

For a long time I was a counter-shaft gear enthusiast, and I gave Mr. A. D. Powell, of Northampton, the order for the Sturmey-Archer on condition that he could fit it in such a way that the back wheel could be removed like my T.T. Triumph.

This he has done, and I congratulate him on doing a clever job, and the Sturmey-Archer firm on their gear.

WILLIAM LEES.

A Sidecar in Australia.

Sir,—Having been a constant reader of your valuable paper for the past two years I thought the enclosed photograph of myself and my Bradbury sidecar combination might be of interest to you.

Mine was the first sidecar in Moree, which is a town over four hundred miles from Sydney, and is in one of the finest grazing districts in New South Wales. There are a great many cars here, something like 250, but motor cycles are scarce, worse luck, as I was hoping to be able to form a club and have some good runs. The roads are good for about fifteen miles round the town, but after that there is no metal and it is all black soil plains, which are good in dry weather but absolutely impossible to ride over in the wet.

I have been riding the Bradbury for nearly two years and have never had the slightest trouble, which speaks volumes for the machine, as I was quite a novice when I got it and have ridden over some very bad country roads.

Every week I look forward to receiving my copy of *The Motor Cycle*, and have received some very good hints from it.

Moree, N.S.W., Australia. ERIC L. HUDSON.

E. T. Hudson on his 8½ h.p. Bradbury sidecar. See accompanying letter.

The Large Single Geared Twin

Sir,—Now that single geared machines are considered by some as antiquated, I want to put in a word for the single geared big twin.

A 6 h.p. semi T.T with an adjustable pulley weighs less than most two or three-speed 3½ h.p. machines, and can do all the work of the latter, and, withal, is a pleasure to drive.

With a minimum possible gear of 4½ to 1, I have yet to find a hill that I cannot climb, though the machine has, amongst others, Alms Hill and Porlock to its credit, the latter on a wet day.

With regard to economy, a large engine is so seldom "all out" that the bearings wear splendidly.

After two seasons' average hard use the bearings show hardly any play. I have used the same belt for more than twelve months, the original front tyre is still on the front wheel, and I am now using my third back tyre.

S. KING SMITH.

An Undesirable Practice.

Sir,—I should like to support BL 2318 in his remarks on carrier-riding. I have taken carrier-passengers several thousand miles altogether, and although I have suffered several accidents, in an approximately equal distance solo, I have never had a mishap when two-up. My experience is certainly not due to slow driving—I run a 6 h.p. twin and do not waste time—and I have had the usual amount of riding on skiddy roads, and through traffic, not to mention sudden tyre deflations at speed; but I can confidently say that given a plucky passenger, there is no more danger than in solo work. The only advantage of the sidecar as far as safety goes is in the elimination of the passenger factor, and with the girl of to-day, it is almost an unnecessary precaution.

The advantages of the practice are numerous: I can do 80 to the gallon with my passenger, and I have yet to have my first stop on a hill; so I, for one, should strongly object to carrier riding being suppressed by legislation.

C.H. 759

Sir,—May I congratulate you on having the courage to tackle this very urgent question. I am very pleased to see "Ixion's" very appropriate remarks in your issue for October 23rd, and trust they will be taken to heart by those who indulge in this dangerous practice. Last Sunday I was on my way from Westerham to Burford Bridge and overtook two youths on a light weight twin (no, not a Douglas), and, having ample time, followed them for some miles to make observations. I noticed that the machine was obviously overloaded and extremely unsteady on the greasy patches met with. On quite slight rises pedalling was resorted to, and, in several cases, the passenger dismounted and ran. Approaching Redhill the road makes a winding descent into the town, and here the driver was able to touch about 30 m.p.h. On one of the sharp curves he was unable to keep to the left side of the road, and would have smashed into a large motor car had not the driver of it smartly pulled out of the way. They crossed the main London road at a good 25 m.p.h., and I only hope the policeman there will charge the driver with driving to the common danger. The machine was obviously out of control, due to the extra weight carried. Personally, I have had three narrow shaves on corners from fools riding in pairs on motor bicycles, and I promise that the next one who serves me this trick shall have a summons for driving to the common danger. I am inclined to think we should soon see the last of this idiotic practice if the above course were pursued. THE DREADNOUGHT

Sir,—As a motor cyclist who has carried passengers some 25,000 miles on a specially constructed seat on the carriers of my 1910 and 1911 F.E. Triumphs, I cannot allow the statements made in your issue of September 25th regarding the danger of this system of passenger carrying to pass unchallenged.

To commence with, I fear the writer of the article has had very little practical experience or he would not have suggested that it is necessary or advisable for the passenger to be in sympathy with the driver as regards steering; on

the contrary, it is essential for the passenger to sit and move naturally and to take no part whatsoever in balancing or steering the machine.

The strain on the machine generally is far less when carrying the passenger on the carrier than when pulling a sidecar, and there is far less risk of accident due to mechanical breakdown. Also there is less liability to collision in tight corners owing to the small space required, and little fear of overturning on sharp corners.

The carriers, wheels, frames, etc., of most 3½ h.p. and upwards machines are sufficiently strong with an ample margin of safety to carry a double load.

My experience is that with a passenger on the carrier the machine is as easily steered and is as steady, if not steadier, in traffic as when riding solo, provided always that the passenger takes no part in the balancing and steering of the machine.

Many motor cyclists, although they wish to take a passenger, cannot afford to purchase and run a suitable sidecar outfit, neither have they space for it in their homes and would have to go to the additional expense of storage. Further, a decent 3½ h.p. machine will take a passenger on the carrier as fast as or faster than the average 6 and 8 h.p. sidecar outfits at something like half the running cost.

Whilst it must be admitted that great care should be exercised when travelling over wet roads, especially tram rails, its many advantages as compared with a sidecar (of which method I have had some 10,000 miles experience) have been recognised, and this method is now being used by a large number of motor cyclists who, speaking generally, do not unnecessarily run the risk of smashing up their passengers, themselves, or their machines.

Accidents are liable to and do happen to all classes of vehicle, sometimes with the most careful and expert drivers in charge, but I think you will agree that each class of riding or driving has to be learned—solo riding is different from sidecaring, and carrier passenger carrying is also quite distinct, and no one should take a passenger on his carrier or by any other means until he has thoroughly mastered and is proficient in the method he intends to adopt. [How is he to become proficient?—Ed.]

As regards the danger of burst tyres, I have had some ten to twelve bursts during the past few years, but in only one case did the machine fall, and that was through the tyre rolling off the rim and locking the wheel dead, fortunately unattended by any injury either to my passenger or myself. This trouble is now fast becoming minimised now that tyre manufacturers are producing suitable and special tyres for this class of work.

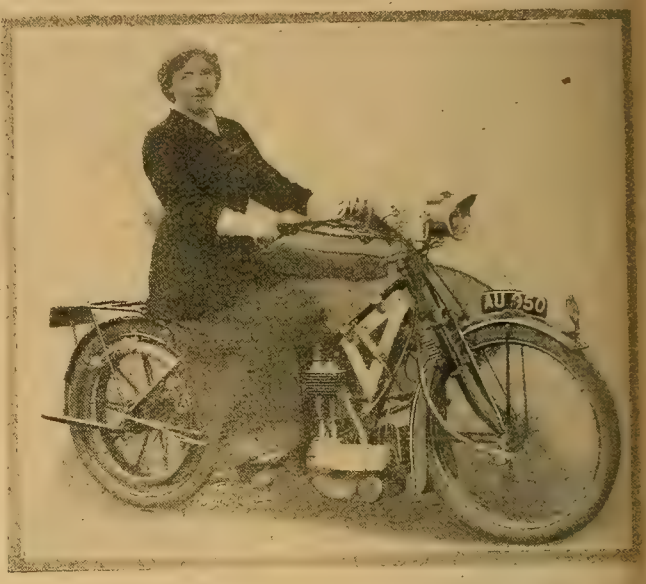
In conclusion, I may say that the narrowest escapes I have had have been under circumstances where had I been carrying my passenger in a sidecar instead of on my pillion seat bad smashes would have been unavoidable.

W. T. SAUNDERS.

First ascent of East Lomond Hill. See accompanying letter from T. R. Inglis Melville

The Most Suitable Frame for Ladies

Sir,—I have read your article with reference to Miss Reid, and I am pleased to know of yet another lady rider who does not approve of the diamond frame for ladies.



Mrs. M. Wilson, who contributes the letter on this page.

With my open frame I can dress for any ordinary social function without any trouble. My machine is also a 3½ h.p. Brough, and I have done over 4,000 miles this summer with sidecar attached, and often a passenger over 13 stone.

(Mrs.) MAUDE WILSON.

What it Costs to Run a Cycle Car.

Sir,—I was much interested in your article on this subject, and herewith I hand you my experience of upkeep of Singer cycle car.

I have now run the car 6,114 miles. You will note that the item for repairs seems a heavy one, but I must explain that it includes £5 for a new engine fitted by the makers, as they had found their former engine to contain a radical fault. The fitting of the new engine has made the car much more efficient, and I have nothing but praise for it. Of the miles run 4,625 were done on petrol—157 gallons, which equals 29.45 miles per gallon, and 1,489 miles on Ford's benzole—32¼ gallons, equal to 46.20 m.p.g.

Details of Expenses.	s	d.		Per Mile. d.
Petrol and benzole	269	5	=	.528
Lubricating oil	21	2	=	.042
Repairs	239	1	=	469
Insurance, licences, and registration	197	7	=	.389
Lighting	7	3	=	.013
Tyres and repairs	160	2	=	.315
Total cost	894	8	=	1.756

To the insurance and licences I have put down the amount accrued due to this date

THOMAS WADSWORTH

On East Lomond Hill

Sir,—I enclose a photograph of my 3½ Triumph, which successfully reached the summit of the East Lomond Hill, a few miles from here (Kingskettle, Fifeshire) on 14th ult. The hill is about 1,500 feet high, and the machine took a coach-built sidecar to within a few hundred yards of the summit, where it had to be detached owing to the presence of a high wall. The machine received no tuning whatever, and although I am over 13 stone, the engine did not over heat. This is the first time a motor cycle has been at the summit of the Lomond.

UNSOLICITED TESTIMONIAL.

Messrs. Phillipson & Co. [COPY] Swansea, October, 1913.

Dear Sirs,—I would like to say how very pleased I am with the results obtained with your pulley since I adopted it to use on my Standard Triumph. I have covered fully 10,000 miles with it, and it appears quite as good as the day I fitted it, the flanges having just recently been trued up for the first time. It does ALL you claim for it, and this is saying much in the face of the fact that there are so many fitments for motor cycles put on the market claiming advantages that are not and never can be obtained. Prior to fitting your pulley I had to keep my gear to not higher than 5 to 1 for my all-round work as a traveller in this country. I can now set it at 4¼ or 4½ to 1 on top, and with ratio obtained with your pulley it enables me to climb a dangerous hill in comfort, and I have the advantages, "which are many," of the higher gear on good roads. I have recommended it with confidence to my motoring friends all over this country.

Yours faithfully, C. H. SIMONS.

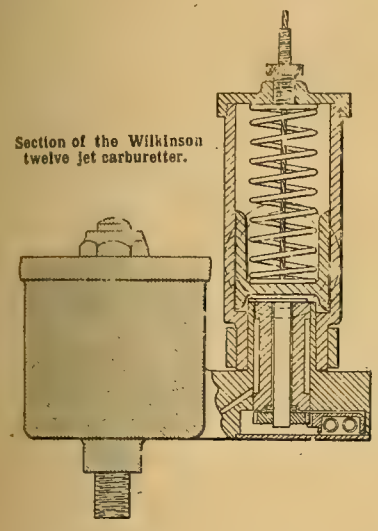
A Racing or Touring Carburetter at Will.

Twelve Jets controllable from the Saddle.

ONE of the most desirable features of a motor bicycle is its ability to run slowly, and there is no question of doubt that five or six years ago the change-speed gear was hurried forward, as it was realised that with such a device a motor bicycle could be made to run at any speed and



Section of the Wilkinson twelve jet carburetter.

would therefore appeal to the inactive. Of late years, however, great advancement has been made in the design of carburetters, until nowadays it is quite a usual sight to see a motor cyclist walking alongside a fixed geared machine with the engine firing regularly. But it is not every carburetter which renders this feat possible, and, further, it is only certain types of slow running engines that permit of such a performance.

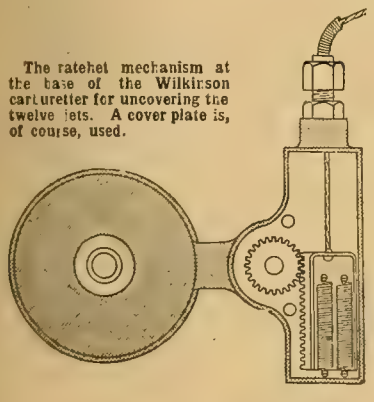
A Road Test.

Last week we had an interesting demonstration of a new carburetter (which we have already referred to and illustrated), viz., the Wilkinson twelve-jet. Mr. J. H. Wilkinson owns a T.T. Matchless-J.A.P. with overhead valves, and we think Mr. Prestwich himself will admit that of his splendid range of engines, the 5 h.p. T.T. model with overhead valves is one of the most difficult to control at slow speeds. Mr. Wilkinson rode his machine over from Doncaster to our offices, purposely to demonstrate its docility when fitted with one of his carburetters. We measured the gear used, and found it to be $3\frac{5}{8}$ to 1, yet the rider had no difficulty whatever in turning round in an ordinary roadway with the engine firing regularly. It was a most impressive sight to see him threading his way in and out of the traffic, and turning round as slowly as if he were mounted on a machine with a three-speed gear. We tried the machine ourselves, and found that even without practice we were able to equal Mr. Wilkinson's feat.

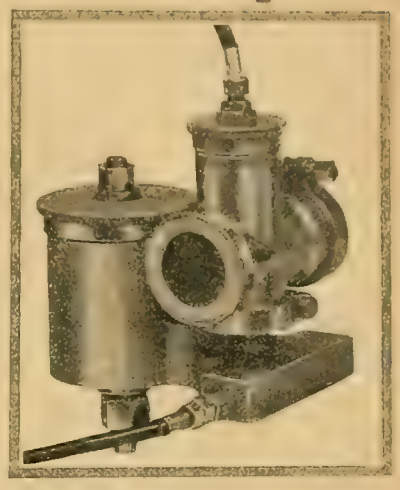
The most attractive point about the Wilkinson twelve-jet carburetter is the ability of the rider to vary the opening of the jets from the saddle. A flat valve covers the jets, and, by means of a Bowden wire, they may be covered and uncovered one by one. In other words, the driver has a carburetter completely

J. H. Wilkinson and the 5 h.p. single geared Matchless-Jap he used to demonstrate his twelve-jet carburetter.

controllable from the saddle, which may be immediately adjusted for slow running and low consumption, and at once made into a racing carburetter by opening up the jets. Thus the time taken to change jets in the ordinary way is done in a twinkling by a handle-bar lever with the Wilkinson instrument.



The ratchet mechanism at the base of the Wilkinson carburetter for uncovering the twelve jets. A cover plate is, of course, used.



The complete Wilkinson carburetter in its latest form.

We have tested some carburetters which, although giving extremely slow running, are unable to pick up rapidly without choking the engine. Twice, after running some distance with the Wilkinson carburetter at a very slow speed, we opened up the jets, and the engine at once gathered way, and we were soon travelling at a speed in excess of the legal limit. A separate lever is provided as usual for the air, and the port is of large size, and admits sufficient air when all the jets are in action.

It will be understood that with a variable jet carburetter petrol can be economised, and, furthermore, the engine can be kept very cool by governing speed by the lever controlling the opening of the jets. A choked jet is a thing almost unknown, as, if any foreign matter finds its way to one of the jets, a further opening of the lever clears the obstruction. The behaviour of motor cycles fitted with this device in important trials will be watched with interest, especially as more and more attention is now being paid to flexibility tests.

The Wilkinson carburetter is being made by Messrs. Rotherham and Sons, of Coventry, and will be handled in London by Messrs. Brown Bros., Ltd.

NEXT THURSDAY'S ISSUE
OF
THE MOTOR CYCLE
will be mainly devoted to
Passenger Motor Cycles of all Types.

HORSE POWER OF NEW VELOCE.

Since the description of the new 2 h.p., 2-stroke Veloce went to press last week, we received information from the makers, Veloce, Ltd., Fleet Street, Birmingham, that the brake horse power, developed at 2,800 revolution per minute is 3.6. They have therefore decided to call this engine a 2½.

STEEL PISTONS AND RECORDS.

It is interesting to note that when Mr. H. C. Newman broke sidecar records at Brooklands on Oct. 20th he used "Simplex patent steel pistons, made by the Oxygen Welding Works, Ltd., New Summer Street, Birmingham, on his Ivy-Precision.

Hill-climbing and Racing in New Zealand.

MOTOR cycle events are exceedingly popular in New Zealand, and two successful competitions were held last month, one a race meeting at New Plymouth, when five and ten mile races were held, and the other a hill climb at Lyall Bay, near Wellington. The racing was very keen, and in the five miles race Anderson (3½ h.p. Triumph) was first, after a Douglas rider had set the pace at the outset. Anderson was third in the ten miles, Boucher (3½ Rudge) scoring a fine win, with Coleman (2¾ Douglas) second.

Boucher is evidently one of the best riders in New Zealand, for he was in great form at the Lyall Bay hill-climb with his Rudge. He made fastest time of the day, and also received a special prize for being the rider whose two attempts varied the least in time, his variation being only one-fifth of a second. Other competitors rode Triumphs, Douglas, B.S.A., Indian, and Matchless machines.

J. Boucher (3½ h.p. Rudge), who won the hill-climb at Lyall Bay N.Z., on 30th September.

PETROL COSTS.

HAVING regard to the steadily mounting price of petrol, the accompanying curves are intended to point out the effect in the aggregate of, and the importance of striving after, any small improvements which can possibly be made in the petrol consumption (m.p.g.) figures.

Fig. 1. In these curves a yearly mileage of 6,000 is assumed, and the total cost in petrol can be read off when the mileage per gallon, and the price per gallon, are known. Thus, taking petrol at 1s. 9d. and the consumption as being 100 m.p.g., then the season's petrol bill would be £5 5s. Supposing a wasteful engine, a heavy 8 h.p. machine, or a sidecar machine, in use, and petrol consumption 60 m.p.g., then expenditure would be in the neighbourhood of £9. As showing the result of the constantly increased price of petrol, take the price in 1910 to have been 1s. 1d. At 100 m.p.g. the season's petrol bill would have been £3 5s. as against present £5 5s.

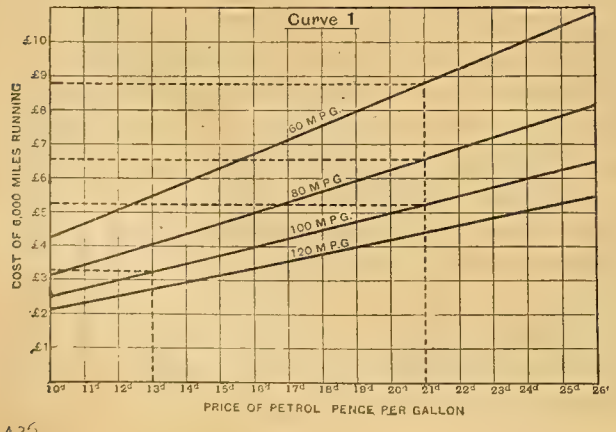


Fig. 2 shows in another manner the necessity of reducing running cost of petrol. The curve shows the number of miles running which can be obtained with varied consumptions (in m.p.g.) for the expenditure of £5 (petrol at 1s. 8d per gallon). The distance varies from 3,600 miles at 60 m.p.g. to 7,200 miles at 120 m.p.g. For every increase of 10 m.p.g. one stands to gain an additional 600 miles of running with the same expenditure (£5) on petrol.

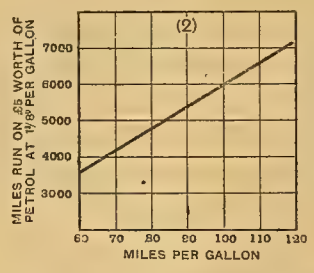

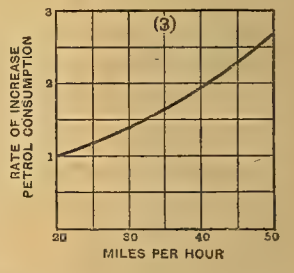

Fig. 3 shows the importance of moderate speeds in touring work, if m.p.g. figures are to be high. Taking a given level course, and considering a machine to traverse this course at different speeds ranging from twenty to fifty miles per hour with the same weight carried, and the engine working as nearly as possible at the same efficiency on each journey, then the curve would represent the ratios of the petrol consumptions at the different speeds, the consumption at 20 m.p.g. being taken as unity.

ELIGNUM.

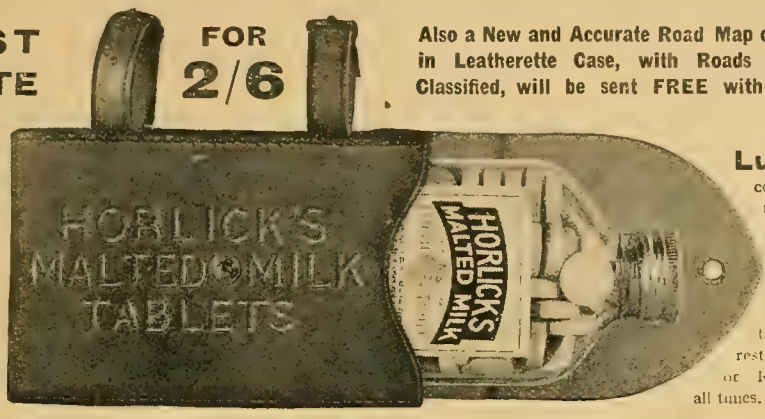
"Lathe Work by some Amateurs" is the title of a book recently issued by Drummond Brothers, Ltd., Ryde's Hill, Guildford. It describes various machines made on a Drummond 3½in. centre lathe by amateurs.

ANOTHER HORLICK OFFER.

A LEATHER CASE WITH FLASK OF HORLICK'S LUNCH TABLETS.

To be attached to the Frame.

BY POST COMPLETE FOR 2/6



Also a New and Accurate Road Map of ENGLAND & WALES in Leatherette Case, with Roads shown in Colours and Classified, will be sent FREE with this Case and Flask.

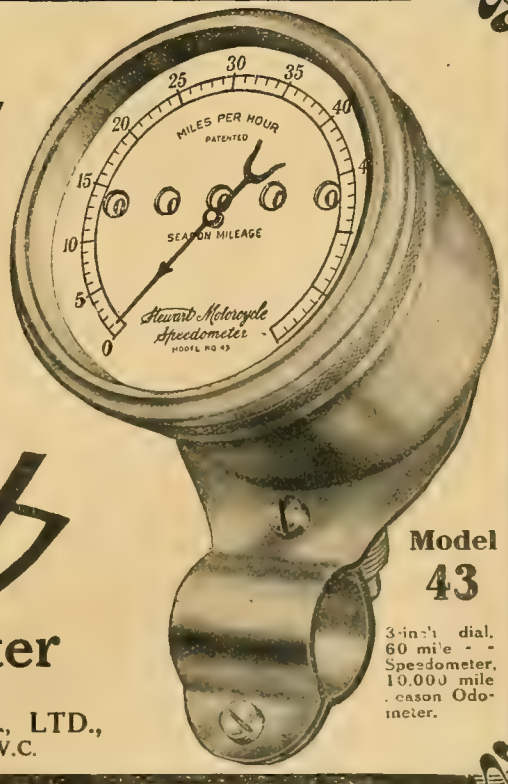
THE LEATHER CASE illustrated is strongly made in solid, light brown leather and is excellently finished. It may be attached to the handle-bars or frame in a convenient position, so that the Flask may be removed for use at a moment's notice without dismounting.

Horlick's Lunch Tablets contain all the valuable nutriment of full cream milk and choice malted grain in a convenient tablet form. A few dissolved in the mouth from time to time will supply the necessary nutriment to maintain strength and vigour, and restore energy when Touring or Racing and are useful at all times.

PRICES: IN GLASS FLASKS TO FIT CYCLE CASES—ONE SHILLING EACH,
and in Sterilized Glass Bottles, from which these may be refilled, 1/6, 2/6, and 11/-, at all Chemists and Stores.
Send Postal Order to—HORLICK'S MALTED MILK CO., SLOUGH, BUCKS.

PRICE NOW REDUCED TO 50/-

It is just because we do a larger World-trade in Speedometers than all other Makers combined that we are enabled to reduce the price of our popular Model 43 to £2 : 10 : 0. We can sell so cheaply because we make so many. We do not believe in keeping up prices and so keeping out a large section of the motor cycling public.
Model 43 indicates all speeds from zero up with unfailing accuracy, and can be read at a glance. Can be fitted either to top tube of bicycle for back wheel drive, or to *either side* of front wheel.



Model 43
3-inch dial. 60 mile - - Speedometer. 10,000 mile - eason Odometer.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry" or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

— THE —

1914 ROC GEAR.

The Roc gear is FIRST in 1914

Just as it was FIRST in 1904

Nothing could be better in quality, workmanship, or design.

These are its points:—

FOOLPROOF.
INDESTRUCTIBLE.
SMOOTH & SILENT MOTION.
GEARS ALWAYS IN MESH.
SINGLE REVOLVING PINIONS (meshing at any point).
IMPROVED FORK ENDS AND DUSTPROOF BEARINGS.
DOUBLE FULCRUM ADJUSTMENT.
PEDAL CONTROL.

The 1914 Roc gear has behind it the longest record of experience. The cost is not increased—it is fixed at 10 guineas until further notice, fitted ready for use.

In ordering specify:—The H.P. of engine; state whether sidecar is used.

NOTE—The Roc gear herein announced is the type adopted as standard for the 1914 Season which will be exhibited at Olympia. There is no need to wait. Send your machine now for the fitting. By the same opportunity we will examine the general condition of your machine, and where necessary re-enamel or overhaul at slight cost.

Apply for particulars now—

WE all know it; the elusive patch that curls up and clings to everything but the tube. Hard to find if you put it down; hard to stick when you put it on. Reliance Stiff-Back Patches will not curl up. Their stiff backing enables them to be affixed easily and securely without imprisoning air, then the backing can be removed and thrown away. Reliance Stiff-Back Patches make real, permanent mends, and are unaffected by heat.

CHEMICO RELIANCE Stiff-Back PATCHES.

In all sizes, from **1/3** per dozen.

CHEMICO CARBIDE.

The best Carbide money can buy. Every tin contains full weight of gas-yielding Carbide; all waste, dust, etc., being removed by careful cleansing.

½ lb. tins, **4½d.** 1 lb. tins, **7d.**

CHEMICO RUBBER SOLUTION.

The finest rubber solution obtainable. Sticks, and sticks tight, making repairs real mends.

In tubes, **1d., 2d., 3d., 6d.,** and **1/-.**

THE MOTOR CYCLE
ESTABLISHED IN 1903
AND FOR OVER SIX YEARS THE ONLY PAPER SOLELY DEVOTED TO THE PASTIME

The Future of Passenger Machines.

IN spite of the competition of the cycle car, which has now had a clear year in which to assert its rivalry, there is not the slightest falling off in the popularity of the sidecar, and from the indications and portents around us, 1914 will prove even more a sidecar year than has the past season. And there are not wanting signs that a very considerable number of motor cyclists are quite ready to put their hands in their pockets to the tune of £100 or even more for a sidecar outfit, so fine and luxurious are many of the latest productions. And all this in face of the old parrot cry that the sidecar was doomed because it was an unmechanical "contraption!" Well, unmechanical or not, the sidecar is very much alive, and, in point of fact, was never in a more healthy condition.

Much care and thought has been lavished by designers on motor cycles prepared especially for sidecar work, and a reflection of this skill is discernible in the sidecar attachments themselves, the best of which are now a credit to the finest machine imaginable. And it is not only in the combination itself that the industry has "spread itself," but also in its *accoutrements*. In this issue of *The Motor Cycle* we have devoted a large space to passenger outfits and their appurtenances, and a perusal of these pages will show that a number of cunningly devised little fitments for the general comfort and convenience of sidecar users are now provided by the big accessory houses. Indeed, this form of travel has now claimed almost as much attention from such firms as have light cars themselves.

With regard to the trend of design of passenger machines for 1914, we are very pleased to record that there is a general adoption of three speeds. A multiplicity of gears has been consistently urged in *The Motor Cycle* for years, and we are quite prepared to go further and urge the production of infinitely variable speed-changing devices giving ratios from zero to, say, 20 to 1, if such a desirable state can be arrived at by workable mechanical means. Anyway, three speeds are better than two, when a load has to be carried in hilly countries, though admittedly, a two-speed gear is simpler, usually lighter, and less costly.

Manufacturers evidently are fully alive to the fact that nowadays sidecars are serious touring vehicles, and much larger space is now being provided for fuel, and the better sidecars are being admirably equipped with neat little cupboards and drawers snugly fitted in scuttle dashboards, or behind the body out of the way of the passenger. Chassisless sidecars, which are easy to clean and have few external parts to break or rust, are coming into popularity, while the methods of attachment to the machine have been greatly improved, and the better designed connections are now absolutely safe, and at the same time easy of detachment, when required. Altogether, next year promises some very comfortable travelling *à deux*.

Coming to cycle cars, it must be confessed that the cycle car proper is still in rather a transition state. Some have been transformed into light cars proper, while certain makers are still undecided as to whether to adopt air or water-cooling, belt, chain, or shaft drive, or how to settle a hundred and one other details, so easy to decide in one's head, so difficult when worked out on the drawing board when a 7 cwt. vehicle is desired.

We believe that there is a great market awaiting the designer who can put a light, simple, and smooth running cycle car on the market which above all is absolutely reliable, but it will have to be sold at a price competitive with sidecars. The latter have now obtained such a firm hold in the affections of motor cyclists that the fight for the cycle car designer is hard. But struggles stimulate genius, and we have no doubt that one of these days a cycle car on simple lines will come along which will seize the rather fickle fancy of the public, and then this form of motoring will come into its own.

There is one point which we feel we ought to touch upon. There seems to be a feeling abroad in some quarters that motor cycles are in the near future to be considerably reduced in price. As a matter of fact there is no foundation for this rumour. It is true that some firms are marketing very serviceable machines at a popular figure, but no cheaper than was the case for similar types even six years ago, and the best-known makers are still asking and obtaining equal prices for their products to what they have obtained during the last two or three years. Indeed, in many cases, so numerous are the refinements added, higher prices will be the vogue than have obtained during 1913.

Lighting Dynamos for Motor Cycles.

It was no daring prophecy of the editor a month or two ago to hope that the motor cycle should only be a year behind the motor car in the matter of electric dynamos. Now such a system has been standardised. I have already seen a few machines so fitted, but the devices were either cumbrous or unsatisfactory. Good as the present day acetylene generator is, a little experience with dissolved acetylene has taught me the delights of a lighting system that is absolutely reliable and needs no cleaning. An electric lighting dynamo may be slightly less reliable than a cylinder of dissolved acetylene, at least for several years to come; but it is not a great deal more complex than a magneto, and within the short space of four or five years we have come to regard the magneto as the most reliable item in our specifications. A friend of mine uses a lighting dynamo of German origin on his push-bicycle; he is ignorant of its name, for he procured it as an odd traveller's sample, and fortunately he has never required any spares in three years' regular use. It is mounted in front of the forks over the front tyre, and in the daytime it folds back clear of the tyre; as night draws on, a touch of the finger or toe throws the hinged portion forward, and illumination instantly begins. It is difficult to imagine a more ideal lighting system; and there is this advantage, the power can also be applied for engine starting on heavy machines de luxe, and so enable the maker to dispense with kick-starters.

The Rear Light Question.

To my mind it is quite incredible that the authorities will not abolish this incubus at the earliest possible moment; I do not believe for one moment that the decision will go unrepealed for longer than the inevitable period demanded by the cumbrous machinery of the law. The decision may be good law, but it is too wildly illogical to appeal to anybody but a lawyer; and though we are so largely governed by lawyers nowadays, they are mostly men who have partially abandoned their original professions, and have learnt to dilute three fingers of law with a tumblerful of commonsense. In this instance, the old illogicality of imposing rear lights on the vehicles which are least often overtaken and most visible by night has been extended a step further. There would be much more to say in favour of compelling all pedestrians to wear phosphorescent hats after sunset, and every beast allowed on the roads after dark to have a Klaxon strapped to its brow, operated by wires leading to a switchboard breast-plate worn by the driver.

Perhaps the most extraordinary thing in the rear light controversy is the fierce hatred many cyclists, including a few veteran journalists, show towards th red reflex mirror. This hatred is one more examp of unreasoning prejudice. It is unfortunately true th motoring has grossly impaired the pleasures of cyclin There was a time when I thought no holiday bett spent than in eighty or a hundred miles pedalling *p diem*, and I visited all the hilly districts, such North Devon, or Lakeland, or the Highlands, whic still make me a little anxious about engine tune whe I revisit them on a motor bicycle. But such trips a largely spoilt nowadays—one feels less safe wit motorists about. One gets choked with dust, whic penetrates the best cycling garbs, and imparts a horribl gritty feel to the skin within ten miles of breakfas So, while one knows that the old must give place t the new, and that cycling must decrease until we g universally dustless roads, one can feel a profoun sympathy with the people who still cling lovingly t the push bicycle, and with the journalists who cater f them, and one can understand the occasional bitte ness of their resentment. But it is a thousand pitie when that resentment takes the perverse form of di couraging the red reflex mirror. No decent motori wants cyclists to use these mirrors in order that h may drive faster—most of us are as nervous as ol women in our night work. We want cyclists to us these mirrors in order that they themselves may b safer—we should drive no faster if the mirrors we legally compulsory and used by everybody. Selfish ness only enters into our motives in so far that w intensely dislike the risks of committing manslaughte that we have to run at present; for the simple fac is that in many conditions of the atmosphere a cyclis protected only by a small oil lamp on his front bracke is practically invisible till the motor car or moto cycle is within a yard or two of him. Every sensibl cyclist should do his best to extend the use of thes invaluable mirrors.

If the Worst comes to the Worst!

Supposing my sanguine optimism is hopelessly mis placed—and all our Governments have committed som dreadful *faux pas* in their time—I should opine tha electric lighting must boom rapidly. It is possible— under this supposition—that a device on the lines o the Miller rear light might be legalised, and migh become popular; readers are probably aware that i takes the form of a tiny acetylene lamp on the righ handle-bar grip, with a red lens facing backwards gas being supplied by a Y piece and a flexible tub from the main generator. But tiny items are not too promising when subjected to the vibration of a handle bar. Their dimensions scarcely permit of sufficiently staunch construction. The presence of a bulky self contained lamp at the tail of the carrier is hardly

TRIUMPH

Occasional Comments.—

thinkable—what a boon it would be to the makers of waterproof overalls—there would be more rips in the first week than there are now, and many a costly suit has met its Waterloo within seven days, as things are. I think a wee electrical tail lamp, mounted in the gap between the flat of the carrier and the tail of the mudguard would fill the bill best; and this, too, would almost need to be made of armour plate, for vibration is at its worst just there. If things come to this pass, the same source of illuminant might be applied to light transparent numbers with a red disc in the centre. A device of this kind was made for me by C. A. Vandervell and Co. as long ago as 1903, when the number-lighting law first came in. Owing to the fact that I used accumulators, it proved too bulky for my perseverance; but I should view it very differently if it were fed by a little dynamo.

Petrol Gauges.

Mr. Davison is, of course, perfectly correct in stating that the sunk-in type of gauge registers accurately. Its main defects are its invisibility (with all deference to him, I never managed to read mine from the saddle, though I have often tried), and the risk of losing the cut-off rod if it is not screwed tightly down, balanced by the risk of being deceived if the rod is tight home when one fancies it is loose, so that one learns how much petrol was in the tank perhaps an hour ago instead of the actual amount remaining. In other words, this gauge will suit a careful and methodical owner, but may be an innocent cause of annoyance to the happy-go-lucky. I agree with him that the "warning tap" is excellent; in fact, I prefer it to any gauge I have yet sampled, and as it is the cheapest expedient, I wonder it has not been more generally adopted.

"Jock" Outshone.

Mr. Eastburn's bull pup is not the only inhuman mechanic in the world. As long ago as 1901 I used to store an Excelsior tricar in a stable frequented by a tame cockatoo, and for a week or two I was extremely puzzled by the fact that the caps of my tyre valves used to vanish into thin air, and that I frequently found the machine with one or more tyres flat, and nothing remaining of the valve except the bare tube, which is, of course, secured to the tube. Breathing out threatenings and slaughter I kept a watchful eye on the small boys of the neighbourhood, only to discover that cocky was the real culprit, and that he used to chew the small parts off with his ingenious beak.

[Next please! One would not be surprised to hear that this interfering cockatoo drank the petrol and drained the crank case.—ED.]

Some Accessory Criticisms.

My eulogy of certain accessories brought me a crop of letters, confirmatory and otherwise. A reader in far Newfoundland objects to my statement that "Forward fasteners never break," and to show me "that there is nothing perfect under the sun," he enclosed a Forward link which had parted at one end. Actually his sample link was a magnificent testimonial, for, comparing it with my own long-enduring Forward links I should estimate that the link has not broken so much as worn through, after a probable distance of about 10,000 miles. Another reader disagrees with my praise of the Garner exhaust whistle. All I can say is, that if he has had trouble with a Garner, he would have trouble with any of them, for the Garner is most cunningly designed and exceedingly staunchly made.

The first two-stroke Triumph is for Miss Muriel Schulte, daughter of the managing director of the Triumph Co. Mr. Schulte rode the new model to his home at Kenilworth and soon his daughters were trying the machine, and manipulating it with the greatest ease. Mr. Schulte returned to the works that day a very happy man, for the first order for this type of Triumph was in his pocket!

Autumn 'Midst the Welsh Crags

BY GEORGE D ABRAHAM

Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.

WITH workaday England far behind and holiday Wales ahead, we sped forth from Chester. The wonderful summer had given way to a perfect autumn. Thus, with a splendid road under-wheel and the wayside an avenue of russet and golden glory, enthusiasm for the joys of autumn touring was easily roused. Lightheartedly we set out, and light of petrol, too, it proved ere Ruabon was reached. Speedy flight gave place to a gentle but unmistakable halt. Visions of magneto troubles or internal engine disorders came to mind, but the lack of motive power was soon discovered. Close by was a petrol filling and distributing station, where the landscape was almost blotted out by familiar red tins. Yet for us it was not a land of plenty, for a youngster in charge tendered the information that under stringent rules they were not allowed to sell petrol to passers-by. Under the circumstances we were certainly not included in the latter category, and after judicious interviews with officials the needful fluid was forthcoming, on the understanding that payment was credited at the nearest garage.

In due course we swung down into the valley of the Dee, and the beauties of Llangollen demanded a halt. The landscape is here referred to, but one of the ladies of the place supplied information pleasantly. The view from the bridge, with the dark green water wandering lazily 'midst huge brown rocks, was delightful. Barber's Hill seemed an appropriate name for the confronting mountain with its stubbly growth of pines, but the name came from a decidedly less picturesque source. Long ago a Deeside barber killed his wife on the mountains.

"Via Dolorosa."

Then, after crossing the bridge with its curious buttresses, we sped through pine woods and up past Corwen, with road surfaces steadily deteriorating. Nearer Cerrig-y-Druidion the running conditions became unspeakable in polite company—in fact, the worst encountered on any highway in twelve years of motoring. The road resembled a choppy sea suddenly petrified, macadamised, and covered with three inches of mud. However, we went muddling through successfully though nervously for five miles, mostly on the middle gear. Exciting moments occurred when traffic was met, and we slid bodily aside into the deeper quagmire on the side of the fairway through the mud. It was often a struggle to gain the road centre. The real trial came on the final curve, when a large car swung suddenly and skiddingly down upon us, flinging lumps of mire in all directions. Our spokesman, usually so voluble on such occasions, had just time to open his mouth when it was closed effectually by a flying fragment. Curiously enough, the fearful road surface, evidently caused through heavy traction engine traffic, changed hereabouts with surprising suddenness. Thus we whirled merrily upwards, almost thankful for a passing shower and its cleansing effects.

The long "straights" over the lofty moors to Pentre Voelas called for speed, and soon in front the great blue mountains stretched in wide array. There, on the left, was shapely old Snowdon, unmistakable amongst a host of giants rendered big and bulky by their contiguity. Then the Glyders led the eye around to the wonderful central dome of Tryfaen, with the long purple ranges of the Carnedds swerving away to the right and downward to the valley of the Conway.

Surely this is the grandest of all approaches to North Wales. The sight stirred the driver of the Clyno, a type of adventurous Briton who is only happy

The Clyno and its passengers in the shadow of Snowdon

Autumn 'midst the Welsh Crags.—

in a fierce speed draught or on a steep crag with open heaven above and little else below. Down from the 750 feet levels we flew, the speedometer readings being such that one was sorely tempted to break the old rule "never speak to the driver!" Then swiftly the pine trees came up to meet us, and we entered the mountain gateway, where gaunt grey rocks hung overhead, and far below us the Conway glistened amidst the tree-girt gorges. A glimpse up the Lledr Valley on the left reminded us that a slight detour would have led to the famous Fairy Glen; but wilder scenes had more attraction, and even familiar Bettws-y-Coed with its pretty bridge scenes at Pont-y-Pair only called for a slackening of speed to conform with the new and much enforced ten-mile limit.

Ogwen—The Best Mountain Centre.

The long climb upwards towards Capel Curig, the mountains led us past the Swallow Falls, even yet the grandest sight of the kind in Wales, despite the spread of sandwich papers, bottles, and other fragments which signalise the approval of tripperdom. We were glad to leave the carriage-crowded haunt and breathe the sweeter mountain air, though it were flavoured with the dense yet healthy exhaust of a large car which made the pace ahead merrily. The shapely peak of Moel Siabod now towered in front with the river Llugwy soon making noisy echoes in the gorge by Capel Curig. When Snowdon appeared ahead, we swung up to the right clinging still to the Holyhead Road, and making for the gap between Tryfuen and the Carnedds, wherein lies Ogwen Lake and its little cottage—the grandest mountain centre in all Wales. It is scarcely necessary to mention how we spent the next few days there clambering up innumerable crags and feeding on inexhaustible Welsh mutton. The words of a writer in the visitors' book were true enough.

"The dose you'll more or less repeat on each successive day
Till when you meet a mountain sheep you'll turn the other way."

However, it may be mentioned for those who go to Wales for mountaineering and motoring that Ogwen is the very best place to stay. It stands practically 1,000 feet above sea level, and so gradual is the approach thereto that its loftiness is scarcely realised. Even the steepest side of the Nant Ffrancon Pass from Bethesda needed little else than top gear from the well-tuned though over-loaded Clyno.

Numerous motor travellers are beginning to realise that from Ogwen Cottage, the Glyders, which afford the grandest mountain views in the Principality, may be most conveniently ascended by any ordinary pedestrian. The peaks themselves are most interesting from this side, with their huge ridges enclosing tiny tarns, glistening like silver gems in crag-girt hollows. Tryfaen should also be climbed from Ogwen as well as the two masses of Carnedd Dafydd and Carnedd Llewellyn, the latter only a few feet lower than Snowdon, and until the railway finally settled the argument, often considered loftier than the Queen of Cymric peaks. Thousands of motorists pass by Ogwen Cottage without realising that the romantic hollow of Llyn Idwal, with its frowning bastions of the Devil's Kitchen rising above the blue waters, is scarcely ten minutes' walk away from the main road. It is the most beautiful bit of wild lake and mountain scenery in Wales, if not in all Britain. The fact that venturesome cragsmen have been flung to their doom in fruitless efforts to climb the Devil's Kitchen adds to the impressiveness of the scene.

These details and many others we had learned on previous visits, for this district is the rock-climber's paradise. Thus, after a few days of energetic sojourn, we turned the Clyno towards the south-westerly side of Snowdon. It was a glorious run over the wild moors, now dark crimson, mantled with the fading heather, and aflame with the ruddy glow of the dying bracken's colour splendour. Then from Capel Curig to Pen-y-gwryd the purple heights drew ever nearer and nearer, until at Pen-y-Pass, the *gorphwys fa*, or resting place, at the top of the Llanberis Pass, the heart of Snowdonia was regained. The dangerously hidden corners on the approach to the top of the famous pass were at last receiving attention. Great masses of rock had been cleared and by next season there will be no further need for rash motor cyclists to perform aerial flights over the wall to alight providentially on soft mountain slopes. In the way of narrow escapes records have been broken here—next time something more vital may be shattered.

The driver of the Clyno on a gradient of 1 in 1.

We found at Pen-y-Pass that on account of the copper mines being now closed permission may be obtained to ride over the fell road. This runs up to the shores of Llyn Llydaw, into the heart of the mountain solitudes within an hour's walk of the top of Snowdon. Who would now go up the peak by the railway which runs up the dullest, ugliest side? Rather let them come by motor and afoot from the Llydaw side—'midst all of the greatest interest and beauty that Snowdon can offer.

After renewing the acquaintance of mountains and mortals thereabouts we returned to Pen-y-gwryd, and thence down that wonderful road to Lake Gwynant, with Yr Aran, Llrwedd, and the other great peaks playing hide and seek with us amidst masses of sunlit vapour. Silver birches, now golden, drooped over the roadway, and only the song of the mountain streams broke the stillness as we skimmed valleywards with engine at rest. But suddenly the drowsy peace of mind was broken. At the first sharp corner a sidecar machine was encountered with small space to spare for our passing, and its passengers dismounted. The cry—"a broken spindle"—was wafted to us as we flew past, but trusty brakes soon stopped progress.

Autumn Midst the Welsh Crags.—

Then we learnt that the unlucky, or lucky, travellers, as the case may be, were hung up 800 feet high and five miles from anywhere with a broken front wheel spindle. By marvellous good fortune they had just pulled up to enjoy the wonderful view when the wheel collapsed; otherwise there would have been serious work for the doctors. A temporary spindle was fitted out of toolbag fragments, and finally, we left the two adventurers determined to push their machine to Beddgelert. Incidentally, it seemed to us that stronger spindles are required for the front wheels of sidecar machines, which travel these mountain roads. On such places the strain on the front wheel bearings is excessive. An anxious inspection of the Clyno front wheel details added to peace of mind once more.

At the crest of the Nant Ffrancon Pass. Ogwen Cottage is seen nestling under Tryfaen, with the Glyders on the extreme right.

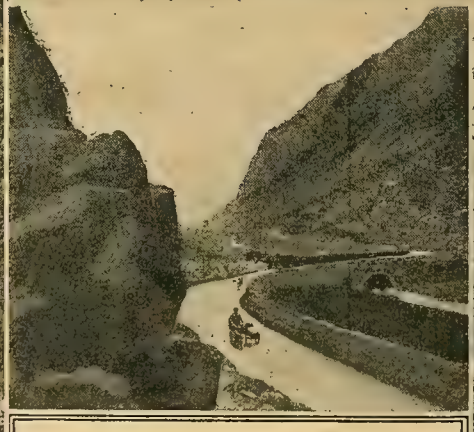
On the shores of Llyn Ogwen, with the many peaked mass of Tryfaen behind.

Mountain Trips.

Then down by the shores of Gwynant we threaded through tawny groves of elm, beech, and chestnut to Llyn Dinas, undoubtedly the most beautiful of the two lakes, for the motor way skirts close to its open shore line with Moel Hebog bulkily lofty in front. At Beddgelert, with its pretty scenery on the Gwynant River and the bridge so favoured in poem and picture, we turned off to the right. Five miles of gradual ascent on the Carnarvon highway brought Rhyd ddu within sight. There we found a delightful abiding place for the exploration of the mountains 'twixt Snowdon and the sea.

On one day a delightful trip was made through the beautiful Nantlle Valley towards the coast. Nazareth, a typically quaintly named Welsh village, attracted attention as a halting place from which to visit the adjacent heights. The roads were excellent in this region, and seemed practically unknown to motor folk. Shortly after leaving Rhyd ddu there was one mile-long hill leading down into Drws-y-Coed which would commend itself to tyre makers especially. Of the three gates thereon

(1) In the pass of Aberglaslyn. In the Autumn time, the mountain girt gorge is a wonderful scene of colour splendour. (2) Into the mountain gateway of the Llanberis Pass. The bridge is known as Pont-y-Cromlech.



(3) Through the narrow jaws of the Nant Ffrancon Pass. A peak of Carnedd Dafydd rises 2,000 feet.

Autumn Midst the Welsh Crags.—

one occurred with startling suddenness on the steepest section, and only a strongly braked wheel saved its disreputable appearance from further aggravation. The upkeep of that gate is said to be heavy.

"Spitty Evan."

Another typical day was spent in a run up the Festiniog Valley to visit the rugged crags of Moel Wyn. The way lay through Beddgelert to Aberglaslyn Pass. An aureate array of larches clung perilously to the steeps which rose to bare grey crags overhead, whilst a hundred feet below the roadway the torrent echoed noisily. But louder still during our halt there came a small car up the pass, its big engine misfiring, spluttering and spitting lustily. The driver, nodding ahead, asked: "Is this Spytty Evan?" The obvious answer was, "Yes! You're sitting on it." However, we pointed out the proper way to the curiously named village, Yspytty Evan, pronounced Usputty Efan, and away went the noisy interlude back down the pass to take the left-hand turn over Aberglaslyn Bridge. We followed later, avoiding the rough mountain road by Tan-y-Bwlch, passing through Penrhyndeudraeth and Mæntwrog *en route*. During the scramble up Moel Wyn our machine was left in the village of Tanygrisiau, much to the interest and amusement of the natives, one of whom mounted guard over it with a serviceable "shillalegh," and no machine could be "garaged" more securely!

The return journey to Rhyd ddu was made through Portmadoc, where a 9d. toll was gladly paid for the crossing of the estuary. Thence the splendid highway between the mountains and the sea was followed by Dolbenmaen, Pen-y-Groes, and Nantlle.

The Homeward Journey.

For the homeward run to Chester the Llanberis Pass was the first objective. With thick clouds filling the wild valley and hiding the rugged head of Mynydd Mawr—or elephant mountain—we hurried along by the reedy shores of Quellyn Lake to Carnarvon. Thence, away up past the lakes of Padarn and Peris, with their slaty turmoil, we sped forward into the narrow jaws of the dark pass. The Clyno seemed to feel the breath of the coming storm, which finally chased us up the steep road into finer weather on the easterly side. The surface on the famous pass was excellent. With heavy luggage and passengers to match the Clyno climbed the pass with its heavy load grandly on the second gear

Then soon the great mountains sank behind as we whirled swiftly down to Bettws-y-Coed and seaward along the valley of the Conway, missing the toll-less bridge at Llanrwst, and finally crossing the river at Tal-y Cafn. By Colwyn Bay and a glorious coast road, Chester was reached in the grey evening light. Next day came the farewell to the trusty Clyno, whose speedometer reading bespoke nearly 500 miles of faithful service. No better companion could be wanted on any mountain wanderings. The detachable wheels of the Clyno make is particularly suitable for work on roads that are likely to cause tyre trouble, for it is literally the work of a moment to substitute the spare wheel and have the puncture repaired on arrival at the end of the day's run.

(1) The long gate-barred hill leading down into the Nantlle Valley from Rhyd ddu. Bwlch-y-Drws-y-Coed—the pass of the gate way into the wood—is the name of the hill.

(2) In the Nantlle Valley. A splendid road runs along this beautiful mountain enclosed valley, which more motor cyclists should visit.

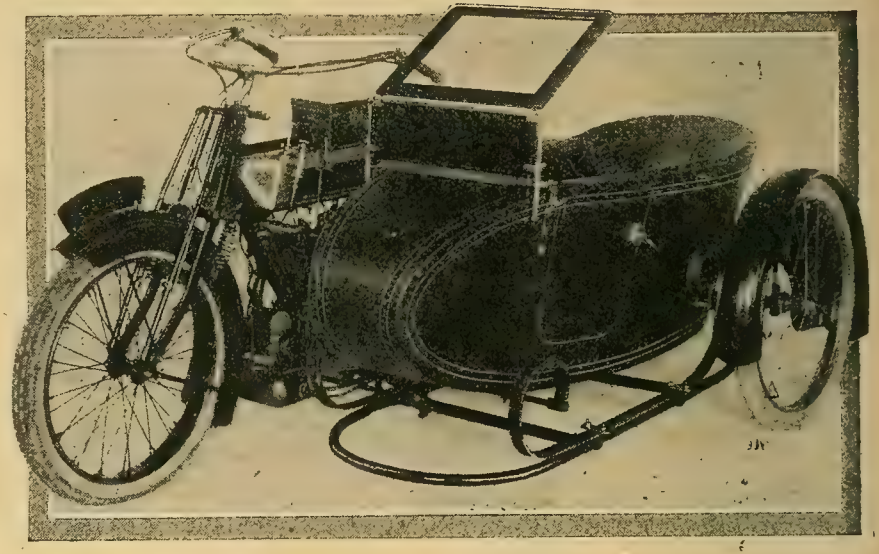
(3) On the shores of Llyn Dinas. Moel Hebog rises above the lakes further-shore line.

PASSENGER MACHINES OF ALL TYPES.

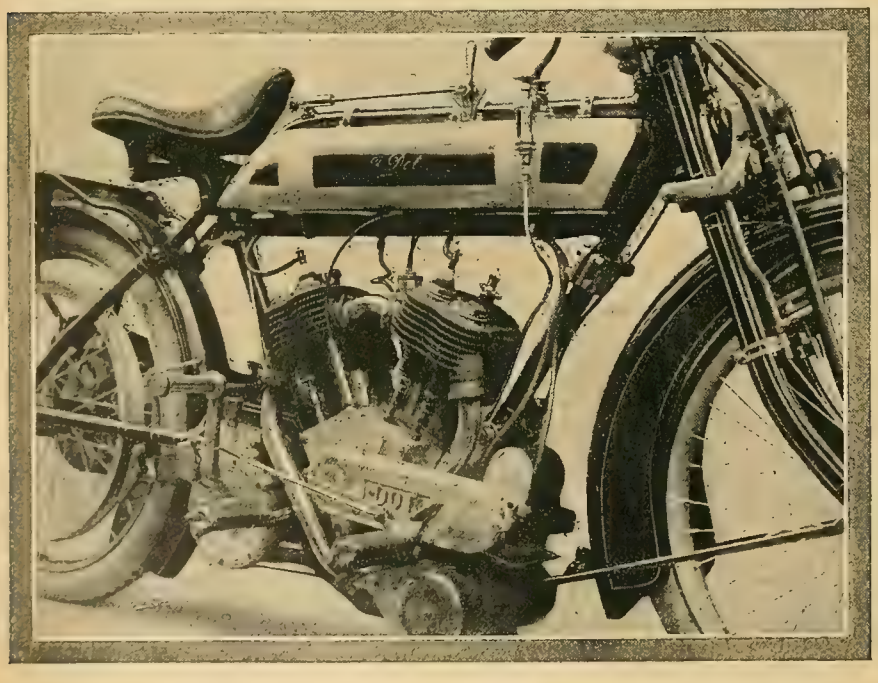
In the following pages we give particulars and illustrations of a number of 1914 passenger models of all types. All of these will not be exhibited at Olympia, but none the less possess considerable interest. Further new designs of motor cycles, sidecars, and cycle cars, will be illustrated and described in our next two numbers, which will be mainly devoted to the Olympia Show exhibits.

THE DOT SIDECAR MODEL.

One of the most successful twin-cylinder machines in competitions has been the Dot, made by H. Reed and Co., Ellesmere Road, Hulme, Manchester. The power plant is either a 6 or 8 h.p. twin-cylinder J.A.P., and the transmission is by chain throughout, a Jardine G.H. three-speed gear being fitted on the counter-shaft principle, a kick starter being provided on the gear-shaft. Another new feature for 1914 is the provision of a long exhaust pipe from the silencer to the rear of the machine and the fitting of a very neat internal exhaust lifter to the engine. Saxon spring forks are fitted, and other features of this admirable machine are an Xl-All saddle, a very large wedge-shaped brake acting inside the V of a dummy belt rim, and a very large carrier of particularly strong design. A drip-feed lubricator is also used, and the turnout should make a magnificent sidecar machine capable of taking a heavy touring load anywhere the wheels will grip.



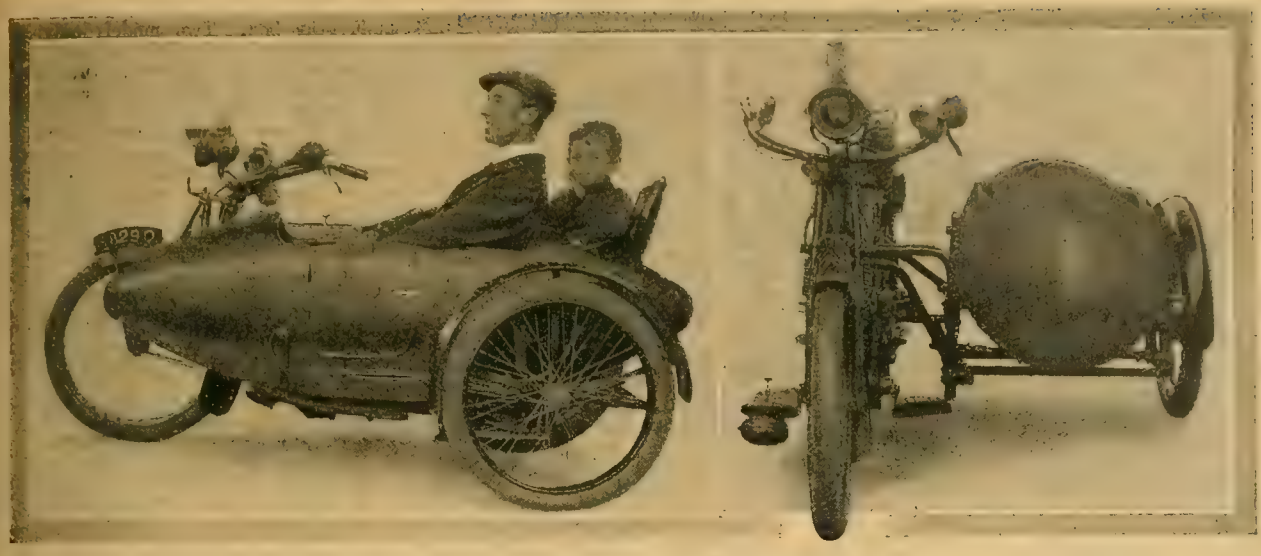
The 1914 6 h.p. three-speed Bradbury sidecar combination.



Showing the power unit, counter-shaft gear, and kick-starter on the 1914 model 8 h.p. Dot-Jap.

6 h.p. TWIN BRADBURY.

Wonderful as has been the success of the 3½ h.p. single-cylinder Bradbury when fitted with sidecars in competitions and in the hands of private owners this year, this firm evidently recognise that there is a large demand for a more powerful type of passenger machine, and are therefore marketing for 1914 a special sidecar outfit equipped with their new 6 h.p. twin-cylinder motor, which we have previously described. A three-speed counter-shaft type gear box embodying a large clutch is employed, and the drive throughout is by chain. The sidecar fitted is an extremely handsome and well designed turnout, with ample leg room and an excellent large door. A great feature is made of proper mudguarding of the sidecar wheel, and this has been so well carried out that the passenger should not suffer in the least from mud or wet being thrown by the wheel. The chassis is underslung and long C springs are employed fore and aft. Altogether, this is a most taking turnout, and should go far to enhance the already excellent reputation of this firm's products. For those who require a less powerful machine for passenger work, Messrs. Bradbury are



A novel design of sidecar is that made by Mr. S. B. Killin, and illustrated above. The addition of a dickey seat at the rear will be observed.

marketing a 3½ h.p. single-cylinder model with a two-speed counter-shaft gear box and belt-cum-chain drive, a kick starter being embodied with the gear box. Features of this machine are the long comfortable footboards and the very long lever on the side of the tank for changing the gear.

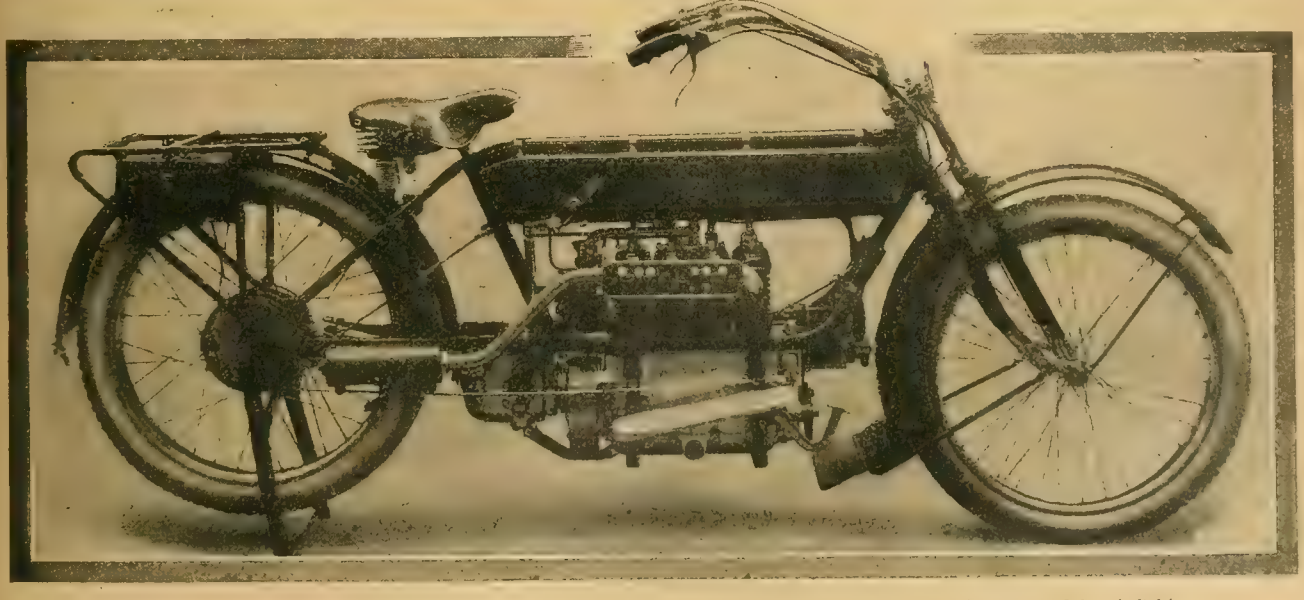
A STREAMLINE SIDECAR.

There is no limit to the ingenuity of sidecar manufacturers. The present boom in passenger machines has evidently stimulated makers to devise many, and strangely shaped sidecars, the "freakiest" being on view at a B.M.C.R.C. meeting at Brooklands. But it is quite possible to make a wind-cutting attachment of very distinctive design, without in any way coming into the "freak" category, and this desirable state has been attained by Mr. S. B. Killin, 261, High Street, Hounslow, with the New Torpedo sidecar. A perfect stream line effect has been gained, and also a dicky seat, large enough for a good sized child, is incorporated in the design. Also there is ample leg room without giving undue length to the coachwork. An excellent feature is the very long springs on which the sidecar is suspended. The coachwork is of sheet metal, and the dimensions are 6ft. 6in. long and 2ft. across the centre. An excellent feature of the dickey seat is that it is practically impossible for a child to fall out, as the folding well-padded back reaches up to the shoulders of the occupant. When empty, the back folds down. The price is £16 16s., and a wind screen can be fitted for 30s. extra.

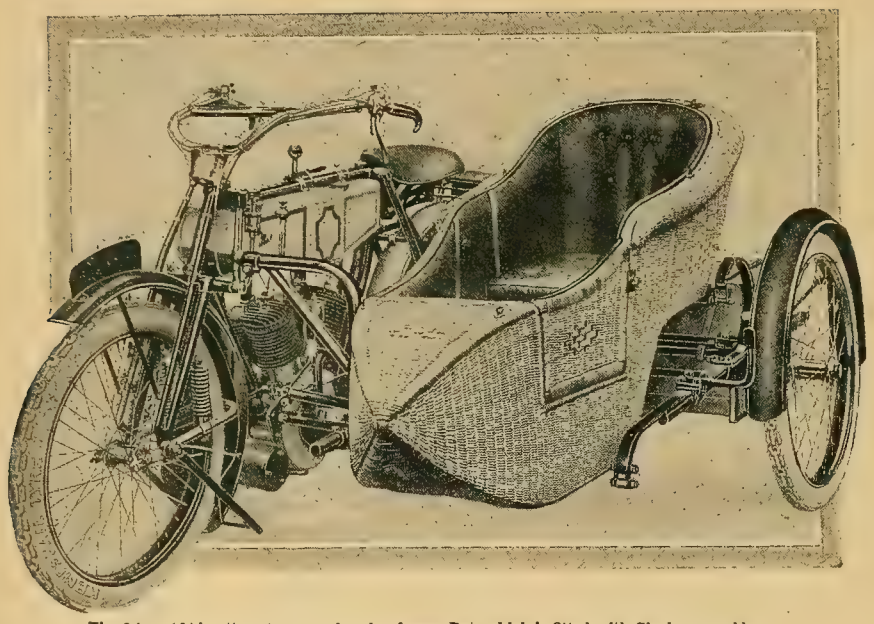
F.N.'s AS SIDECAR MACHINES.

In these days of luxurious sidecars, which demand considerable power from the motor for comfortable use, it is unusual to come across sidecars attached to quite light machines. Yet Messrs. F.N., Ltd., inform us that the 2½ h.p. F.N. is frequently used for sidecar work and, carefully driven in reasonable country, can perform quite good service in this way. Indeed, such a combination has been driven through the London-Edinburgh Run with success. Of course, no great speed or hill-climbing power can be expected from so low a power when loaded in this manner, but for ordinary use the machine is capable of giving good service in this direction. It is a tribute to the excellence of the F.N. workmanship that the frames of these little machines are strong enough for such work.

A sidecar machine *par excellence* is the latest four-cylinder F.N. of 7 h.p., bore and stroke 52 × 88 mm. It has a car type three-speed gear box and clutch, and shaft drive, and will make its first public appearance in England at Olympia.



Quite one of the most taking designs of passenger machines for 1914 is the four-cylinder, three-speed F.N. of 7 h.p. illustrated. It has shaft drive.



The 8 h.p. 1914 pattern two-speed spring frame Bat, which is fitted with Gloria cane sidecar.

BAT TOURING COMBINATION.

The combination of a two-cylinder Bat with a Gloria sidecar provides one of the most admirable touring passenger outfits imaginable. This machine is in no way a solo mount, but is specially designed for drawing sidecars of the heaviest and most luxurious type. The main alteration for the 1914 model will be the fitting of a three-speed gear box instead of the two-speed as has hitherto been the custom. This is a car type gear box, and is situated on the counter-shaft, the drive being by chain, a kick-starter being provided, acting on the gear box shaft. A clutch is incorporated with the gear, and next year practically double the friction surface will be provided. The whole construction of this mechanism is of the most robust description, and great rigidity throughout is noticeable. The motors fitted are either a 5-6 h.p. or a 7-8 h.p. J.A.P., gas being supplied by an Amac carburetter, and Kempshall tyres will be fitted. A minor but noticeable alteration for next year will be newly designed hubs fitted with journal ball bearings, which is a move in the right direction, as with these powerful sidecar combinations there is apt to be some considerable wear on the front wheel bearings unless these are fully up to their work owing to the drag and pressure of a heavy sidecar at corners. The whole outfit is most luxuriously equipped, and no pains have been spared in order to make this machine a thoroughly serviceable go-anywhere mount. It is capable of climbing any hill on which the wheels can gain a grip. The well-known Bat suspension type front forks are, of course, retained.

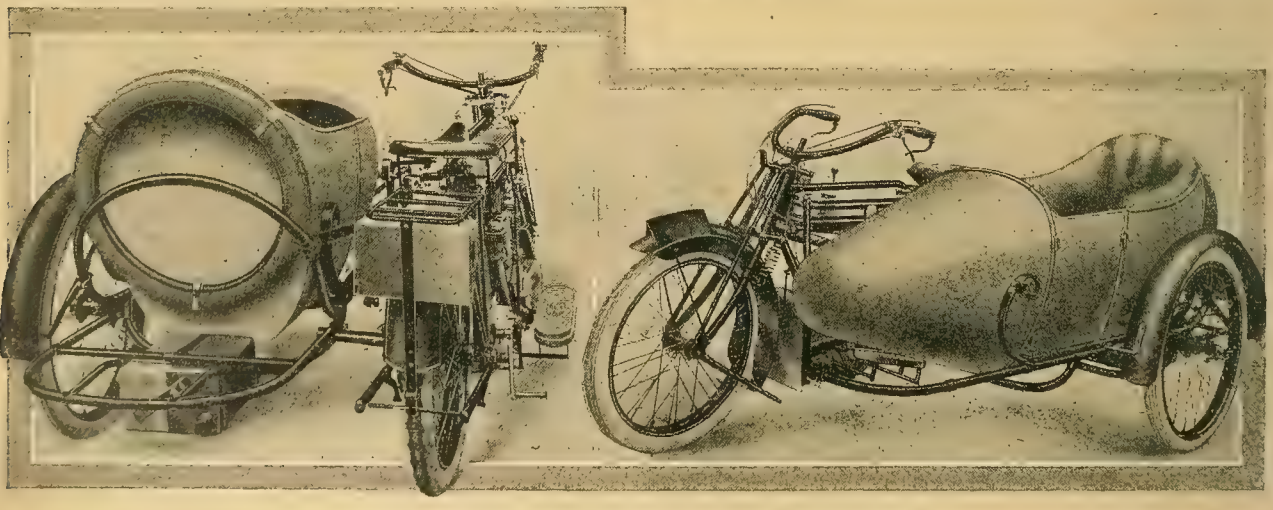
THE CHAIN-DRIVEN REX-JAP.

A new move has been made by the Premier Motor Co., Birmingham, who will in future produce the Rex-Jap machines at their own works in Great Brook Street. The greatest departure from their present model is the adoption of enclosed chain drive and a three-speed counter-shaft gear box. Two models only will be made, a 6 h.p. 76 × 85 mm. twin and an 8 h.p. 85 × 85 mm. twin. Both these models will be identical except for the engine. The engine is carried in a sturdy frame, which incorporates all four sidecar lugs. The magneto is directly over the large silencer and just in front of the engin and a large metal shield protects it from mud and water.

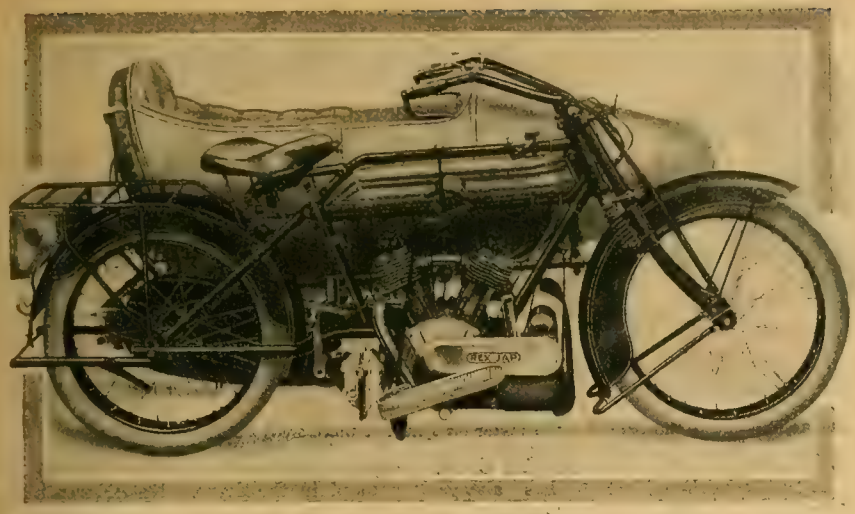
Immediately behind the seat post a three-speed sliding gear box is mounted, the clutch, which is of the cork insert type, being carried on the primary shaft. Gear ratios of $4\frac{3}{4}$, $7\frac{1}{2}$, and $12\frac{1}{4}$ to 1 are

Rex-Jap kick starter showing method of adjusting rear chain.

supplied, and the gears are changed in a gate. Both driven and driving chains and the quadrant and pinion kick-starter gear are entirely enclosed in substantial casings made of stamped sheet steel, and provision has been made for simplifying the detachment of the rear wheel. The rear hub incorporates a large internal expanding brake, which is operated by pedal through the medium of a Bowden cable. The front hub has been considerably enlarged and has been rendered waterproof. 650 × 65 tyres are fitted all round and the rims are of the flat base type, with countersunk spoke nipples. The rubber-covered footboards have deep heel pieces and are sprung at the front end, which, combined with a sprung saddle pillar and adjustable position handle-bars, should provide a comfortable riding position for a driver of any height. The heaviest type Druid spring forks, ample (5in.) guards, and a metal-covered



Two aspects of the latest model twin-cylinder Rex-Jap and coach built sidecar.



Valve side of an entirely new pattern 8 h.p. Rex-Jap, with three-speed counter-shaft gear, and all chain drive.

tool case at the rear end of the carrier, complete an excellent specification, and the lubrication is by an adjustable sight feed drip. Brampton Bi-flex forks are fitted.

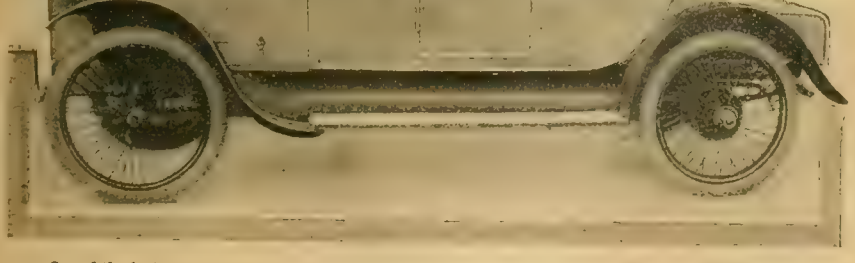
A Comfortable Sidecar.

A well carried out sidecar is made specially to suit the machine and can be supplied with or without the Premier Motor Co.'s special quick-fit coupling. The chassis of this sidecar has been carefully thought out and is extraordinarily strong, the mudguard particularly being stayed to prevent rattle. A large luggage carrier can be obtained as an extra, and is fitted to carry a petrol can underneath. The body is light and roomy, being long enough to suit the tallest passenger, and having a distinctive torpedo nose. A special sidecar chassis will be made by this company to suit the new Indian models, the body for which will carry a large electric lamp built into the nose.

THE WOODROW CYCLE CAR.

This excellently designed cycle car called after its makers, Messrs. Woodrow and Co., Stockport, has a number of features calling for favourable comment. The engine is a 9 h.p. air-cooled J.A.P., set across the frame, and the drive is transmitted through a friction-coned clutch to a three-speed and reverse gear box situated in the centre of the chassis, the gears being changed by means of a gate. Thereafter the drive is taken through a propeller-shaft fitted with two universal joints to the worm-driven back axle, the worm being situated on the top of the wheel. The front axle is underhung, and the springs, front and back, are of the semi-elliptic car type. A feature of the chassis is the strong manner in which the pressed steel side members are brazed together by cross tubes. The wire wheels are 650×65 mm. detachable and interchangeable, an excellent feature.

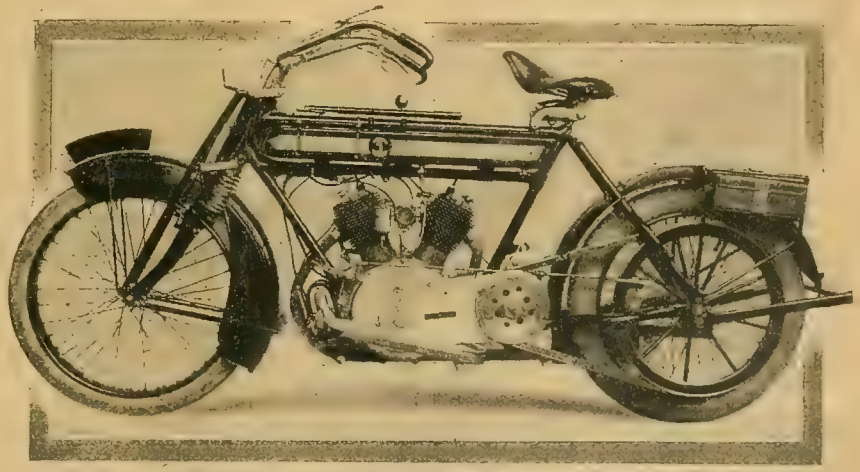
Rack and pinion steering is fitted with ball steering heads, while two sets of internal expanding brakes are placed in the back wheels. The whole car bears evidence of very careful design, and it is claimed that running costs are very low, about 50 to 60 miles to a gallon being obtained, while the car on top gear is capable of speeds up to nearly 50 miles per hour, although owing, largely, to the use of a good sized external flywheel the motor is flexible enough to allow it to fire regularly at practically a walking pace on top gear.



One of the features of the latest pattern Woodrow cycle car is its clean lines and pointed front, thereby affording less wind resistance.

A SPECIAL PREMIER.

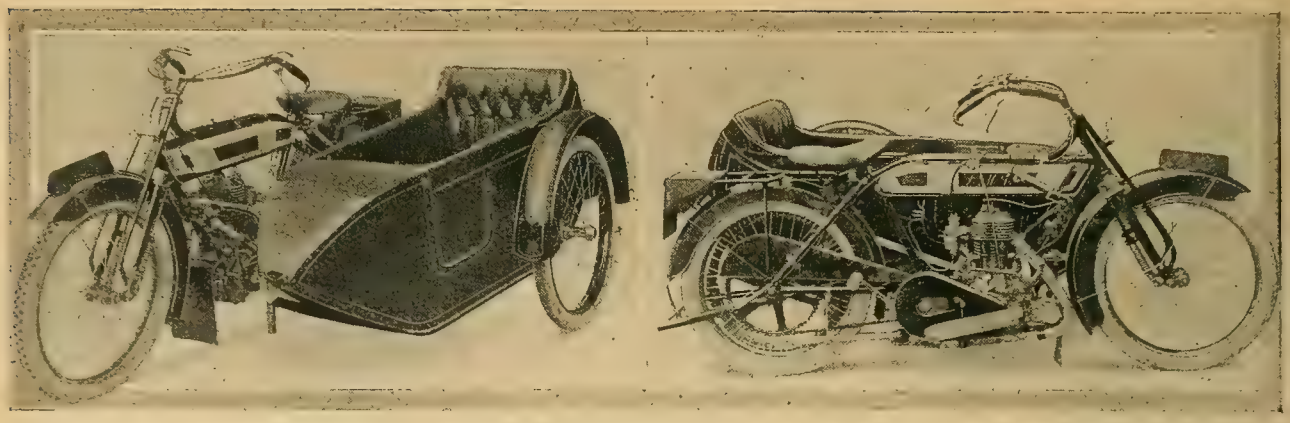
The 7-9 h.p. Premier which we illustrate has been supplied by the Premier Cycle Co., Ltd., Coventry, to the order of a South African rider. It will be noticed that the frame and saddle position are very high, as the rider is over 6ft. 3in. in height. The height of the XI'All saddle from the ground is 40in., and the machine is remarkable for the large size tyres fitted—765×65 mm. in front and 700×80 mm. on the back wheel. The engine is a standard 7-9 h.p. Premier, and the Premier counter-shaft gear with enclosed chain or belt drive is fitted, a noticeable point being the very large belt pulley. The machine, of course, is very heavy, but, as it is intended for use in the Orange Free State, where comfort and strength are essential, it should prove thoroughly up to the most exacting work. As an example of a special Colonial model, the machine is highly interesting.



A Special Colonial model 7-9 Premier. This machine has been built to the order of a very tall rider in the Orange Free State, and the size of the rear tyre is a notable feature.

THE INTERESTING LLOYD TRANSMISSION.

The L.M.C. is a machine which has gained an admirable reputation in a comparatively short space of time, but the designer, Mr. Lloyd, has had years of experience behind him, as he was the designer of the original Quadrants which obtained such a wonderful reputation in the early days of motor cycling. The L.M.C. designer is one of the growing

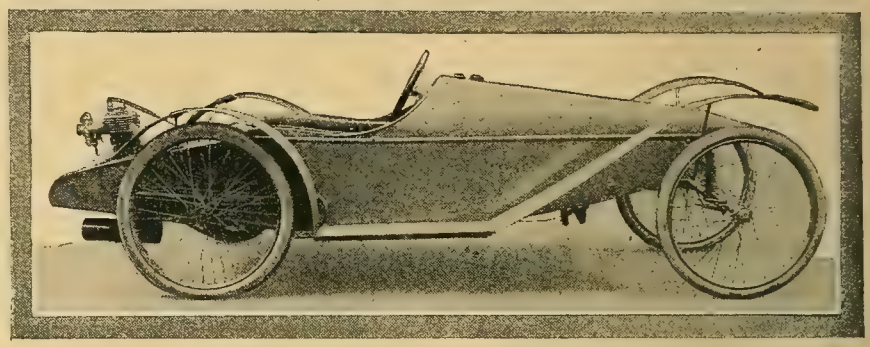


The latest two-speed L.M.C. machine, to which is attached a Bramble sidecar the springs of which are invisible.

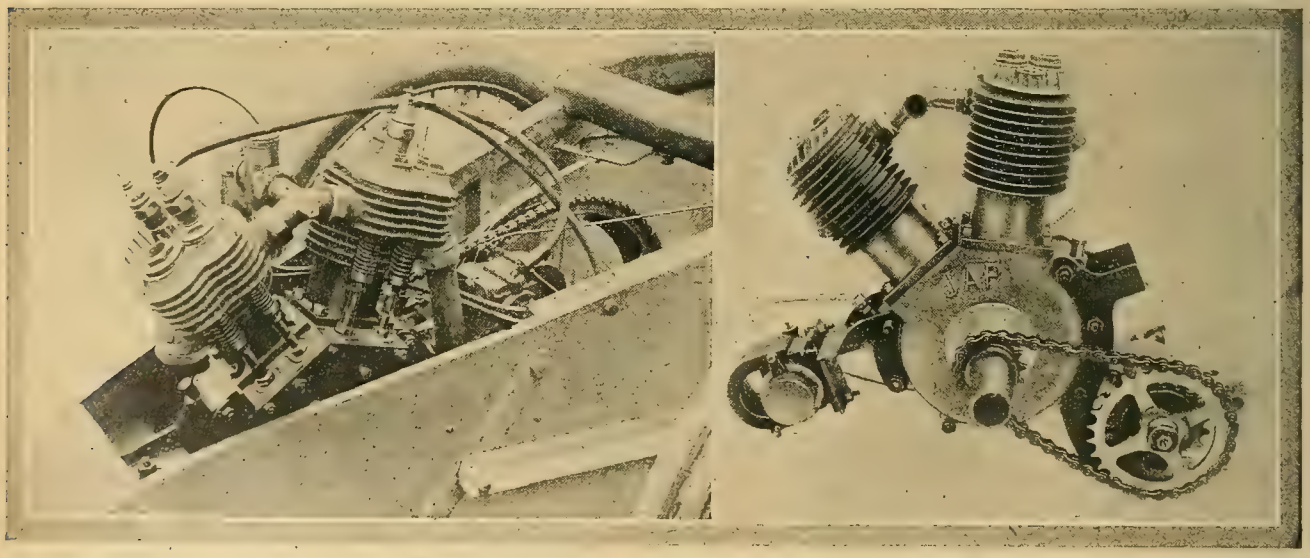
band who pin their faith largely in a big single cylinder, and for 1914 are marketing a special sidecar mount with a motor of 89 mm. bore and 92 mm. stroke, which gives a cubic capacity of 572. The outstanding feature of this machine is the system of transmission employed, a belt transmitting the power on high gear and a chain on low. This has a great many features to recommend it, chiefly as it ensures the smooth drive of a belt for ordinary work, while for low gear there is no possibility of slipping. The whole design is very neatly carried out, and the total extra weight involved by this gear is slight. The motor is rated at 4 h.p., and a kick starter, spring footboards, special large silencer, L.M.C. spring forks, and a mechanically-operated half compression device are features of an interesting machine, and an excellent idea is the fitting of 2½in. tyres. The price is reasonable for the sidecar combination, which sells at £75. Messrs. L.M.C. also manufacture a wide range of 3½ h.p. solo models, and although sidecars for the above are supplied, the company recommend the use of their 4 h.p. motor for passenger work.

A FEATHERWEIGHT CYCLE CAR.

A little vehicle which has always attracted a great amount of attention whenever seen in public is the Carden cycle car. A feature of this machine is that the body is practically a cigar shape, and the engine is situated behind the back axle, and transmits the drive through a short chain to the axle, a multiple-disc clutch being fitted to the engine and a spring shock absorber incorporated in the drive. No differential is fitted, and although up to the present this machine has only been made with a 3½ h.p. J.A.P. single-cylinder engine, it is now proposed by the Carden Engineering Co., Ltd., Farnham, Surrey, to market three models for 1914, viz., the simple single-cylinder single-speed model, the same type fitted with a 5 h.p. twin,

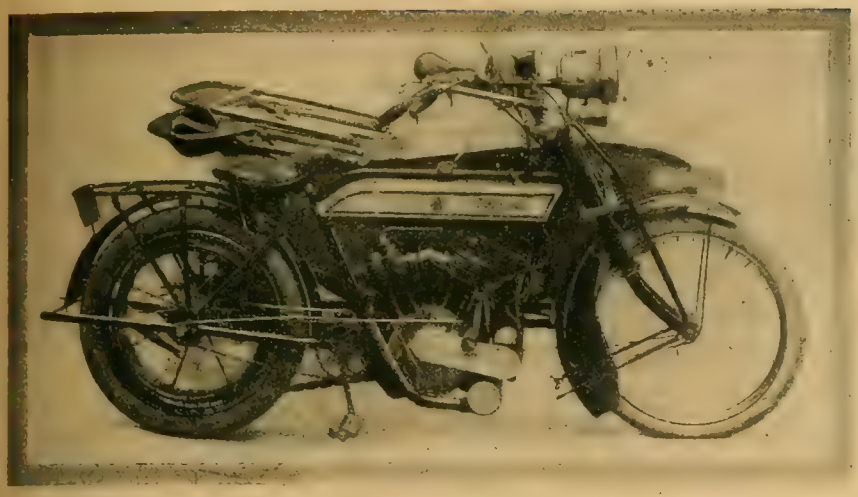


Side view of the novel 3½ h.p. four-wheeled Carden cycle car.



Rear view of the twin-cylinder Carden showing engine, magneto position, and chain drive.

4 h.p. twin Jap engine with change speed gear box on Carden cycle car.



Side view of the twin-cylinder Hercules, fitted with Sturmey-Archer three-speed gear and 6 h.p. J.A.P. engine.

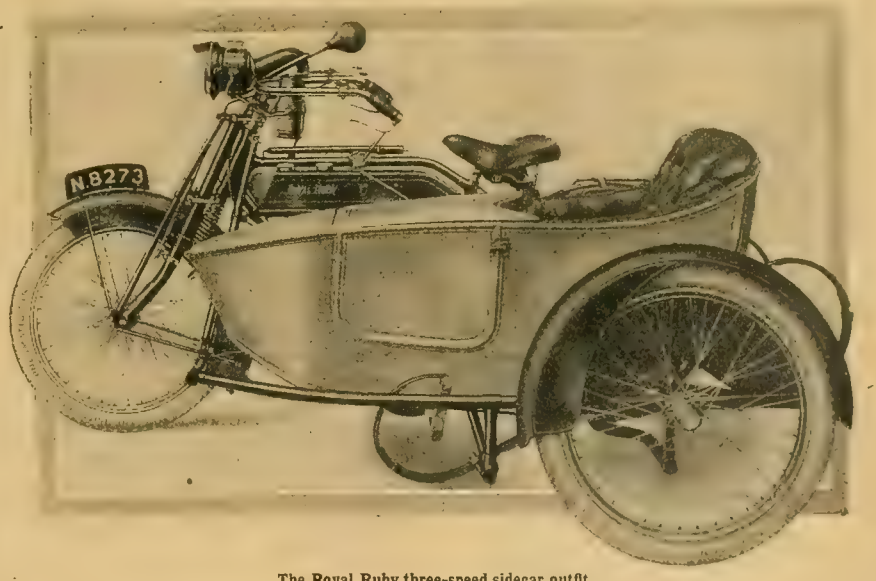
and a 4 h.p. twin fitted with a two-speed gear. The prices of these little vehicles are exceedingly moderate, in fact they cost little more than a high-class motor cycle, and as they only seat one person they may best be described as a motor cycle on four wheels, but at the same time it is claimed that the Carden suspension, which is a combination of levers and spiral springs, renders the machine exceedingly comfortable, and the driver is certainly afforded excellent protection against the weather by the deep scuttle dash provided, and if desired a small wind screen can be fitted at a slight extra cost.

THE GORDON CYCLE CAR.

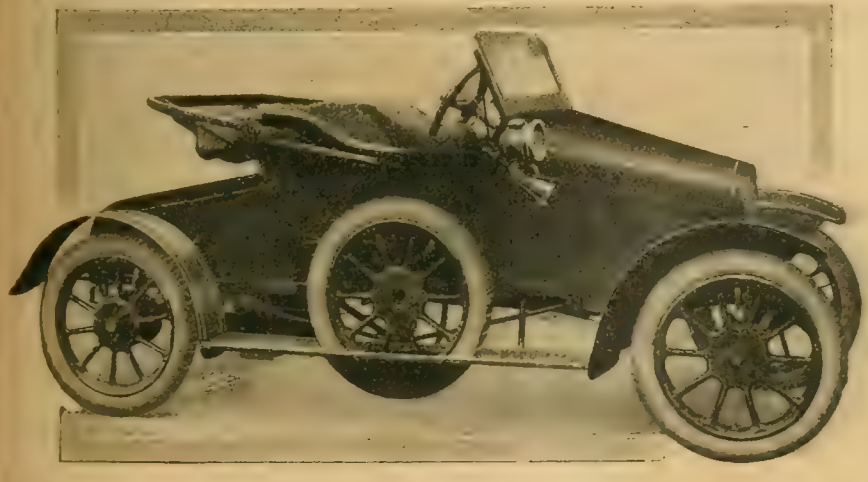
This distinctive cycle car, made by the East Riding Engineering Works, Beverley, Yorkshire, will remain unaltered for 1914, the model marketed being exactly the same as the one which performed so successfully in the Scottish Six Days Trials this year—probably one of the severest tests which any machine could be put to. The speed of this little vehicle over the tremendous gradients in Scotland was really remarkable. It is fitted with a 90° 9 h.p. J.A.P. engine, either air or water-cooled, ten guineas extra being charged for water cooling. The price of the air-cooled model with hood, screen, and lamps is 110 guineas. The gear employed is the two-speed epicyclic type, a reverse also being fitted. Probably part of the efficiency of this machine is accounted for by the transmission, which is by single chain drive from the engine to the back axle. The carburetter is especially designed for running on benzole, though, of course, petrol may be used if required, a special feature of the machine being the exceedingly neat detachable wheels.

ROYAL RUBY SIDECAR OUTFIT

A fine sidecar outfit is that manufactured by the Royal Ruby Cycle Co., Manchester. The engine fitted is a 6 h.p. J.A.P., and the transmission is by belt to a three-speed Sturmey-Archer hub. The sidecar supplied with this machine is noticeable for the extreme length of the springing, which should provide great comfort even over bad roads, especially as the upholstery of the sidecar is on the most generous scale. The outline is graceful, and the passenger is admirably protected by a cover which can be raised in order to get in or out. The company also market a cheaper and simpler form of sidecar, which may be attached to their twin or single-cylinder machines, but the "Special" Royal Ruby combination described above is the most noticeable of this firm's productions.



The Royal Ruby three-speed sidecar outfit.



The 8 h.p. air-cooled Gordon cycle car.

HERCULES PASSENGER OUTFIT.

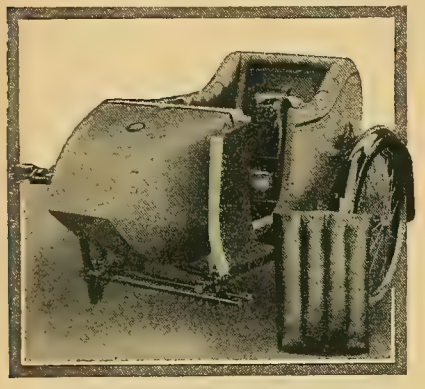
The Hercules Cycle and Motor Co., Ltd., besides building for the home market, have a considerable trade in the colonies and specialise in export work. The motor cycle models are fitted with J.A.P and Precision engines. We illustrate a 6 h.p. J.A.P. engined model fitted with a Sturmey-Archer three-speed gear, and attached to one of the firm's own sidecars. The sidecar is a fine piece of work and is beautifully finished. The chassis is up swept at the rear and has

Passenger Machines of all Types.—

four points of attachment: springing has received much attention, and the latest type springs are wider and have an additional leaf. A folding luggage carrier and a sidecar stand are both fitted, and the attachments are easily detachable. The body provides plenty of leg room, and the hood and wind screen form a useful protection for the passenger.

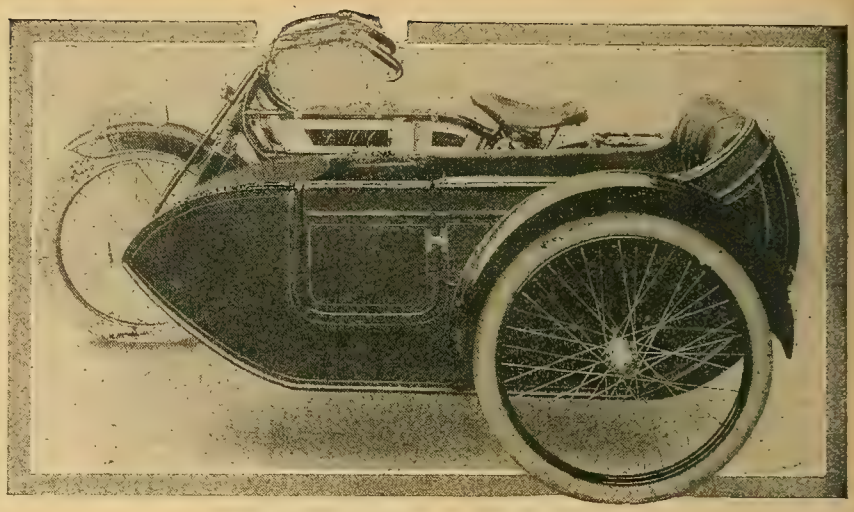
GLORIA SIDECARS.

Since the days when sidecars began to gain their popularity the Gloria sidecar has always been one of the most popular on the road, which can be accounted for by reason of the many novel features incorporated, and the sound design and construction of this sidecar, which affords so much comfort to the passenger. The patent spring wheel suspension, the excellent luggage-carrying facilities, and



The Swan coach-built sidecar has a compartment for a spare can of petrol at the rear, and the body is mounted on combined C and coil springs. Four-point attachment is employed.

the patent double tube attachment have long been features of this make, and will be continued for next season, when an entirely new model will be introduced which is provided with a dropped chassis, boat-shaped cane body, luggage grid, four-point attachment, spring wheel suspension, which will be sold at a popular figure. At the other end of the scale is the "Projectile." Every conceivable luxury is embodied in this attachment, and certain improvements have been



A 1914 model two-speed L.M.C., with Bramble sidecar.

made for 1914, the body being more roomy with deeper upholstery, and Cee springs are now used throughout in place of the coil springs hitherto fitted. A collapsible luggage grid is fitted to the back of the chassis large enough to carry a considerable sized trunk. Everything throughout is of the best, and this sidecar, turned out fitted with footboards, stand, apron, side lamp, and reflex light, and superbly finished, sells at £30. Quite a feature of the latest model Gloria coachbuilt sidecar is the provision at the back, embodied in the coachwork, of a boot to carry parcels or tool rolls. It is exceedingly neatly constructed, and, if anything, adds to the appearance of the complete outfit. In addition to the touring models, this company also makes a range of commercial sidecars which can be used as light delivery vans.

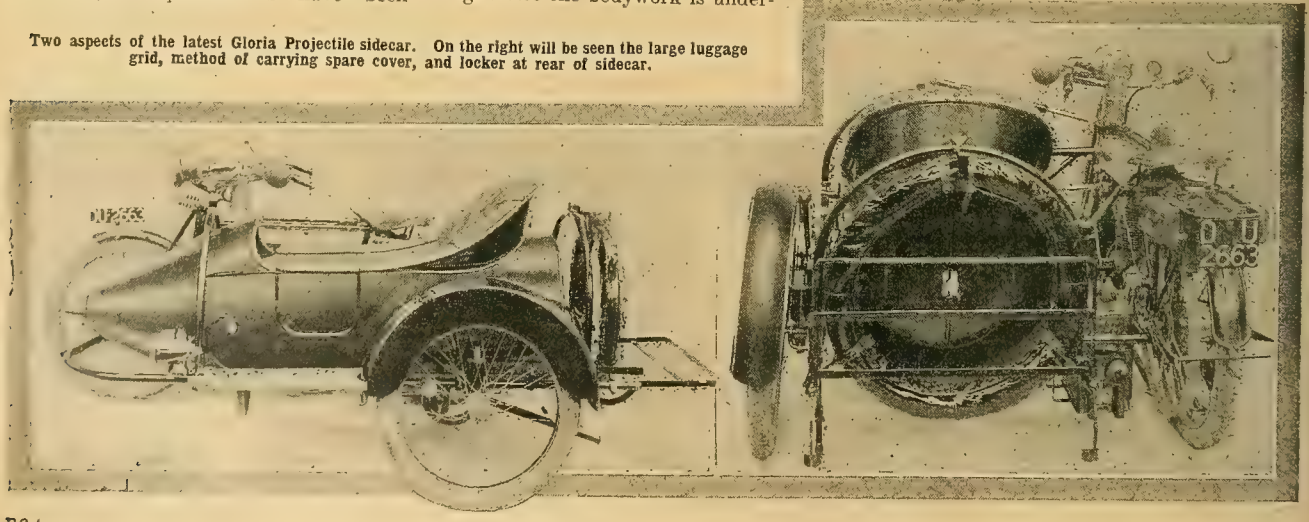
THE LATEST BRAMBLE SIDECAR.

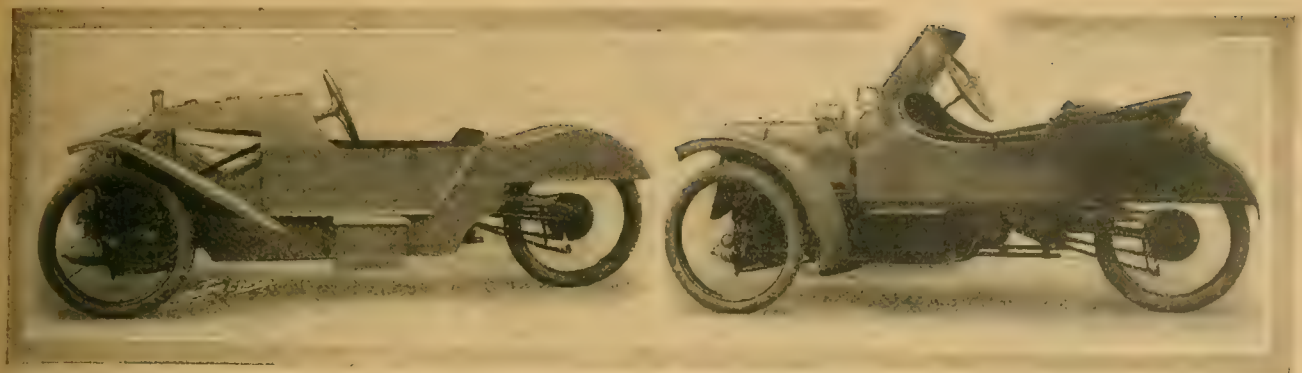
The Bramble Manufacturing Co., Ltd., Coventry, have produced for 1914 a new patent sidecar, which is coachbuilt on an angle steel frame. The whole structure is complete in itself and is not composed, as is usually the case, of a separate body and chassis. By a clever springing device the bodywork is underslung on the axle, thereby adding greatly to the comfort of riding. Neither the framework nor the springing is exposed, and long wear, due to absence of rusting, is thereby assured. The springing arrangements and all connections are bolted directly on to the steel frame, making the sidecar extremely strong and at the same time keeping down the weight. The Bramble sidecar is beautifully finished and comfortably upholstered, and is fitted with a spring seat and a back rest. The attachments, which are four point, are of the quick detachable type. The Bramble is a sidecar which has sprung into great popularity during the past season, and everything points to an exceptional demand for it in 1914.

SIDECAR WITH NOVEL FEATURES.

The Swan sidecar manufactured by the Midland Motor and Cycle Co., Cowley Road, Oxford, is remarkable for a number of ingenious refinements making for comfort. The suspension is unique, inasmuch as the body is hung upon coil springs, something after the system employed on large motor cycle saddles.

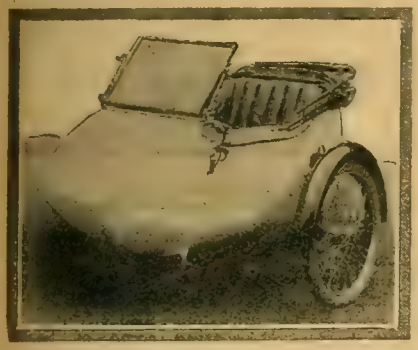
Two aspects of the latest Gloria Projectile sidecar. On the right will be seen the large luggage grid, method of carrying spare cover, and locker at rear of sidecar.





TWO TYPES OF 8 H.P. MORGAN RUNABOUTS.
On the left is the sporting model, while that on the right is the water-cooled Grand Prix type.

The coachwork is so arranged that the back cushion is detachable, and when removed discloses a large locker capable of carrying a two-gallon petrol can and other smaller articles. An exceedingly neat hood and screen are fitted, and a special model will be shown at Olympia,



The Swan coach-built sidecar with hood and wind-screen.

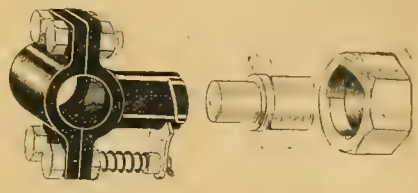
constructed to be suitable for motor cycles fitted with spring frames, the one shown being specially adapted for an Indian and painted red to match, and the firm will also show a model enamelled to match the well-known khaki colour of the Matchless machines. The whole design of this sidecar is excellently carried out.

THE MORGAN RUNABOUT.

The 1914 Morgan three-wheelers will vary little from this year's models. They comprise the Standard, Sporting, and De Luxe models. In the two former a tail forms the mudguard, and the luggage carrier is fitted over the driving wheel. The chassis has been considerably strengthened, and many improvements in detail have been made. The prices remain unchanged namely, 85 guineas, £91, and £100 respectively. Owing to the success in the Grand Prix race, the Grand Prix model has been added to the catalogue. This has a water-cooled engine, thermo-syphon circulation, with radiator behind the engine, and will be exhibited in three forms—one with side-by-side J.A.P. engine, 85×85 mm.; the same model with a wider body, and built for touring; and still another with the overhead valve J.A.P. engine, 90×77½ mm. The last is recommended for racing only. The touring Grand Prix models are intended for those who desire speed alone. The chassis of this is identical with that of other types, except that it is a few inches longer. The price of Nos. 1 and 2 is £105, and of No. 3 £115.

The Morgan Motor Co. pointed out to us that for all ordinary purposes air-cooling has been satisfactory.

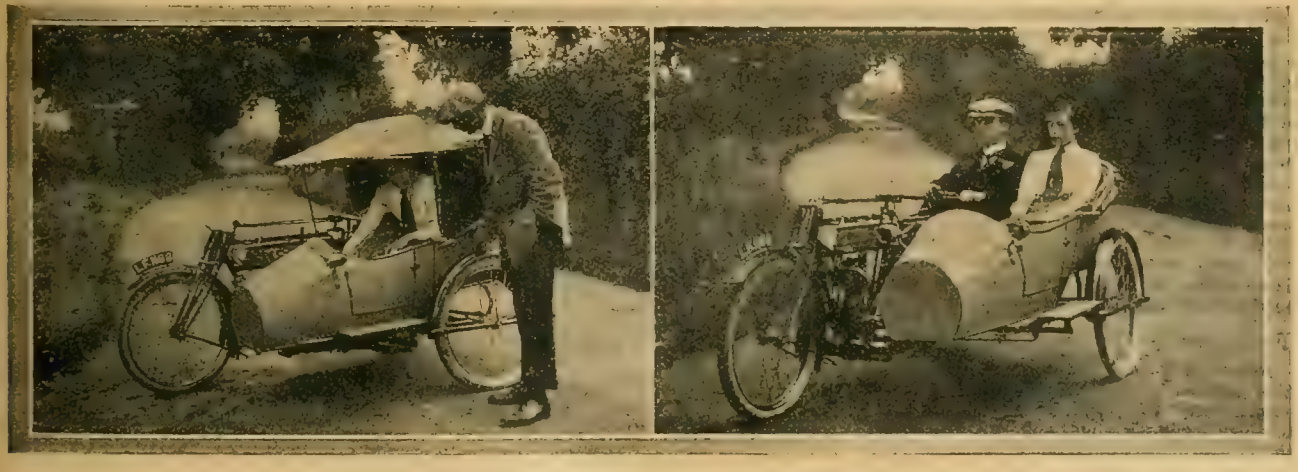
The firm are specialising for 1914 in a commercial vehicle for the conveyance of small parcels. A twin-cylinder air-cooled J.A.P. or Precision engine is fitted. This type affords seating accommodation for two, and has a carrier fitted at the rear of the seats, which is built to support a weight of about 1 cwt. The carrier hinges up to give access to the rear wheel. It can also be removed bodily by unscrewing eight nuts, and a standard passenger body can be substituted in a few moments. The cost, ready for the road, is £95, with £3 extra for the alternative body.



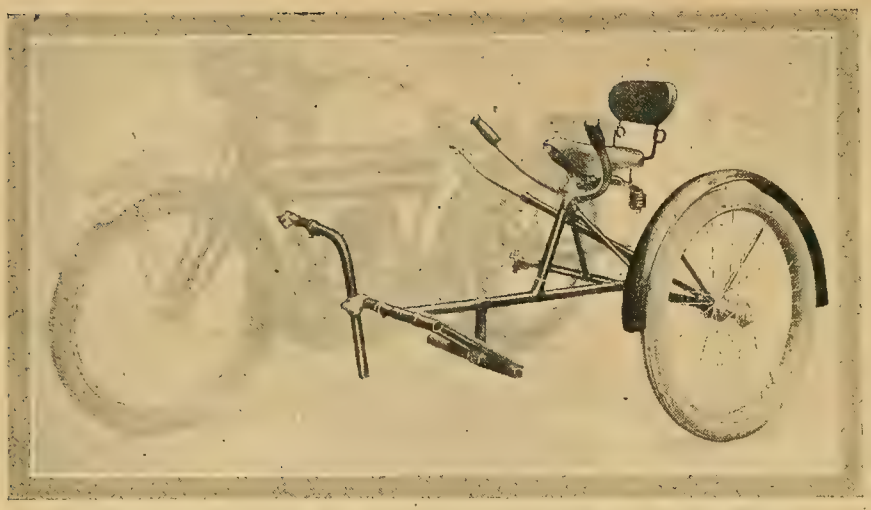
The Norman Barrett sidecar couplings.

A SIDECAR FOR TWO.

Mr. Norman Barrett, who for some considerable time was associated with the Repair Department of Messrs Rudge-Whitworth, Ltd., is now engaged in manufacturing the "U and I" sidecar. This is a miniature motor car body, with side entrance, scuttle dash and hood, which is attached to a motor cycle, and the steering is from the body of the sidecar by means of a special steering



The U and I double-seated sidecar, attached to 3½ h.p. Rudge-Multi.



The "Sports" sidecar attachment which, as may be seen, is fitted with a saddle in place of the sidecar body for lightness.

column to the head of the motor cycle, in place of the usual handle-bars. The advantages of this system are, of course, that the driver as well as the passenger is protected and conversation is far easier, while it is claimed that the effort to draw it is no more severe for the motor cycle than with the usual disposition of rider and passenger, as the sidecar is built so close to the motor cycle that the weight on the back wheel is approximately the same as if the driver were on the saddle. Full particulars of this fitment may be obtained from Mr. A. N. Barrett, 56, Rathbone Place, Oxford Street, W. The control of the machine is by pedals operating the clutch and brakes respectively, and these are mounted on a tilted board under the scuttle dash. The handle of the steering tiller is hinged to facilitate the driver getting up from his seat without disturbing the passenger. All the carburetter controls are mounted on the tiller, and the exhaust lifter on the tube of the machine near the saddle. The front brake can be fitted on the tiller or any other convenient place, and is worked by Bowden wire in the usual manner. Nearly all the machines now have the change speed lever high up on the tank, and such types of lever are quite accessible to the driver. Altogether the whole outfit has a very workmanlike appearance. A special feature is made of the attachment of the "U and I" sidecar to the machine, the principle of the joints used being that of a union nut, only instead of screwing up the joint it is pressed up to the desired position and secured by means of a bayonet joint, the locking device being a small spring operated catch, which engages on a ratchet on the large union, the great point about this method of fixing being the speed with which it can be attached and detached.

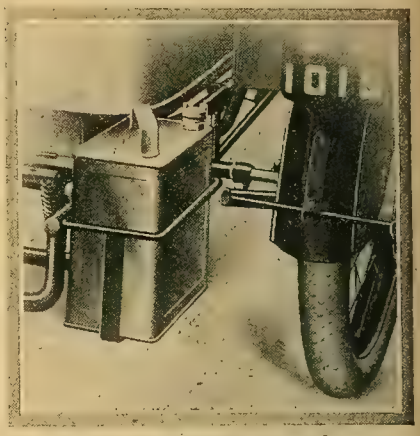
Featherweight Sidecar Attachment.

Recognising that there are a considerable number of riders who do not wish permanently to attach a heavy sidecar to their machines, but who require some simple and light method of carrying a passenger on short journeys in fine weather, the Tennant Engineering Co., Pershore Street, Birmingham, have evolved an attachment known as the "Sports" sidecar, which we illustrate. This consists of a very light skeleton sidecar chassis with an ordinary motor cycle saddle fitted with a backrest as a seat, the rider obtaining support by the pair of handle-bars on either side of him, and resting his feet on footboards or footrests as desired. For surveyors and other professional men who find it convenient occasionally to carry a passenger about for short journeys, this attachment should prove useful.

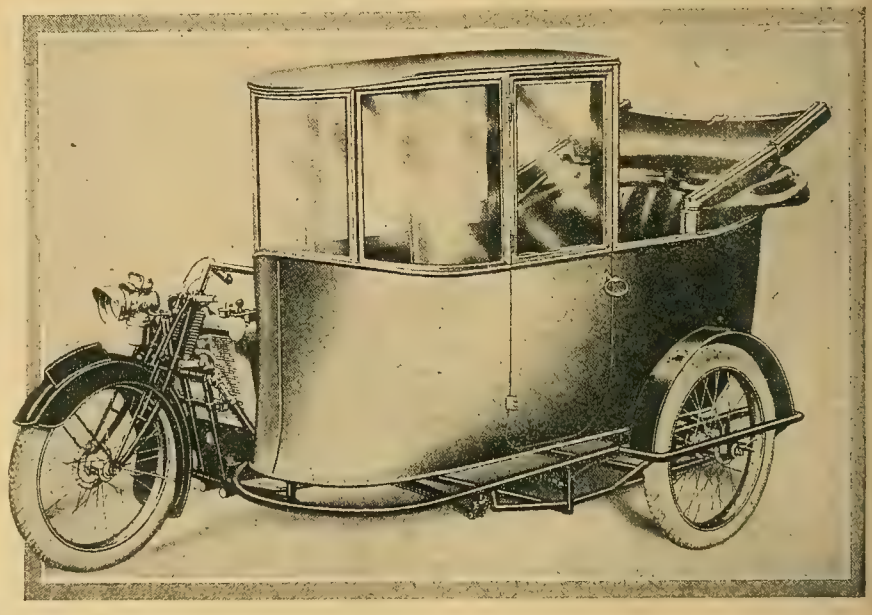
A neat sidecar body constructed by the Light Car Body and Fittings Co., of Grey Friars Lane, Coventry. Note the sound method of attaching the wind screen.

A LANDAULET SIDECAR.

Unique sidecars are quite a speciality of Mr. W. Williamson, and his latest creation to be fitted to the well-known water-cooled 8 h.p. Williamson motor cycle is a landaulet which seats no less than three passengers. Of course, the weight is fairly heavy, but the Williamson machine is specially constructed to pull a big load, and although it may appear a little cumbrous at first sight, it is exceedingly comfortable. Indeed, it has been suggested putting some of these combinations on the streets to ply as taxicabs, the fares suggested being about half those ruling for taxicabs. This sidecar is interesting as showing what can be done in this direction.



Method of carrying spare tin of petrol at the rear of the Williamson sidecar.



One of the Williamson Co.'s productions is the three-seater landaulette sidecar machine, as shown above.

Passenger Machines of all Types.—

THE 1914 SPARKBROOK SIDECARRIAGE.

The production of sidecar machines only is the policy of the Sparkbrook Manufacturing Company, Coventry, and this specialising has led to the appearance for 1914 of a very finely designed and constructed outfit. The Sparkbrook sidecar machine is replete with clever points of design, and we are glad to see the care that has evidently been exercised in securing proper accessibility to all working parts.

The power plant is a 6 h.p. or 8 h.p. J.A.P. twin-cylinder to order, and the features of these engines are so well known that it is unnecessary to dwell upon them. Gas is supplied by either

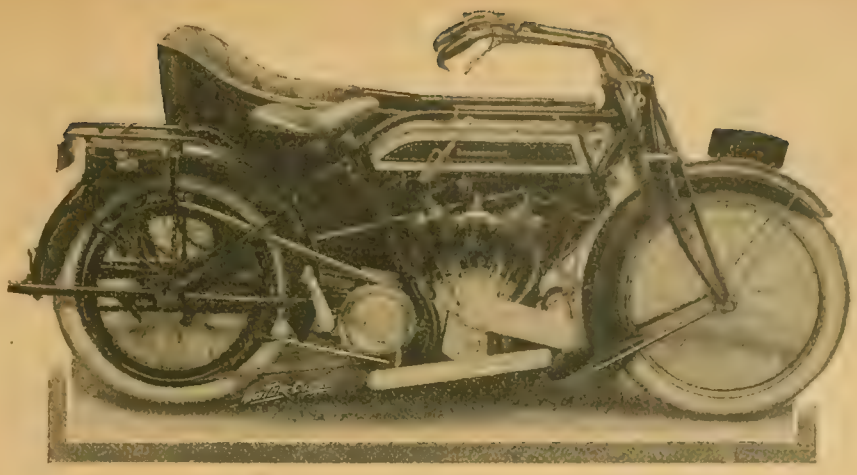
Showing how the spindle may be withdrawn and the back wheel of the Sparkbrook models easily detached.

a Senspray or B. and B. carburetter, according to the fancy of the purchaser. The front forks are of the Druid type and exceedingly substantial. But the most interesting feature of the machine is the transmission.

The Gear Box and Drive.

The gear box is neatly attached to the bottom bracket, and the gears are driven by a Hans Renold chain from the engine, the final drive being by belt to the rear wheel, the belt running over an 8in. diameter pulley fitted to the right-hand side of the gear box. The makers state that so confident are they in the ability of the belt to perform its

Details of the Sparkbrook two-speed countershaft gear box.



Valve side of the chain and belt-driven Sparkbrook.

task satisfactorily that they are prepared to guarantee 5,000 miles from a belt. This arrangement of drive leaves access to the rear wheel easy for purposes of removal, and in the Sparkbrook it is a particularly simple job, as the wheel is fitted with a detachable spindle. The light rear wheel thus obtained also makes tyre wear light and assures comfort, due to absence of bouncing.

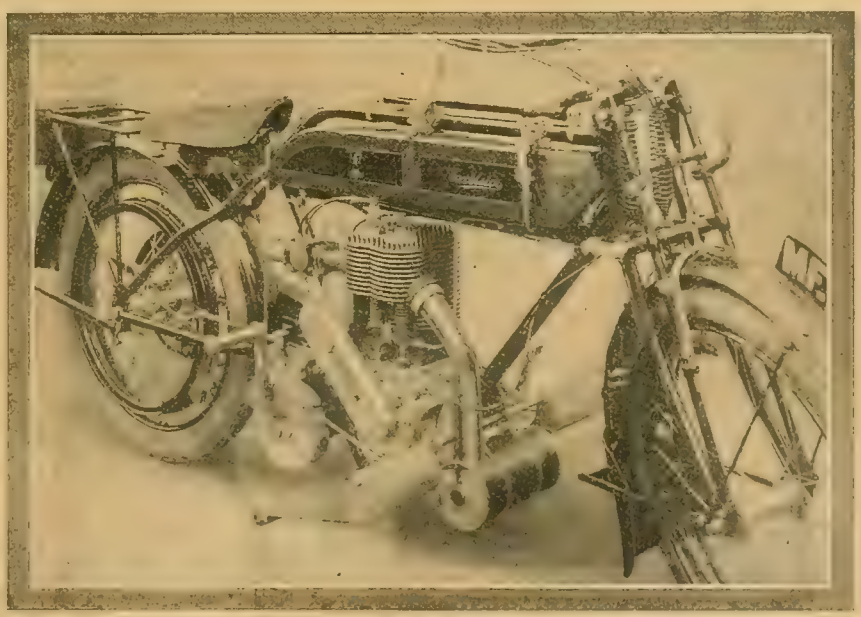
For Colonial riders, and those at home who prefer it, 28in. wheels can be fitted in conjunction with an 8 h.p. engine. On rough country this should prove an admirable mount.

With regard to the gear box, this is neatly designed, and provides two speeds by means of a dog clutch, and the gear wheels are carried on shafts running on gun-metal lined bearings. Quite a feature of the machine is the exceedingly neat and simple change-speed lever, fitted to the top tube and operated by the right hand. It is fitted with three undercut notches, the central one giving neutral position. All that it is necessary to do when changing gear is to depress lightly the knob at the top of the lever and gently move the lever to the desired position, when releasing, the knob allows the catch to lock the gear. A kick starter is fitted on the gear box working through the neutral.

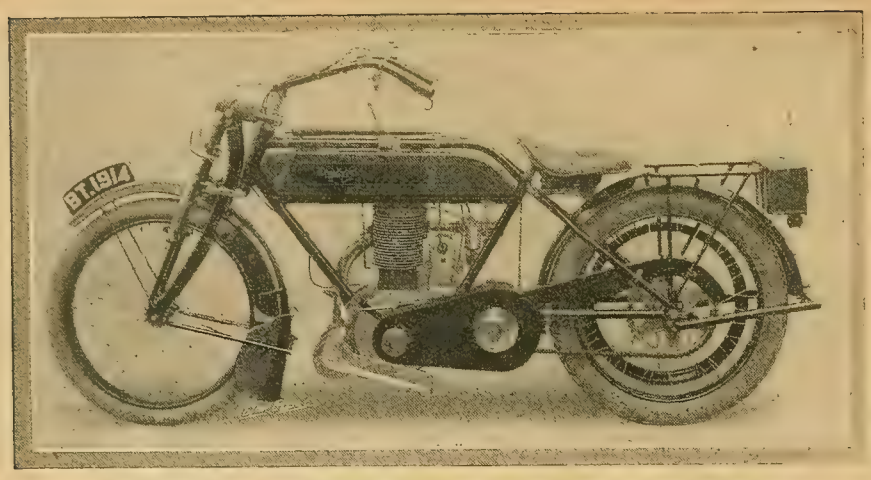
The Sparkbrook Sidecar.

The chassis of the sidecar is constructed of straight tubes throughout, and the axle is strong and well designed. The wheel is fitted with a 2½in. section tyre, and a stand is fitted to facilitate tyre repairs.

The coachwork is most graceful and also exceedingly comfortable, and the top part of the sidecar hinges upward and is curved into a sort of scuttle dash. A large draw is fitted under the passenger's seat, and provision for luggage carrying is made on a large grid fitted at the rear.



Power unit of the 5-6 h.p. single-cylinder Excelsior, also showing kick-starter, counter-shaft gear, footboards, and large silencer. Brampton forks are fitted. (See pages 1488-1489.)



The latest model 5-6 h.p. three-speed Excelsior. Observe chain drive and 3in. rear tyre.

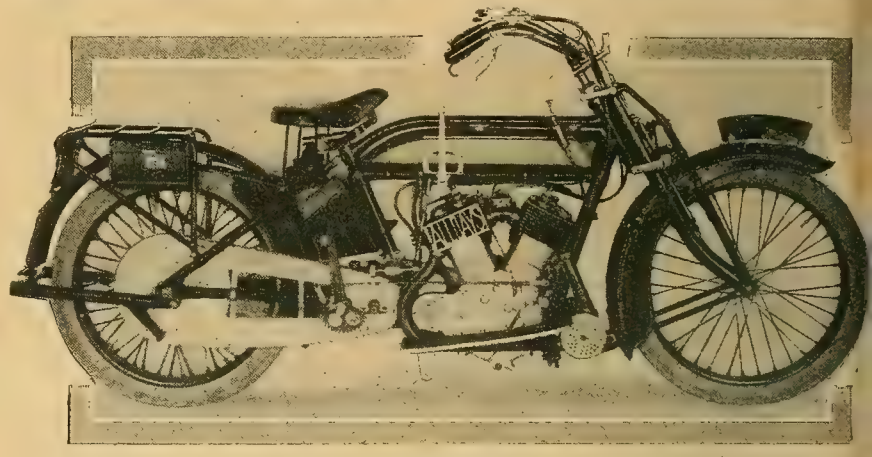
THE ALLDAYS-MATCHLESS PROGRAMME.

The alterations for 1914 to the Alldays-Matchless machines, though not immediately noticeable, are of some importance. The chief of these is the strengthening of the primary gearshaft and sliding key mechanism, by which the three-speed counter-shaft gear is operated. The change enables the sliding key and striking-shaft to be made from a single forging with consequent increased rigidity. Besides this improvement, a considerable change has been made in the actuating lever mechanism which now works on a quadrant fixed on an aluminium bracket at the off side of the tank. The connections are well carried out, and ball joints are employed wherever necessary. The front driving chain is enclosed in an oil-tight case, and the rear chain is almost entirely enclosed, and an internal brake on the rear hub serves to check the machine. The engine is of unusual design, for it is not generally realised that, though the engine is of the V-type, the two cylinders are arranged to fire at 180°, or the same interval as that of a horizontal twin. This arrangement gives the most perfect torque obtainable from a two-cylinder engine, and the result is obtained by a two-throw crank, the cylinders being slightly staggered. The valve springs and tappets are enclosed by aluminium covers, and the magneto, which lies behind the engine, has been rendered more accessible by the fact that the gear case has been split vertically, so that the rear part may be removed without disturbing the rest of the timing gear. The bore and stroke of both 3½ single and 6-8 twin are 85 × 88 mm. respectively, and large valves and valve chests are a striking feature of the design.

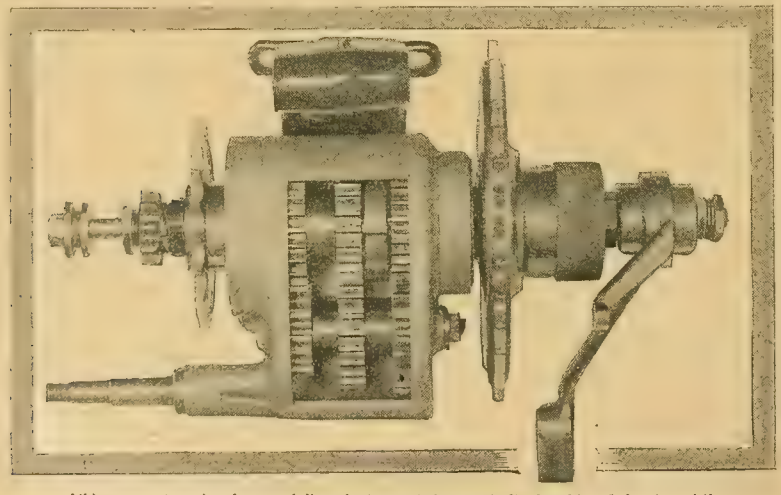
Saxon forks, large mudguards, and Best and Lloyd semi-automatic lubrication are all fitted. 650 × 65 tyres are to be standard on the 6-8 h.p. model, and 26×2¼ on the 3½. The large footboards on both types will be sprung at the front end.

A New Silencer.

A 3½ h.p. belt-driven model will also be listed, but the only alterations from last year will consist of a larger big end bearing and improved rear forks, which will no longer be cranked. A new silencer is to be fitted, which consists of a large expansion chamber into which two inverted cones are fitted; the gas passes from the central chamber, through the small end of the cones, and then, on expanding, through holes in both end plates, thus giving a gentle final outlet.



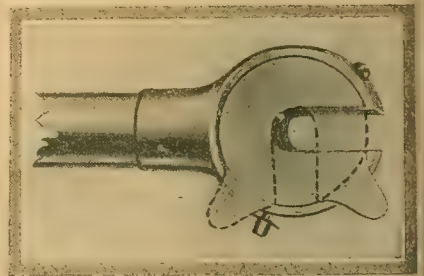
Valve side of the 6-8 h.p. twin Alldays, showing kick-starter, chain cases, valve spring covers, and counter-shaft gear.



Alldays gear box showing specially spigoted and riveted shaft, the object being to get the key and shaft in one stamping, thus making replacement easier.

A Large Choice of Sidecars.

No less than seventeen different models of sidecars are marketed by the Godiva Sidecar Co., Ltd., Little Park Street, Coventry, ranging from the feather-weight to large touring models. The chassis on which the bodies are mounted is of strong and simple design, and great strength



Quickly detachable joint on the Godiva sidecar.

combined with simplicity is claimed for the attachment to the motor cycle. A special line of models is listed for the driver who requires as little weight as

Passenger Machines of all Types.—

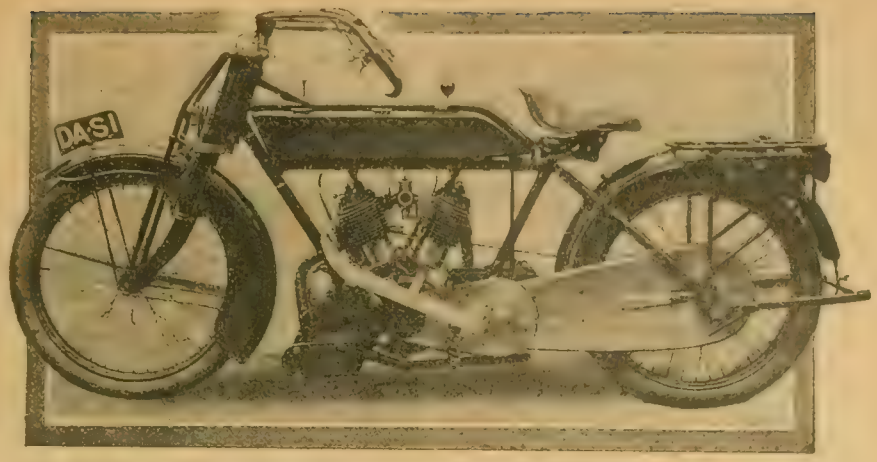
possible, and some of the coachbuilt models weigh as little as 40 lbs., though, of course, these are not of the most luxurious patterns and are built primarily for speed purposes, being fitted with pointed fronts. Wicker, cane, or coachbuilt bodies and a model with an extra seat for a child are all marketed, and it would be difficult, among this range of models, not to be able to find one suitable for almost any type of machine.

The Godiva coach-built sidecar.

1914 STAR MODELS.

A machine that created great interest at the last Olympia Show was the single-cylinder 4½ h.p. Star, made by the Star Cycle Co., Wolverhampton. During the past season a great many minor alterations and improvements have been embodied in this model, and the result is now a very striking and workmanlike model, embodying several novel but well-tried features, the most noticeable of which is the method of lubrication, which is a system of pressure feed by centrifugal force, thereby ensuring a sufficient supply of oil to all working parts. The cylinder head is of the detachable type, held down by four bolts, and in the timing gear only one gear and pinion is used. Accessibility of all parts has been specially studied, and great attention has been paid to ensuring an absolutely oil-tight engine. To this machine a new design of coach-built sidecar with a chassis sprung on novel lines will be attached, and the company is also marketing a specially designed tradesman's side carrier, suitable for attachment to this machine.

In addition to the single-cylinder, the range of Star motor cycles will be augmented next year by a model fitted with a 6 h.p. twin-cylinder J.A.P. engine. On both models the same transmission is used, viz., totally enclosed chains, a free engine clutch being mounted on the engine-shaft of the leather-to-metal cone type operated by a pedal. The three-speed gear box is of the sliding gear type, with direct drive on top speed, and is bolted to the bottom bracket, allowance being made for chain adjustment. The gears are changed by a lever situated on the side of the tank, working in a quadrant. A kick starter is also attached to the gear box. The designers of these machines have followed car practice throughout as far as is possible in the construction of motor cycles.



An entirely new model twin-cylinder Star which has two-speed counter-shaft gear and enclosed chain drive.

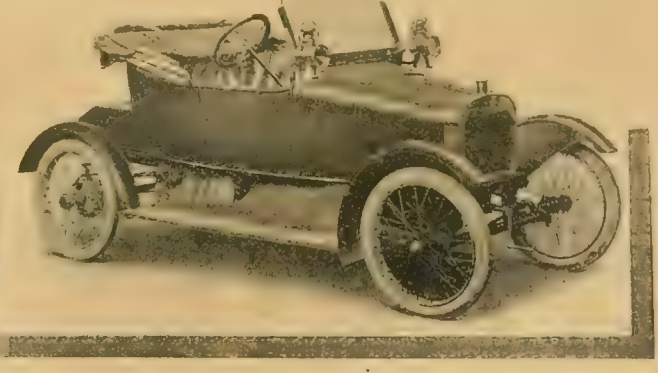
THE RANGER CYCLE CAR.

This ingenious little runabout is designed and manufactured by Mr. E. J. West, who has been well-known as the designer of cars and voiturettes for many years. It is sold by Messrs. Polyrhoë Carburetters, Ltd., 144, Great Portland Street, W., and has a number of ingenious features embodied in its design. The engine is an 8 h.p. Precision twin, and the drive is taken through a shaft to the gear box situated amidships, and thence the final drive is by single chain to a solid rear axle. There is no differential, but a slipping device is incorporated which allows one rear wheel to slip when rounding corners by means of a friction plate. The frame is of armoured wood, the engine and gear box being carried on a separate tubular under frame. The springing is by quarter elliptics on all four wheels, and a very taking and comfortable body, hood and screen, and domed mudguards, together with side footboards and valances, are fitted. This cycle car may be obtained with either air or water cooled engine.

NEW L.M. WATER-COOLED CYCLE CAR.

Mr. W. M. Cunningham, of Clitheroe, has introduced many improvements into his cycle car for 1914. The engine is a water-cooled twin J.A.P. of 8 h.p., 85 ×85 mm., 964 c.c., with extra heavy flywheels, forced feed lubrication to the big-ends and thermo-syphon cooling. The gear box is of the sliding type and contains three forward speeds and reverse. The transmission is by Renold chains, each chain being provided with means of adjustment. The foot brake operates on the counter-shaft; 18in. rim brakes are provided on the back wheel, worked by a side lever. The torpedo body contains ample room for two persons and boxes for tools, etc. The weight is approximately 6 cwt. The body can be finished in red, blue, green or grey, according to the taste of the purchaser. The petrol tank, which holds about 4½ gallons, is placed under the scuttle dash. The complete car with lamps, hood, screen, horn and tools sells at 135 guineas. The little vehicle is quite comfortable and an excellent example of the cycle car class.

The latest model 8 h.p. L.M. which has water-cooling.



The 8 h.p. water-cooled Ranger.

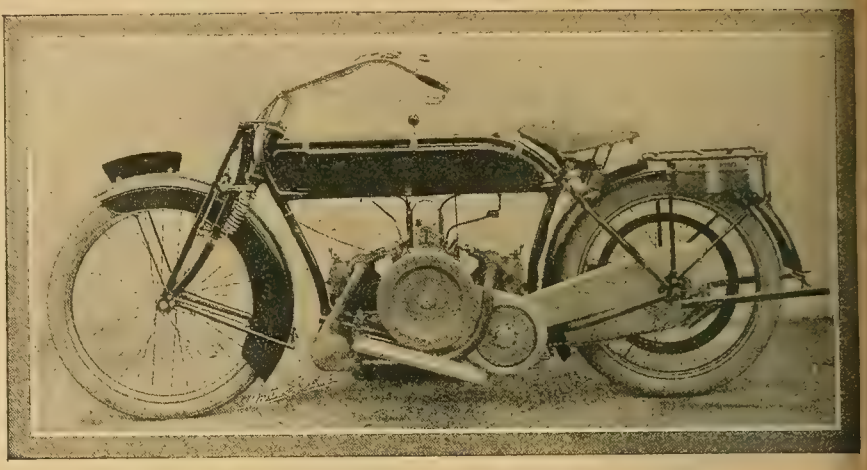
Three-cylinder 6 h.p. Humber.

A Novel Horizontal Engine giving Excellent Balance; Three-speed Countershaft Gear.

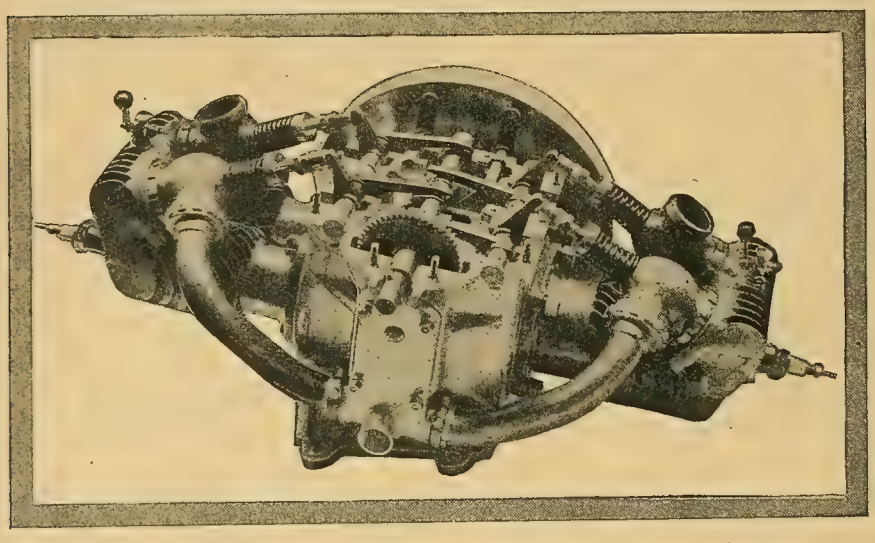
ONE of the most original designs seen for a very long time in motor cycle engines is the new 6 h.p. Humber for 1914, particulars of which we are able to give. It is an engine which will probably create some sensation when shown at Olympia.

The outstanding feature is the adoption by the Humber firm of three cylinders in this motor. The engine is of the horizontal type, with the cylinders at 180°. The front cylinder has a bore and stroke of 78 × 78 mm, while the two rear cylinders, which have a common combustion head, have a bore of 55 mm. and a stroke of 78 mm. This double rear cylinder has, of course, two pistons and connecting rods which work on concentric cranks set one on each side of the main crank and at 180° to it.

The radiating fins are arranged in a most ingenious manner, and in every case slope forwards to catch the air rush due to the passage of the machine.



Flywheel side of the 6 h.p. three-cylinder horizontal engined Humber.



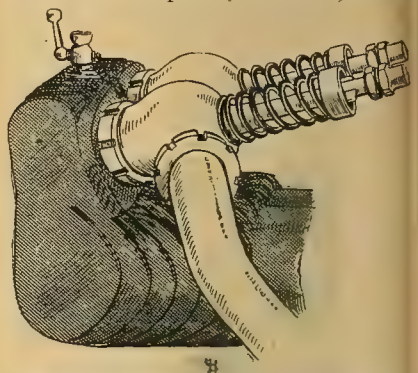
The engine of the new Humber. Observe the two-cylinders (cast in one piece with common combustion head) at the left.

Smooth Transmission Assured.

The whole *raison d'être* of this novel design is to obtain perfect thrust balance along the axis of the crankshaft, and obtain thereby as perfect a torque as possible, with consequent smoothness of propulsive effort and the natural sequence of light tyre wear and long life to the mechanism. This desirable feature will be greatly aided by the provision of a large outside flywheel.

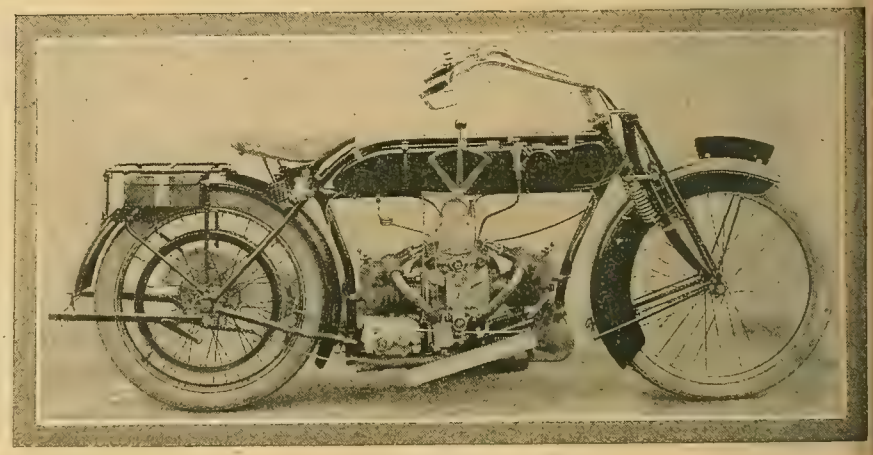
The valves are situated on the top side of the cylinders and are actuated by a single camshaft. The machine to which this three-cylinder engine is fitted has a car type gear box affording three speeds, and the transmission throughout is by chains, any harshness in the drive being softened by the fitting of a shock absorbing device in the rear wheel. Two and a half inch tyres will be fitted, and large petrol and oil capacity is provided in the tank.

We understand that the bench tests, both in power given off and revolutions obtained, have proved thoroughly satisfactory, and on the road last week end on its initial trip the machine is said to have climbed a hill of 1 in 6 on middle speed with a passenger in the sidecar.



The rear cylinders with common combustion head and detachable valve seatings on the new Humber.

(Continued on page 1487.)



A REALLY NOVEL MACHINE.
The 6 h.p. three-cylinder Humber showing gear control and position of carburetter

With the CYCLE CARS on the AUTUMN TRIAL

HAVING disposed of our cycle car in anticipation of a new model, we gladly accepted the offer of Mr. Sydney Tessier to pilot us round the A.C.U. cycle car trial course on the 29th ult. on a sidecar. We met by appointment at Redhill, the starting point, the sidecar placed at our disposal being attached to one of the latest 8 h.p. Bat-Japs with two-speed counter-shaft gear and chain drive.

For our particular requirements a fast machine is a necessity, that is if each test hill is to be observed, for in the intervening space time has to be made up; and it is the pace at which hills are ascended that renders a good average possible. Practically any machine nowadays will travel fast enough for all reasonable requirements on the level, but few will take hills at the same speed when called upon to do so. The Bat, however, is one of the exceptions, for the way our driver tore up quite appreciable gradients on top gear of 4¾ to 1 was a real eye-opener. Undoubtedly one of the attractions of a sidecar is its speed in hill-climbing and general nippiness. Fitted with an 8 h.p. engine similar to 50% of cycle cars, and scaling little more than half the weight of a cycle car, the secret of its liveliness is not very obscure.

The Desirability of Secrecy.

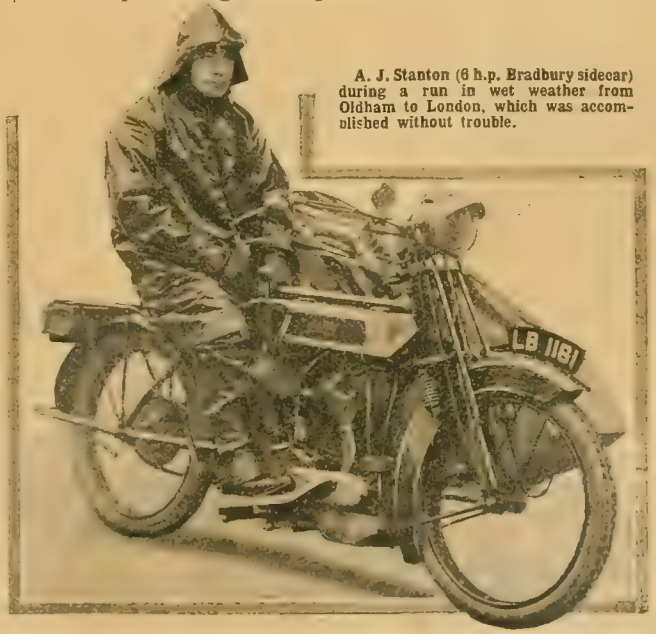
Seldom was the low gear needed, and as for speed on the level, well, when the Rev. G. P. Greenhill, driving a Bayard car with Mr. Glynn Rowden as passenger, tooted his horn in the rear, we simply had to let our sidecar go. Nor could we seem to shake the judge's car off, though we noticed through our goggles tears streaming down Tessier's cheeks. Perhaps we had better not divulge any idea of the speed, for Mr. Chiozza Money has admitted in Parliament that he has been taking note of the admitted speeds of motorists in the press! What a delightful run it was over Hindhead on that glorious autumn morning, the engine purring away and simply revelling in its work.

After witnessing the ascents of Haste Hill, Haslemere, we commenced the homeward run, which promised to be less interesting owing to the absence of test hills. We had bowled along merrily for some distance, and were among the vanguard, when, nearing Guildford, we heard the roar of an engine, and glancing round recognised George Griffiths on his Grand Prix Morgan, which he is tuning up for record. It has a single-seater body and streamline tail. Like a shot our pilot at one fell swoop opened the throttle wide, and the big Bat leaped forward in an attempt to lead the Morgan. Not being the most contented of passengers in a sidecar at speed we endeavoured to exercise a restraining influence upon the driver, but no entreaties of ours would cause the throttle to be closed, and by this time the speed had increased alarmingly, though the Morgan gradually crept up. Soon it was on a level, and slowly forging ahead. Suddenly there was another roar, and the chain of the Morgan was seen on the road wriggling after the owner at a good 40 m.p.h. What joy to the Bat driver on the victory! What a relief to the writer! A few minutes later, when the rain came down in torrents, we thought of Griffiths and his broken chain.

Storm Aprons v. Hoods.

For many miles the rain fell pitilessly, and crouched under a storm apron we could not help but think that in the matter of weatherproofness the hooded cycle car could claim at least one victory that day. The sidecar, however, kept going splendidly without a misfire, the heavy roads making no difference to its speed. We reached the finishing point in time to witness the competitors arrive, and should have earned a non-stop certificate if there had been one to gain.

Finally, we should like again to draw attention to the comfort of Bat machines. The spring frame, or to be more correct, the sprung seat and footboards, are much to be preferred to the ordinary rigid frame, and on rough surfaces when a reduction of speed is usually necessary, both driver and passenger float along without experiencing the slightest discomfort.



A. J. Stanton (6 h.p. Bradbury sidecar) during a run in wet weather from Oldham to London, which was accomplished without trouble.

TIME TO LIGHT LAMPS.

Nov.	13th	...	5.11 p.m.
,,	15th	...	5.8 ,,
,,	17th	...	5.5 ,,
,,	19th	...	5.3 ,,

Half and Half.

There are a number of light cars at Olympia this week having engines within the cycle car limit of 1,100 c.c. but are over the chassis weight.

Show Stand Attendants.

On several occasions we have directed attention to the desirability of stand attendants at Olympia wearing some distinctive badge, so that visitors to the Show who desire to make enquiries may do so without hesitation. Each year more firms adopt our recommendation, and we again throw out this timely hint for the convenience of buyers.

Next Week's Guide to the Show.

In our issue of Thursday next will appear *The Motor Cycle* Buyers' Guide of 1914 models—an invaluable work of reference introduced in this journal in 1906. The issue being the second of our Special Show Numbers will be considerably enlarged, and will contain further descriptions and illustrations of new designs for 1914, and an article outlining progress of the past year, in addition to the usual features.

Club Secretaries Meeting during the Show.

A meeting of secretaries of motor cycling clubs will be held at Olympia on Wednesday, November 26th, at 4 p.m. in the Princes Rooms. This is to be an informal meeting, and has been called with the object of enabling secretaries of clubs desirous of holding open competitions during 1914 so to arrange the dates for these events in order, so far as is possible, to avoid clashing.

New Records.

Last week we hinted in a paragraph on this page that records were bound to go before Show time, and this week we publish new figures for a number of motor cycle and sidecar records, the most noteworthy of which are the long distance figures set up by R. O. Clark on a F.N. lightweight.

C. G. Pullin is still waiting with his Rudge for a favourable opportunity to attempt G. E. Stanley's hour record of 67 miles 782 yards. It is questionable, however, if Stanley would let his Singer rest long supposing the record were wrested from him.

Streamline Sidecars.

In view of the interest being taken in streamline sidecars and the number to be shown at Olympia next week, it is worthy of note that the original suggestion for this form of sidecar body was published in *The Motor Cycle* nearly two years ago.

Two-stroke Engines.

The increase in the number of two-stroke engines (mainly of the lightweight type) is one of the most striking features of 1914 models. Those readers who are not thoroughly acquainted with the working principles of a two-stroke motor should read the chapter on this subject in "Motor Cycles and How to Manage Them."

Medal Winners in the Streatham Trial.

We regret that in our list of provisonal awards of the Streatham open touring trial we omitted the following names from the list of medalists: L. Martin (10 Singer c.c.) and C. R. Collier (7 Matchless sc.); both provisionally obtained gold medals, and R. E. Guest (7 Matchless sc.) should have been mentioned as a silver medallist in place of R. G. Charlesworth, who had already been mentioned in the list of those who obtained gold medals. The Matchless machines behaved particularly well in the trial, and C. R. Collier went through the strenuous test with absolutely no trouble.

SPECIAL FEATURES:

PASSENGER MACHINES OF ALL TYPES.

AUTUMN 'MIDST THE WELSH CRAGS.

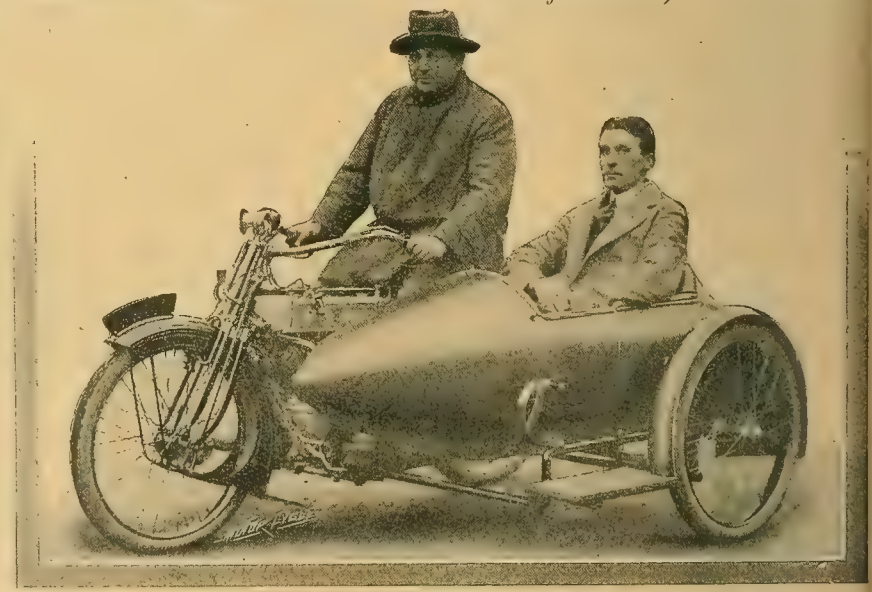
THE EQUIPMENT OF SIDECARS AND CYCLE CARS.

A.C.U. and Olympia.

The Auto Cycle Union has made arrangements for members visiting the forthcoming Cycle and Motor Cycle Show at Olympia to have the free use of the Princes Rooms (ground floor).

The Robialac Competition.

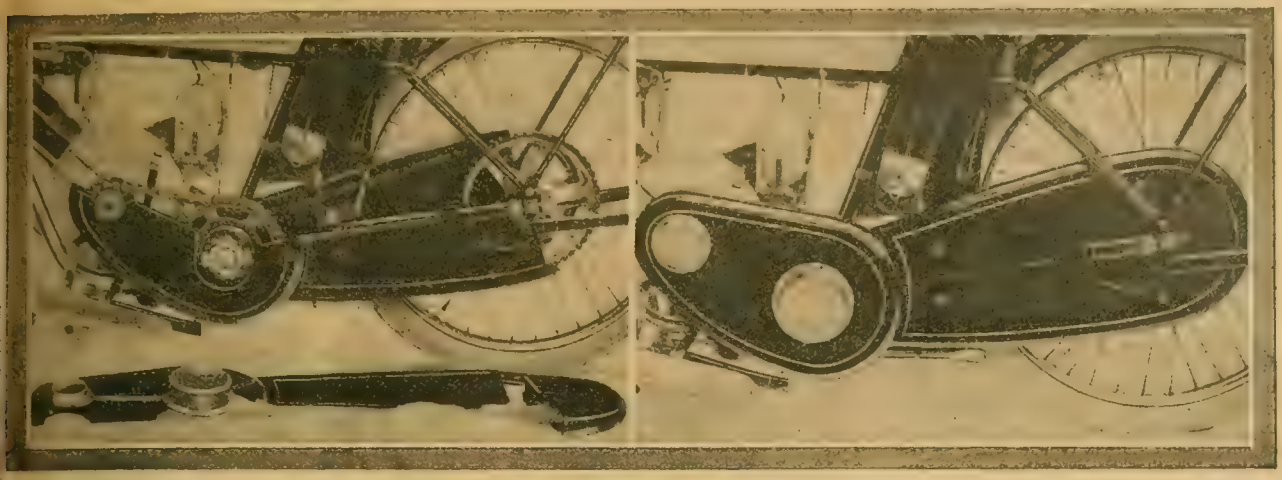
The judging in connection with the above competition was duly carried out last week in Birmingham from among the scores of articles sent in to the County Chemical Co. The winners of the ten Clyno motor cycles offered in connection with the event will be made known after the usual enquiries have been made in respect of the validity of the entrants. The many and varied articles submitted showed that great pains had been taken by the participants, and the work on the whole was exceedingly good, and the finish of certain samples really excellent. The work of judging occupied over two hours, and was performed by Mr. Geoffrey Smith *(The Motor Cycle)* and Mr. T. McKenzie, jun. *(The Cycle and Motor Cycle Trader)*.



A special sidecar built by Messrs. Phelon and Moore to the order of Mr. T. G. Bullus, a Bradford motor cyclist (who is seen in the saddle). The body is built entirely of wood and is finished a dark purple. Mr. Moore is the passenger in the sidecar.

The New P. and M.

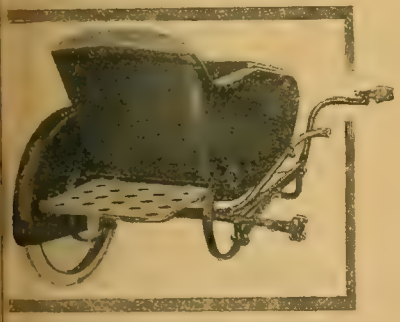
FEATURES: Entirely Enclosed Chains; Improved Engine Lubrication; A Smart Sidecar.



Chain guard on the new P. and M. removed in three sections to show the chain drive and gears.

Clean design of chain covers.

EXCEPT for the addition of oil-retaining, dust-excluding chain cases, the external appearance of the P. and M. motor cycles for ext year has not been materially ltered. So satisfactory is the service iven by these machines that alterations or the mere sake of change are not to e looked for, and, wherever any little etail alteration has been effected, it is provide some further comfort to the der in the way of longer service and eater immunity from trouble. The ell-known P. and M. gear has only been tered in minor details, in order to



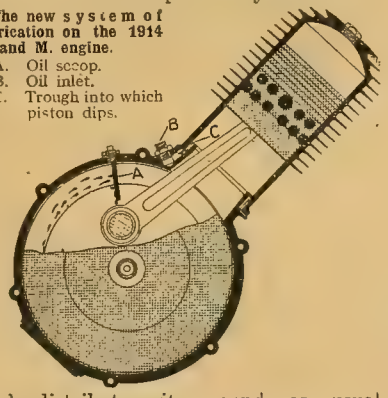
New design luggage grid for sidecars made by Phelon and Moore. It folds up out of the way.

tain greater gripping power and to cilitate lubrication, which will, it is lieved, add considerably to the life of e gear.

But the makers have felt that the brication system offered a field for provement, and they have tackled this portant matter with great skill. We ustrate the system, which may be best scribed as a distributed splash system, e piston being used as the distributer, ter, of course, first seeing to its own eds.

The New Lubrication System.

Instead of the ordinary method of jecting oil into the crank case, a annel has been provided in the case hich communicates directly with the cylinder, and in such a position that, with the use of the system of drip-feed as fitted to the P. and M. machines, the piston on descending comes in contact with the oil being admitted, and both carries it up the cylinder walls

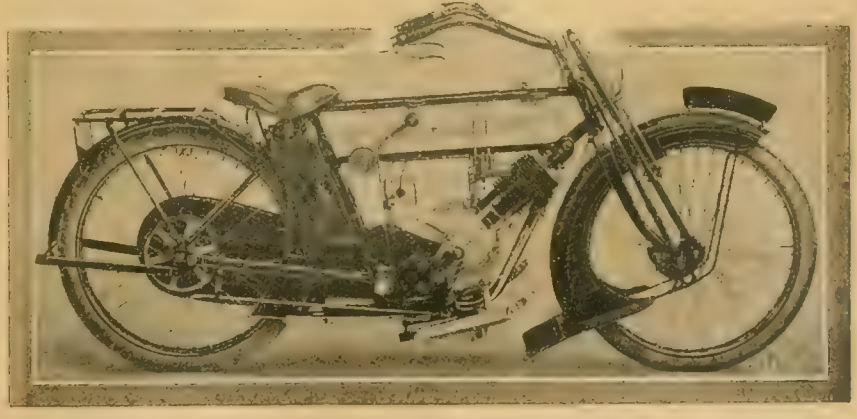


The new system of lubrication on the 1914 P. and M. engine.
A. Oil scoop.
B. Oil inlet.
C. Trough into which piston dips.

and distributes it around as usual. Any excess of oil drains back to the base chamber in the ordinary manner. A scoop is also provided, which is fitted through the top of the crank case directly between the flywheels. This scoop catches a certain amount of oil thrown off from the sides of the flywheels, and directs it downwards on to the connecting rod every time it passes the lead. A three-ringed piston is now being fitted. Great care is taken to make the base chamber absolutely oil-tight.

The New Chain Cases.

The most striking point in design of the new models is the provision of chain cases, which, as the illustration shows, are extremely neat, and quite add to the appearance of the machine. They are so constructed that there is not the slightest difficulty in getting at any of the chains or in removing the back wheel. The cover is made in five sections, four of which may be detached as required. The two front chains are automatically lubricated by means of a hollow engine-shaft, while the rear chain has a pipe from the half-time gear box directed upon it. Thus it will be seen that, with chains completely enclosed and constantly lubricated, very small wear and tear should take place in the transmission system. Indeed, the makers estimate that 10,000 miles is on the low side to be obtained from a set of chains.



Valve side of the 1914 3½ h.p. P. and M. with improved counter-shaft gear, kick-starter, and entirely enclosed chain drive.

The New P. and M.—

The mudguarding has been remodelled, tyre accessibility having been studied.

A minor improvement is the provision of a larger petrol tank—1½ gallons can now be carried, and a quart of oil. Large diameter filler caps are provided, and tank gauges are done away with. Aluminium footboards also greatly add to the appearance of the machine. Although not shown in the illustration, a new method of fitting the control wires will be adopted, by which they will be practically hidden. The makers of the P. and M. have always studied appearance very closely, and it must be said that their latest designs are some of the prettiest we have inspected.

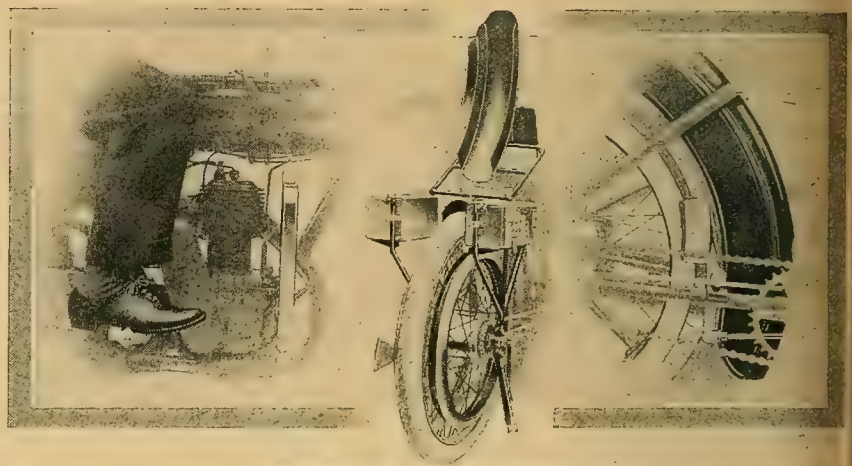
The Sidecar Design.

A very sporting-looking sidecar will be marketed for next season by Messrs. Phelon and Moore. It has a pointed front and scuttle dash, while at the rear is a large cupboard, a tyre carrier, and luggage grid. The design is exceedingly neat, and it is specially made to fit these machines. A good-sized footboard step is fitted, and the body is most luxuriously upholstered. The torpedo-shaped body is carried fore and aft on shackled Cee springs, the axle being deeply stepped and the body slung low. Altogether, the 1914 P. and M. and sidecar is a highly distinctive and beautifully finished passenger carrying outfit.

1914 ROVER MOTOR CYCLES.

FEATURES: New Gear Change, New Type Forks, Hinged Footboards and Rear Mudguard.

QUITE a number of detail refinements are incorporated in the 3½ h.p. Rover for 1914, all tending to add to the convenience and comfort of the driver and render the machine even more reliable, if possible, than in the past. As far as the engine goes this is substantially the same as the 1913 type, but a new method of manufacturing the crank case has been adopted, giving it a cleaner external appearance and enabling a harder metal to be used. The case is also made slightly larger to provide greater freedom for the flywheels in their passage through the oil. Easier starting will also be a result of this change. Ignition remains unaltered, by Bosch magneto driven by a silent chain, but a choice of two types of B. and B. carburetters is given, either the two-lever type, which is recommended for sidecar work, as the air can be entirely closed, or the new semi-automatic carburetter. Recognising that nearly all multi-speed machines are eventually used with sidecars, and, indeed, the Rover Co., Ltd., manufacture an exceedingly fine sidecar for use with these machines, the frames have been strengthened to withstand the hardest wear, and the front forks have been widened, thus giving greater bearing surfaces for the pins and at the same time providing ample space for a 2½in. tyre. Additional coil springs are fitted at the top of the fork in a horizontal position to take shocks thrown back on the steering head. This is neatly carried out, and should provide a real advance in comfort.



FEATURES OF THE 1914 ROVER.

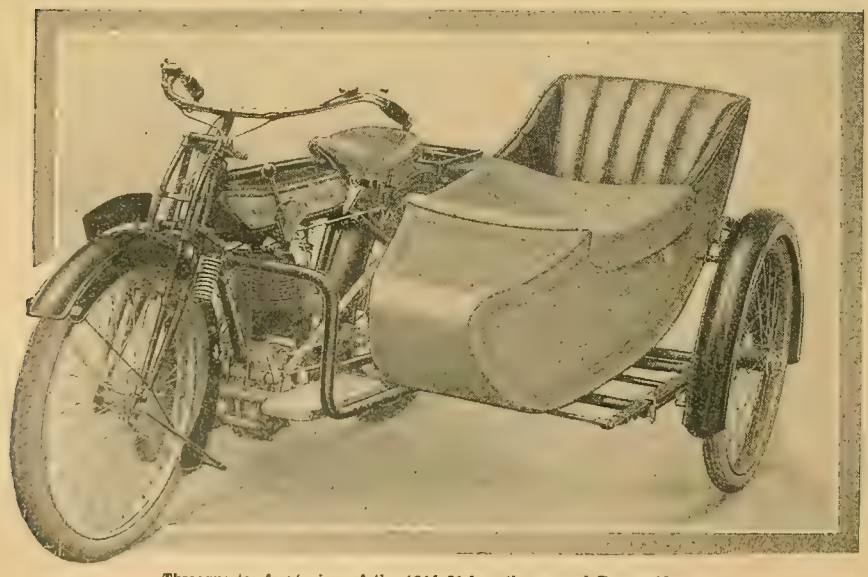
(1) Swing footboards in position for pedalling. (2) Back mudguard and carrier top swung up to facilitate tyre repairs and the removal of rear wheel. (3) New type mudguard and back brake acting on a reversed brake rim.

New Gear-changing Method.

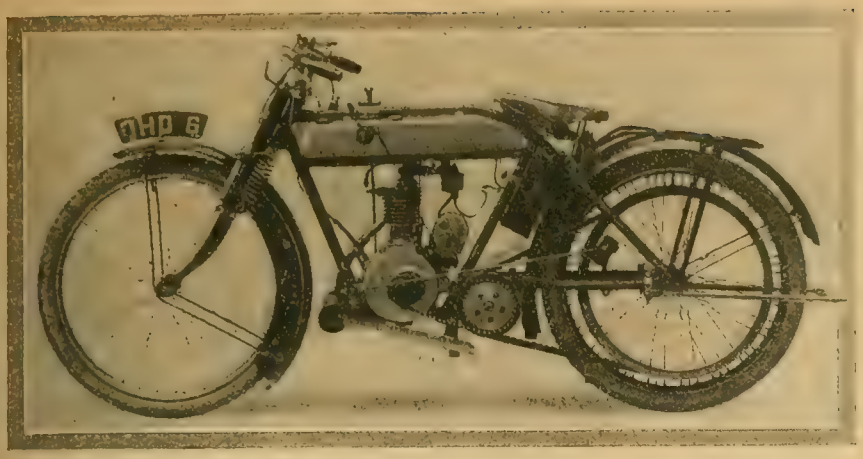
Quite a noticeable feature is the device by which the latest pattern Sturmey Archer three-speed gear is changed. It is at once neat and efficient. A little protected gate is fitted on the left side of the tank, and the striking rod is taken thence to a bell crank lever fitted to the back forks a little below the saddle, and another rod connects the other arm of the lever to the gear. The whole effect is admirable, and entirely removes the rods from the driver's legs and the possibility of bending them through their being squeezed.

The brakes have been largely re-designed, the leverage on the front brake having been increased, while the rear brake is the exact opposite in action to that hitherto employed, inasmuch as the shoe goes on in front of the dummy bel rim, which now points with its V to the outside and the hollow inside.

The clutch model is fitted with the Philipson governor pulley, controlled by a handle-bar attachment. Transmission is by rubber belt, and 2⅜in. tyres are fitted to the three-speed and clutch models. A great improvement giving accessibility to the back tyre is the hinging of the rear mudguard and hal the carrier. Comfortable footboards are fitted in place of footrests, and these hinge up at the forward end, enabling the pedalling gear to be used for engine starting. The finish of the machine is superb.



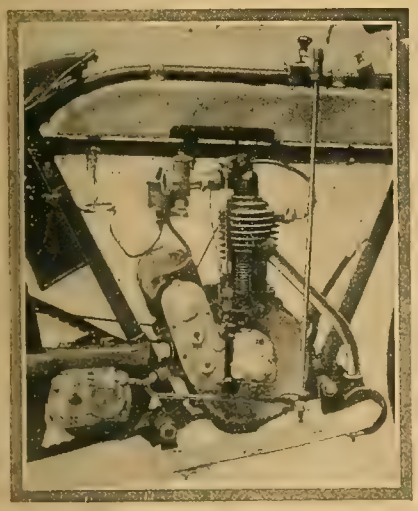
Threequarter front view of the 1914 3½ h.p. three-speed Rover sidecar



A new departure for Messrs. Humphries and Dawes is the marketing of the single-cylinder O.K. Junior fitted with chain and belt drive and two-speed counter-shaft gear.

O.K. JUNIOR.

The O.K. Junior motor cycle made by Messrs. Humphries and Dawes, Ltd., Birmingham, is being produced for those riders who require moderate power, and, considering the specification embodied in its design, the price, viz., £30 (which includes a two-speed gear), is very moderate. The weight of the machine is 120 lbs., and a petrol consumption of 140 miles per gallon is claimed. The engine is a single-cylinder 58 × 72 mm., 190 c.c., and the two-speed gear arranged in the counter-shaft is of the dog clutch type, the ratios afforded being 6 and 12



Valve side of the two-speed O.K. Junior.

to 1 as a standard. Chain and belt drive is used, the pulleys being of large size. Druid forks, Ruthardt magneto, Dunlop tyres, Amac carburetter, and Lycett belt are among the fitments to be found on this machine, which is excellently finished and turned out. It should obtain a large measure of popularity.

We tried this handy little mount in the Birmingham traffic last week, and must say that it is as controllable and easily manipulated as one could wish. It starts immediately by a dig on the ground with one foot and one can crawl along behind motor 'buses and turn in the road with ease. It climbs Rose Hill, Rednal, with a fourteen stone rider quite easily, and will restart in the middle of the hill.

1914 BAT.

The Bat Motor Manufacturing Co., Kingswood Road, Penge, S.E., whose works are conducted in a most efficient manner by Messrs. Tessier, sen. and jun., the latter being responsible for so many excellent performances in leading competitions, will exhibit at Olympia several new models. The No. 3 remains the same as 1913, except that it will be fitted with a three-speed counter-shaft gear, and the clutch bands and drums have been doubled in diameter and width. The method of operating the internal-expanding bands remains unchanged.

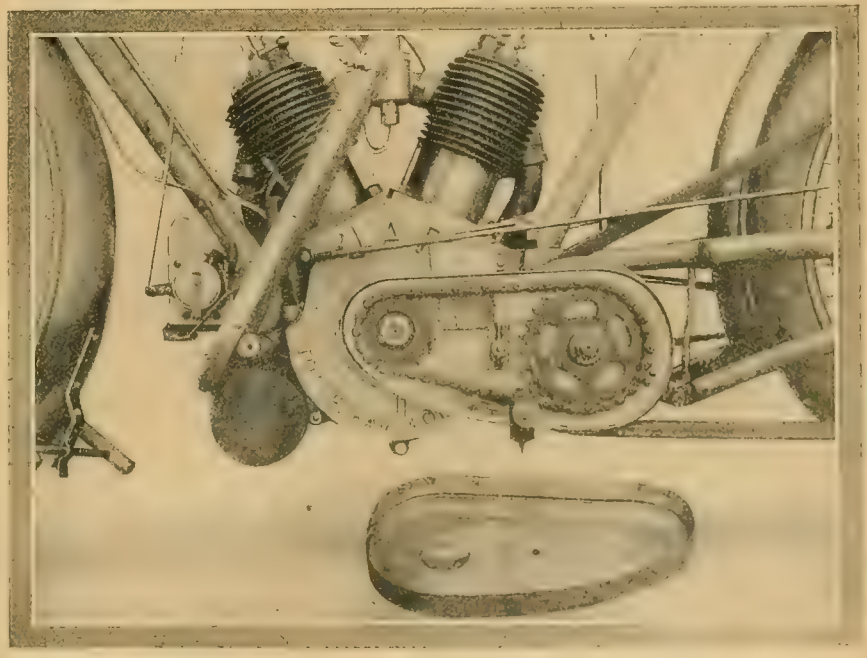
The 2a model will have an Armstrong Mark VII. hub gear, otherwise it remains unaltered. The 2b will have the Bat counter-shaft three-speed gear and combined chain and belt transmission. In this instance the same type of clutch as is fitted to the gear box of the No. 3 will be placed in the back hub. Yet another model is the 2c, which has a chain drive throughout.

We illustrate the near side view of the No. 2a with one half of the chain case removed. This case entirely encloses the chain. In the combination belt and chain model it will be noted that to get at the chain connecting link, and to pass this into position, would be rather difficult from the offside unless Mr. Tessier had arranged for a small sliding window to be fitted in the case. This is shown half up, and is situated in the upper portion of the casing. An entirely new model is the No. 1. This has been introduced to enable the Bat Company to sell a twin cylinder machine of 4 h.p., Jap engine 70 × 85 mm. at the moderate price of £57. It has a two-speed counter-shaft gear box, but no clutch nor foot-starter is fitted. An illustration of this model is appended, and it will be noticed that the silencer has two short pipes extending from the rear of the box for the final exhaust, and very neatly curved exhaust pipes. These latter are nickel plated.

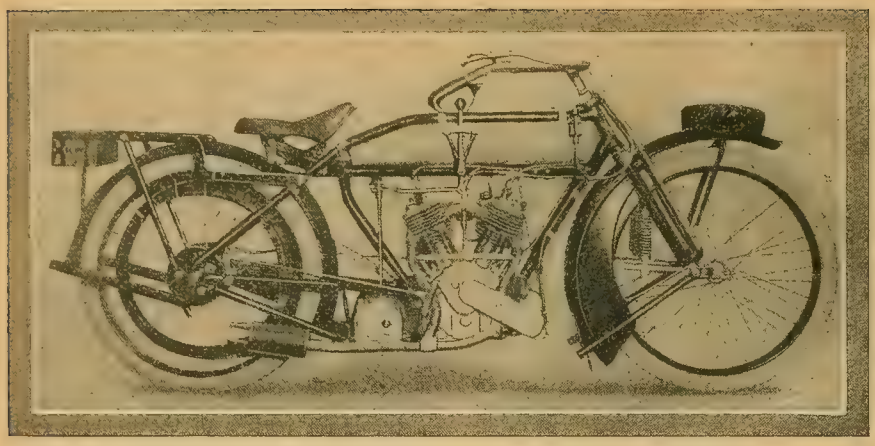
Chain and Belt Drive.

The transmission is by chain and belt, and it will be noticed that both chain and belt are on the near side. This is a feature worth mentioning as many machines are now constructed differently, having the chain on one side and the belt on the other.

Other features which are general on the Bat machines for 1914 are that the brake fittings and mudguards have been improved in detail, and the magneto chain case is now quite horizontal with



Folding footboards, chain cases, and chain and belt drive on the new Bat.

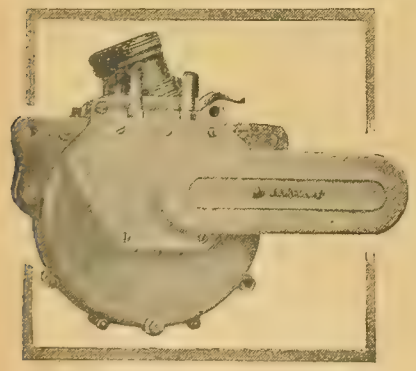


The new twin-cylinder Bat-Jap with chain and belt drive and counter-shaft gear.

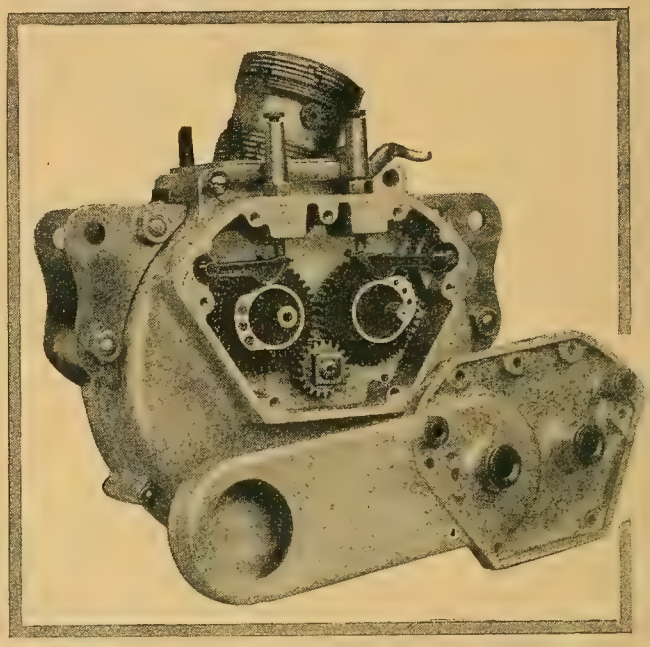
the ground. Previously, this case inclined downwards. This improvement has very much enhanced the appearance of this portion of the machine. The method of operating the three-speed gear on the re-designed Bats is similar to other types, namely, the central sliding pinion, which is in mesh on the middle gear, moves to the right and left for highest and lowest speeds, dog clutches engaging and locking the respective pinions to their shafts. A good feature which might be more generally adopted is that in the sidecar models the lugs for attaching the Millford sidecars are built into the frame in an extremely neat manner. When the sidecar is removed there are no loose parts to carry and the sidecar frame attachments are taken away with the sidecar. This is a great improvement on clips and similar attachments which Mr. Tessier pointed out have proved unsatisfactory through purchasers screwing up clips too tightly and pinching the tubing of the bicycle frame.

NORTON INNOVATIONS.

We referred to the Norton improvement in our issue for October 23rd, page 1371. We now illustrate the new cylinder, piston, and crank case relief valve, which prevents oil from blowing out at the bearings. Oil leakage on to the belt pulley is guarded against by an oil ring on the flywheel. The cam spindles are hollow, and provided with oil passages, and the cams are balanced. This will be a standard feature. At the base of the crank chamber is an oil sump, so arranged that when ascending a hill more oil will reach the flywheels and be by them thrown upon the cylinder walls.



One of the new Norton crank cases which has all bosses inside leaving a smooth exterior It is now fitted with an oil sump at the bottom.



The 1914 Norton crankcase, also showing grooved piston with single ring. drilled cams, and interior bosses on timing gear case.

Norton machines for 1914 will be provided with a three-speed countershaft gear, driven by a chain from the engine, the drive then being continued by means of a belt to the back wheel. The gear is of the dog clutch type, with one shaft in front of the other, but the middle gear is brought into play by a sliding pinion.

LIGHTWEIGHT SUN MODEL.

The Sun machines with Precision and Villiers engines have done well in competitions this year, and next year two single-cylinder models with $3\frac{3}{4}$ h.p. and $4\frac{1}{4}$ h.p. engines will be marketed for sidecar use, together with a new 4 h.p. twin model.

All these models will be fitted with Sturmey-Archer three-speed gears and Precision engines. An improved pattern of kick starter will be fitted. For those who prefer a more powerful model, a 5-6 h.p. twin-cylinder Precision-engined machine will be marketed, fitted with a sidecar made by the Sun Co. A considerable choice is thus given to purchasers. It is interesting also to note that next year a new two-speed model of about $1\frac{1}{2}$ h.p. will be marketed by this firm. The price will be in the neighbourhood of 25 guineas, and the speed attainable will be 25 to 30 m.p.h., the gear ratio being low enough to climb a 1 in 3 gradient. This little machine will doubtless appeal to a large number of riders who are anxious for a machine to take the place of a pedal cycle for running about on short journeys.

THE EDMUND SPRING FRAME SIDECAR MODELS.

Messrs. Charles Edmund and Co., Chester, whose machines are fitted with the Edmund patent adjustable spring frame, are marketing a sidecar machine for 1914 which will be equipped with a 6 h.p. M.A.G. twin-cylinder engine, an Enfield two-speed gear, kick starter, and chain drive. This company are also marketing a $3\frac{1}{2}$ h.p. twin-cylinder M.A.G. engined machine, which they state is amply strong enough and powerful enough for sidecar work if suitably geared, special reinforced tubing being used for the frame, for which great strength and light weight are claimed. Both these models will be exhibited at the Olympia Show.

Cylinder of the new design 4 h.p. big single-cylinder Norton.

CLUB NEWS.

Meet outside the headquarters of the Doncaster A.C. (Motor Cycle Section) on the occasion of the club's closing event for 1913.

Surrey M.C.C.

The annual dinner will take place this evening (November 13th) at the Angel Hotel, Guildford, the president Lt.-Gen. Sir Edmund Elles, G.C.I.E., K.C.B. in the chair.

Bristol M.C.C.

The annual dinner, followed by the presentation of prizes, took place on Saturday last. A gold watch was presented to Mr. P. Grout, the hon. secretary, as a recognition of his services to the club.

Sutton Coldfield and Mid-Warwickshire A.C.

On Saturday, December 6th, the annual reliability trial will be held over a non-stop course of about twenty miles, to be completed four times, the start and finish being made at the club's headquarters in Sutton Coldfield. The route will be kept entirely secret until the morning of the trial. On one of the hills in the circuit there will be four tests, one of these tests being undertaken on each round. (1.) Flexibility trial (slow and fast), non-stop. (2.) Slow test, non-stop. (3.) Stopping and starting test. (Engines may be stopped within the lines.) (4.) Acceleration test (from a standing start).

Mersey (Liverpool) M.C.C.

The annual general meeting will take place on the 20th inst., at St. George's Restaurant, Redcross Street, Liverpool. The annual dinner, followed by the distribution of prizes and a concert, will be held at the conclusion of the meeting.

Motor Cycling Club.

The Committee of the Motor Cycling Club invite all motor cyclists to attend their smoking concert, on Thursday, November 20th, at Holborn Resturant. Mr. Charles Jarrott, the president, will take the chair at 7.30 p.m.

Cambridge University M.C.

This newly-formed club held its opening event at Gazeley Hill, Newmarket, on the 25th ult. Results:

CLASS 1 (up to 350 c.c.)—C. O. Hayward (2¾ Douglas).

CLASS 2 (any standard touring machine up to 600 c.c.)—G. E. Cuffe (3½ Premier).

CLASS 3 (any machine up to 600 c.c.)—C. O. Hayward (2¾ Douglas).

CLASS 4 (up to 800 c.c.)—C. H. Sparks (6 Zenith).

New North-Western Automobile Association.

720 Motor Cyclists Enrolled at Liverpool.

ON Saturday last an enthusiastic meeting was held by delegates from many of the Lancashire and Cheshire clubs, at St. George's Restaurant, Liverpool. The object of the meeting was to confirm or otherwise resolutions passed at a meeting held in Liverpool on October 18th, at which the representatives of the Mersey (Liverpool), Stockport, Preston, Oldham, Chester, Blackpool, St. Helens, Liverpool Amateur M.C.C., Liverpool A.C.C., and Bury Motor Clubs considered it desirable to form a North-Western Association, in order that the clubs in this area might co-operate to their mutual advantage.

Most of the delegates at the former meeting were again present (having in the meantime consulted their respective committees) together with representatives of several of the clubs who were unable to attend on the first occasion. Amongst others present were the following well-known motorists: Messrs. Frank Whitehouse (secretary, Oldham club), chairman of the meeting; S. W. Carty, Liverpool, secretary; J. Brown and H. Bennett, Preston; W. Randolph, J. Wood, and W. D. Williamson, Liverpool Amateurs; C. J. Nevatt and W. Leather, Chester; T. Rees, Mersey; Harry Reed and C. E. Kettle, Manchester Motor Club; H. Moorhouse, H. Clough, and R. Parry, Bury; W. H. Garlick, Oldham; H. Marsden, N. Pilkington, and John Collier, Stockport; and C. Higham, of Hyde.

Considerable discussion arose out of a letter from the Secretary of the A.C.U. relative to the attitude of the new Association to that body, and although nearly half the clubs of the delegates present were not affiliated with the A.C.U., it was considered that it would be mutually advantageous to co-operate, as far as possible, with that official body, and the resolution, "That this Association has no intention of working in antagonism with the A.C.U.," was unanimously passed.

The meeting then proceeded to adopt the various rules of their constitution.

The delegates of the following clubs enrolled to form a nucleus, as it was confidently anticipated that many other North-western clubs would join after their committees had been informed of the proceedings:

	Members.
Bury and District	95
Chester	25
Stockport and District	100
Manchester Motor Club	200
Oldham	50
Liverpool Amateur	60
Mersey (Liverpool)	140
Preston	50
Total	720

Although it was decided to hold the meetings in the principal towns of the North-western area when the Management Committee gets to work, yet the first meeting of the Committee will be held in Liverpool in December, when delegates from any clubs anxious to join will be welcomed.

The usual votes of thanks and mutual congratulations concluded a most interesting night's business.

F.N. AND SINGER RECORDS.

Several records were set up at Brooklands on Thursday last. R. O. Clark, riding a 2½ h.p. F.N., 63½×86 mm., 273 c.c., made a fairly clean sweep of Class A figures. His machine ran with the greatest regularity throughout, and he had no mechanical stops. The only alterations to the machine were the removal of the mudguards and accessories and the raising of the gear. The machine carried a two-speed gear box complete and also a flywheel cover. The weight of the rider was no less than fourteen stone. His times and distances were as follow:

Hrs.	mls.	yds.	m.p.h.		Previous best by N. Slatter (Alcyon), 31/10/11. mls.	yds.	m.p.h.
1.	45	548	= 45.31		—	—	—

250	5 40 45⅗	= 44.02	Record.	—	—

J. Cocker, driving a single-cylinder Singer, 85×88 mm. = 499 c.c., with sidecar, and W. Pickering as passenger, made the following records in Class C:

	m. s.	m.p.h.	Previous best, H. Newman (Ivy-Precision), 20/10/13. m. s.	m.p.h.
5 miles flying.	5 19⅕	= 56.39 ...	5 35⅖	= 53.67
10 miles standing.	10 56⅗	= 58.84 ...	11 22⅗	= 52.74

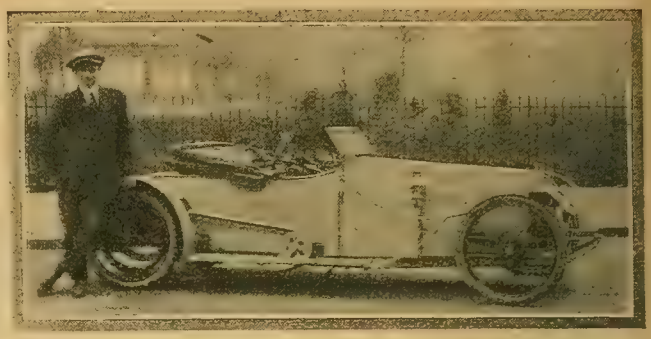
Cocker also attempted to beat the one hour sidecar record recently established by C. G. Pullin in the One-hour A.C.U. Championship Race, and, whilst lapping consistently at 55½ m.p.h., punctured and gave up.

On the following afternoon further attempts were successfully made by G. E. Stanley (single-cylinder Singer, 85×88 mm. = 499 c.c.), who beat records in Classes C and D:

	m. s.	m.p.h.	Previous best by D. R. O'Donovan, 30/9/13. m. s.	m.p.h.
5 miles flying.	4 6⅕	= 73.11 ..	4 11⅗	= 71.54
10 miles standing.	8 31⅖	= 70.39 ...	8 48⅘	= 68.08

R. O. Clark (2½ h.p. F.N.) who broke nine class records up to six hours last week.

TYRE MILEAGE COMPETITION.



The winner of the John Bull mileage competition, who has chosen an 8 h.p. Adamson cycle car as a prize.

Early in the year the Leicester Rubber Co., Ltd., makers of the John Bull tyres and belts, instituted a competition for users of their tyres, the prize for the winner being a cycle car at choice. Competitors had to purchase a T.T. John Bull cover, and this entitled them to a diary and voting card. In the former a careful record of the mileage achieved on the tyre had to be kept, and on September 30th the voting paper had to be filled up, estimating the average mileage obtained by all the entrants in the competition. The nearest estimate gained the prize. Mr. Sydney J. Tayler, hon. secretary of the Purley and District M.C.C., and Mr. D. K. Hall acted as judges, and as a result of their deliberations the winner was declared to be Mr. E. H. Gowing, White Hall, Sprowston, Norwich, who has chosen an Adamson cycle car as the prize. Mr. Gowing's estimate only varied by forty-eight miles from the total average, which, in the period allowed, January 1st to September 30th, was 2,774 miles.

HERTS. COUNTY RELIABILITY TRIAL.

The Herts County M.C.C. held a competition for the New Hudson cup during the week-end over a figure 8 course with the starting point at the approximate centre. In normal circumstances it might be described as a "tricky" but not really difficult course; but the heavy rain of the morning converted it into an almost impossible one for the competitors, who had to make a non-stop run of just over sixty miles at an average of 20 m.p.h. (watches and speedometers barred) to qualify for a silver medal. There were fifteen entrants of whom ten faced the starter.

Results: C. F. Halsall (Wilton), E. C. Jarvis (Singer), and A. R. Hare (Enfield sc.) qualified for silver medals.

IMPORTANT EVENTS IN 1914.

The Auto Cycle Union announce that the following fixtures have been provisionally arranged for next year:

Jan. 14th.—A.C.U. Annual Dinner.
Mar. 7th.—Spring One-day Trial.
,, 18th-25th.—Paris-Nice Trial.
May 19th-21st.—Junior and Senior Tourist Trophy Races in the Isle of Man.
June 9th-11th.—Car Tourist Trophy Race.
July 5th-11th.—English Six Days' Trial.
,, 17th-18th.—Automobile Rally, Nottingham.
,, 26th.—International Cup Race, Le Mans.
Aug. 4th-9th.—International Six Days' Trial.
Sept. 24th.—Cycle Car Tourist Trophy Race.
A.C.U. Championship Race Meeting at Brooklands.
Oct. 28th.—Autumn One-day Trial.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Difficulty with Piston Rings

Sir,—The difficulty with piston rings from which "L.H." has suffered, and which he described in your issue of the 6th inst., is very similar to the trouble which occurred to a friend of mine, who made alterations in the width of his rings. The machine being two or three years old, a slight ridge had been formed all round the cylinder at the level of the top of the piston ring. With the wider rings, the edge of the top ring came just above this ridge, and at a moderate speed the constant hammering of the ring against the ridge proved too much for the ring. My friend solved the trouble by slightly chamfering the top ring.

C. POUNTNEY WILLOUGHBY.

The Effect of Benzole on Tanks.

Sir,—You invite your readers to give their experiences of benzole on the insides of tanks. Here is mine. It has detached the baffle plates, and they lie prone on the bottom. I also think that benzole has been the reason of the Bowden wire becoming rotted away at the end in the spraying chamber of the carburetter. In fact, I am sure it is.

My machine is a 1913 Douglas R., and I have used benzole with excellent results barring those mentioned. All the same, I would rather use it than petrol, even if benzole were the higher in price.

JESSE BLISS.

A Novel Sidecar.

Sir,—If Mr. W. M. Pannett, or any other of your readers who are interested, will communicate with me, c/o Editor, I shall be pleased to give them full particulars of my sidecar—the Knut's Egg.

FRANKLIN FLETCHER.

Sir,—Replying to Mr. Fletcher's letter of October 30th, I beg to state that the style of chassis (October 9th), namely, C tubes with saddle springs, was registered by me in July, 1912, Rd. No. 603,840. As regards the type of body, I do not make any claim. Various types of bodies are fitted to my chassis with C tubes, and my springs are specially made for the purpose of suspension. Mr. Fletcher can see for himself at the Patent Office that my contention is correct.

W. E. MANNING.

The Cycle Car Trial.

Sir,—I should like to make one or two small corrections if I may be permitted to trouble you. As regard the A.C.U. one day trial for cycle cars in the measuring of petrol a level spot was chosen, but whether this was truly level or not does not matter in the least if the same place is used upon both occasions—that this was not done was due to the police, but the ground chosen was almost absolutely level and in any case each cycle car was measured on the same spot. While taking the final measurements, no one was allowed to stand on the car, while I examined the inside of the tank by an electric light, even waiting until any rock had ceased. These points are really of no importance, but in justice to the gentlemen who so kindly and effectively helped in the work, I think I ought to say that we were by no means as slow as you state. There were thirty-four machines to measure, and if this number is divided into the number of minutes taken over the whole job it will be found that the time taken was in the neighbourhood of three minutes for each. This cannot be called slow—far from it—but as a matter of fact I have designed one or two simple little pieces of apparatus which will enable such work to be done in future with infinitely greater speed and comfort.

A. M. LOW, A.C.G.I., D.Sc., ETC.

Rear Lights.

Sir,—Your article *re* rear lights for motor cycles prompts me to inform you that here in Wigtownshire horse-drawn vehicles can and do go without lights during the summer months (May, June, and July); the law permits them. It would be interesting to know why they have this privilege here. I do not know of any other county. It is very dangerous to motorists. Coming home late one summer night, I met a pony and trap on a woody part of the road—no lights, driver asleep in the bottom of the trap, and on the wrong side of the road. I had to take a toss in the ditch to avoid a nasty collision. I reported to the police next day, giving name and address of the driver, but never heard any more about it. Had the neglect been by a motorist, I have no doubt the law would have paid more attention to duty.

J.B.

National Signpost Fund.

Sir,—Being a keen motorist, I notice with a great deal of pleasure that a scheme is being set on foot for the provision, by public subscription, of a fund of £50,000 for the purpose of organising and carrying out a definite plan, viz., the erection of road signs whereby all users of the thoroughfares of the United Kingdom will be able, without enquiring of chance wayfarers, to ascertain the direction in which to proceed.

I am confident that the scheme could not be in better hands than those of the Automobile Association and Motor Union, this organisation having made rapid strides during the past few years. The patrol system has benefited my friends and myself on numerous occasions.

If this scheme is inaugurated it will confer a boon on all users of mechanically driven vehicles.

A MEMBER OF THE A.A. AND M.U.

Cycle Cars v. Light Cars.

Sir,—Is not confusion becoming worse confounded? In *The Light Car* the G.W.K. and the Humberette, both of which differ materially from standard design, are included as light cars. In *The Motor Cycle* of the same week the 10 h.p. four-cylinder A.C. is described as a cycle car. Really, "we don't know where we are." It is useless to discuss the merits and defects of the light car and the cycle car until we know precisely what is included in those terms. What do the manufacturers of the three above types say of themselves? Personally, I hold that the definition of the A.C.U., backed as it is by the authority of the R.A.C., the C. & M.C.M.T.U. and F.I.C.M., holds the field. "The public," says the writer of an interesting letter in *The Autocar*, "required to see tests under official observation, and the makers of light cars fell back on the A.C.U. for publicity." Quite so, and they will continue to fall back on the A.C.U. until trials can be organised, comparable in importance and interest with the Grand Prix, the proposed Tourist Trophy or the Six Days. I may add until they can secure a show of their own at Olympia. Meanwhile, in spite of the acknowledged authority of *The Motor Cycle*, I believe that the definition of the A.C.U. should be upheld. After all, the makers of light cars, who believe that they "lose by association with the cycle cars," can hold aloof from A.C.U. competitions and the C. & M.C.M.T.U. Show at Olympia. Whether they have gained or lost by that association I will not venture to decide, but that they have thought to gain and not to lose I am quite certain.

H. G. MORGAN.

The Liverpool A.C.C. Trial.

Sir,—As one of the correspondents whose letters have not been published with regard to the above trial, I again venture to request the favour of a space in your interesting paper.

In the first place I would mention that I am not interested in any particular make of machine or rider.

I have never had the pleasure of meeting either Mr. Sproston or Mr. Heaton, but for several years have been interested in motor cycling and have keenly followed the articles on the various trials in the motor cycling press.

In my previous letter I enquired what the cup was awarded for? If for reliability I certainly thought the club had come to an unfair decision, as Mr. Sproston's was certainly not the best performance, as he failed to make a *non-stop run* and Mr. Heaton, I believe, was the only one actually to do so.

I was astonished to note in your issue of last week, a letter from Mr. Phillpot emphatically stating that the cup was offered *not* for the best performance.

Considering that it was a *Reliance* cup and a reliability trial it is no wonder that I sign myself by the *nom-de-plume* of "Perplexed," as it was stated that Mr. Sproston won the cup by the best performance. Mr. Phillpot clearly states that Mr. Heaton's was the best performance, and under these circumstances it appears to me obviously unfair for the cup to have been awarded otherwise.

PERPLEXED.

Leaking Cylinder Heads on Scott Machines.

Sir,—In reply to "Two Years Ahead's" query, I have found Waterite quite satisfactory for sealing leaks on my machine. I put three large teaspoonfuls in my radiator in the first week and in a fortnight the leaking stopped. I add a little once a month now and find it quite satisfactory, but if I try to remove the rust from the weak spots on the heads I get a fresh outburst. If Waterite will not do, I should advise your correspondent to send the machine to the makers. Possibly he might try Caementum first; it is a waterproof cement and quite simple to use, though difficult to get in most places (the price is 6d. a tin).

Choked gauzes used to worry me till I got a sight feed lubricator fitted. I find I get much better running and use much less oil now, while I get immediate warning if anything is wrong with the crank case suction.

May I add that I have a Lukin carburetter on my machine, and that I consider a hot air jacket is a necessity if one is to get absolute satisfaction in all weathers. Since adding a jacket to mine, I have got a greater mileage per gallon, and much better running at high speeds (fifty and over). Taxibus is what I use whenever possible, it gives (on my machine) considerably more power than I. and II. petrol, and, if a trifle dirtier, 5s. worth of Cylclean sends me on my way rejoicing with a fine crisp exhaust. I can recommend Cylclean to Scottists. It saves a deal of time and is just as good as scraping. In conclusion, may I ask if there is any four-stroke (British made) machine which compares at all favourably, for comfort and ease of driving, with the Scott? I wish some practical experience of a four-stroke engine before taking to a cycle car, but I like comfort and simplicity.

I have no interest in any of the articles or process above referred to, but I like to give honour where I consider it due. NORTH BRITON.

Two-stroke Lubrication.

Sir,—With reference to the article in last week's issue of *The Motor Cycle*, describing the new Triumph two-stroke engine, we wish to protest against the way the lubrication system is described. Anyone reading your article would conclude that the method of lubrication, by mixing oil with the petrol, is quite novel, whereas it has been copied from the Connaught. We were sneered at and ridiculed at the Show last year, and everyone predicted failure for our system. We have proved its efficiency in all the big trials of the year, and feel that honour should be given where honour is due. We shall be glad if you will kindly publish this letter in your next issue.

THE BORDESLEY ENGINEERING CO.,
JOHN D. ROWLAND, Managing Director.

[We described the lubrication system as interesting, not novel. We were well acquainted with the Connaught system of lubrication, and, as a matter of fact, this method has been in use for some years in America.—ED.]

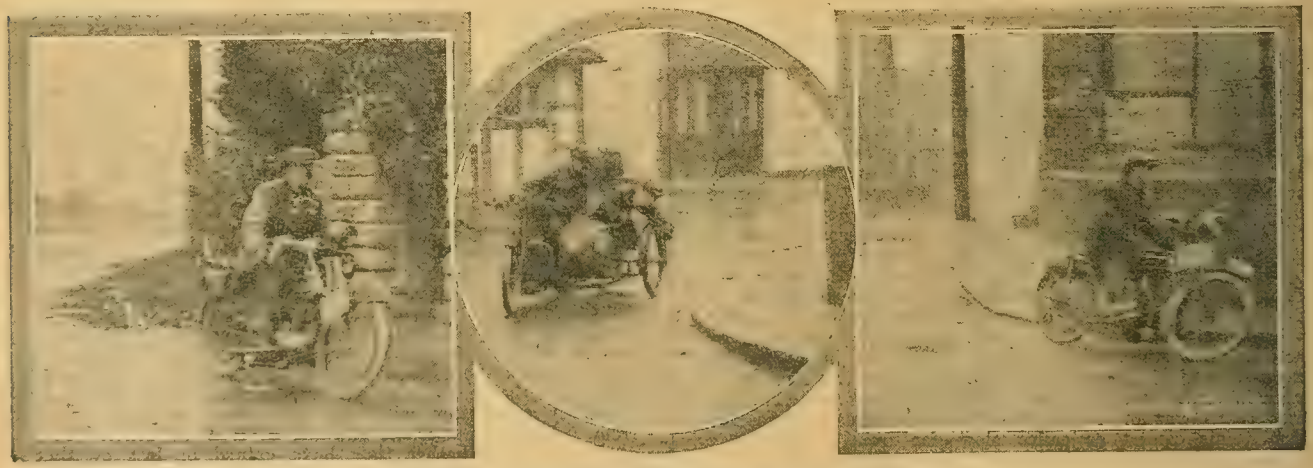
Excessive Garage Charges.

Sir,—On August 27th, owing to a breakdown I left a motor cycle with the Falcon Motor, Cycle, and General Engineering works, Totnes Road, Paignton, S. Devon, saying that I should instruct someone to call for it. Unfortunately I had to travel to the extreme North of England, and so left the machine there until October 5th. When my friend went to fetch this solo machine, garage charges of £1 14s. were made, being 1s. per day, and when the garage proprietor was told that it was a trade machine, he made a special concession of 10% discount. As a general rule, 6d. per day is the usual charge for motor cycles, and in many cases less.

Possibly I was to blame for not getting to know the charges before I left the machine. A. H. HILL.

[We submitted a proof of the above letter to the Falcon Motor, Cycle, and General Engineering Works, and publish below extracts from their reply.—ED.]

"I have not the pleasure of knowing Mr. Hill in this matter, and the bill was paid by Mr. Holmes, of Plymouth, who informed me that he owned the machine. . . . With regard to my charges, I always charge 1s. per day in the season, because space is valuable, and I gave Mr. Holmes the usual trade discount in this case. . . . I would add that Mr. Holmes offered me 3d. per day, but as I am not in business for the good of my health, I had to decline his offer.—Yours faithfully, "FALCON MOTOR WORKS,
"G. B. Wilson."



STUDIES IN CORNERING DURING THE STREATHAM TRIAL.

(1) H. V. Colver (Enfield) on the way to Westerham. (2) J. E. Greenwood (3½ h.p. Sunbeam (3) Passing through Oxted.

Touring Trials.

Sir,—As a club secretary, I feel I should refrain from passing comments on a trial promoted by a rival, although friendly club, and merely give the energetic officials of the Streatham and District Motor Club well earned credit for the efficient manner in which their very original trial held on the 1st inst. was carried out. However, as a competitor, I feel I have a grievance against the organisers for describing this event as a "touring trial," and yet allowing such racing freaks as Ware's Zenith, Holden's B.S.A., and Frank Smith's Grand Prix Clyno to compete on the same footing as genuine standard touring machines. I consider the nature of this trial which included acceleration tests, stopping and restarting on a steep gradient, and speed on Brooklands particularly favoured such freaks, and moreover gave them a distinctly unfair advantage. In my opinion, by allowing this sort of thing to continue, club officials are doing their best to tempt manufacturers, perhaps unconsciously, to mislead the public. As, undoubtedly, other clubs will follow the lead of the Streatham and District in organising what might be a very instructive trial, I take this opportunity of urging them to word their rules and conditions in such a manner that anything in the nature of a special machine (or flyweight passengers) will be barred from entering. F. J. ELLIS,

Hon. Sec. Woolwich, Plumstead, and District M.C.

Why More Air with Benzole?

Sir,—After his effort in last week's *Motor Cycle*, Mr. Cameron Gibson might well reflect. After proving, to his own satisfaction, that "Chemist" is wrong, he proceeds to prove, again to his own satisfaction, that "Chemist" is right, which is absurd.

In discussing the amount of air which a given fuel requires, we have to consider volumes, not weights. To deal with the question in the way Mr. Gibson does, we should require to know the molecular formulæ of both benzole and petrol before passing judgment. In dealing with volumes, however, we have a much easier task.

A very elementary law of physics states that equal volumes of gases under equal conditions contain equal numbers of molecules. Thus equal volumes of benzole and petrol vapour under the conditions considered would contain an equal number of molecules. But since the benzole molecule contains a greater percentage of carbon than the petrol molecule, a given volume of benzole will contain a greater number of carbon molecules (and therefore carbon atoms) than the same volume of petrol.

Now, one carbon atom requires two atoms of oxygen ($C+O_2=CO_2$) for complete combustion, whilst, to use up the same volume of oxygen by means of hydrogen, we should require four atoms of the latter ($2H_2+O_2=2H_2O$). Thus the carbon atom is equal to four hydrogen atoms in oxygen absorbing power, and consequently the greater the percentage of carbon in the fuel, the more oxygen (*i.e.*, the more air) will be required for complete combustion.

J. H. PRESTON.

Sir,—In my letter of the 9th October, I condensed my matter as much as I possibly could out of respect for your space, but as I have led Mr. Cameron Gibson into exposing his very elementary acquaintance with chemistry as well as to misunderstand me, may I ask space for reply.

I distinctly pointed out that there was about 18% more fuel in benzole than in petrol, volume for volume, and, of course, assumed that the same jet and throttle opening was used in both cases; also that the internal viscosity and external friction of the two liquids was the same, and that the amounts of liquid passing the jet in each case were equal. On the first principles, of course, more air is required. But I omitted to state a well established fact in combustion. It is that if you have a fuel which contains carbon and hydrogen, and you decrease the correct amount of air supply, the whole of the hydrogen will be burned up before any carbon is consumed, the unconsumed carbon dropping out as soot or smoke usually. This is the underlying principle of luminosity of flame, and also the cause of soot and smoke in the silencer. On this subject I do not propose to take up your space, but I cannot pass over Mr. Gibson's elementary chemistry without correction. One volume of gaseous carbon weighing twelve units combines with two volumes of oxygen weighing thirty-two units, and two volumes of hydrogen weighing two units combine with one volume of oxygen weighing sixteen units. Carbon as gas thus requires four times the volume of air that the the same volume of hydrogen requires, which supports the practical results.

Let me in conclusion urge any who wish to test benzole by distillation to use a condenser, and have a tray of sand below the retort in case of an accident—but better for an amateur not to bother about this test. CHEMIST.

On the level crossing at the bottom of Pebble Hill, Betchworth. The machine is a 7-9 h.p. Premier sidecar.

SUMMARY OF CORRESPONDENCE.

THE CARBURETTER FOR SCOTTS.—In our issue of September 11th, a letter appeared over the signature of George Bax on the subject of Lukin and Binks carburetters for Scott motor cycles. Mr. Bax's concluding sentence was: "I also, like Mr. Kelly, have no financial interest in either C. Binks or Lukin, Ltd." Later we were informed that Mr. Bax was employed in a London house dealing in carburetters, and accordingly addressed the following letter to him, to which we append the reply received:

OUR LETTER.

"Dear Sir,—Permit me to refer you to your letter of August 21st, with regard to your experience with the Scott machine fitted with Binks and Lukin carburetters. I am given to understand that you are employed in the motor trade, and are, in fact, interested in the sale of carburetters. I shall be glad if you will advise me if my informant is correct, and also the name of your employers.

Yours faithfully, THE EDITOR."

THE REPLY.

"Sir,—In reply to your favour of the 5th inst., the letter you refer to was written by me as a private owner of a Scott motor cycle. I do not acknowledge your right to any further information, and resent the inquisitorial tone of your letter.—Yours truly, GEORGE BAX."

"S.R.G." writes from Manchester: "In reference to your reply to 'R.F.' in *The Motor Cycle* of 30th October on the question of the best route from Alderley Edge to Olympia, I beg to point out that the road from Congleton to Leek is anything but good. Your correspondent would do better, after leaving Alderley, to turn left at Monk's Heath through Chestergate, Macclesfield, at the end of which turn right; it is then a straight road to Leek where the route should be followed as suggested by you. I have been this way several times, and find it quite satisfactory."

THE CYCLE CAR TRIAL.

THE JUDGES' REPORT.

THE weather conditions were good for the purpose of a motor trial; a fine morning with storms later in the day. The road surfaces were generally excellent, but were somewhat heavy and muddy under trees. The course comprised hills of moderately severe gradient, and, with the exception of Haste Hill, well metalled surfaces.

A comprehensive variety of machines was entered, as shown in the following table.

Summary of Types of Vehicles entered.

No. 5, an original and commendable type of sidecar machine, was disqualified as not being a cycle car.

Transmission.	No. of entries.	1st class certificate.
Shaft	12	8
Belt	10	4
Chain	8	4
Friction	3	3
Engine Cooling System.		
Air	17	9
Water	16	10

Seating Capacity.	No. of entries.	1st class certificate
Single	2	2
Double	31	17
Wheels.		
Three-wheeled	6	4
Four-wheeled	27	15

The performances of the machine were, on the whole, satisfactory, nineteen out of thirty-one starters successfully completing the course within schedule time. Of the failures, at least three failed from tyre troubles, and on account of arriving too early at the finish.

There was a marked improvement as regards hill-climbing and reliability, the latter due, to a great extent, to the fitting of heavier tyres.

Engine workmanship and fitting showed an improvement, the engines being more free externally from oil, and there being less noise from the timing gear. There is still much room for improvement in engine design, particularly with reference to the maintenance of torque at low speeds or alternatively, of vibration at a comparatively high rate of speed, to the further elimination of noise from valve gear, and to silencing of the exhaust, by the provision of larger expansion chambers.

The various types of transmission showed signs of careful experimenting, a differential being apparently considered as essential, except in the case of belt drive, where correctly proportioned belt pulleys appeared to work satisfactorily, allowing the necessary amount of slip on corners, without any appreciable loss of power on the straight. The absence of a reverse is a distinct handicap.

Chassis design appeared to copy very closely that of car practice The otherwise excellent design of one cycle car was spoilt by an insufficiency of road clearance. The back axles of more than one type were obviously over-stressed. Insufficiency of steering lock was noticeable in certain cases.

With regard to equipment, there was in some cases very much to be desired, particularly as regards comfortable seats, better mudguards, more substantial fitments, such as lamp brackets, more accommodation for luggage, tools, etc., and a better finish throughout. The lack of finish and smart appearance was the more noticeable, as certain of the competing cycle cars were excellently equipped and finished. The judges consider that it is most short-sighted on the part of manufacturers to send out for a public trial vehicles with makeshift bodywork. The suspension in the majority of cases was good.

Easily detachable wheels and the carrying of a spare wheel would be a material advantage.

The majority of machines only possessing two speeds, it would seem that three or even four speeds are desirable, enabling a higher top ratio to be fitted, with a consequent saving in petrol, etc.

Accessibility showed signs of marked attention, it being easier to get at carburetter, magneto, etc.

Oiling devices seemed to vary between entirely automatic and hand-controlled drip feed with plunger pump. A few makes relied on the unsatisfactory, if simple, hand pump.

Petrol and oil unions, taps, and pipes were sufficiently stable to stand the vibration, but the radiators on some machines showed signs of leaking more or less badly.

In the stopping and starting tests it was noticeable that many of the vehicles ran backwards for some distance before proceeding. This points either to brakes not holding satisfactorily when the machine commences to coast backwards, or to the difficulty in applying brakes with the discrimination needed in such a test.

E. P. Greenhill
Glynn Rowden Judges.

FIVE HUNDRED MILES IN EIGHT DAYS.

It is interesting to note the extent to which the motor cycle and sidecar is gaining favour with ladies. The lady rider above is Miss E. Aubrey, of Bristol, who a week ago toured from Bristol to Liverpool via London and Coventry and home direct, with her sister, on her 3½ h.p. Rudge-Multi sidecar outfit

OFFICIAL RESULTS.

FIRST-CLASS CERTIFICATES.

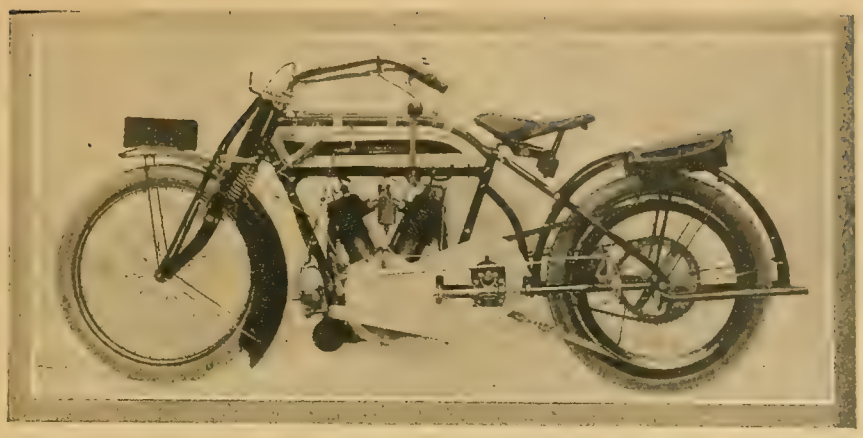
Driver, H.P., and Machine.	Consumption. M.P.G.	Remarks.
J. Munday (6 A.C.)	52	Coachwork unfinished.
W. S. Brownsort (6 A.C.)	36	Coachwork unfinished.
W. G. McMinnies (8 Morgan)	65	Little regard for appearance.
V. Busby (8 Morgan)	54	Condition fair.
H. E. Dew (8 Dew)	49	Bodywork crude.
J. T. Wood (8 G.W.K.)	49	Excellently equipped throughout.
C. M. Keiller (8 G.W.K.)	44	Appearance good.
J. G. Panling (7 Swift)	56	Appearance fair, seats too low.
P. Meers (10 A.C.)	38	Coachwork unfinished.
Albert B. Phillips (8 Warne)	29	Workmanlike job.
S. Wright (8 Humberette)	37	Efficiently mudguarded.
Lionel Martin (10 Singer)	35	Competition body, insufficiently mudguarded for touring.
R. G. Thomas (8 Pyramid)	47	Bodywork satisfactory, back axles sagging.
L. T. Payne (8 Pyramid)	42	Ditto.
J. Chater-Lea, jun. (8 Chater-Lea)	42	Back axle weak, valances needed to mudguards, body unfinished.
W. Cooper (8 Humberette)	36	General appearance fair.
Rex G. Mundy (8 Humberette)	45	Ditto.
Victor Wilberforce (8 G.W.K.)	42	Good competition body with well-designed detachable wheels.
C. F. Halsall (10 Wilton)	24	Design of chassis excellent, bodywork poor.

CERTIFICATES OF PERFORMANCE.

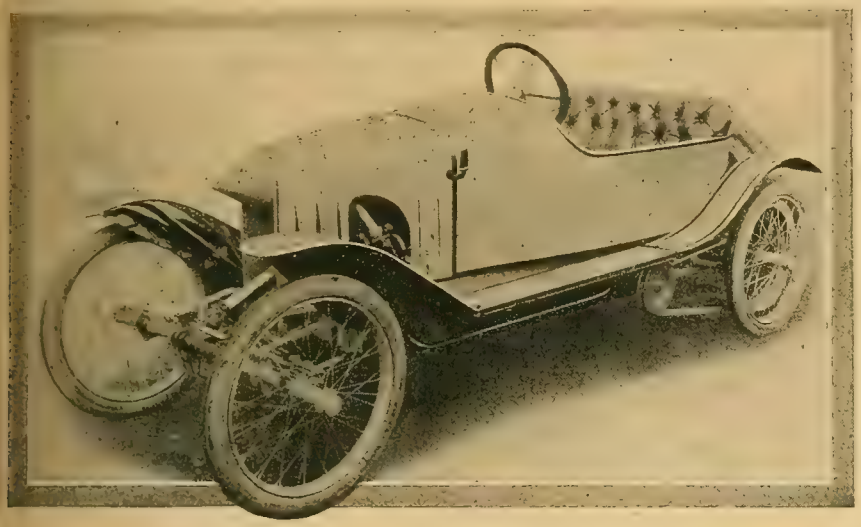
Driver, H.P. and Machine.	Consumption. M.P.G.	Remarks.
W. Skinner (8 Morgan)	42	Two stops: puncture and engine trouble, leaking radiator.
John Gibson (8 Morgan)	—	Three stops for tyre trouble: slovenly appearance.
A. Maitland (8-10 Beacon)	72	Eight stops on hills; appearance sacrificed for lightness.
M. Bryan (7-9 G.N.)	47	Failed at Wray Lane and Tanhurst Hill.
C. Pressland (8 Crouch Carette)	39	Two stops on Tanhurst Hill, and stopped on Haste Hill owing to shorting switch.
R. Barton Adamson (10 Adamson)	42	Commendable general design, but insufficient road clearance; gate broke and gears had to be unmeshed by hand; two stops owing to gear trouble.
A. Percy Bradley (8 Duo)	44	Failed on three corners and lost one belt; one exhaust pipe broke off; insufficient lock.
G. N. Higgs (10-12 G.N.)	41	Time error, otherwise clean sheet; faulty top gear: excellently equipped.

LINCOLN ELK PASSENGER MACHINES.

Mr. James Kirby, Broadgate, Lincoln, is marketing a new model 6 h.p. for passenger work. Some very interesting features are to be met with on this machine. A special patent counter-shaft two-speed gear is fitted, the drive to the back wheel being by belt on the high gear and chain on the low, a feature which has a good deal to recommend it. The rear part of the frame is of novel design and the price of the machine is exceedingly moderate, viz., £55. A kick starter is fitted and another make of sidecar can be attached as required. Mr. Kirby also makes a single-cylinder 4¼ h.p. Lincoln Elk machine with two-speed gear and with similar transmission, which is also suitable for passenger service at the moderate price of £46, as well as several solo models.



Belt side of the latest model two-speed twin-cylinder Lincoln Elk showing combined drive and counter-shaft gear.



Threequarter front view of the latest model 8 h.p. twin-cylinder G.N.

1914 G.N. CYCLE CAR.

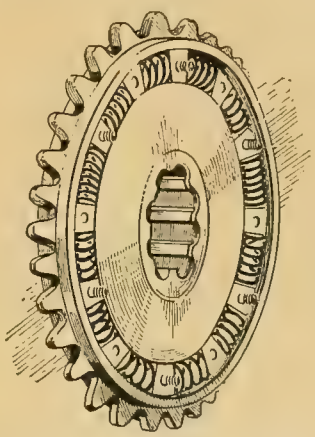
The G.N. cycle car will have no radical alterations for 1914. However, there are several improvements in detail. Instead of having open holes through which the oil must pass to the pulley-shaft bearings, a neatly fitted pipe at each end of the shaft enables the driver to lubricate the bearings from the inside of the car. This device, together with extension covers, keeps out all the dust and dirt, so considerably lessening the wear of the bearings. The lever front springs have now been replaced by radius rods.

During a recent visit to the G.N. works, Mr. Frazer-Nash gave us a demonstration of the power and speed of his own Grand Prix model. In a remarkably short distance, the engine, which pulled magnificently, had accelerated to 40 m.p.h. on second gear. When the top gear was engaged, the speedometer soon registered a speed of just over 50 m.p.h.

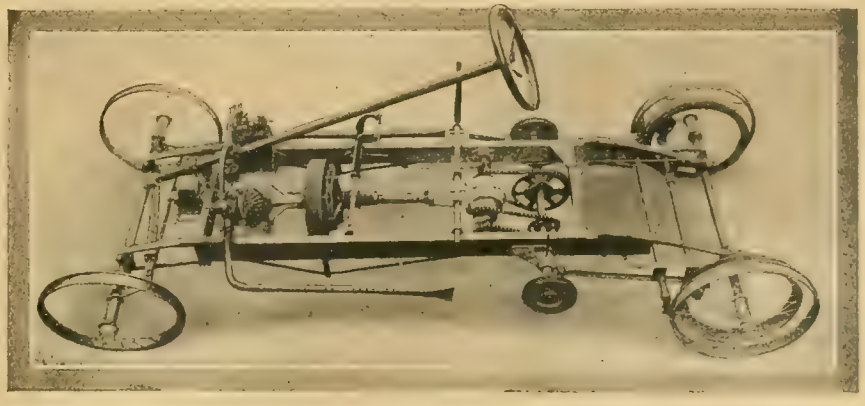
Later on we drove the machine, and were surprised at the extreme ease of handling, and particularly the delightful steering. It held the road well, and was excellently sprung, while the seating accommodation was comfortable and provided ample leg room.

A BIG SINGLE-CYLINDER.

A machine that has attained considerable fame by reason of its neat design, excellent construction, and reliability is the James. We have quite recently described the latest models in our pages, and for 1914 they are being constructed as in the past with a special view to performing sidecar work. The company are well known as exponents of the big single-cylinder principle, and the capacity of the single-cylinder James has been increased for next year to 86 bore × 103 mm. stroke, which gives a capacity

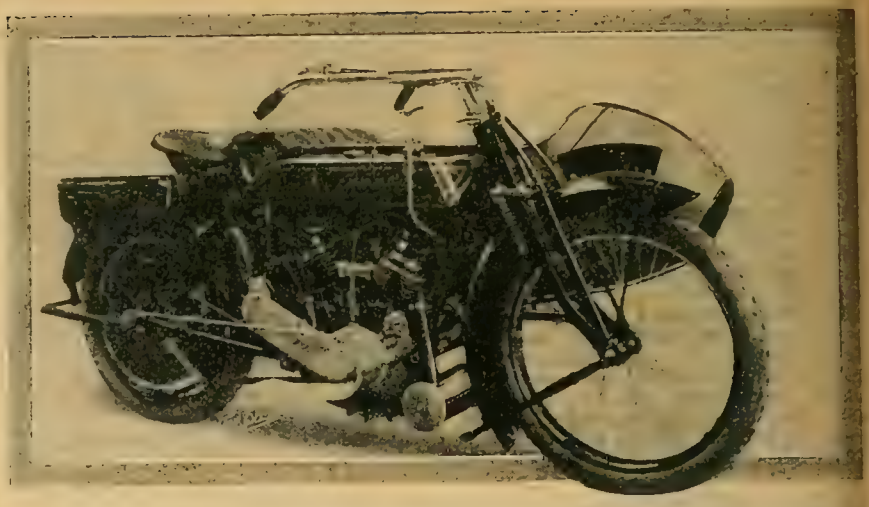


DETAILS OF JAMES SHOCK ABSORBER. The rear hub of the chain-driven James models is fitted with a neat spring shock absorber, which, it is claimed, is so efficient, that it considerably reduces tyre wear, besides, of course, saving the chain. Its design is rendered clear by the sketch.

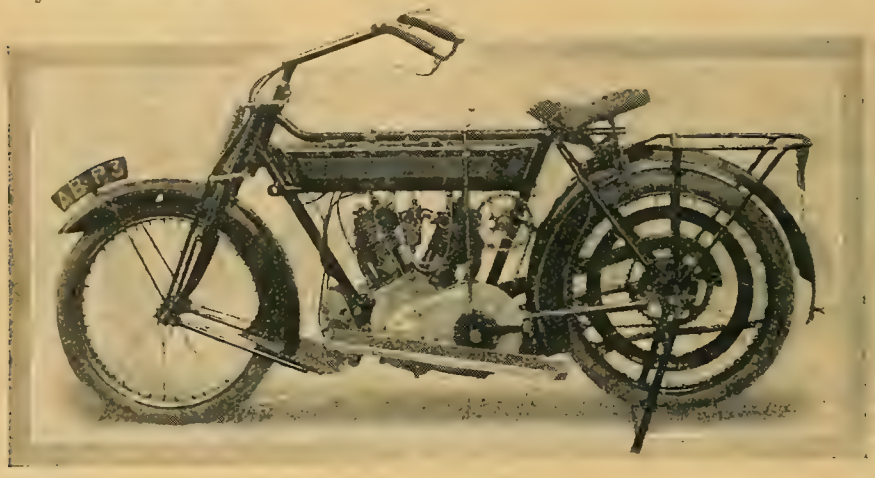


Semi-plan view of the 8 h.p. G.N. chassis, showing shaft, chain, and belt drive, position of engine, and large steering wheel

of 599 c.c. In addition to the increased capacity it is claimed that the engine is more efficiently designed than in the past, and is thoroughly up to the work of pulling a comfortable coachbuilt sidecar and full load anywhere, fitted as it is with an admirable two or three-speed counter-shaft gear at option, to which is attached the kick starter. The transmission is totally enclosed in pressed steel chain cases. A notable feature of this model is the fitting of the front hub with Timken roller bearings, which are specially designed to resist the thrust and drag of a sidecar at corners. In addition to the big single, the James Co. are marketing a 496 c.c. twin-cylinder machine designed for solo use. It is fitted with the James counter-shaft three-speed gear box and all enclosed chain drive, and is a most attractive mount and beautifully finished. For use in conjunction with the big single cylinder, the James-Canoelet sidecar is supplied by the company finished to match the machine, making a very attractive turn-out.



The latest addition to the ranks of passenger machines is the 6 h.p. New Hudson with Mark VII. Armstrong gear, and kick starter. It has a chain and belt drive.



The 6 h.p. twin-cylinder 2-speed Enfield in its latest form, showing aluminium front chain case, and chain to handle starter, mounted on the down tube from the saddle.

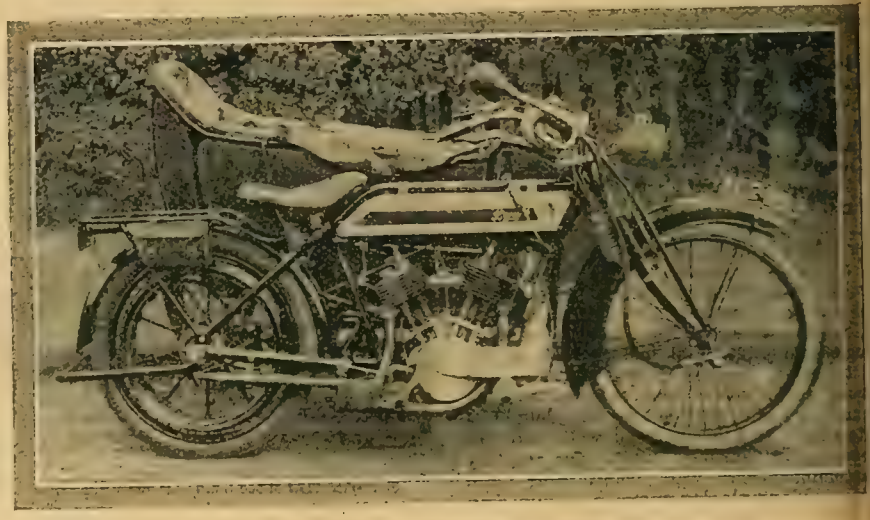
THREE EXCELSIORS IN 1914.

Single cylinders and plenty of power are the outstanding features of this make, and for next year they will be made in three models, viz., 3½ h.p., 499 c.c.; 4½ h.p., 650 c.c.; and 5-6 h.p., 800 c.c.—the latter being known as the big single. These models are specially designed and built for passenger work and are not in any way looked upon as speed models; in fact, it is for the slogging, get-anywhere tourist that Messrs. Bayliss, Thomas and Co. cater. The hill-climbing feats of this make in the hands of Mr. W. H. Carson are well known, and for those who do not object to the powerful beat of a large single-cylinder there is a great deal to recommend this type of machine, for not only is great efficiency obtained from such an engine but, as the parts are all on a fairly large scale, it is possible to construct them in an exceedingly robust manner. In fact, in the Excelsior engines there is a good deal of car practice, for three-ring pistons are fitted and the lubrication of the big end bearings is taken through a hollow

THE CANOELET SIDECAR.

The greatest interest was displayed in the Canoelet sidecars at the last Olympia Show, and so great has been the demand that the makers, Messrs. Mead and Deakin, Birmingham, have been obliged to seek more factory space during the past year. The general outline of these attachments is extremely attractive, and the suspension most comfortable: in fact, the comfort and protection provided for the passenger are quite noteworthy. The chassis itself is most simple, and at the same time very strong, being simply a single tube running completely round the body.

Chassis of the 1914 Canoelet coach



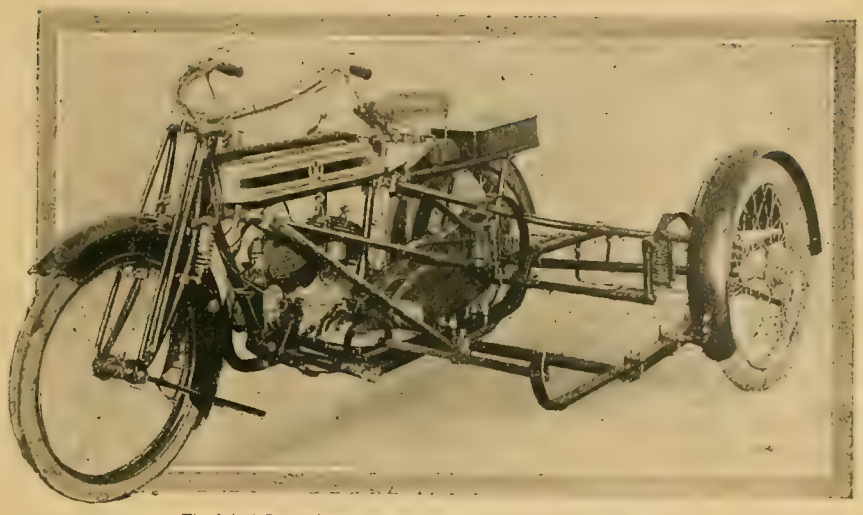
Valve side of the latest model 6 h.p. three-speed Brough and coach built sidecar

Passenger Machines of all Types.—

crank pin, the oil being fed through a Best and Lloyd sight feed lubricator to the cylinder wall opposite to the gudgeon pin at the bottom of its stroke.

A Choice of Gearing.

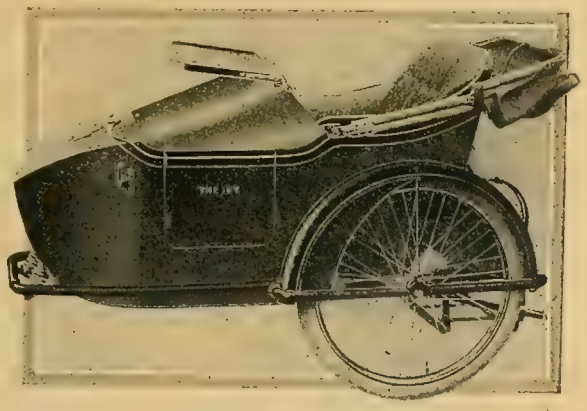
Next year the 5-6 h.p. model will be supplied either with a Sturmey-Archer three-speed hub gear or a three-speed counter-shaft gear, embodying a clutch, and both types will be fitted with a kick-starter. This will allow the pedalling gear to be dispensed with and, in its place large-sized footboards will be fitted. An excellent feature is the fitting of cycle car sized Palmer cord tyres on this model, while an XL'All saddle, Bosch magneto, Senspray carburetter, Brampton Bi-flex spring forks, and other details complete a soundly constructed machine. A really praiseworthy effort has been made to eradicate as much nickel plate as possible from next year's machine, and the handle-bar in future will be covered with black celluloid, which has the advantage of looking neat and being easy to clean.



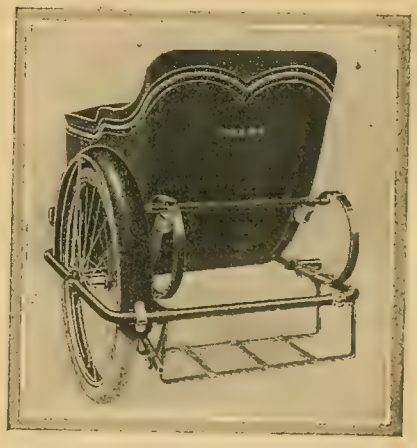
The latest Rex sidecar chassis which has four point suspension.

THE IVY SIDECAR.

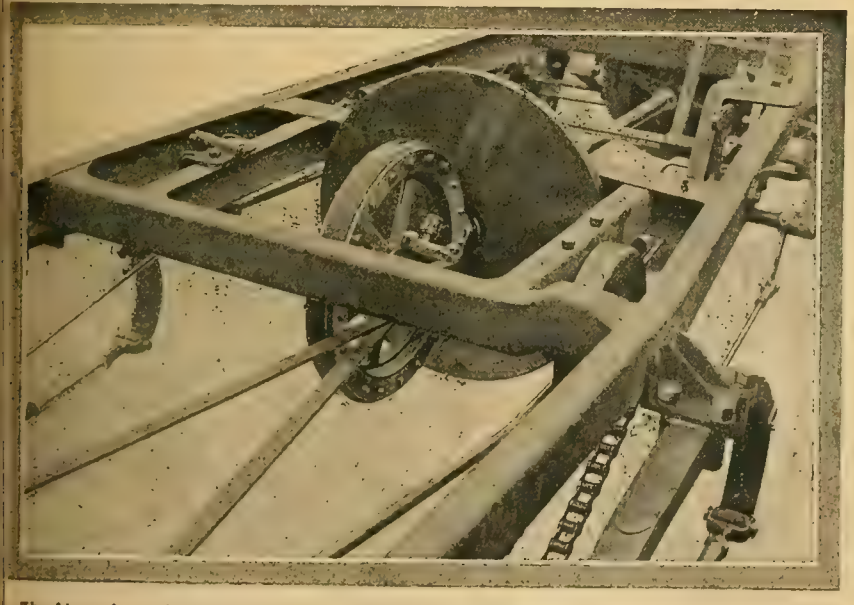
The suspension of the Ivy sidecar, which we illustrate, is improved by the addition of coiled springs connecting the rear part of the body to a crossbar joining the ends of the "C" springs. Mr. Newman is making a special feature of Ivy sidecars, painted in colours to match various machines, such as the Matchless and other models. The sidecar is a particularly well thought out attachment; the body is well made of three-ply wood, the interior being upholstered with Vegamoid, well-stuffed, and provided with springs to seat and back. The door has a concealed lock, and when fitted with hood, screen, and stormproof apron, the passenger is absolutely sheltered from the elements. The illustration shows the method of support for the wheel spindle on both sides and the efficient mudguarding of the wheel, also the neat lamp bracket fastened to the body.



Side view of the new Ivy sidecar, which, as will be noticed, has a scuttle dash, hood and screen.



Rear view of new Ivy sidecar.



The Ajax, a four-cylinder French cycle car, selling at under £100. The method of fitting the friction transmission is shown. Final drive is by single chain to one rear wheel.

A PIONEER FIRM.

Ever since the motor cycle movement was started in this country Messrs. Brown Brothers, Ltd., Great Eastern Street, E.C., have supplied motor cycles which have gained an excellent reputation for their reliability, and in the old days for their wonderful hill-climbing powers. For next year they will list two models, a 3½ h.p. single-cylinder, and a 3½ h.p. twin. The twin-cylinder model has an Armstrong three-speed gear and direct belt transmission. The engine is fitted with overhead inlet valves, and the special features of these machines are spring forks, centre springs being used one above the other to take the compression and recoil. The single-cylinder model has chain-cum-belt drive, the gear box being situated on the counter-shaft, and a kick starter is fitted, but no pedalling gear is used as on the twin-cylinder model.

Passenger Machines of all Types.—

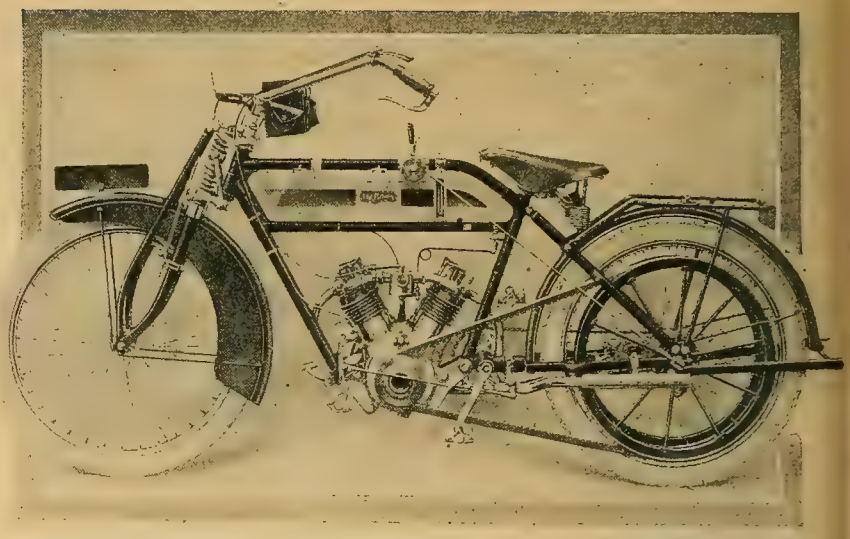
The gear on the single-cylinder model is changed by a Bowden wire from the handle-bar, and both machines present an exceedingly neat and workmanlike appearance.

A HANDSOME SIDECAR OUTFIT.

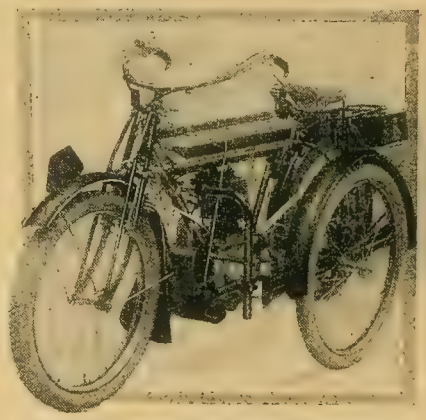
During the past season the Hazlewood motor cycle has done exceedingly well in trials, and the new sidecar outfit produced for 1914 by Messrs. Hazlewood, Ltd., Coventry, should thoroughly uphold their reputation. The power plant is a 5-6 h.p. J.A.P., having a cubic capacity of 664 c.c. The transmission is by chain to the counter-shaft, and thence by belt running over large pulleys to the rear wheel, in which is situated the latest pattern Mark VII. Armstrong gear, the change of which is effected by a large lever working in a quadrant on the left-hand side of the tank. These machines are finished in an attractive brown colour, and the coach-built sidecar is finished to match. A kick starter is provided, and other noticeable features of these well-designed machines are a very large spoon brake, acting externally on a dummy belt rim on the rear wheel, and a neat device for locking the spindle of the hub gear, and grease cups to the spring fork shackles.

THE PARAGON PATENT FOLDING SIDECAR.

The Wincycle Trading Co., Ltd., 106, Great Saffron Hill, E.C., are manufacturers of the Paragon folding sidecar, which is made in a variety of types, varying in price from eight to fifteen guineas. This attachment is capable of being folded up without removing from the motor cycle so that the whole will pass through a 30in. doorway, the time required for this being only a few seconds. The Wincycle Trading Co. market an attractive 4¼ h.p. Precision-engined motor cycle suitable for passenger work, and this will be shown at Olympia complete with the Paragon folding sidecar.



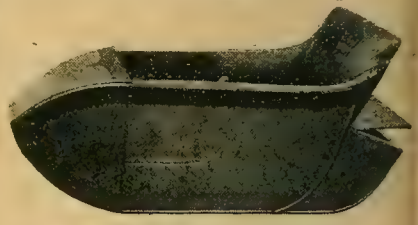
The 3½ h.p. twin-cylinder Brown in its latest form. Notable features in this machine are automatic carburetter, Armstrong three-speed gear, overhead valves, direct belt drive, and large driving pulley.



The Paragon sidecar chassis, which, as may be seen, folds up close to the machine when not in use.

LUGGAGE BOOT ON SIDECAR.

The Monarch Fittings Co., 203, Edward Road, Birmingham, are making a speciality of a sidecar, at the back of which is fitted a large boot capable of

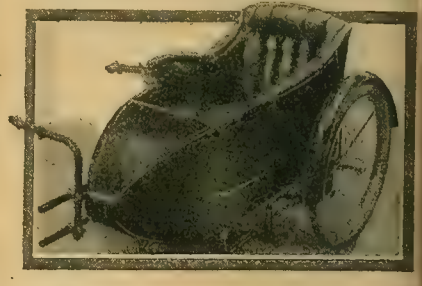


The Monarch coach-built sidecar, showing the box at the rear for tools, spares, etc.

holding a two gallon tin of petrol. The lid can be made to accommodate quite a good size bag. At the same time no loss of space is made in the sidecar, and the whole design is well carried out.

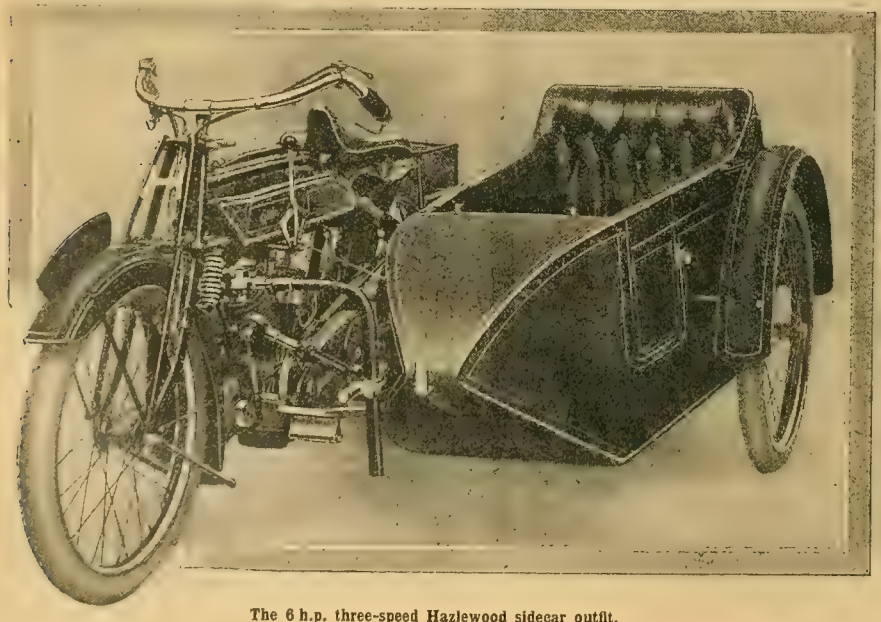
THE COSICAR TWO-SEATED SIDECAR.

A sidecar on novel lines is being marketed by the Ram-Car Manufacturing Co., 10, Gun Street, Ancoats, Manchester. A feature of this sidecar is the provision of two seats, the second seat being suitable for a fair-sized child,



The Cosicar, which is made by the Ram-car Co., and has a child's seat in the inside.

and made by curving outwards the inside panel of the sidecar. Should it not be required for passenger service the seat can be detached, and it then provides admirable space for carrying parcels.



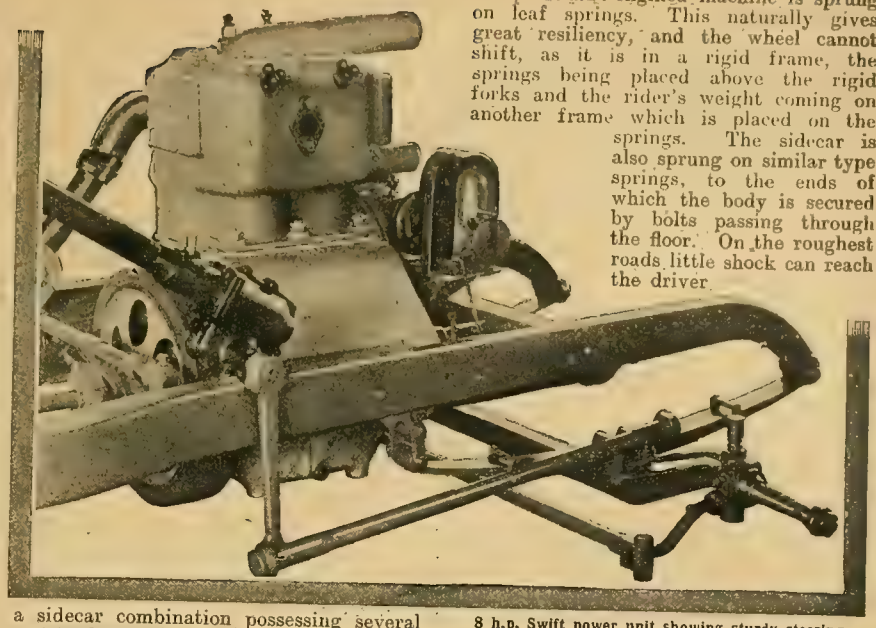
The 6 h.p. three-speed Hazlewood sidecar outfit.

SWIFT CYCLE CAR.

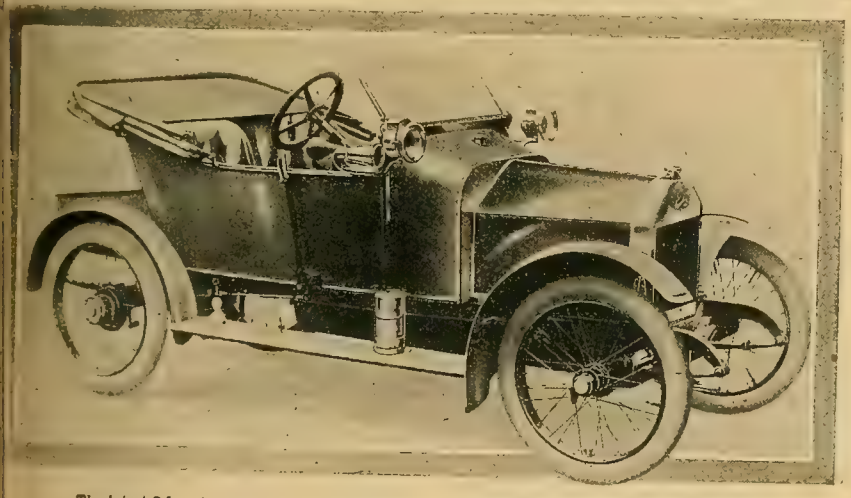
The Swift cycle car for 1913 has proved itself an admirable little vehicle, but it will hardly be recognised in its 1914 guise, so many and varied are the alterations and improvements effected. The tubular frame gives place to a substantial one of pressed steel, and the whole appearance of the machine gives the impression of far greater strength than the 1913 model. The engine remains the same, a twin-cylinder, water-cooled, 75×110 mm. bore and stroke. The gear box affords three speeds and reverse, and is actuated by a gate change. Ball bearings are extensively used throughout this cycle car, and an excellent feature is the provision of a five-gallon petrol tank, while the coachwork is very smart, being finished in grey with green leather upholstery and brass finish to the bright parts. The seats are slightly staggered to allow greater comfort for the passenger. The whole machine is exceedingly attractive in design, and the price is very little in excess of that of the earlier models, being £140, with hood, screen, lamps, and horn.

WELL SPRUNG COMBINATION.

The Craven Motor Co., 116, Greenwood Road, Dalston Lane, N.E., market a sidecar combination possessing several novel features, the chief being the manner in which the rear wheel of the 9 h.p. J.A.P.-engined machine is sprung on leaf springs. This naturally gives great resiliency, and the wheel cannot shift, as it is in a rigid frame, the springs being placed above the rigid forks and the rider's weight coming on another frame which is placed on the springs. The sidecar is also sprung on similar type springs, to the ends of which the body is secured by bolts passing through the floor. On the roughest roads little shock can reach the driver.



8 h.p. Swift power unit showing sturdy steering gear and channel steel frame.

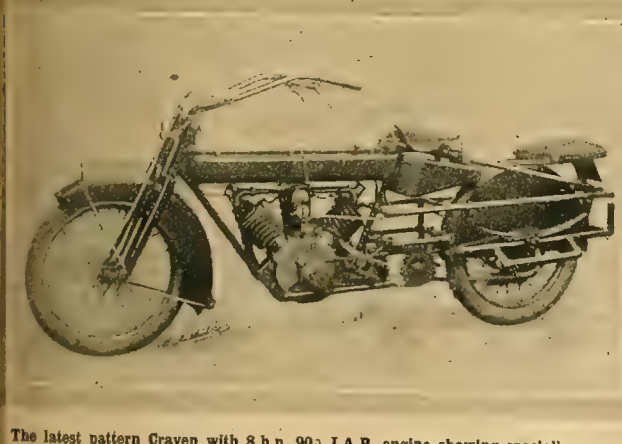


The latest 8 h.p. Swift cycle car, showing general arrangement and improved appearance.

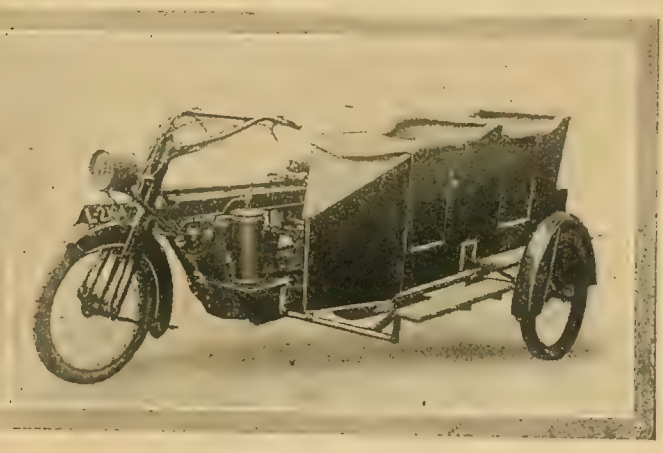
SIDECAR WITH DETACHABLE TOP.

There is no end to the ingenuity displayed by sidecar designers, and the limousine Compeer, made by the Compeer Sidecar Co., Coventry, is one of the latest types to provide complete protection to the occupant against bad weather. The top is coachbuilt, with

A neatly designed Compeer racing sidecar.



The latest pattern Craven with 8 h.p. 90° J.A.P. engine showing specially designed spring frame and chain drive.



The Craven double-seated coachbuilt sidecar outfit.

Passenger Machines of all Types.—

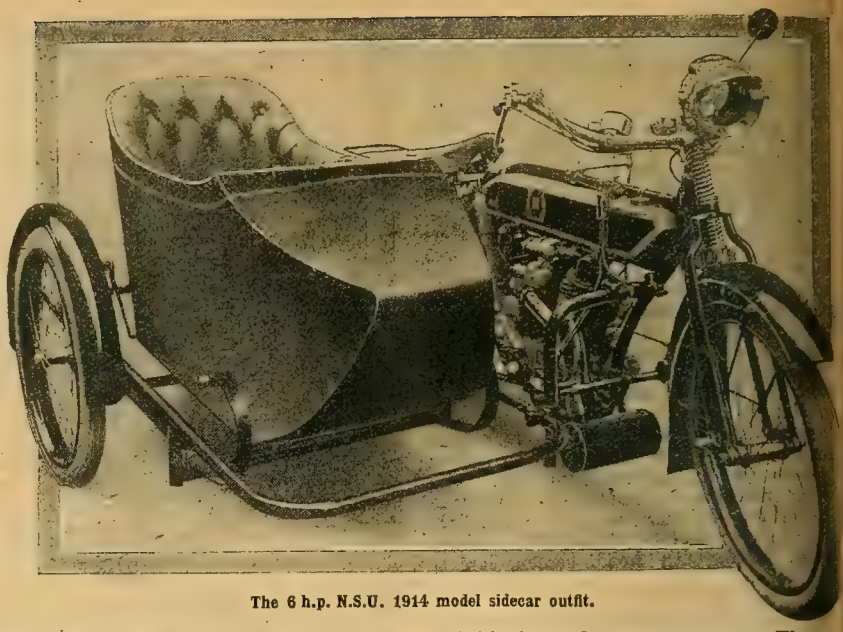
celluloid windows, the two front ones being detachable. The front is V-shaped, so as to offer as little wind resistance as possible, and is quite light.

The Compeer Sidecar Co. will market a Cabriolet model for next year with a detachable top as shown.

When removed, the sidecar presents the ordinary appearance of an open one. There is plenty of room when once inside. A member of our staff has had one of these sidecars in use during the last year, with considerable satisfaction to himself.

A LUXURIOUS PASSENGER OUTFIT.

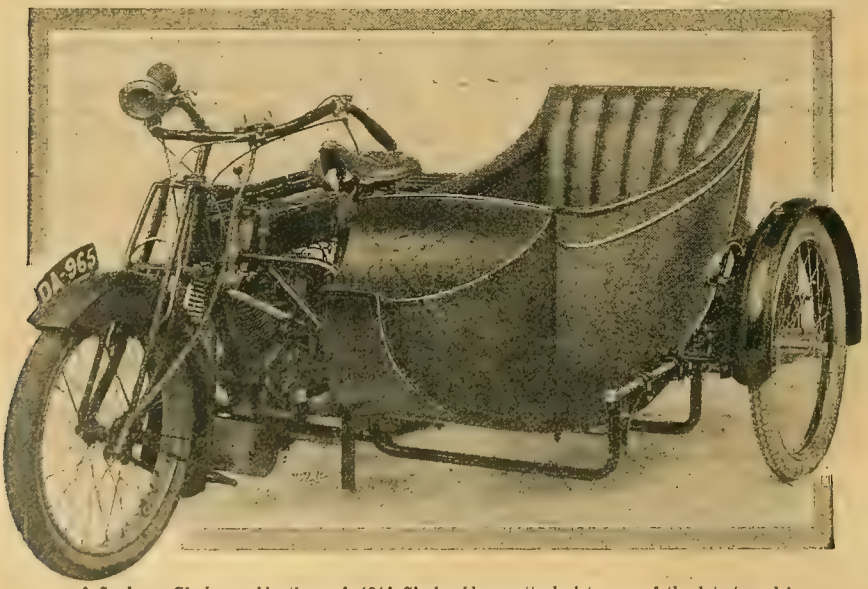
Almost instantaneous success was achieved by the 2¾ h.p. Sunbeam made by John Marston, Ltd., Wolverhampton, and next year this model will be supplemented by two others, particulars of both of which have previously appeared in our columns. These are the 3½ single-cylinder three-speed model, and the 6 h.p. twin-cylinder three-speed model. The general lay-out and design are substantially the same in both except that the front fork on the single cylinder is of lighter pattern than on the twin, the latter machine being specially designed throughout for sidecar work, although the 3½ h.p. is fully capable of giving admirable service in this direction, and the makers, in fact, in their catalogue recommend certain types of sidecar for use with it. As is generally known the Sunbeam name is associated with chain transmission enclosed in an oil bath case, and on all three models this is most neatly and completely carried out, the chains being absolutely protected from all wet, grit, and dirt, and running under the very best possible conditions. On the 6 h.p. twin model, a twin-cylinder engine of 76 × 85 mm., giving a capacity of 770 v.v. is used. To the engine is fitted a spring drive to ease the shock to the chains and gear box. The gear ratios provided are 4½, 7½, and 10 to 1. A great effort has been made to suppress as much unnecessary nickel plate as possible, and the black and gold finish is exceptionally neat and looks very handsome when combined with a sidecar finished in the same manner. The pr ductions of this firm are in every w high class, and the finish down the last bolt and nut is superb, effort being made to save cost of pr duction in any way. The result is, course, that the machines are among t most expensive on the market, but th are undoubtedly worth it, as the u of such a machine cannot help but f that it would be almost impossible him to obtain anything better.



The 6 h.p. N.S.U. 1914 model sidecar outfit.

N.S.U. PASSENGER MACHINES

The N.S.U. Motor Co., Ltd., 1 Great Portland Street, W., are mark ing a range of models suitable for side work next year. Special features these machines will be a quick detachal front wheel by withdrawing the spind mechanical drip feed lubrication, t pump being driven from the engine, a the supply being continuous, t amount of oil passed being decided by regulator which is adjustable, and t fitment of adjustable tappets. T engine employed has two cylinders, w overhead inlet valves, and two sizes engine are offered, 6-7 h.p., 74×94 m bore and stroke, and 7-9 h.p., 80× mm. bore and stroke. A three-spe gear box and clutch are provided, a chain drive is utilised. The coach bu sidecar fitted is an extremely han some one with a simple but strong fran This company have evidently laid the selves out to cater for the passeng machine class, and their latest tw cylinder models bear evidence of t most careful design throughout. excellent feature is the provision efficient mudguards.



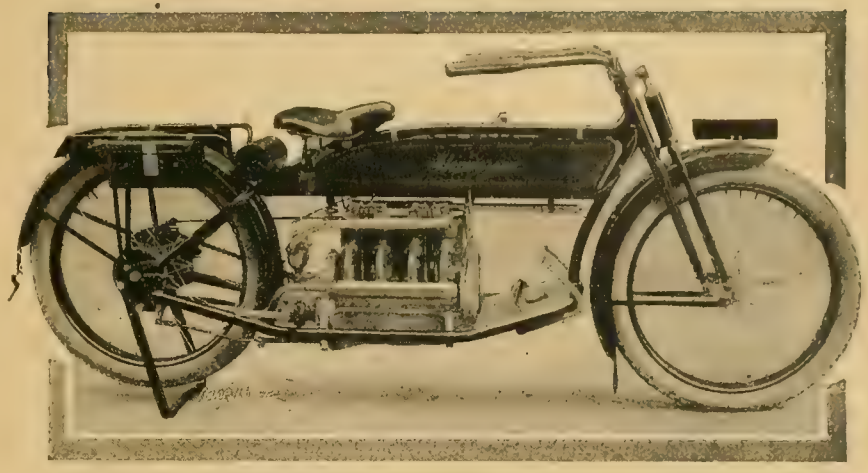
A Sunbeam-Gloria combination. A 1914 Gloria sidecar attached to one of the latest model 6 h.p. twin three-speed Sunbeams.

THE PARAGON CYCLE CAR.

The illustrations which we reprod of this little vehicle give an admira idea of its general appearance and out. The chassis that we illustrate fitted with a 90° J.A.P. engine, but future this will only be fitted to spe order, the standard engine used be

assenger Machines of all Types.—

he ordinary 50° twin, but a feature to e noted is that air or water cooling can e supplied at the same price. The ransmission is by chain to a counter-shaft nd thence by two 13ft. belts running ver expanding pulleys, but the makers laim that there is perfect grip even on ottom gear of ten to one, as even when that position the belts are still on in. pulleys, the pulley diameter for the igh gear being 9in. This, combined ith the length of the belt, should en-ure a long life for the drive. The ngth of the belt allows it to be run ery slack, and thus it is possible to dis-ense with the differential gear without ny ill effect. All engines are fitted with large outside flywheel, and a further finement is the provision of detachable heels. The whole idea of the makers, ho are Messrs. Portway and Co., anningtree, Essex, has been to pro-de a thoroughly simple cycle car, id in no way to make a "small car." he price of the vehicle is £115.



Valve side of 1914 Henderson. Observe neat silencer arrangement, kick starter, overhead valves, and general neatness.

Chassis of the 9 h.p. Paragon cycle car, showing the 13ft. belts running over 9in. pulleys, mounted on the counter-shaft.

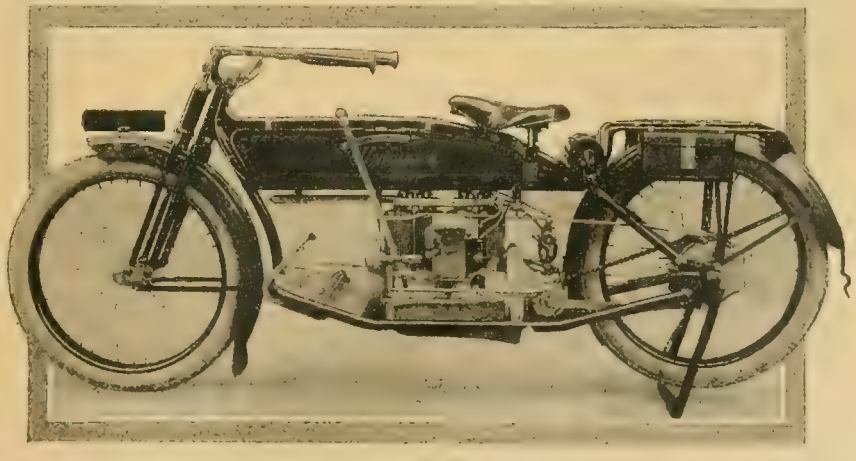
THE HENDERSON FOR 1914.

As regards the engine, the new four-inder Henderson has not undergone ny alterations. The dimensions 67×76 n. (1,085 c.c.) remain as before. White tal bearings, however, are now em-yed, the pistons are three ounces ter, and the gudgeon pins are held in in ingenious manner. A hole is drilled in e of the bosses, through which the low gudgeon pin passes, which isters with a hole in the latter. A it pin passes through the whole, and then opened out in the centre by ans of a punch, so that an absolutely ure fixing is obtained in the simplest sible manner. The timing wheels now steel. The magneto is a car e ZU4, water-tight Bosch, while the rebler carburetter is retained, and the thod in which this receives hot air worthy of mention, as it is derived m a pipe running right through the aust chamber, which latter is open its forward end. As regards the me, the saddle is now two inches er than in last year's model, and is ced in a slotted lug, so that three erent saddle positions can be obtained, ile it is also interesting to note that head is a drop forging. The tank, ich is made of two pieces of pressed el, holds three gallons of petrol, and f a gallon of oil, and the spring forks made more substantial than last year. The clutch is larger, and the plates are now ground to a mirror finish, causing it to be very sweet and gradual in its action.

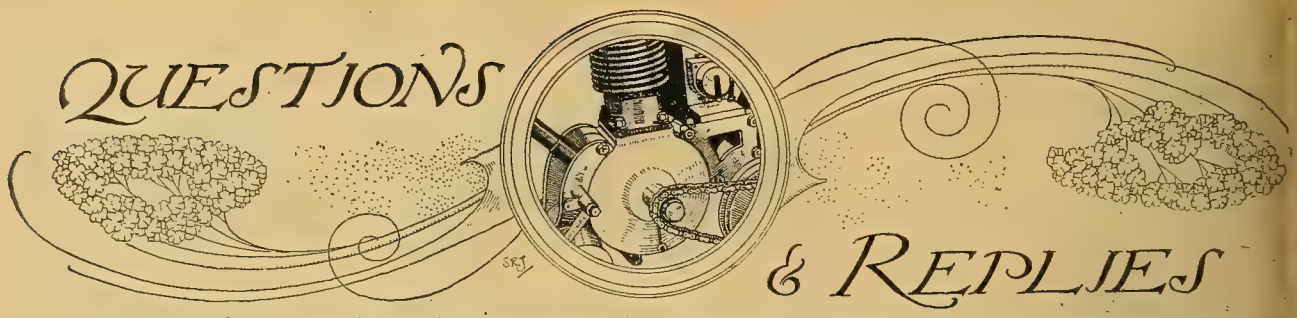
New Two-speed Gear Box.

An innovation is the introduction of a two-speed dog clutch type of gear incorporated in the back hub, and enclosed in an aluminum casting, visible in the accompanying photograph on the near side of the machines. Both clutch and gear are controlled by two long levers working in a common quadrant. Despite the fitting of the gear the back wheel is exceedingly accessible. Yet another improvement is the fitting of a larger band brake to the rear wheel, while it may be mentioned that the front hub is wider, and that stronger spokes are fitted. The control is effected by means of twist handles, works very easily, is quite positive, and delightfully simple. The cylindrical box noticeable in the photographs behind the saddle is a neat form of tool box, which is very popular in the States, and in addition to this two strong English tool bags are fitted. while yet another English fitment is a large front rim brake, not shown in the photographs. A small detail improvement which is worthy of mention has been effected in the design of the starting handle, and enables the latter to be engaged at four points instead of two, as formerly.

Owing to its flexibility, smooth running, and power, the Henderson, which is sold by Messrs. Robertson's Motor Agency, 157, Great Portland Street, W., is a machine which is highly suitable for sidecar work. Indeed, the Henderson is nearly a car on two wheels, with its cycle car size motor.



Transmission side of the four-cylinder Henderson, showing gear control, magneto position, and chain drive.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Taunton to Ludlow.

Would you kindly tell me the best route with distance from Taunton (Som.) to Ludlow (Salop), avoiding large towns?—W.O.S.

Your best route is Taunton, Bridgwater, Highbridge, Bristol, Gloucester, Tewkesbury, Worcester, Tenbury, Ludlow. The approximate distance is 130 miles.

The Life of Magnets.

I shall be obliged if you will kindly answer the following questions. (1.) How long does a magneto last before requiring remagnetising? (2.) Do the magnets deteriorate at the same rate while not in use? (3.) Can you recommend a reliable firm who would remagnetise the magnets, also the approximate cost of same?—H.D.

(1.) Provided the armature is not withdrawn from the channel in which it runs the magneto will last practically an indefinite period without requiring remagnetising. (2.) No deterioration of the magnets takes place when the machine is not in use. Of course, they gradually lose their magnetism, but the rate of loss is so low that it is not appreciable. (3.) The best people to apply to, if the magnets really require remagnetising, are the makers of the magneto. If you send us the name on your magneto, we can give you the name and address of its makers.

Running into Sheep at Night.

Whilst riding my motor cycle one evening lately, I encountered a flock of sheep. It was quite dark at the time, and although the drover said he shouted, I did not hear him. I was travelling about fifteen miles an hour at the time, and my acetylene lamp was lit. The drover had no light, and I had absolutely no room to pass. The consequence was I ran into one of the sheep, and the machine fell on top of it and injured it, and it subsequently died. I may mention that I also seriously damaged my machine. I shall be much obliged if you will kindly let me know—(1) If I am liable for the damage done, and can the owner sue me for the price of the sheep? (2) Ought the sheep not to have been turned off the road before dark; and (3) can I claim for the damage done to my machine?—D.T.R.

We have submitted your query to our legal adviser who replies as follows: "As regards query 1, this all depends upon the evidence. It is quite possible that a judge or jury would hold that on a dark night fifteen miles an hour was too fast, and that your correspondent ought to have been going at such a speed that he could pull up in time to prevent colliding with the sheep along the road. As regards query 2, a drover has every right to drive his sheep along the road after dark; and as regards query 3, it is quite certain that your correspondent would not be able successfully to claim for any damage done to his machine."

Gravesend to Bournemouth.

I should be much obliged if you will let me know the best road from Gravesend to Bournemouth. I wish to avoid big towns and long hills as much as possible.—F.E.J.

Your best route is as follows: Wrotham, Borough Green, Westerham, Redhill, Reigate, Dorking, Guildford, Farnham, Alton, Winchester, Romsey, Ringwood, Christchurch, and Bournemouth.

Removing Tar Stains.

I am now taking down my machine for an overhaul, and should esteem it a favour if you can suggest any means by which the lumps of tar may be removed from the enamel without damaging the latter.—S.E.P.

Tar is very difficult to remove from enamel without leaving a mark, but probably the best way is to use butter

Fitting Accumulator and Coil.

I have fitted a new tank to my motor cycle, and am now writing to ask you the best position to fit an accumulator and coil. Formerly there was a apartment in the tank for them, but the new tank is only for oil and petrol. Would it be satisfactory to fit the on top of the silencer?—F.B.

On the top of the silencer is rather a bad place to fix an accumulator or dry battery, even if the battery be contained in a metal case, owing to the heat dryi

A FAMILIAR SIGHT.
On the road during the forty-mile speed judging test promoted by the Doncaster A.C.

up the accumulator. Why not fix a metal case on the front of the steering fork above the front mudguard. You can obtain a leather case lined metal for this purpose from most of the big accessory dealers.

An Insurance Query.

I should be obliged if you would give me your opinion on the following: While riding my 3½ h.p. machine I had a heavy sideslip in rounding a corner too quickly on a muddy road. I then found that, in addition to the usual bent footrests, etc., the engine was jammed. I dismantled the cylinder by the roadside, and discovered that a piece of metal, attached to the top of the connecting rod for lubricating purposes, had been knocked out and fallen on the top of the crank case, thereby breaking pieces off all round the bottom of the piston and scoring the cylinder. After taking out the broken pieces of metal I was able to ride the machine home. The machine is insured against damage caused by sideslip, but the underwriters refuse to pass the claim for damage to the engine, stating they "are quite convinced that the damage to the engine was not the direct result of the sideslip," and they said they considered it more probable that the mechanical defect caused the sideslip. Although, of course, the piece of metal might have fallen out later, I think it is highly probable that I could have ridden many hundred miles further before it happened if I had not had a sideslip. (1.) Do you consider I have a reasonable claim, or are the underwriters justified in repudiating liability in this manner? (2.) It is, of course, possible that the underwriters do not believe my statements, but in this case who can decide the question?—R.H.B.

1.) We consider you have no reasonable laim against the underwriters, as the amage to the engine could not possibly ave been caused directly by the sideip. (2.) We think you must abide by he decision of the underwriters, as they re within their rights in refusing to ay the claim under the circumstances, - it is quite reasonable to argue that ie part mentioned which dropped off ie top of the connecting rod and used the damage would have dropped ff sooner or later with or without a deslip.

Difficulty in Starting a Twin.

I should be much obliged if you would help me in a little matter concerning my 6 h.p. Royal Enfield. It has now run nearly five hundred miles, and from the very first it has been extremely difficult to start. I always inject a little petrol in the compression taps, flood the carburetter, and then turn the starting handle as fast as I can, first with the valves lifted, and then with them down. I have tried all sorts of different mixtures, with the spark advanced and retarded, etc. I also use the half compression device that is fitted. The machine runs exceedingly well, and is very powerful on hills. Also it starts fairly easily when hot, but sometimes when it is cold I turn for about a minute with no result. The compression is high, but sometimes I can revolve the engine with the valve lifter down. The plugs are all right and spark well. I have just taken the carburetter down and find that it works well. The magneto I have not touched, except for putting a little oil in occasionally.—H.C.C.

It is difficult for us to say what is the matter with your machine without personally examining it. See if the valve lifter allows the valves to seat properly; also clean the magneto contacts with petrol; clean the sparking plugs and set points closer if necessary. See that the injected petrol really reaches the cylinder. Let your hand partially cover the air inlet of the carburetter, and if the engine starts more readily, it points to the fact that a smaller adapter is needed.

Excluding Grit from Engine.

I should be obliged if you would give me advice on a certain point. I have an idea that the life of motor cycle engines would be considerably lengthened if a suitable apparatus was fitted which would prevent any road dust or other destructive material from finding its way into the working parts. A motor cycle, of course, does not lend itself well; but in the case of a cycle car it would be an easy matter to find a space capable of taking a box, say about one cubic foot in size. One side of this box would be coupled up to the air supply of the carburetter, and the opposite side would preferably face the direction of motion. Inside the box a frame work would be provided, which would be covered with suitable cloth arranged so as to get as large a surface as possible, all air, of course, having to pass through the cloth before entering the engine. Of course, this cloth would have to be renewed or cleaned occasionally, but this should not be any great objection. —J.J.

There is no doubt that the life of all engines would be considerably lengthened if no dust or dirt were drawn into them through the inlet pipe, but your suggestion is not a novel one, as we used a contrivance on a motor bicycle about two years ago, which was sent us by a Northern reader. This consisted of a cylindrical case, which was attached to the carburetter, and through which all air was drawn. A gauze was used, surrounded by a closely knitted sort of stocking. After riding the machine all the summer it was possible to detect traces on the stocking of fine dust which had been collected. The idea was illustrated in *The Motor Cycle*, but did not catch on, as it was somewhat cumbersome. Theoretically, all traces of dust cannot be arrested unless the air is drawn through water.

Biggleswade to Harrow.

I should esteem it a favour if you will tell me the best way from Biggleswade to Harrow-on-the-Hill. I do not mind hills at all.—P.H.B.

Your best route would be as follows: Biggleswade, Hitchin, Codicote, St. Albans, Elstree, Little Bushey, Harrow, Weald, Wealdstone, Harrow-on-the-Hill.

EXPERIENCES WANTED.

"C.W." (Mansfield).—6 h.p. A.J.S. and 5-6 h.p. Clyno sidecar combinations. Reliability and durability of engine, chains, and change-speed gear.

"S." (Perthshire).—Senspray or other carburetter on Douglas. Power, petrol consumption, and starting.

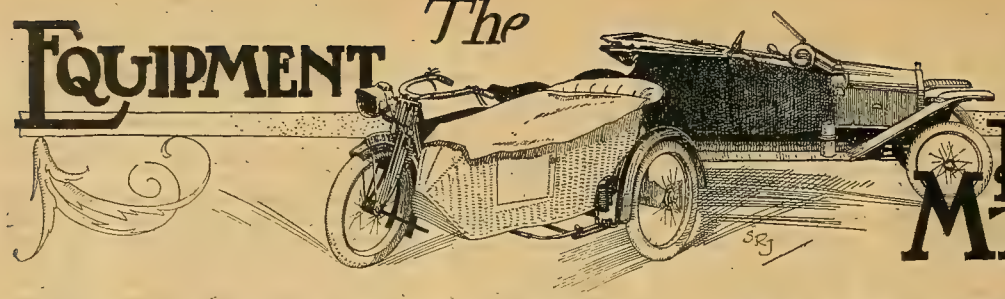
"H.S.L." (Chatham).—Voltalite lighting dynamo. Power of light and durability.

"H.A." (Melbourne).—1913 7 h.p. Indian. Power, durability, and general reliability.

"L.C." (Heathfield).—Standard Connaught single gear, hill-climbing, wear, lubrication, and petrol consumption. Brampton variable gear, with 3½ h.p. single cylinder; especially belt wear and effect of dirt, water, etc.

A group of ten Sheffield motor cyclists who are all mounted on Norton machines.

The Equipment of Passenger Machines



AS a really powerful and up-to-date passenger outfit is likely to cost the best part of £100, or even more, it obviously deserves good accessories, and they should be chosen to match it, if the complete equipment is to look harmonious. I have a great weakness for grey enamelled tubing and coachwork, set off by black oxidised metal fittings. Nothing looks so smart, and nothing is so easy to clean, but it is not a simple matter to obtain a full kit, including hooter and speedometer, in the black finish, so that a certain amount of nickel plating must be tolerated. Nickel and black and grey make a very pleasing *tout ensemble* indeed, and the lamps and generator at least should be oxidised. A mixture of brass and nickel finish looks abominable, with the possible exception of machines enamelled vermilion, like the Indian, a colour which, I think, suits brass better than nickel.

Fittings which are Necessities.

The prime necessities are those which have to do with the safety of the passengers; the secondaries are those which concern comfort. In the first-class, as a bulb hooter does not carry far, and as an exhaust whistle needs some auxiliary support in case of trouble, an electric alarm is desirable; two good lamps are essential. The side lamp should be mounted on a kinked bracket at the extreme edge of the sidecar, and should have a lens emitting short broad rays to light up the edge of the road only, while the head lamp should have a long distance ray. Dissolved acetylene is the best no-trouble illuminant; failing this, it is sensible to prefer two small generators to one large sample, and to carry a short Y of brass tubing, so that one generator can serve both lamps in emergencies. A red reflex mirror is a *sine qua non*, for special service when the outfit is stationary on the road after dark. Turning to comfort, a foot muff for the passenger is an excellent investment at this time of the year, and the rug should be both wind and waterproof—ordinary railway rugs are almost useless. Men generally prefer a storm apron, with a neckhole, to a hood and screen, but ladies dislike being blown about, and the machine that is intended for their use should have a hood and screen if the engine is big enough to do the requisite pulling.

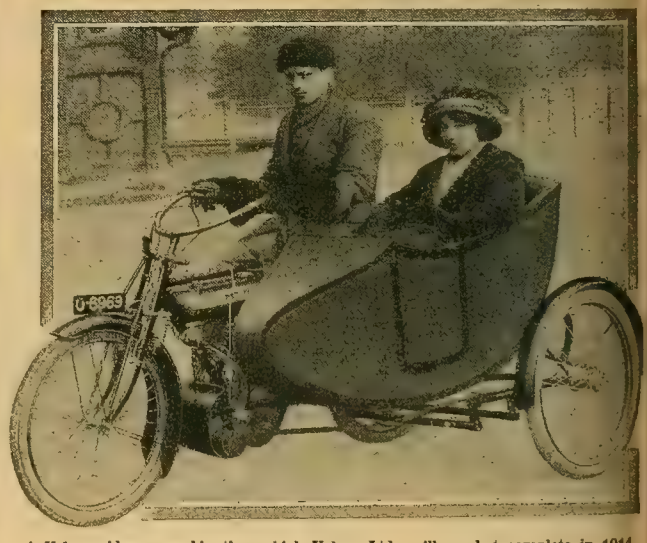
And those that are Luxuries.

All the above are obviously requisites. Proceeding into the sphere of luxuries, we must name a speedometer first. It is practically essential to the tuning of an engine and also to fuel economy, while it is simply invaluable in route finding, as it indicates the distance to a turning which looks obvious on a map or in a route book, but has to be sorted out of a dozen tempting roads in actual travel. A clock is almost as helpful. A handle-bar mirror is desirable, especially when the driver is inclined to be absorbed in a fair passenger. Some provision should be made for damping the oscillations of a sidecar when it is driven empty. The smartest tip is to fit two metal hooks on the chassis, and procure a broad strap or band of webbing with hooked ends of just the length to keep the chair low and steady; some provision in the way of tiny fenders to prevent the strap scraping off enamel is desirable, and two wee L-shaped brass plates will be found to wear best; these special fittings take a little trouble to arrange, but their benefits are great on a solo trip.

A luggage grid astern is essential for touring, and if the makers have been oblivious of this need, any cycle dealer who does a bit of brazing will rig one up cheaply when his men are slack in the winter. In its design the spare petrol can should not be forgotten, and brazed pegs or clips, to prevent straps shifting, are worth inclusion.

The Carriage of Tool Kits.

In the matter of tool and spare part storage, I am all against chucking a mixed assortment into a locker under the seat. They may be carefully packed once or even twice, but the day is sure to come when a hot and weary driver, hours behind time, throws them all back anyhow. I always use something in the way of a small attaché case for the tools, rolling them up in big soft dusters. If the locker is big enough to accommodate the case, so much the better; otherwise it will repose comfortably under the passenger's legs. The objection to big tool rolls is that they



A Veloce sidecar combination which Veloce Ltd., will market complete in 1914.

The Equipment of Passenger Machines—

seldom possess padlocks, and there are so many light-fingered gentry in the average garage.

Some kind of jack is useful with all types of passenger machine, but jacks are awkward to store. For sidecar work a special stand, permanently attached to the chassis, is infinitely preferable, and the market furnishes several cheap and efficient examples. For cycle cars a jack is better. One rider of my acquaintance has a wooden jack, made of two short pieces, hinged amidships, unfolding into an L, and strutted open by a third loose piece of wood, abutting against two stops on the arms of the L. Another uses a light car jack, which is fixed well forward under the scuttle to the footboards by a screwed bolt which threads through a hole in the jack-foot, and is secured by a wing nut. All passenger machines can and should carry big tyre pumps; a motor bicycle size pump is a sickening instrument for the inflation of large tyres. On cycle cars the pump is best stored in two clips fixed to the front board of the locker under the seats. Don't forget to carry at least one full-sized tyre lever.

It is foolish to use the leather pockets on the door of a sidecar or cycle car for permanent storage; theft is inevitable. On many machines it is possible to fix up a tiny unostentatious wallet, *e.g.*, under the scuttle of a cycle car or under the "lid" of a sidecar; in this should be kept the small items which ought to be handy, and which are bad for pockets, viz., a petrol injection squirt, a grease gun, a spare plug, a small King Dick, or a pocket tool kit containing half a dozen small instruments. Such a wallet will save many a reluctant visit to the main tool storage.

The storm-proof garb—probably high-grade oilies—should be furled into one big tight roll when dry, and either strapped on the carrier or used as a passenger's foot stool, or stowed under the passenger's legs. Oilies should be kept in a case. When they are once wetted they should not be repacked until they have been thoroughly dried. They will dry on the riders' persons in a few miles after a storm has terminated, or they can be hung up at the garage during the night; but they must not be rolled up till they are bone dry.

A roomy outfit should spare a corner for a tiny mat on which the mechanic in chief can kneel or squat during roadside repairs to the salvation of his clothes. A small square of lino, normally stowed under a seat cushion, takes some beating; others prefer a cocoanut mat, which saves the passenger's feet from damp and vibration.

ROAD RIDER.

TWO-HUNDRED MILES RELIABILITY TRIAL AT THE CAPE.

(1) On Roolhoogte. D. Garlick (6 h.p. Enfield sidecar) climbing the mountain pass.

(2) Preparing for the homeward journey. W. H. Easton (7 h.p. Indian sidecar), who gained third place, is seen in the foreground. (See "The Motor Cycle" last week, page 1427).

(3) R. C. Woodville (four-cylinder F.N.) pushing through one of the many streams.

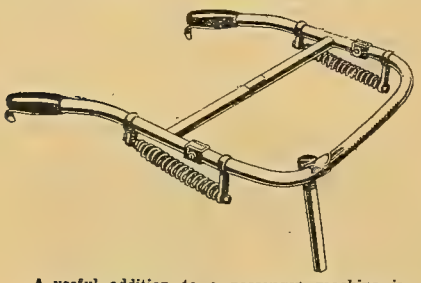
(4) Early arrivals at Villiersdorp, the luncheon stop. O. J. Prillevitz (6 h.p. Enfield sidecar) is seen studying the map for the return journey.

(5) W. Herbert (6 h.p. Clyde sidecar) passing through the Worcester district. He ultimately secured second place.

In the following pages we illustrate and describe a selection of accessories, mostly specially applicable to passenger machines. "The Motor Cycle" Show Report Number (on sale while the Exhibition is in progress) will contain a special section devoted to the accessories exhibited.

A Shock Absorbing Spring Handle-bar.

The Sphinx Manufacturing Co., Bradford Street, Birmingham, are marketing a spring handle-bar, the general working of which is apparent from our sketch. One of the features of this handle-bar is the substantial way in which the moving joints are made, and there should be no

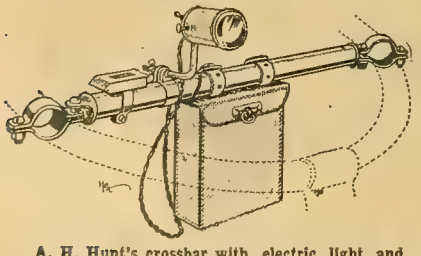


A useful addition to a passenger machine is a spring handle-bar, of which a very novel type, made by the Sphinx Manufacturing Co., is shown above.

suspicion whatever of side play, the handle-bars moving in a small arc. The bars are supported by a strong central tube which should go far to protect them in the event of a fall, and at the same time would be extremely useful for fitting a speedometer, lamp bracket, etc. Any type of grip can be fitted to these bars, and the standard bars supplied have a neat inverted grip.

Instrument Lighting Set.

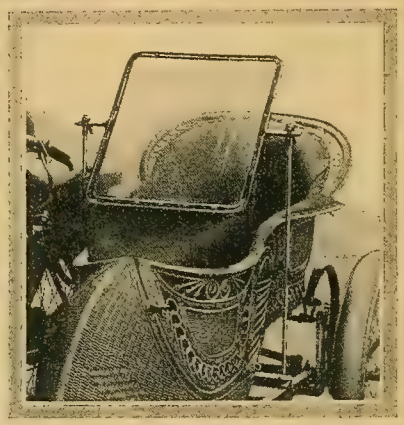
A neat little set is sold by Messrs. A. H. Hunt, 115-117, Cannon Street, E.C., for attaching to handle-bars of motor cycles to enable route cards, watches, speedometers, or such like fittings to be easily read at night. This set consists of a cross bar which can be fitted across the handle-bars inside the curve, the ends of the bar being adjustable and fitted with clips to take any size handle-bar.



A. H. Hunt's crossbar with electric light and H.H. battery for reading the speedometer and route card, etc. The H.H. match-box holder will also be noticed.

On this cross bar is mounted a small inspection lamp, together with a battery in a leather case which is suspended on two straps to the cross bar. A further refinement on this fitting is the provision of a matchbox and striker, which should be greatly appreciated by motor cyclists who ride much at night, as it is frequently a difficult matter to get at matches when wrapped up in thick overalls. The whole set is extremely neat, and adds practically nothing to the weight of the machine.

Among the many new interesting accessories which Mr. A. H. Hunt has introduced for motor cyclists is an ingenious form of valve lifter, which possesses the advantage of being extremely simple and very light. It consists only of four parts, is very powerful in action, and possesses the additional attribute of remaining in position when extended to its fullest limit.



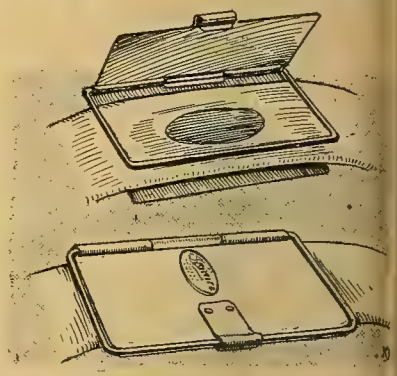
A useful accessory for passenger machines, the sidecar wind screen, made by Bluemel Bros. of Wolston, Coventry.

Adjustable Wind Shield for Sidecars.

The firm of Bluemel and Bros., Wolston, near Coventry, have a world wide reputation for celluloid tyre pumps and such like fittings, and they are now marketing an exceedingly neat sidecar wind screen. The screen is supported on two adjustable nickel-plated tubes, which are secured to the sidecar itself, whilst the screen may be adjusted at any angle and raised or lowered within a wide range of movement. The gap between the lower part of the screen and the sidecar is filled in by a leather curtain, and the screen itself consis of a very neat metal frame enclosi a sheet of celluloid. The whole atta ment is exceedingly rigid and al pleasing in appearance.

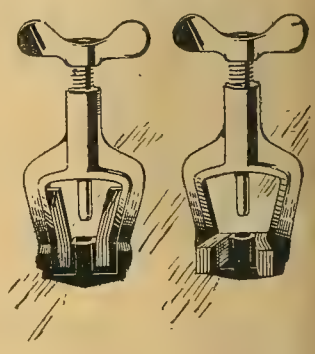
A Neat Patch Fixer.

The Service Co., Ltd., 292, High H born, W.C., are marketing a neat lit device for ensuring the proper adhesi



The Service Co.'s patch press.

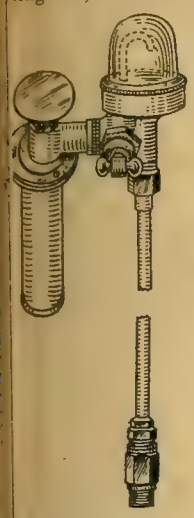
of patches to tubes. Many motor cycli will have experienced the difficulty th is sometimes in getting a patch to evenly on a tube, and to obviate this t Service Co. have brought out a sm metal clamp, somewhat in the form a very thin pocket book. One half the shield is slipped under the tube a the upper part is then clamped down a fastened with a snap lock, thereby suring a perfectly even pressure up the patch. This accessory has t further advantage of taking up v small space in the tool kit.



Belt punch which may be adapted to any size of belt, introduced by Benton and Stone.

A Useful Range of Fittings.

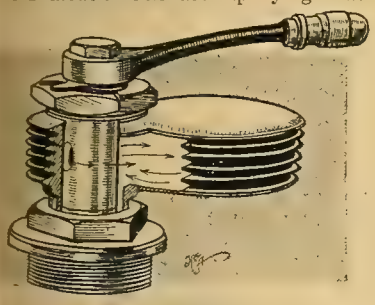
The excellence of the products of Messrs. Benton and Stone, Ltd., Birmingham, is well-known and a very large display of useful accessories will be made. Spare tyre carriers for sidecars, automatic drip lubricators with auxiliary pump, improved hinged filler caps for tanks, triple action motor cycle and cycle car tyre pumps will be shown, together with a very neat combined petrol tap, filter drain tap and two level tap, by which the rider is informed when he is getting towards the end of his supply of fuel in the tank, a fitting for which there should be a very considerable demand, seeing that it is so simple.



Enots sight feed and auxiliary hand pump lubricator.

Variable Compression Device.

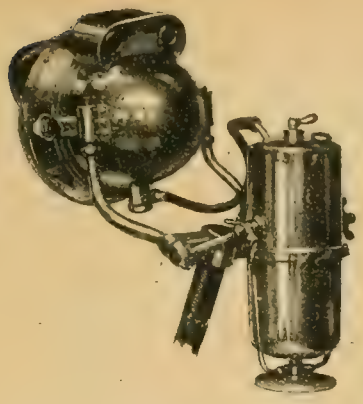
The accompanying illustration shows an improved form of decompressor introduced by Messrs. Packer and Prentis, of Ilford. It is a great improvement on the old model. The accompanying illustration clearly shows its working, and it will be seen that it consists merely of a valve cap and a decompressing chamber, the exterior of which is provided with well finished radiating fins. It is designed to fit into the valve cap, and is provided with a sparking plug thread. Thanks to the radiating fins no overheating trouble is now experienced.



Part sectional view of the P. and P. variable compression device.

Motor Cycle Lighting Outfits.

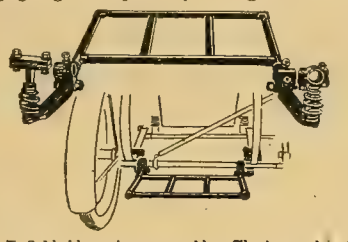
The Rotax Motor Accessories Co., 61, Great Eastern Street, E.C., make a speciality of motor cycle lighting outfits, and we illustrate a new lighting set, which, it is claimed, is specially suitable for powerful and fast machines, as the parabolic reflector projects an intensely brilliant beam of light. The generator is of the shaking grid pattern, the principle of which is well-known, and it ensures cleanliness and avoids waste of carbide. The generator is of large capacity, and will burn from six to seven hours on one charge. The complete set can be obtained either nickel plated or in stone black finish.



Rear view of the Rotax complete lamp and generator set.

The Royal Enfield Luggage Grid.

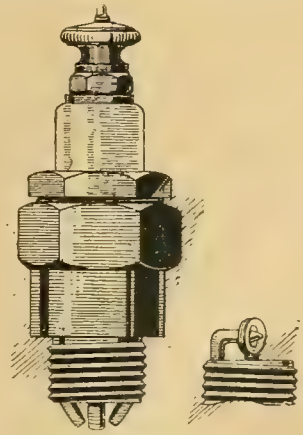
The Royal Enfield Co. have for a long time specialised in passenger outfits, and they have placed on the market an exceedingly strong and well designed luggage grid, specially designed for fitting to the 6 h.p. Enfield combination. It is designed to carry a large amount of luggage, and is attached to the sidecar chassis at four separate points, two of which are supported by springs to prevent undue shaking of the luggage. Ample road clearance has been provided, and at the price of 40s. this should meet with a large demand, especially as it can be easily attached to any existing Royal Enfield sidecar chassis by the owner without any outside assistance.



The Enfield sidecar luggage grid. The lower drawing shows method of attachment.

Forward Plugs and Belt Fasteners.

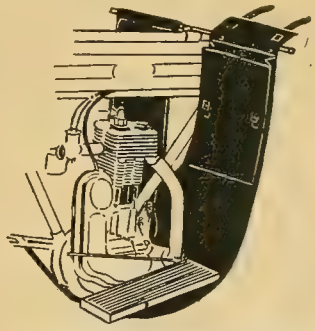
The belt fasteners and plugs made by the Forward Motor Co., Birmingham, are well known, the adjustable belt fastener in particular having gained an admirable reputation for durability and adaptability for some time past, while the Forward sparking plug sold by this firm is also well known for its ability to resist carbon forming on the points. A new model belt fastener is the Giant, which is an exceptionally strong pattern made for 1⅛in. belts. This is sufficiently strong for use on cycle cars.



Two types of Forward plugs. On the left the double point, and the right the well-known ejector type

The College Mudshield.

In winter riding it is almost essential to have some form of extra mud shield if the rider's feet and legs are to be properly protected, and for professional men this is an important point. The College mud shield, made by Beard-Brown and Co., Northampton, has for some years been a speciality of this firm, and a new pattern has this year been brought out with pockets attached to the inside of the shield, into which many useful articles may be stowed. They are even large enough to accommodate a spare pair of light overalls. These pockets have the further advantage that they can be fitted to an older pattern College shield, and these shields are also made in a variety of patterns suitable for almost every well-known machine on the market.



The College mudshield, showing pockets for spares, tools, etc.

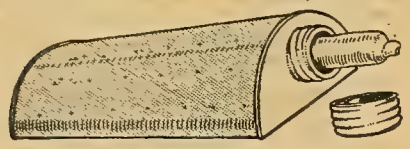
Tyres for all Purposes.

The Avon India Rubber Co., Ltd., 19, Newman Street, W., and Melksham, Wilts., who have gained a very enviable reputation with their motor cycle tyres during the past season, will show a very comprehensive selection of their products. Cycle car tyres are a speciality with this firm, and are made in various types, the Avon Combination tyre consisting of rubber and steel studs, the steel-studded and the all-rubber treads giving a wide range of pattern for this class of work. These tyres are also suitable for the heavier types of motor cycles and sidecar machines, and in addition to these, various patterns of rubber tyres suitable for machines from 2½ to 6 h.p. are marketed, as well as motor cycle belting.

The Sunstone Avon grooved tyre.

The "Capital" Foot Warmer.

Mr. Harold Perry, 101, Gray's Inn Road, W.C., has sent us a sample of an extremely handy little foot warmer for use in sidecars or cycle cars. It takes

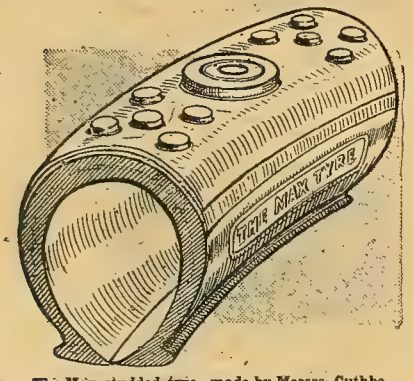


Perry's "Capital" foot warmer.

up very little space, and should be a most useful fitment in the winter months, especially as the price is an exceedingly moderate one, viz., 2s. 6d., while charcoal sufficient for about thirty hours can be obtained for 3d. a packet.

Max Tyres for 1914.

A new design of Max tyre will be marketed for 1914 by Messrs. Charles Cuthbe and Co., 37, Great Portland Street, E.C. The tyre is built up of rubber and leather, and is of special thickness. The tread is of high quality chrome leather specially prepared,

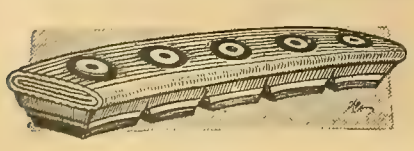


The Max studded tyre, made by Messrs. Cuthbe and Co.

through which protrude rubber discs shaped in the form of suction cups, the discs forming an integral part of the cover. Between the disc steel studs are embodied, and set close together. The walls of the tyre are of great strength. The tyre which we illustrate is specially designed for light car or cycle car use and is of 650×65 mm. section, this particular type of cover being made in three sizes, viz.: 2¼, 2½ and 3in.

A Strong Belt.

The Bulldog belt is a built-up power transmitter made by Mr. W. Pollin, Shepherdswell, near Dover. Our readers will remember that Mr. Pollin was at one time the maker of the Spalding belts. The new belt, the Bulldog, consists of a five ply of the very best and strongest Balata belting made, the under parts being built up with leather in sections, and the whole connected

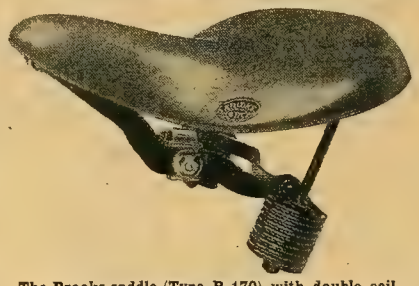


The Bulldog belt.

with bifurcated hollow rivets. The rivets have washers under the heads, which in the 1⅛in. belt measure ¾in. diameter; these support the top strand and prevent it from doubling. It is claimed for this combination that the Balata does not stretch in wet, and the leather does not slip, so that it provides a very useful spare for bad weather. The belt is made in ⅞in., 1in., and 1⅛in. sizes, and as a special inducement to readers to give it a test trial belts are offered for a few weeks at 1s. per foot.

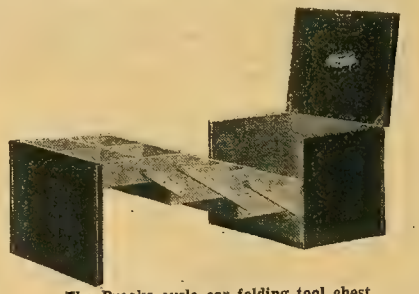
Brooks Equipment Specialities.

Wherever motor cycles are ridden the name of J. B. Brooks and Co., Ltd., Birmingham is known for the excellence of their saddles, tool bags, and other



The Brooks saddle (Type B 170) with double coil suspension spring.

accessories for motor cycles. For 1914 this firm is putting two new models of saddles on the market, which will be known as the B 160 and B 210, both specially designed for lightweight motor cycles, and are smaller additions of the well-known B 170 and B 220 types respectively. Extreme comfort is given by these saddles, and as the speed of lightweight motor cycles is not so great as to necessitate fitting a very large saddle, these will be found all that can be desired, with the further advantage of looking neat and not too large for small sized motor cycles. The popular model B 170 will, of course, be con-



The Brooks cycle car folding tool chest.

tinued. Cycle car equipment is also catered for, and an exceedingly neat folding-up tool cabinet for fitting to the footboard is being marketed. This is a miniature edition of the well-known cabinets provided for use on large cars, and is one of the most useful accessories it is possible to fit. Trunks made to almost every shape and size for fitting to the footboards or luggage grids of cycle cars or sidecars are other specialities of this firm, and a point to be noted is the really excellent finish of even the smallest accessory turned out.

Mabon Gears and Clutches.

For many years the Mabon var gear, providing eight speeds and engine, has been favourably known, ratios of about 4 to 1-7 to 1 for and 5 to 1-8 to 1 for sidecar can be obtained. A feature of the is that the belt is always at co

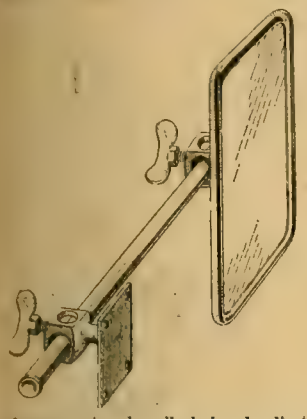
nong the Accessories.—

Some Useful Fittings.

The Priory Accessories Company, Coventry, are marketing a wide range of useful fittings for motor cycles and cycle cars. A good range of lamps of all patterns is listed, and a neat motor cycle



A very neat and well designed adjustable mirror for fixing to the dashboard of cycle cars. Sold by the Priory Accessories Co., Coventry.

oil lamp finds a place in the list. An excellent mirror for the dashboard of a cycle car should meet with much appreciation as it is well made and has a good glass area. It is adjustable within wide limits.

A useful accessory—the Priory Accessories Co.'s valve spring lifter.

Lucas Lamps.

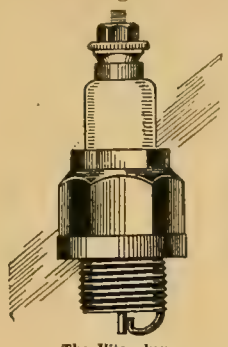
Joseph Lucas, Ltd., Birmingham, will exhibit at Olympia a comprehensive display of their lamps and accessories, the chief among them being the King of the Road motor cycle projector set, fitted with Mangin lens mirror and adjustable double bracket to carry the lamp and generator. This set will be shown in three sizes. Another interesting display will be a new pattern sidecar lamp, designed to throw a white light forward

The Lucas cycle car horn.

and a green light to the rear. An adjustable handle-bar mirror giving a wide range of vision, motor cycle horns, acetylene pumps, and last but not least, the Magna rear light, with which it is claimed a very wide area of light is reflected at the back of the machine, will complete a most interesting display.

Carburettors and Plugs.

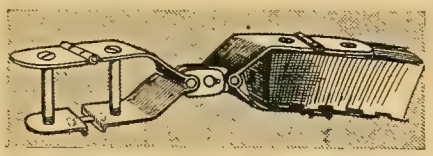
J. A. Riley, Martineau Street, Birmingham. A very comprehensive line of accessories and fittings, particularly adapted for cycle car and motor cycle requirements, are handled by this firm, and a special display will be made of certain lines exclusively handled. Foremost among these will be the Sthenos carburetter. This carburetter has been used with great success by the Swift, Belsize and Arrol-Johnston companies. The K.E.W. magneto will also be shown, and this is specially designed for use with V engines, such as those with which the majority of small cycle cars are fitted. Messrs. Riley also specialise in complete chassis sets from which light cycle cars can be built up. When built up, this chassis is designed to take a 6 h.p. engine. This firm also make a great speciality of the "Vita" sparking plug, which we illustrate.



The Vita plug.

A New Belt Fastener.

The accompanying illustration is that of a hinged belt fastener which has been provisionally protected by Messrs. Allen Bullock and Son, Stanley House, Box,

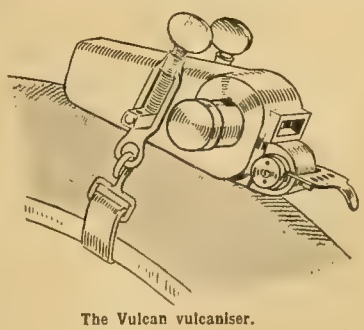


The Double Grip belt fastener.

Wilts. The fastener has a double grip by means of the hinged jaws and also a sliding joint, both of which improve the flexibility of the fastener and its gripping power. The patentees inform us that they have tested it under tremendous pressure against a number of various fasteners, all fitted in the same length of belt, when every fastener pulled out in turn, but the double grip fastener prevented all pulling out.

An Automatic Tyre Vulcaniser.

Messrs. J. Lacoste and Co., 184, Shaftesbury Avenue, W.C., are well-known as providers of many useful accessories, but probably they have never produced anything more useful than the "Vulcan" automatic vulcaniser, which is now supplied in a small size, suitable for motor cyclists' use. The great



The Vulcan vulcaniser.

feature of this instrument is that it is entirely automatic, and while it is working it is self-regulating, and requires no supervision, and thus takes up no time in watching. All that it is necessary to do is to set the instrument working, and at the required time the repair will be finished. An enormous number of these instruments have been sold, and are giving satisfaction. They occupy little space, and can be quite easily carried about in a sidecar while touring, without taking up too much room.

Service Passenger Clothing.

The Service Co., High Holborn, W.C., are specialising in some very smart and up-to-date clothing. Among the items shown to us are a lady's coat, hood, and leggings. The outfit, of course, is intended for lady motor cyclists who ride motor bicycles or drive sidecar combinations. The chest protectors in green leather lined with lambs' wool are not only a good protection from the cold, but

Service Co.'s leather waistcoat for ladies' wear.

neat and attractive. We illustrate one herewith, showing how it is worn by lady motor cyclists. The simplest form fastens over the chest by push fasteners, and hangs down the back for a distance of 4in. The other type passes over the chest and has no back collar; two bands fit over the shoulders and under the arms, and fasten by push fasteners in front.

Another item which was shown to us was a pair of leg overalls made of Cape cart hood material to be used when wearing knee breeches. The sides are fastened by push fasteners. An extremely smart overall in Cape cart hood material, with rubber over-shoes but no heels, is the new Service seatless trouser overall. The shoe portion is very neat and is made of brown glazed rubber. Perhaps the most interesting item of all is a Poncho oilskin with storm apron combined. This measures 120in. round the skirt, and fits over the sidecar, acting as a storm apron and preventing any water from running down the back of the seat. The Poncho has a hood which protects the passenger's head gear.

Among the Accessories.—

Speedometer Drive for Indians.

Thanks to the ingenuity of Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, W.C., riders of 1913 Indians will have a suitable device for driving a speedometer without their spring forks making it necessary to employ either a complicated or makeshift device. The device is very simple to fit; the photograph is self-explanatory. The other photograph shows the indicator, which registers speeds from 5 to 60 m.p.h.

The Robinson speedometer

Speedometer drive specially adapted for the rear wheel of 1913 Indians.

The Abingdon-Ecco Belt Fastener.

This handy little accessory, made by the Abingdon-Ecco Company, Tyseley, Birmingham, possesses several interesting features. It will be noticed that the inner surfaces of the links are serrated so that the belt is firmly gripped. The spindles of the coupling pass through

The new Abingdon Ecco belt fastener.

hexagon nuts, which fit into the closed ends of the links, while the whole is secured by means of a hook which engages with a groove cut in one of the spindles. Like other products of this company, the belt fastener is beautifully made, and manufactured of the very best material.

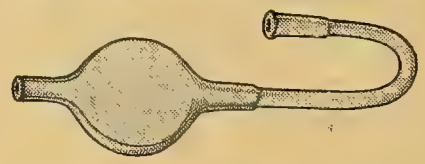
A Piston Ring Remover.

A useful little tool has been brought out by the Two-stroke Engineering Co., Harrogate Street, Otley Road, Bradford. It consists of a pair of tongs, the tips of which are specially shaped to be inserted between the slots of piston rings. When the ends are compressed these force open the rings and allow them to be removed from their grooves. The ring is pushed forward so that the ends project a little way out of the groove, and can then be expanded until it will just slip over the piston. With the aid of this tool a set of rings can be removed in a very short space of time. The Two-stroke Engineering Co. point out that in the case of concentric rings it is necessary to understand that these, when expanded, tend to take an oval shape, and to rectify this they should be held in the finger and thumb of the other hand and slightly squeezed, at the same time that the tool is used to expand them. The price of these articles is 1s. 9d.

A Tool for removing piston rings.

A Gas Bag Lamp Connection.

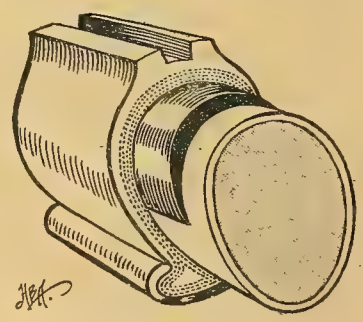
Mr. R. Surridge, the well-known manufacturer of "Holdtite" patches, has introduced an exceedingly well-made lamp connection, incorporating a



gas bag, which is beautifully made. The use of the bag is to allow a steady flow of gas. Many well-known riders use the device.

Peter Union Tyres.

Messrs. the Peter Union Tyre Co., Ltd., 190-192, Great Portland Street, London, will, during 1914, market their usual standard patterns of motor cycle covers and tubes; also a puncture-proof band; this the firm introduced some

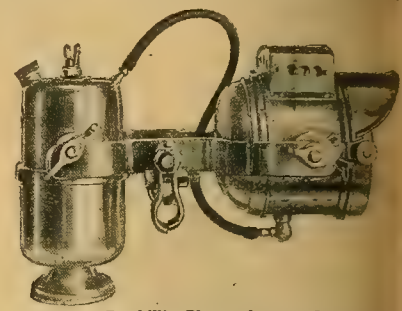


The latest pattern Peter Union motor cycle tyre, with puncture-proof band.

years ago, but it is not as popular as it deserves to be. A section of the band is shown in position in the accompanying illustration. We note with pleasure that the firm are also making covers for 28in. wheels, and have introduced a sidecar type.

Accessories at Dunhills.

A visit to Messrs. Dunhill's motor cycle department resulted in the discovery of several useful and novel accessories. The Pharos lamp is a well-made article differing from the majority



Messrs. Dunhill's Pharos lamp and generator set, which is fitted with a lens mirror behind the lamp lens front glass

of motor-cycle head lights in that a lens is fitted instead of the usual front glass in addition to a lens mirror behind the burner, which should greatly assist in concentrating the beam of light. The strong bracket and method of fixing are also worthy of note. We are looking forward with interest to testing this lamp. Those who care to indulge in carrier riding will be interested in a cushion specially designed for the purpose, made in black shiny material and provided with straps for fastening on to the luggage carrier.

Hanover Rubber Company.

This well-known tyre firm of 17, Goswell Road, E.C., are marketing a special combination three or four ply cover for sidecar use. The tread is composed of a thick layer of rubber in which are embedded steel studs in pairs and between each pair is an arrow-headed rubber projection. The cover appears to be of great strength, and should be practically puncture-proof on the tread, while the walls are of considerable thickness. This should prove very useful for the rear wheel of heavy passenger machines.

The Hanover combination tyre, which has alternate steel studs and rubber arrow headed portions.

THE MOTOR CYCLE

BUYERS' GUIDE

Of 1914 Models.

A complete report of the Olympia Show, with many illustrations, will appear in the issue dated Nov. 27th

ZENITH

MODELS *for* 1914.

3½ h.p. 70 m.m. bore x 64.5 m.m. stroke twin-cylinder engine. Equipped with all the special ZENITH fitments which have so often proved their worth, including the famous GRADUA GEAR, infinitely variable between wide limits.

"Motor Cycling," commenting on this new model, says:—"This machine, we feel sure, will have a very large vogue, as the new J.A.P. engine is one of the sweetest running small twins that we have ever experienced. On the road we found that the acceleration was terrific, and, instead of an impression of being bestride a 3½-h.p. twin, the sensations savoured more of 5-6 h.p As for its ability of pulling a sidecar, there can be no doubt whatever, although, of course, this machine is primarily intended for solo work."

The cylinders being of relatively small size, the machine can easily be paddled off whilst one is seated; its flexibility in conjunction with the GRADUA GEAR make it ideal for town and country use.

STOP PRESS.
STREATHAM & DISTRICT M.C.C.
ONE DAY OPEN TOURING TRIAL.
Acceleration, Speed, Restarting, and Reliability.
3 Non-stops. 2 Gold Medals. 1 Silver Medal. 1st and 2nd fastest time of the day at Brooklands; 1st and 2nd in Acceleration Test in 750 c.c. Class; 1st in Acceleration Test in 1,000 c.c. Class; 2nd in Acceleration Test in 500 c.c. Class; 1st in Acceleration Test in 750 c.c. Passenger Class. (Subject to Confirmation.) The 1914 Model 3½ h.p. twin Zenith with Gradua Gear obtained a Gold Medal, and did a speed of 50.38 m.p.h. in Brooklands Speeed test. (Speed required, 42 m.p.h. for this class.)

Details of the 6 h.p. and 8 h.p. Models will appear next week.

"Undoubtedly, at the coming Show, the Zenith stand will once more be a crowded spot."

Don't fail to inspect the RELIABLE

ARMSTRONG

"Tourist Trophy" MOTOGEAR, at Stand 187 Gallery.

¶ MECHANICAL PERFECTION as portrayed in "The ARMSTRONG" is the outcome of pre-eminent merit in design and constructional refinement in details.

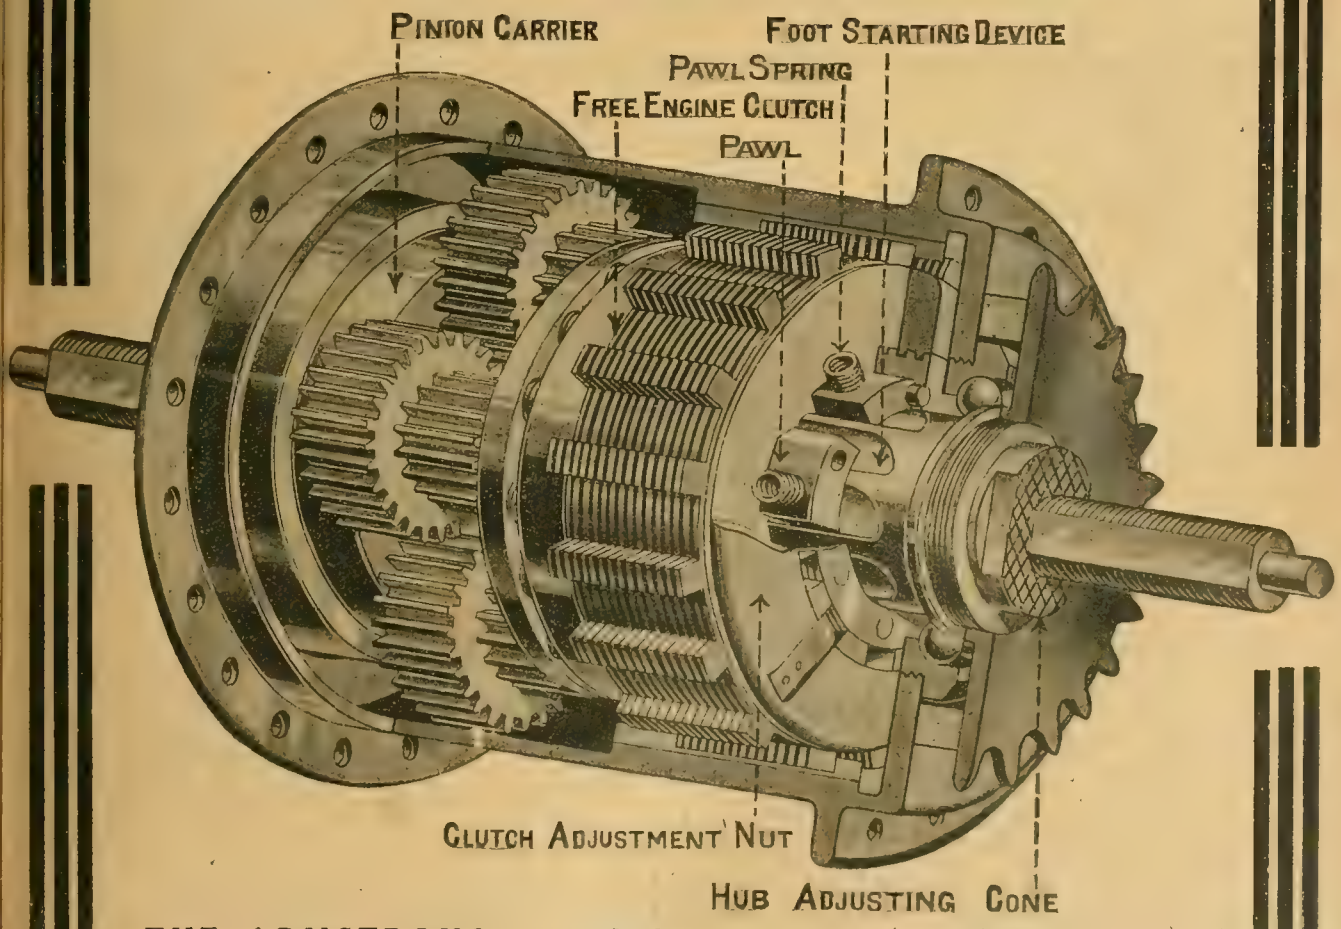
—"STRENGTH—SIMPLICITY—EFFICIENCY" is the keynote of "The ARMSTRONG" MOTOGEAR—backed by sterling "QUALITY" of materials, workmanship, and finish.

—Our sectional view reveals its working parts—those parts, it should be noted, are few, ESSENTIALS ONLY—and their fewness admits of MAXIMUM STRENGTH for each.

—By virtue of these features and the fact that it is the PIONEER 3-Speed Hub Gear, it ranks literally FIRST and BEST; and, inferentially, for its selection by all expert riders, its overwhelming successes in all competitions—with its crowning achievement in the TOURIST TROPHY RACES (winning the 1913 JUNIOR T.T.; FASTEST LAP, and RECORD TIME for the Course)— and its inclusion on the foremost machines of the day.

FIRST AND BEST

¶ FITTED BY ALL THE LEADING MANUFACTURERS!



THE ARMSTRONG 3-speed Gear Co., Ltd., BIRMINGHAM. R.H.S.

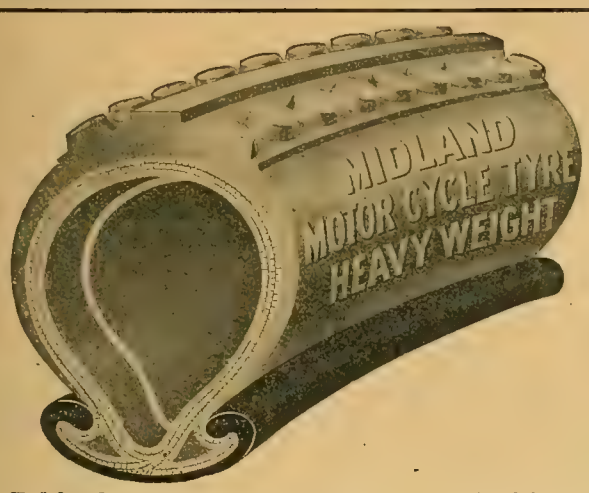
MIDLAND

MOTOR CYCLE TYRES & BELTS



Ribbed and Studded Motor Cycle Tyre

A splendid anti-skid with a heavy centre tread of specially toughened rubber which is practically puncture-proof. A very resilient and long-wearing tyre. Guaranted 3,000 miles.

Prices: 26 × 2¼ **37/6** 26 × 2½ **40/-**

IF it is a Midland tyre it is a good tyre. That goes almost without saying: for Midlands are British—and unequalled. More miles and more satisfaction; less cost and less—far less—risk of disappointment are yours if you choose Midland tyres—and belts. Many times they have successfully helped in record-breaking trials; many times they have made wins; and always they have fulfilled every claim we have made for them. Midlands are above board—and equally above the average.

MOTOR CYCLE BELT.

⅝in. 1/5, ¾in. 1/9, ⅞in. 2/-, 1in. 2/4, 1¼in. 2/9.

SOMETHING NEW

Of the usual V section but made of rubber with a special core of steel wire of high breaking strain, coiled spirally and interwoven into a fabric, moulded under enormous hydraulic pressure. This combination of special wire fabric and rubber does away with all the disadvantages of belts made of rubber and cloth alone, and eliminates stretching and pulling through of fasteners. It is pliable, affords perfect drive, and gives large mileage.

The 'Wire-core' BELT

We are not exhibiting at Olympia but a full range of our specialities may be seen at our London West End Showrooms, 222, Shaftesbury Avenue, W.C.

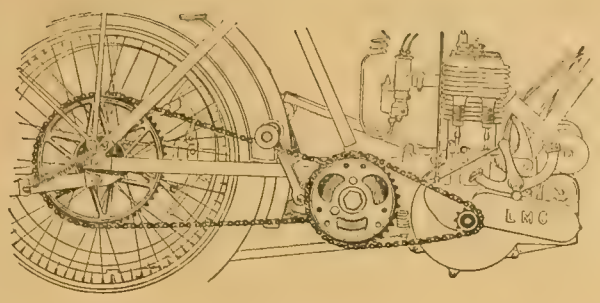
STAND 70



STAND 70

THE STRENGTH

AND POWER OF THE

L.M.C. COUNTERSHAFT 2-SPEED GEAR

CONFIRMED

BY THE

INSTRUCTOR OF ENGINEERING OF THE SYDNEY TECHNICAL COLLEGE.

Mr. RIPP says "It is the best gear I have seen yet," and his view coincides with all other motor engineering experts.

New South Wales,
2nd June, 1913.

Dear Sirs,

I submitted the 3½ h.p. L.M.C. motor cycle fitted with the two-speed Countershaft Gear, to what I consider a severe test. I ran it over the steepest hills I could find in and around Sydney, including Forveaus Street, Ormond Street, Liverpool Street, to Darlinghurst, and the hill at the south side of Coogee, which is an impossible climb to most motor cars. The ascents were made with a passenger in the sidecar, myself driving, and on the last hill mentioned it is as well to remember two very sharp turns have to be negotiated on a very bad surface. The success and power this machine shows as a hill-climber is far and away ahead of my expectations. The old trouble of slipping belts was an impossibility, owing to the direct drive by chain on the low gear. This alone places the gear far ahead of all others.

The kick starter and decompressor are of great comfort. The rider being able to start the machine while in the seat without getting off at any time. All who have inspected this gear are most favourably impressed, and a great business should be ahead of you in this line. It is the best gear I have seen yet.

Yours truly, H. J. RIPP.

The Gear was placed on the Market two seasons ago and the number of successes standing to its credit is probably greater than any other make of variable Gear: Proof of its superiority. It is the simplest, strongest and best Motor Cycle Gear produced and, like the machine itself, is of Proved greatest reliability. See this gear and full range of L.M.C. Models at Olympia.

STANDARD TOURING MODEL

OVER-SEAS

3½ Horse Power £39 : 0 : 0

The OVER-SEAS places motor cycling within the reach of all. Its very moderate cost has been rendered possible by standardisation. The OVER-SEAS is not an untried machine. It has pioneer knowledge and experience to recommend it; for it is the product of Mr. W. J. Lloyd, of the original Quadrant fame, and the designer of that most successful machine which bears his name. The machine conforms to standard specification, and is the embodiment of every reasonable refinement at such a moderate figure as **£39.**

The machine, as the name implies, was originally designed for use in oversea dominions, where much of our business is done, and a motor cycle which will successfully endure heavy colonial conditions, must essentially give still greater satisfaction on the well-conditioned roads of the United Kingdom. Price was also an important factor, because from experience we have realised that the greatest constant demand is for a motor cycle, reasonable in cost, simple in construction, easy to handle, and upon which every reliance can be placed.

BRIEF SPECIFICATION.

ENGINE.—3½ h.p. Overseas, 85 mm. bore, 88 mm. stroke, 499 c.c., Mechanically operated valves, interchangeable. Overseas half compression device operated by lever conveniently placed on the top rail of frame.
WHEELS.—26in. x 2¼in., strong hubs, heavy spokes, belt rim attached by separate spokes. Tyres 2¼in.
BELT.—1in. "Lyso."
CARBURETTOR.—B. & B.
MAGNETO.—Bosch H.T. ball bearing, driven by Hans Reynold chain.
GEAR.—Overseas adjustable pulley, adjusting from 4 to 5½ to 1.
SADDLE.—"Lyso" Pan Seat.
Complete set of tools supplied in folder.

The Tourist Trophy Races.

THE announcement of the dates for the 1914 T.T. Races calls to mind the fact that at the conclusion of the last race there was much discussion as to desirable amendments in next year's conditions to render the races less risky to the competitors. This journal took a leading part in the discussion, and, in addition to making a number of suggestions as to the clothing of the riders and the equipment of their machines, subsequently interviewed prominent A.C.U. officials as to their opinions. The result was a number of really practical recommendations, and, seeing that the regulations must shortly be issued, we offer no apology for refreshing readers' minds as to desirable clauses in the rules governing future Tourist Trophy Races. First and foremost, in view of certain unfortunate mishaps due primarily to the difficulties of the course, we advised that efforts should be made to hold future races on a safer course, and suggested the venue of the 1903 Gordon Bennett Race in Ireland as a suitable spot. Certain A.C.U. officials were with us in this matter, but whether any attempt has been made to obtain the use of Irish roads for the T.T. Race we do not know. Any way, the Isle of Man is once more to be the theatre. Probably congestion of legislation in Parliament rendered it a matter of impossibility to get the necessary Act passed permitting a race in Ireland.

Now that we are assured that the race will again be run over the admittedly rather risky Isle of Man course, it behoves everyone connected with the conduct of the competition to do everything possible to ensure the safety of the riders. Falls there are bound to be, of course, and no one expects to escape them in such a sport as motor cycle racing, but by insisting on suitable clothing and head gear being worn by riders, *in practice* as well as in the race, a great deal will be done to minimise the evil effects.

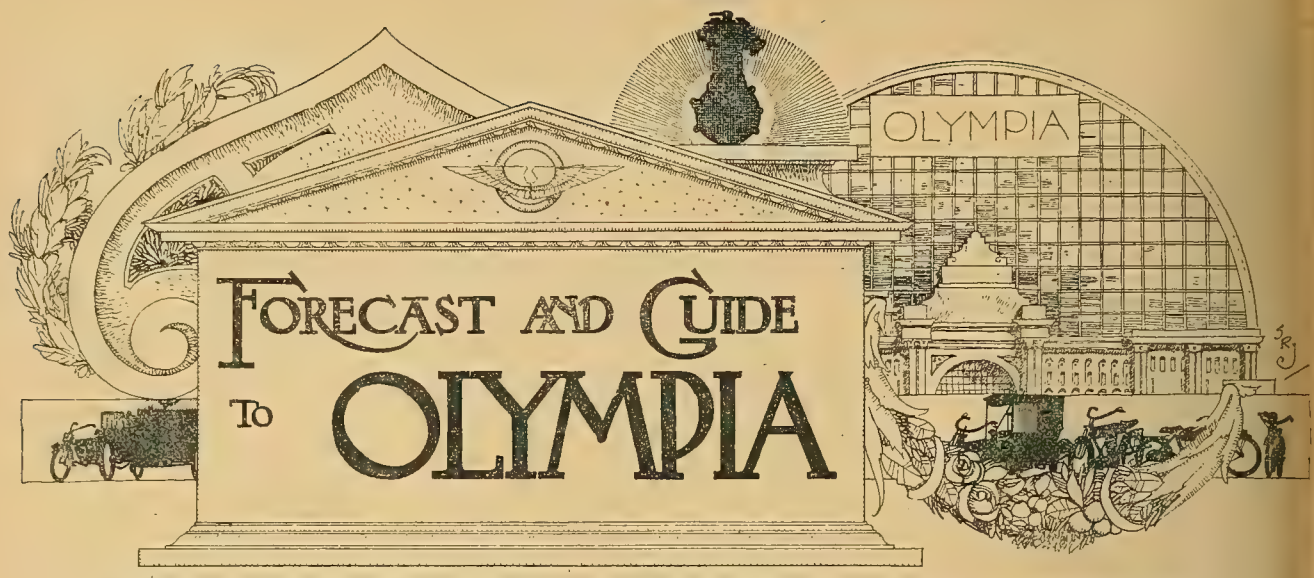
We do not believe in cutting down speed by artificial means such as limiting the fuel supply or cutting down the capacity of the motors to an extent that they would not be of serviceable size for touring purposes. But no rider should be allowed to start who could not satisfy the officials that he had completed at least six laps in practice. Aviation type safety helmets ought to be made compulsory, and each helmet inspected by a competent person, and no rider should be allowed to ride, even in practice, unless so equipped. One of the most dangerous effects of a fall often results from road impurities being forced into a sometimes trivial wound. If it were made compulsory that all riders must wear stout leather coats, breeches and gaiters, a further step towards safety would be made. Last June quite a large number of riders had spills in practice garbed in ordinary tweeds, which are no protection whatever against what is expressively termed "gravel-rash."

With regard to the machines, at least two security bolts per tyre should be obligatory, and in the event of a tyre being changed these should be replaced or renewed, under penalty of disqualification, if finishing without the bolts. Experience has shown that it is not so much the actual bursting of the tyre that causes the danger. It is the chance of its getting off the rim and locking the wheel that is to be feared.

There is another point where we might very well copy our French friends. There should be a slip road provided at the finish, up which each man, as he passed the judge, would be directed. This would allow his friends to surround and congratulate him without danger to other riders finishing. The slip road would best be situated about two or three hundred yards beyond the finish, so as to ensure riders being able to enter it at a moderate pace.

As to whether the Junior or Senior T.T. Races will be run concurrently, as last June has not been announced officially; but we do know that this method of running off the events was not popular, and it is more than probable that separate days will be resorted to, which would enable riders to compete in both events.

It would be observed from our announcement last week that the dates have been brought forward for next year's races, viz., May 19th and 21st. The date of the proposed cycle car T.T. race is September 24th.

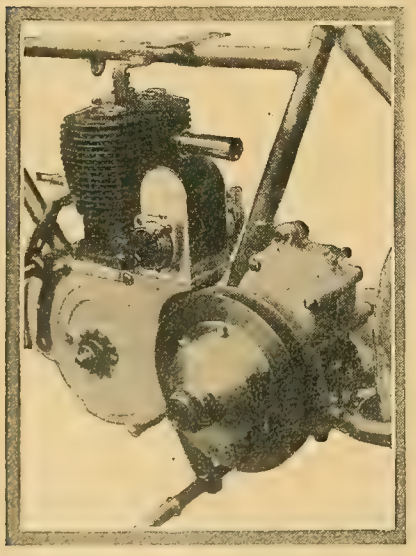


FORECAST AND GUIDE TO OLYMPIA

We continue this week our descriptions of new model motor cycles, sidecars, and cycle cars for exhibition at the annual show, which opens on Monday next. Plans showing the positions of exhibitors are contained in this issue. In "The Motor Cycle," dated November 27th, a full description of the exhibits with numerous illustrations will be published.

NEW PREMIER GEAR BOX.

THE most important innovation found upon the 3½ h.p. Premier for 1914 is the adoption of a very substantial three-speed counter-shaft gear. This is placed in the same position as the now well-known two-speed gear. The kick-starter is combined with the gear and enclosed by the aluminium casting, and the plate clutch is carried in the large diameter belt pulley. The gear itself has three pairs of gear wheels, which are always



Transmission side of the 3½ h.p. 1914 Premier, showing chain sprocket on engine shaft, counter-shaft gear, and belt pulley.

in mesh, but, owing to pending patents, we are unable to divulge the actual working arrangements. However, we may say that there are no sliding dogs and that the gear changes with the greatest possible ease. The new design of clutch is very sweet in action and will stand any amount of slipping in traffic. The gear box appears but little larger than the two-speed box, but the strength of wearing parts has been in no way sacrificed.

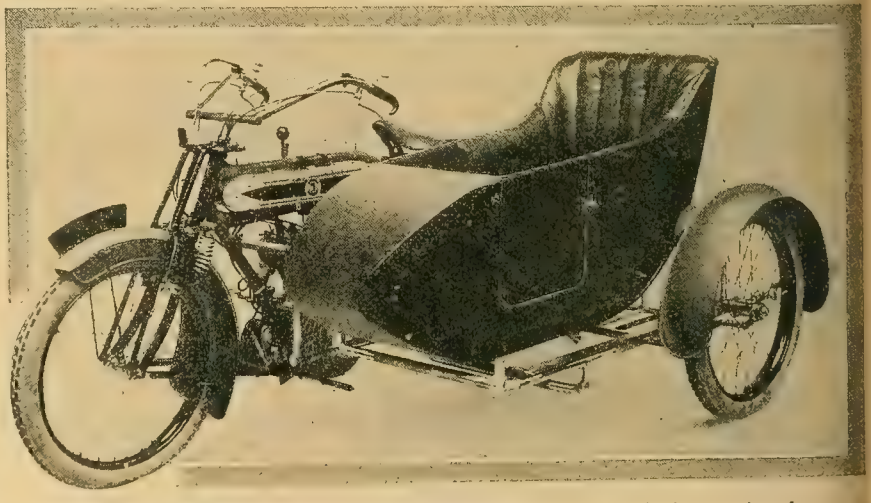
Aluminium footboards are a standard fitting, and the engine plates, which have been somewhat altered in design, now carry the rear brake operation. The rear brake shoe has also been somewhat improved, and is of very solid construction. A cleaning up of crank case and timing gear gives a very neat appearance to the engine and the handle-bars are now neatly curved. The silencer of the new model has a long tail pipe with a flattened end, and this fitting has been found considerably to decrease the noise. The rear guard and carrier is still detachable from the rear forks, which facilitates tyre repairs.

The big 7-9 h.p. model has undergone but few changes. The two-speed gear is still retained, but the final drive is now by belt or chain at option, a neat shock absorbing device being fitted on the engine-shaft. The silencer pipes have been rendered considerably neater by means of lugs cast so as to obviate unsightly pipe bends, and an improved silencer has been fitted.

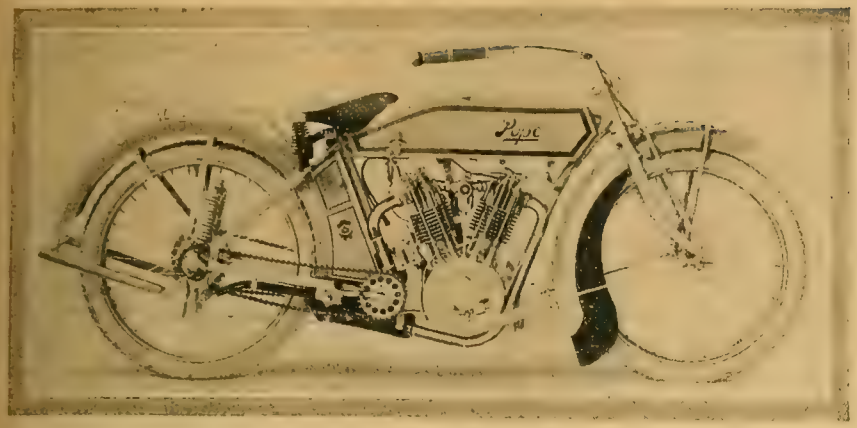
The Sidecar and Cycle Car.

An extremely substantial sidecar is marketed to suit this type. It has four points of attachment arranged in such a manner as to do away with bent tubes and the chassis has curved cross members to permit of a reasonably low body position, and at the back a very solid permanently attached luggage carrier is mounted with special provision for a spare petrol can at one side. The body is coach built, and provides ample space for the passenger, and a 7in. domed mudguard is firmly fixed in position so that it cannot rattle.

An entirely new design cycle car with four-cylinder engine and three-speed gear box will make its *début* at Olympia.



The 7-9 h.p. twin-cylinder three-speed Premier, with coach-built sidecar. Note the large mudguard on the sidecar wheel.



Twin-cylinder 7-8 h.p. spring frame Pope, which has chain drive and overhead valves.

THE LATEST 7 H.P. POPE.

The Pope Motor Cycle Agency, 55, Banner Street, Golden Lane, E.C., is exhibiting at Stand 45 a model of the Pope motor cycle. This machine is of American manufacture.

The chief features of the machine are as follow: The engine is a 7 h.p. twin, 84½ mm. bore × 89 mm. stroke, fitted with roller bearing big ends, mechanically operated overhead valves and detachable cylinder heads. Lubrication is by mechanical oil pump, a hand pump also being fitted for high speed work. The clutch is of the multiple-disc type and is operated by a lever at the side of the tank. The carburetter is a "Schebler" automatic, with auxiliary air valve.

The frame is sprung at the rear as will be noted in the illustration. The spring forks are of the leaf pattern. Ignition is by Bosch magneto driven by shaft.

Control is effected by twisting the grips of the handle-bar. Transmission is by Hans Renold chains throughout. There are two band brakes which may be operated from the foot boards or by means of the pedalling gear.

Among other requirements we might mention that folding footboards are fitted and that the tank is fitted with a strainer.

THE 1914 CHATER-LEA.

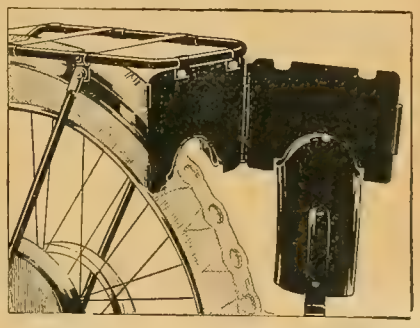
For 1914 Chater-Lea, Ltd., Banner Street, Golden Lane, E.C., have largely re-designed their well-known No. 7 model.

The frame now has a dropped top tube, and a riding position four inches lower than previously is thus obtained, and the sidecar lugs are brazed on to the frame. There is a gear box hanger, formed in one piece, from which the gear box is suspended from three points. The wheel base is six inches shorter, and the weight of the machine has been slightly reduced. Internal expanding instead of external band brakes are now fitted, the segments being covered with Ferodo and controlled by cam motion. The brake surface is 1¼in. in width. The hubs have large size journal bearings at each end with ⅝in. balls, and a felt washer between two collars excludes dust and water.

The engine, an 85 mm. bore × 88 mm. stroke 50° twin, has been radically altered, since the tappets are now driven directly off the cams, so eliminating the use of rockers altogether. The makers claim a quieter engine by means of this alteration. The valves are covered by shields, while the tappets are adjustable, and the main driving chain and the magneto chain can be adjusted. The front chain cover is split and easily detached.

Internal expanding brake on the 1914 8 h.p. Chater-Lea.

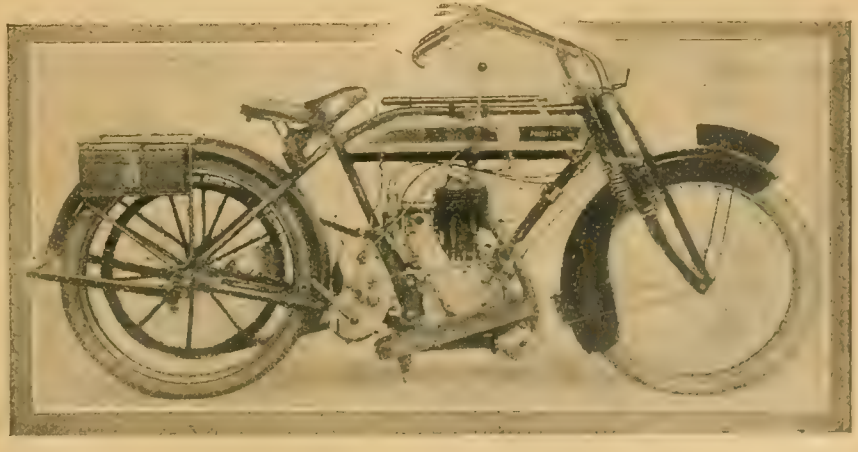
Lubrication is by means of a suction drip feed and by an external pump on the right hand side of the tank. The oil tank is now part of the main tank; it was previously attached to the frame under the saddle. The gear quadrant has been removed from the top tube to the right hand side of the tank, and gear changing is now effected by means of an arm carrying a spring pin sliding into notches cut on a shaft contained in the gear box. The clutch, which is of the multiple disc type, has been altered, and now is pushed in instead of being held out, thus doing away with the special framework formerly necessary for carrying the operating mechanism.



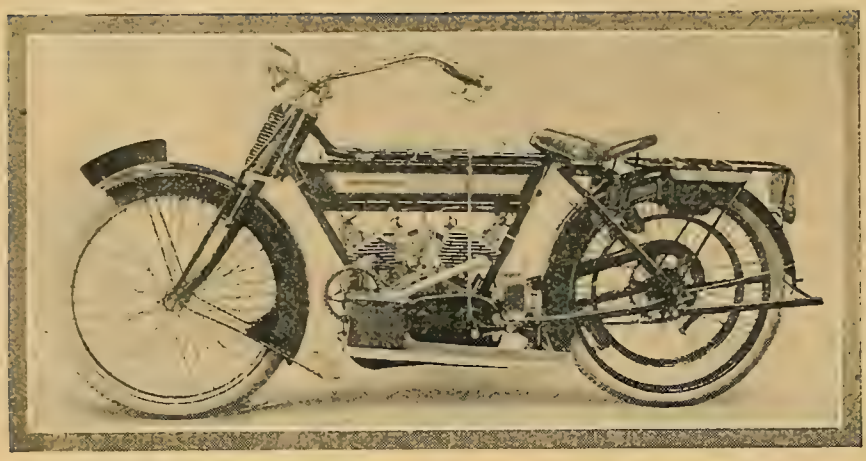
P. and M. rear number plate and mudguard extension, which may be swung round to facilitate tyre repairs.

THE DEPFORD CYCLE CAR.

Mr. de Peyrecave may be described as the "father" of the cycle car movement in England, for he it was who brought over the first Bedelia to this country some four years ago. He is now engaged in manufacturing a new cycle car known as the Depford at 2, Evelyn Street, Deptford, S.E. This machine is a cycle car on true lines, and despite its light weight, appears to be substantially built. It is fitted with either Blumfield, Precision, or J.A.P. 8 h.p. motors, at the purchaser's option, and a choice of air or water-cooling is given. The drive is taken from the engine through a universally jointed shaft to a gear box situated in the middle of the chassis, the gears being changed by gate, the operating lever being situated in the



One of the Premier 1914 range, with three-speed counter-shaft gear.



The 3½ h.p. twin-cylinder Motosacoche, with chain drive and two-speed gear.

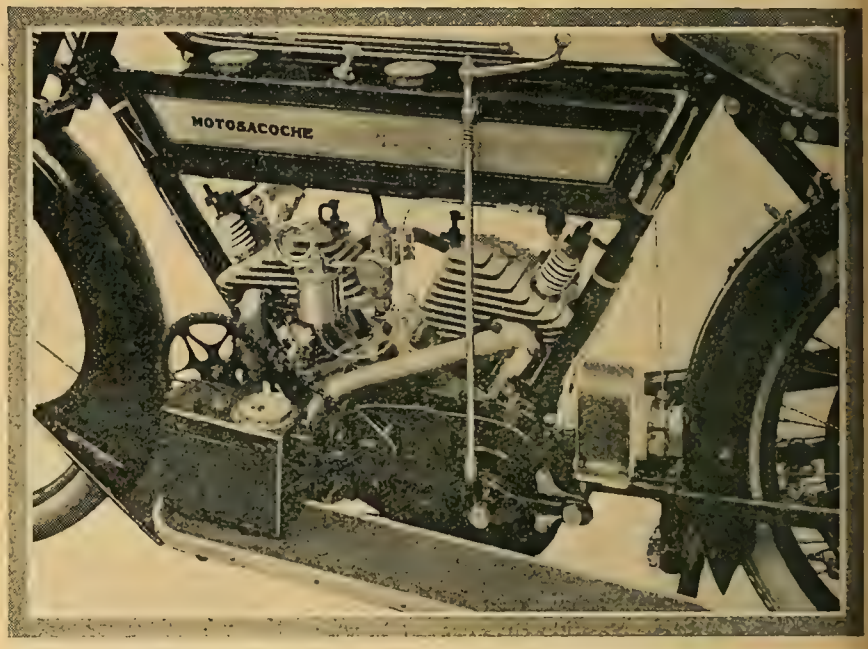
centre of the machine. A cross-shaft carries large automatic variable pulleys at each end, and the drive is thence taken by belt to the rear wheels. The frame is of pressed steel, and the springing quarter elliptic fore and aft, steering being by bobbin and triple cables. The machine is built on taking lines, and is moderately priced, being 120 guineas for the air-cooled model, and 125 guineas if water-cooled.

3½ H.P. TWIN ELECTRICALLY-LIT MOTOSACOCHE.

An exceedingly pretty medium weight machine is the 3½ h.p. twin-cylinder two-speed Motosacoche. Incidentally, the engine is extremely efficient for its size, and the machine has been used with a sidecar with considerable success.

The model we illustrate is fitted with the patent de Lissa exhaust valve, full details of which have lately appeared in our pages. The great claims for this valve are that, owing to the manner in which it is cooled, it will never warp or stretch, and that pitting is unknown, while oil will not carbonise upon the valve face.

The gear fitted is of the Enfield type, and the machine is chain-driven throughout, a useful fitment being the provision for a kick-starter. The neat Motosacoche electric lighting set is fitted, and large mudguards are a further excellent feature of a very workmanlike mount.



Power unit of the 3½ h.p. Motosacoche, clearly showing De Lissa valves, battery on footboards, kick-starter mechanism, two-speed gear, magneto position, and efficient design of mudguards.

Next week we hope to describe and illustrate the 6 h.p. Motosacoche model, which is fitted with the well-known M.A.G. engine. This machine will doubtless prove one of the most attractive sidecar models for the coming year.

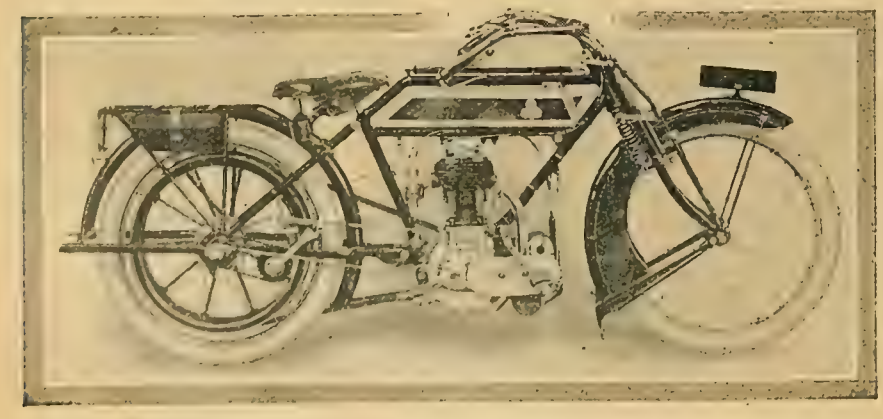
SWIFT 1914 MODELS.

Three types of Swift motor cycles will be marketed in 1914. The engine is of 3½ h.p., 86×85 mm., with large valves and adjustable tappets. The transmission is by chain and belt. The newest model has a counter-shaft gear box, on which is also mounted the free engine clutch. The following ratios are provided: 5.25, 8.5, and 16 to 1. The design of the silencer has been somewhat improved and modernised.

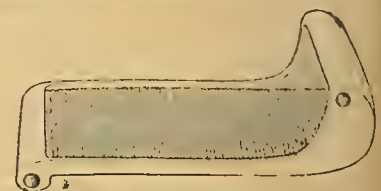
Another model is the 3½ h.p. with half compression device to ensure easy starting; bore and stroke as before. This model is single geared, and, in common with the previous model, is provided with front and back stands, Brown and Barlow carburetter, waterproof Bosch magneto, etc. If desired, a three-speed gear, either Armstrong or Sturmey-Archer, may be fitted at slight extra cost.

A third model also has the engine fitted with a half-compression device, with the same design of engine. To it a three-speed hub gear, together with kick-starter, is fitted as an extra. This is the T.T. model, consequently wide racing handle-bars are fitted.

All the types referred to have black enamelled coslettised frames and are finished in excellent style.



Valve side of the 3½ h.p. Swift for 1914, with three-speed gear and kick-starter.



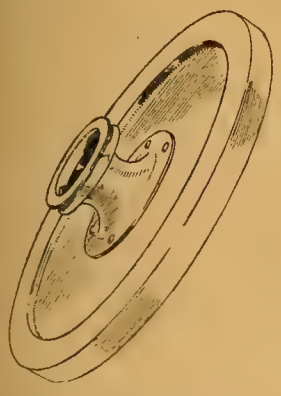
Excelsior curved footboards which protect the rider's feet.

THE 1914 PRECISION ENGINES.

SUPPLEMENTARY to the already well-known Precision models, Mr. F. E. Baker is producing three new types, the chief of which is the little Precision Junior power-unit. This little engine has a capacity of 175 c.c., and combines in its construction many interesting features. The single vertical cylinder has a bore and stroke of 60 mm. with horizontal valves placed in the head, these valves are of ample diameter and have extremely strong stems which effectively prevent breakage. They are operated by rocking beams fitted at the top end with adjustments for wear, and at the lower end with rollers on which the cams work directly. A light two-ring piston transmits the force of the explosion through a hollow gudgeon pin and split big end connecting rod to a solid one-piece crankshaft. This crankshaft is carefully balanced by means of counter-weights attached to the crank webs and the big end bearing is fitted with an oil scoop.

The Two-speed Gear Described.

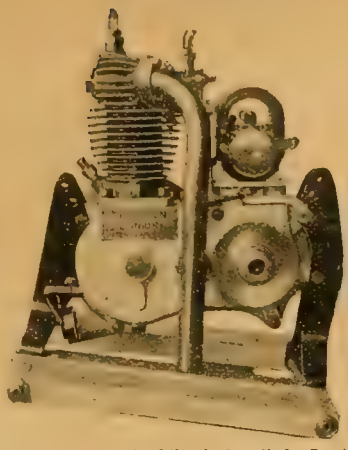
An outside flywheel is fitted on the offside, while, enclosed in the crank case on the nearside, is a stout gear wheel. The crank case casting is extended rearwards to form a two-speed gear, which is



Spun copper oil retaining flange on the flywheel of the Precision Junior.

carried out as follows: Meshing with the above mentioned gear wheel is a two-to-one wheel mounted on a cross-shaft which has a second gear wheel on the further side and two cams mounted between. These cams actuate the valves through the long rocking beams previously described, while the two gears mesh with corresponding wheels mounted freely on a shaft parallel to and directly behind the camshaft. On the end of this secondary shaft is mounted a 4in. adjustable pulley, and between the gear wheels the shaft is square in section and carries a sliding member with dog clutch at either end. To obtain high or low gear the sliding member is moved sideways till the dog jaws engage with similar jaws cut on the face of the gear wheels. Thus with the aid of only five gear wheels, a combined camshaft drive and two-speed gear is obtained.

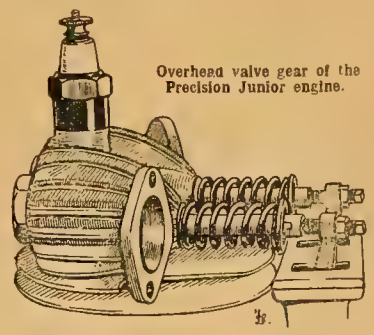
The actuation of the sliding member is carried out in a peculiarly simple manner, for cast in the gear casing is a steel tube, through which runs a rod attached to a fork engaging in a groove in the sliding sleeve. At the front end of the rod is mounted a double pedal extending across the engine and projecting in a convenient position over either footboard, so that if the left pedal is depressed the left pair of dogs are engaged, or *vice versa*. Large plain bearings are used throughout the unit, and spun copper discs are arranged on both pulley and flywheel, which lie inside oil retaining wells on the case, and thus prevent leakage. The magneto is mounted behind the cylinder and is chain-driven from the camshaft, a simple sliding arrangement being provided for chain adjustment.



Two aspects of the single-cylinder Precision Junior, showing general arrangement, method of operating overhead valves, footboards, and gear change pedals.

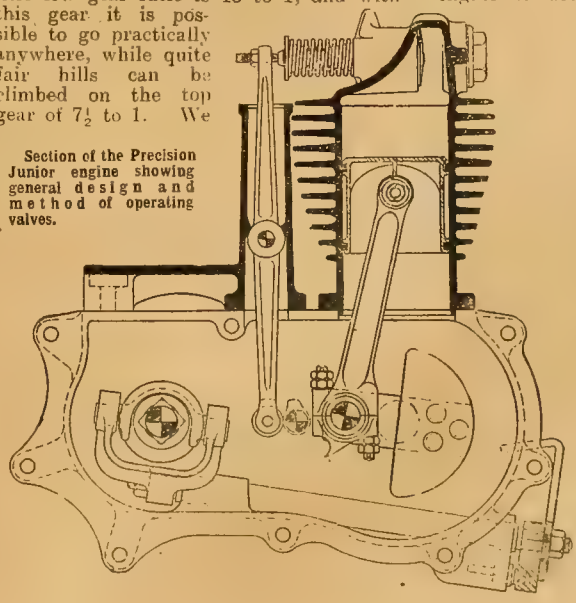
A Real Lightweight.

The complete unit, with carburetter, magneto, plug, footboards, silencer, and gear striking pedals, weighs only about 40 lbs., so that the complete motor cycle should be no heavier than 100 lbs. We tested the machine over some rough ground and up a long slope, and found that it pulled in a most extraordinary way, and, in changing gear, it is not even necessary to lift the exhaust valve. The low gear ratio is 16 to 1, and with this gear it is possible to go practically anywhere, while quite fair hills can be climbed on the top gear of 7½ to 1. We were given a most wonderful exhibition of the utility of the tiny machine, for it was ridden over fields and up paths and in and out of the paths round the New Precision works with the greatest ease.



Overhead valve gear of the Precision Junior engine.

The new 4 h.p. twin has been designed to meet the requirements of the solo rider who desires a fairly fast machine, which is capable of taking a sidecar when necessary. The bore and stroke of the engine are 60×88 mm., and the engine is designed throughout on Precision lines. All bearings are of very serviceable length and diameter, and the cam gear has wide wearing surfaces. A very simple exhaust lifter is used, which consists of a supplementary tappet which, on being pressed down, raises the exhaust valves through the rocker arms. The tappets are now of large diameter, and the flywheels are carefully balanced by means of lead filling. The cylinders are interchangeable, and flange pipe joints are supplied.



Section of the Precision Junior engine showing general design and method of operating valves.

FOR USE ON CYCLE CARS.

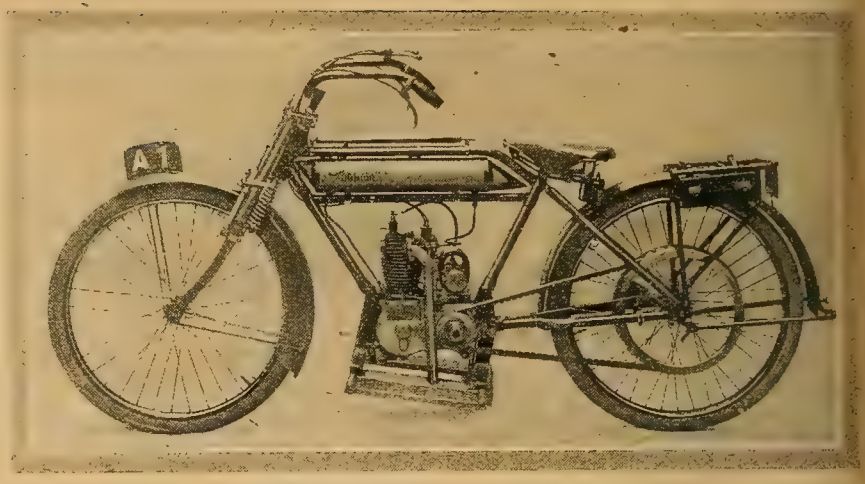
The 8 h.p. cycle car engine may be obtained with either air or water-cooled cylinders. Very large bearings are the feature of this model, and the magneto is now driven across the front by en-

closed bevels. All Precision models now have adjustable tappets which are concentric with the valve stems, and whenever possible twin-cylinder types have expanding flange joint inlet pipes. A new cast silencer and magneto bracket is supplied for the single cylinder models, provision being made for a tail pipe.

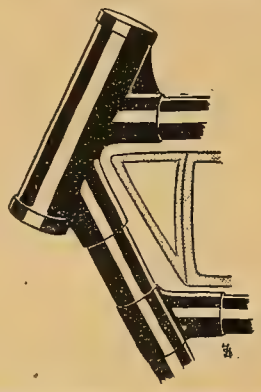
1914 CALTHORPE MODELS.

The new Calthorpe models will be shown at Olympia, one being fitted with the 4 h.p. twin Precision, and either the Calthorpe expanding clutch counter-shaft two-speed gear, or a three-speed hub. The other new model will be fitted with the Precision junior engine unit, which is thoroughly described elsewhere in this issue. This little machine is really well carried out. The lugs are all very substantial, especially the head lug. Druid forks are fitted, and a substantial heel operated foot brake is applied to the 14in. belt rim, there is also the usual front rim brake. A tubular tank containing three quarts of petrol and a pint of oil is carried on the lower frame rail. Stand, carrier, pannier tool bags, Best and Lloyd lubricator, and sidecar wings to the mudguards complete the specification of the "Calthorpe Junior," which weighs only 110 lbs.

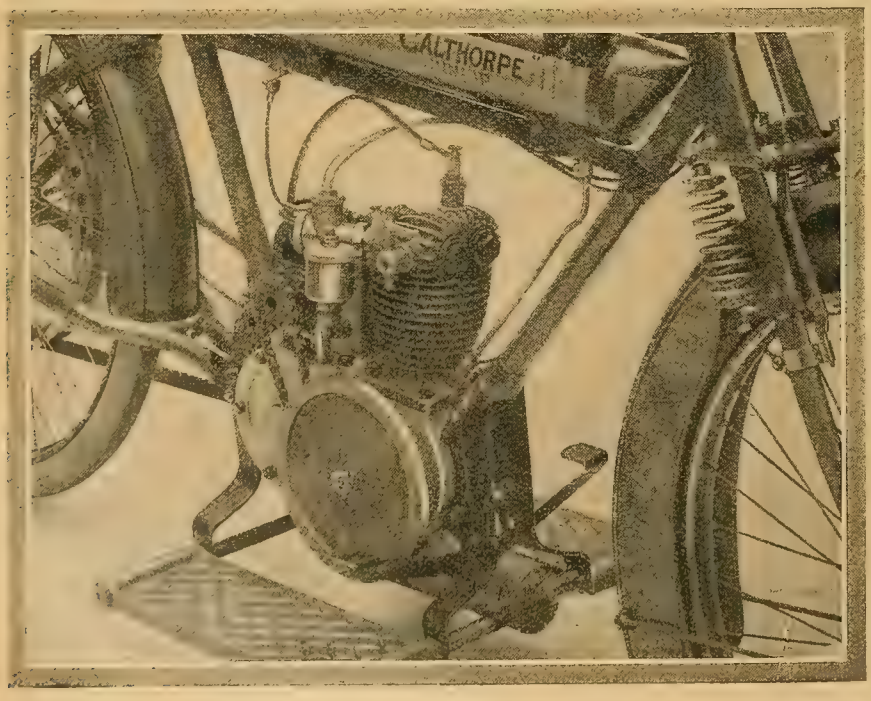
Calthorpe sidecar models have the attachment lugs brazed to the frame, a fourth lug being attached to the steering head stay. The new sidecar chassis has a dropped frame and is very strongly constructed. springing is well carried out, and a luggage carrier and foot plate are parts of the standard outfit. A smart sidecar will be shown, the panels of which are of coach finished leather, which besides looking very neat has the advantage of flexibility and comfort. The Calthorpe counter-shaft two-speed gear is controlled by two expanding phosphor-bronze clutches which lock either the high or low gear in position as desired, a free engine position being arranged in between. Excellent mudguards are fitted to all models and the tool bags are protected by metal base plates.



The 1½ h.p. Calthorpe Junior, which has a two-speed countershaft gear.



The substantial head lug of the Calthorpe Junior.



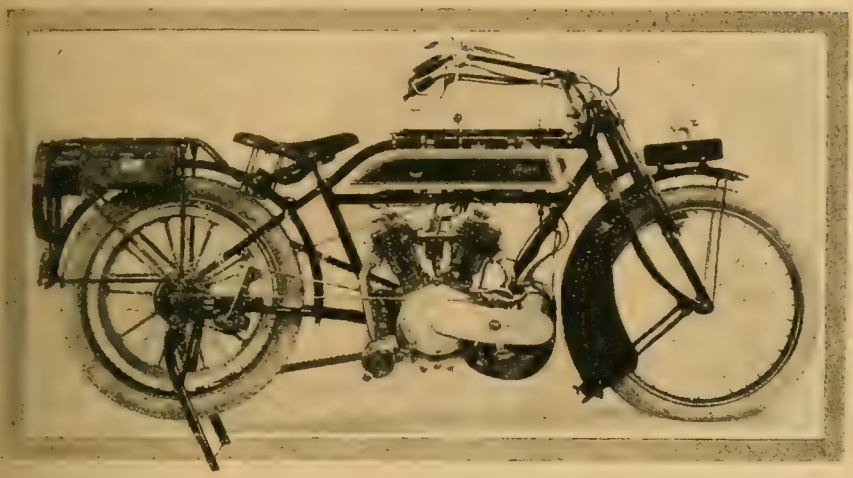
Power unit of the Calthorpe, showing footboards and change-speed levers.

ZENITH-GRADUA NEW MODELS

The success of the Gradua gear as exploited by Zenith Motors, Ltd., Weybridge, has been phenomenal, but it has possessed one drawback for use with a sidecar, in that it has not been possible to obtain a double figure low gear ratio. Realising that a low gear is an absolute necessity nowadays, the designer (Mr. F. W. Barnes) has introduced a method of obtaining the necessary reduction for passenger work. This is obtained by fitting a counter-shaft clutch and kick-starter in front of the engine, a chain drive being used from the engine to the counter-shaft, the drive thence being by a very long belt to the rear wheel. By gearing down the counter-shaft on which the pulley is situated, it is, of course, possible to use a very large pulley, with the result that gears as low as 11 to 1 may now be obtained by Zenith riders, with the further advantage of the very smooth drive given by such a long belt. All models for 1914 will be fitted with the twin-cylinder J.A.P motors, ranging in power from 3½ h.p. to 8 h.p., and in addition a 3½ h.p. model fitted with the Green water-cooled engine is supplied. The kick-starter fitted on the counter-shaft is of the push-forward type, and substantially made. Of course, it is quite possible by changing the engine sprocket, to obtain an almost indefinitely wide ratios of gears.

WOLF MODELS.

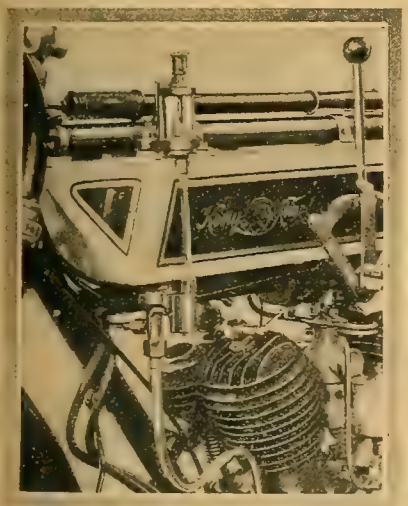
The 3 h.p. Wolf is fitted with a Toroga counter-shaft gear, double chain transmission, kick starter, Pilot spring forks, and Patterson pan seat saddle. The same machine is also fitted with combined chain and belt transmission. Another model is the 2½ h.p. Wolf lightweight, also with Toroga gear, chain and belt transmission. This model can be fitted with either fixed gear or Albion two-speed gear as well as Toroga.



Valve side of the Kerry-Abingdon 5-6 h.p. twin-cylinder three-speed model. Observe the clean crank case, kick starter, separate silencers and belt and tube cases on the end of carrier.

KERRY-ABINGDON.

A large range of Kerry-Abingdon motor cycles will be exhibited at Stand No. 34, bearing the famous King Dick trade mark. Small fittings for the control of the petrol and the priming of the engine have particularly received attention. A kick starter has been embodied with the Armstrong three-speed gear in most of the models, which admits of wheeling the bicycle in a backward direction, as is necessary when adjustments to the belt have to be made.



Kerry-Abingdon automatic drip feed, which only works while the engine is running and requires no attention. A hand pump is also fitted on the offside of the machine for use if desired and also when the engine has been cleaned out.

Another ingenious device that the company fit as an extra, at the option of the rider, is an automatic oiler. This is fitted on the tank, and, although only connected to the engine by one pipe of somewhat larger diameter than usual, by means of a diaphragm pump, contained in a portion of the fitting, oil is forcibly fed through the usual spotting glass (which is under the control of the rider) down to the engine. Unlike semi-automatic oilers, the supply of oil is stopped immediately the engine stops. An ordinary hand pump is also fitted. We understand that this device has given the greatest satisfaction, both on twin passenger machines and 3½ h.p. singles.

A special modèle de luxe passenger 6 h.p. twin is in course of preparation, and it is hoped to exhibit one of these machines at the Show. This will have chain and belt drive, with counter-shaft three-speed gear and kick starter, very large mudguards, and ample gear casing for belt and chain. An extra large tank will be fitted, to carry about two and a half gallons of petrol. The frame is designed to give extra ground clearance for the engine, to suit colonial conditions. The sidecar attachment lugs are in one with the frame lugs, giving a maximum of security at this point.

One of the characteristic features of these machines is still being maintained, namely, the circular spare belt case, which serves as a number plate at the rear of the machine.

In the gallery will be exhibited, besides the King Dick engines, an assortment of fittings and accessories.

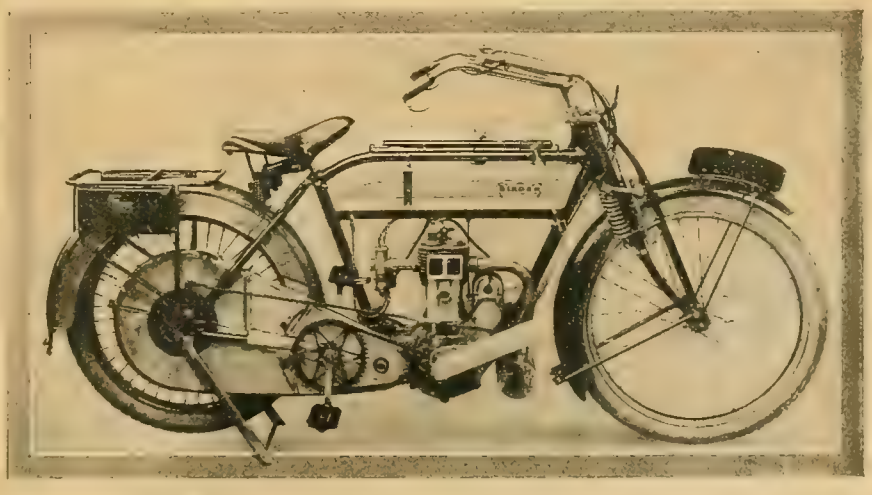
THE 2¾ H.P. DIAMOND UNIT.

Quite one of the most original engine designs is that of the 2¾ h.p. Diamond, which consists of a unit embodying engine, clutch and two-speed gear, all totally enclosed and running in oil. It is manufactured by the D. F. and M. Engineering Co., Ltd., Sedgley Street, Wolverhampton. The engine is 75×79 mm. bore and stroke, 349 c.c., with the cylinder set *déssaré*. The inlet and exhaust valves are driven off a single camshaft, and the former operates on the overhead principle, the mechanism being enclosed in a dust proof cover, and adjustable tappets are provided. Ignition is by a U.H. magneto, gear driven direct from the solid camshaft. Embodied in the unit casting of the base chamber and gear box is the metal-to metal clutch, which, the makers state, can be slipped indefinitely in traffic without damage, and a kick-starter of an improved type is also fitted. The final drive is by a chain, the advantage of which is that the gear ratio can be altered by a change of sprockets. The unit cases for 1914 have been redesigned, giving a neater appearance and greatly facilitating cleaning. To the student of advanced design the 2¾ h.p. Diamond presents many interesting features, and should on no account be missed. It will be exhibited on Stand No. 16, Ground Floor, Olympia.

SINGERS FOR 1914.

The only difference in the Singer models for 1914 will be the fitting of chain drive throughout on the 4½ h.p. model in place of the final belt hitherto supplied. The engine is 88×88 mm. bore and stroke, and a two-speed counter-shaft gear box is used, affording ratios of 5½ and 7¾ to 1. The machine is designed for use with a sidecar. The 2½ h.p. and 3½ h.p. single-cylinder models remain unaltered, Sturmey-Archer three-speed hubs and belt drive being the system of gearing and transmission employed.

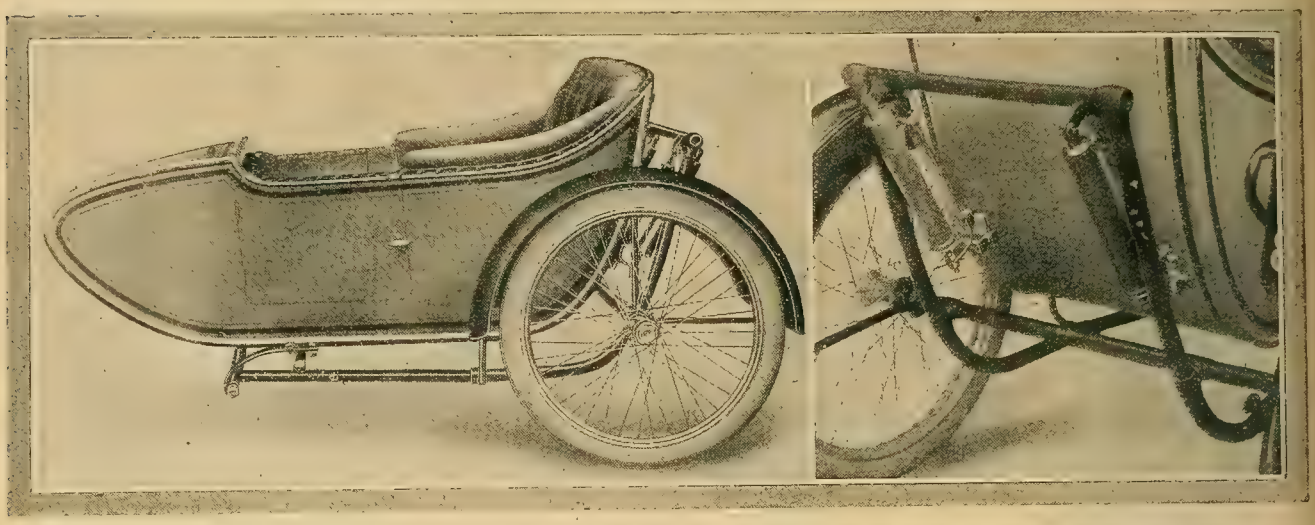
The Singer engines are always interesting to study owing to their extraordinary successes at Brooklands in the hands of G. E. Stanley and other riders, and the firm still hold the coveted hour record for 500 c.c. engines.



Valve side of the new chain-driven Singer, with two-speed counter-shaft gear

A New B.S.A. Model.

FEATURES: Three-speed Counter-shaft Gear, 556 c.c. Engine, 2½ in. Tyres.



The new B.S.A. sidecar is fitted with a decidedly novel type of springing in the form of two long spiral springs at the forward end.

THE policy of the B.S.A. is always a matter of interest, and it is, therefore, a matter of some note that the company will market nothing but single-cylinder engines for the coming year. The 3½ h.p. engine has been retained with all its distinctive features such as the *désaxé* cylinder and pear-shaped casting, the only noticeable alteration to this type of power plant being the addition of adjustable tappets which are held up to their work by enclosed springs. A new 556 c.c. engine will also be standardised, and this will resemble the 3½ h.p. type in every detail except that the stroke has been lengthened by 10 mm., thus increasing the capacity to 556 c.c. This model has, of course, been built for those who consider the extra power necessary for sidecar work in heavy country.

The 556 c.c. Engine and New Gear Box.

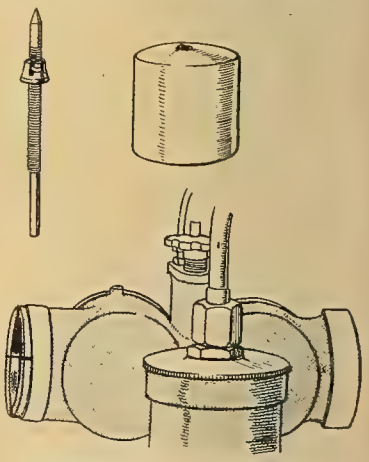
The 85×98 mm. engine is mounted in a substantial frame which follows standard lines in its general construction, but is reinforced by a central helical web. On the end of the crankshaft is mounted a sprocket which is driven through a spring shock absorber, containing three compression and three recoil springs.

A chain transmits the power to the new three-speed counter-shaft gear box, which has several novel features. All three pair of gear wheels are constantly in mesh, and the change is effected by sliding dogs. These dogs are peculiar in that there are nine jaws to each set, each of which is slightly undercut. One set is mounted on the primary and two on the secondary shaft. The sliding members are moved laterally by a very simple and ingenious method which has the additional advantage of being absolutely positive in action.

A fork engages each dog member, and is loosely mounted on the striking rod, the boss of each fork being cut away in the form of a specially shaped slot. Through these slots project hardened steel pin heads, the pins being firmly embedded in the striking rod. The striking rod, on being rotated by a quadrant and pinion, forces the forks to the desired position by means of the pins, and thus the dogs are engaged (this description may be clearly followed by reference to the sectional illustrations). A multiple-plate clutch is also mounted within the gear box and contains twenty bronze and nineteen steel plates which afford ample gripping surface.

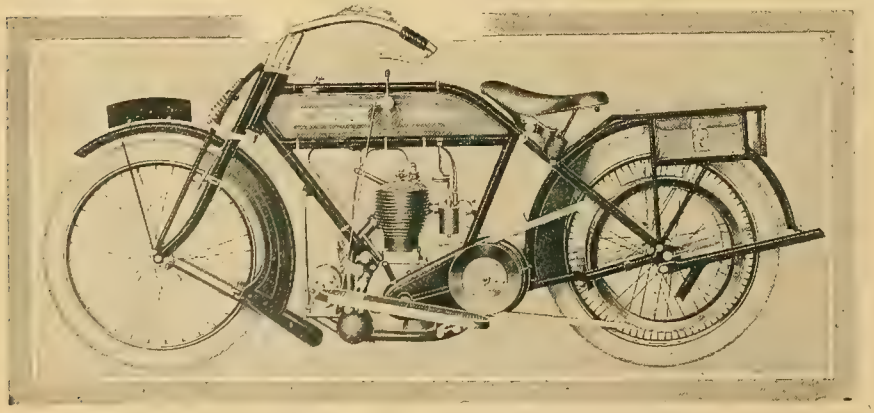
Thoroughness in Manufacture.

Every detail of this gear box is constructed with the most scrupulous care, and a thorough examination of a set of parts which has been under severe road test showed practically no wear. A kick-starter is mounted on the right-hand side and rotates the layshaft through an intermediate gear wheel, the teeth of which are so formed that it is impossible for the teeth to over-ride. Gear-changing is effected by a neat quadrant and lever secured firmly to a special lug on the lower rail. A spring control box is fitted to prevent straining the gears. The final drive of this model is by chain. Both chains are carefully protected from mud and dust, and simple chain adjustments the provided.



Arrangement of new top feed float chamber and threaded needle to enable the petrol level to be readily altered.

The cycle fittings are excellent throughout, excellent mudguarding being fitted, which, in combination with neat and substantial footboards, provide excellent protection for the machine and rider. The B.S.A. spring fork is retained, and Best and Lloyd drip feed lubrication has been standardised; 26×2½in. tyres are now



A new model B.S.A. for 1914 with chain cum belt transmission

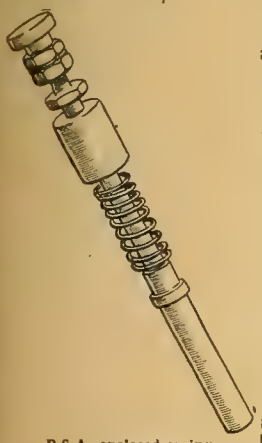
A New B.S.A. Model.—fitted to all models except the T.T. machine, and the frame has been slightly raised to compensate for the consequent decreased road clearance. A similar machine may be obtained with the 3½ h.p. engine and with the two-speed hub gear.

The 500 c.c. Models.

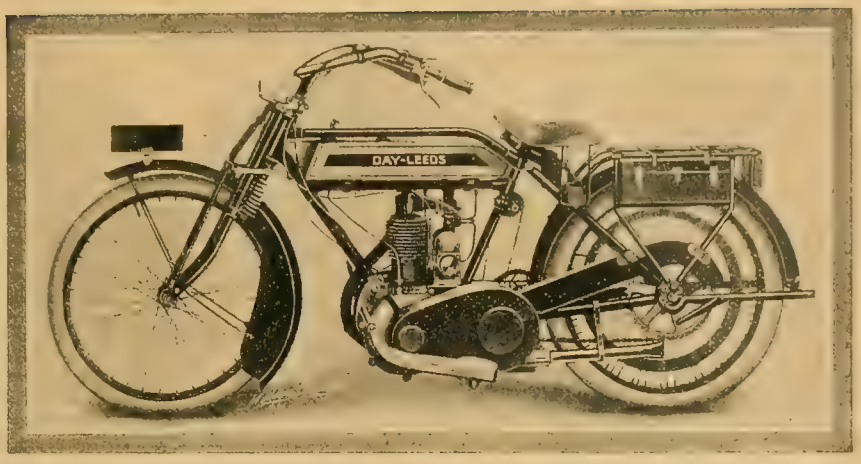
Other models are the 3½ h.p. chain cum belt drive with three-speed counter-shaft gear, a 3½ belt driven model with either the two-speed hub gear or free engine and the belt driven T.T. type. The specification of each of these models is similar except, of course, that the last mentioned model has dropped bars, footrests and 2¼in. types.

Spring drive to deaden the impulses of the engine as used on the chain driven B.S.A.

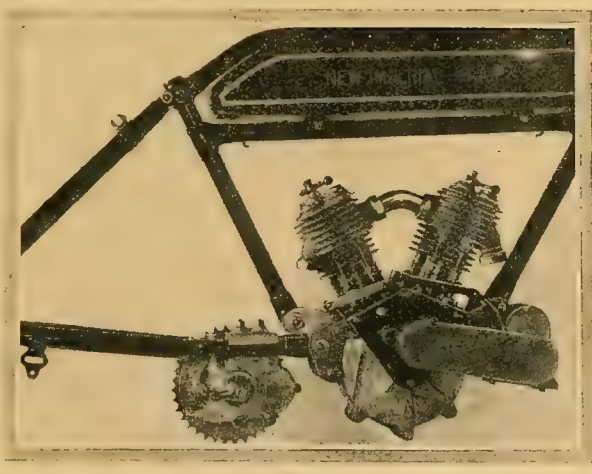
All B.S.A. machines are fitted with two stands, a detachable rear mudguard and carrier, and metal protected pannier tool bags. The Ruthardt magneto has been standardised, and the B.S.A. carburetter is now fitted with the petrol intake in the top of the float chamber, the float needle being reversed and a simple adjustment being provided for the height of the petrol level. Before leaving the works we were enabled to see a comparative test of the 3½ and 556 c.c. engines on the electric brake, and at an average speed of 2,700 revolutions the 3½ h.p. pulled approximately 8 h.p. and the 556 c.c. about ½ a h.p. more. An interesting detail of construction is that the pulleys on the belt driven models are formed of two steel pressings riveted together.



B.S.A. enclosed spring valve tappet.



The 3½ h.p. chain driven Day-Leeds fitted with P. and M. two-speed counter-shaft gear.

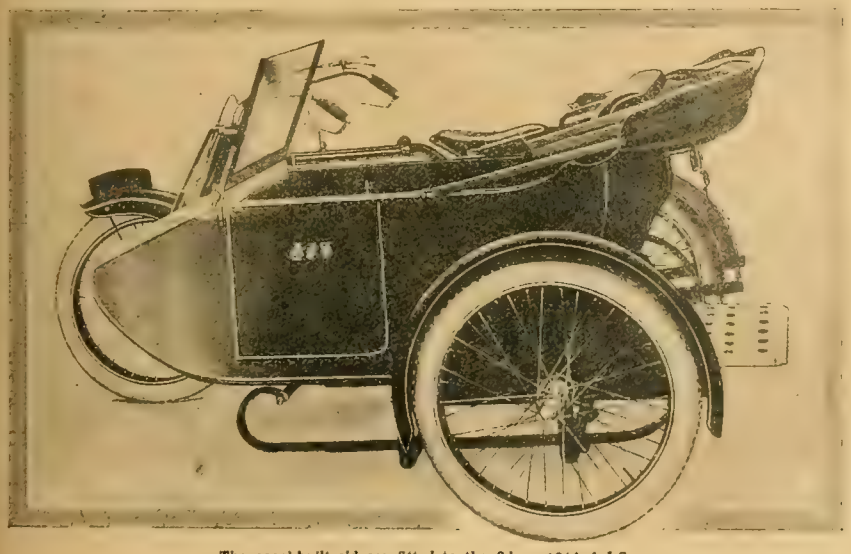


The New Imperial-Jap 4 h.p. twin-cylinder engine and three-speed gear box.

The company are marketing a very attractive sidecar for use with their machines in 1914, and two features stand out prominently on this attachment. One is the upholstering of the sidecar sides on the top with rolled leather arm rests, as in car practice, and the other is the suspension. The body is suspended at the rear by two long spiral springs enclosed in a tube, enabling the springs to be kept lubricated. The design is very well carried out and should provide most comfortable suspension. The outline of the coachbuilt body is clean and plenty of leg room is provided.

As will be realised from this description, the B.S.A. programme provides a range of models from which a machine can be selected to suit almost any taste from a go-anywhere sidecar combination to a single-geared speed machine.

The adoption of the long stroke single-cylinder engine by another large firm of manufacturers is a sign of the times.



The coachbuilt sidecar fitted to the 6 h.p. 1914 A.J.S.

NEW IMPERIAL MOTOR CYCLES.

In addition to a cycle car, this company manufacture a range of motor cycles fitted with a 4½ h.p. single-cylinder and 3½ h.p., 6 h.p., and 8 h.p. twin-cylinder engines. They fit both two and three-speed counter-shaft gears, and a special new model for 1914 is the 3½ h.p. twin-cylinder, the dimensions being 70×64½ mm. bore and stroke. It is fitted with a two-speed counter-shaft gear box, affording a 50% reduction on low, and the machine is said to be very "nippy."

The three speed counter-shaft gear box is fitted to the big single and big twins, and is specially designed for heavy passenger work. The standard ratios provided are 4½, 7⅝, and 13½ to 1.

The cycle car is of very up-to-date design, having a four-cylinder water-cooled engine, pressed steel frame, V type radiator, and three speed gear box.

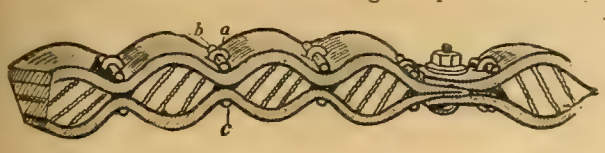
A NOVEL BELT.

WE recently paid a visit to Mr. J. Graham, 29, Perham Road, West Kensington, W., and inspected a novel belt, which we illustrated herewith. It consists of two strips of chrome leather, between which are inserted lozenge-shaped sections of

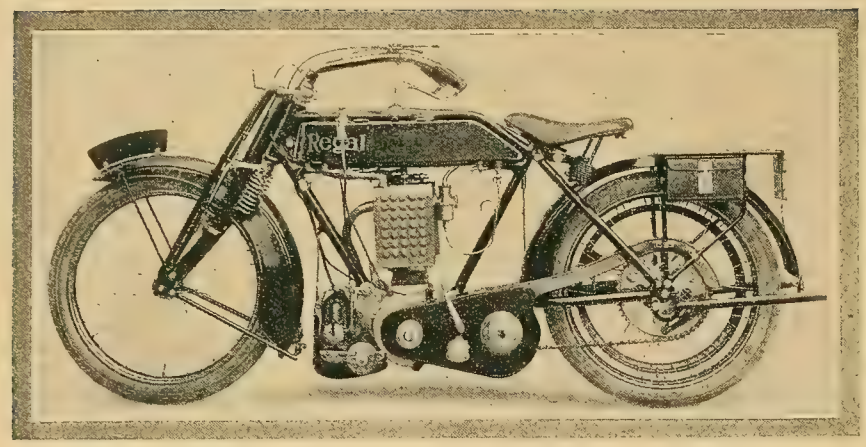


rubber and canvas. These are held together between the strips of chrome leather by means of chain links A, held in position by a fixed pin B and a loose pin C. The belt is flexible both vertically and laterally, and we very carefully examined its action on a 3½ h.p. Triumph.

NEXT WEEK!

THE MOTOR CYCLE SHOW REPORT.

Written and illustrated by our own staff after a stand to stand inspection of the exhibits.

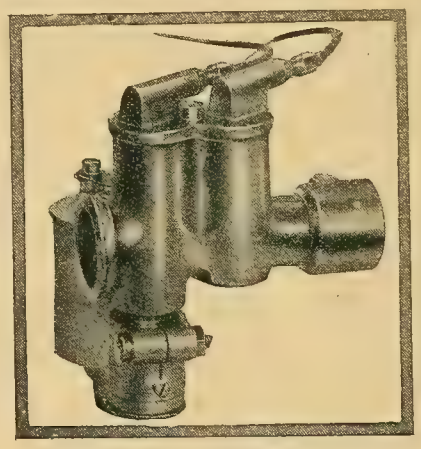


Transmission side of the latest single-cylinder chain-driven three-speed Regal-Green.

REGAL-GREEN FOR 1914.

An attractive and powerful mount is the three-speed chain-driven Regal Green. The engine is the well-known water-cooled Green-Precision 85×88 mm. bore and stroke, 499 cc. There is no change in this engine, the valves still being situated overhead, and the distinctive Green system of radiation remains unaltered. The transmission is by chain throughout, the gear box, the latest pattern Jardine G.H. three-speed counter-shaft gear being used. The front chain is entirely protected, and a neat top shield is fitted over the rear chain. Druid forks, Brooks B 170 saddle, and Bosch magneto and B. and L. drip feed semi-automatic lubrication are other features of an admirably designed machine.

These machines are being manufactured by Mr. Ernest Smith, 15, High Street, Saltley, Birmingham, and in addition to the 3½ h.p. Regal-Green he will market in 1914 a 2¾ h.p. Regal-Green and three other models fitted with Precision motors of various powers.



The new P. & M. carburetter is fitted with a special top, to enable the wires to lie out of sight under the tank. Fitted in the top are small pulleys over which the wires run.

THE FOUR-CYLINDER STELLITE.

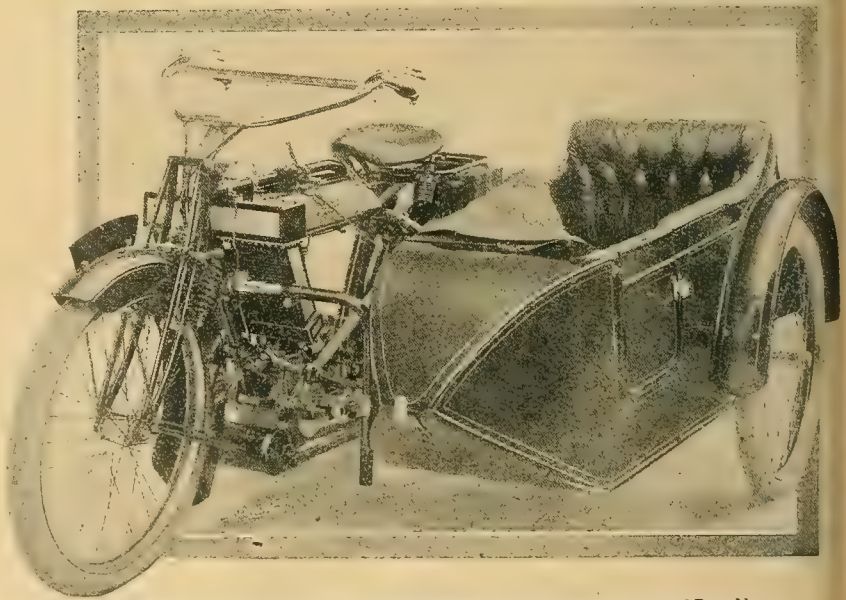
The Stellite cycle car (which is more correctly described as a light car) will make its first public appearance at the Olympia Motor Cycle Show, which opens on the 24th inst. It may be recalled that we first described this attractive vehicle in our issue of August 28th last. Its main features are a four-cylinder water-cooled engine of 62 × 89 mm., driving by shaft to a two-speed gear mounted on the worm driven back axle. We have recently been privileged to try this vehicle on the road, and during a week-end run of 300 miles had no occasion to use a tool. Petrol consumption we found to be at the rate of about 40 m.p.g., and that figure also represented the car's speed capabilities on the road. The engine is very flexible, and the Stellite is one of the most silent cycle cars we have yet driven. Though conforming to the A.C.U. definition of a cycle car in that its engine is under 1,100 c.c. and the chassis weight under 6 cwt., the Stellite is obviously on the border line of cycle car and light car, so we refrain from publishing a lengthy description of its running, but instead refer readers to *The Light Car* of November 11th.

HUMBER WATER-COOLED SIDE-CAR MODEL.

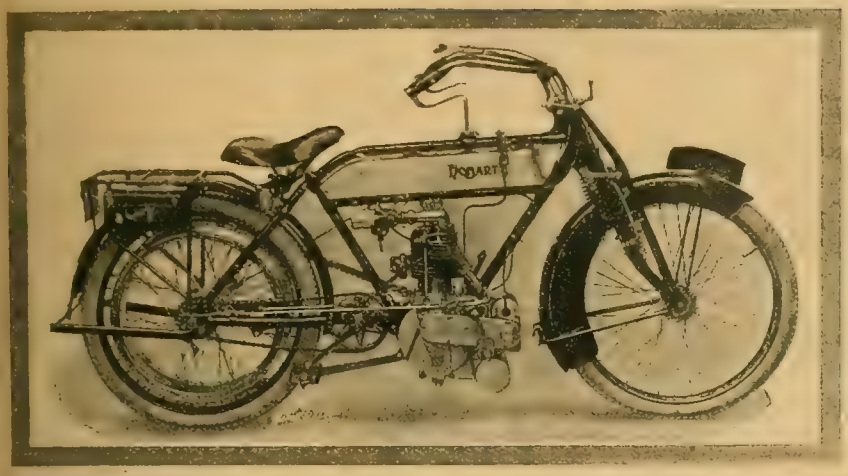
There are a great many riders who prefer the simplicity of a 3½ h.p. single cylinder machine, and numbers of these wish to attach sidecars to them. Messrs. Humber, Ltd., Coventry, have evidently recognised the limitations of such a machine's power, and have thus brought out a 3½ h.p. water-cooled model for next year. This is exceedingly taking in design, very neat honeycomb radiators being fitted on the front down tube with quite a substantially sized water tank at the top. Water circulation is, of course, on the thermo-syphon principle, and a machine of this type should stand long spells of hard driving without any bad effect on the engine, while, of course, such an engine will naturally prove itself a better hill-climber, especially on long gradients, than an air-cooled type. The sidecar attached is a very handsome, well upholstered model, and the whole outfit should prove extremely popular with those riders who desire considerable efficiency combined with simplicity. The gear employed is a Sturmey-Archer three-speed.

HOBART MODELS FOR 1914.

A newcomer among the Hobart models will be the new 6 h.p. passenger machine, which is fitted with a 75 × 85 mm. twin J.A.P. of the latest type, and an Enfield two-speed gear. The frame is very stoutly constructed and embodies the side-car lugs, a dropped top tube is employed, and the steering head is of particularly stout construction. Protection of both machine and rider have received careful attention, both front and rear guards having side wings for their full length. In addition to this, 24in. footboards are fitted and are adjustable for angle, and the front gear chains run in an oil bath. The rear chain is protected by a cover on its upper side, but is not entirely enclosed, so that rear wheel detachment is simplified. A feature of

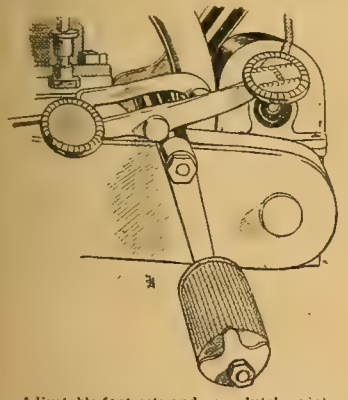


Threequarter front view of the 3½ h.p. single-cylinder water-cooled Humber and Bramble chassisless sidecar.



Valve side of the 4 h.p. single-cylinder Hobart with Sturmey-Archer three-speed gear.

the rear brake, which is of the internal V type, is the very long leverage on the actuating pedal, which enables great power to be applied with a minimum of exertion. The silencing arrangements

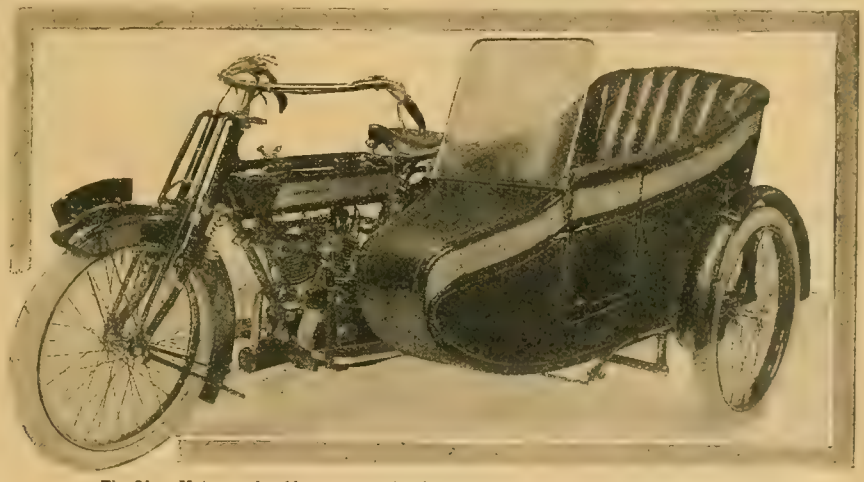


Adjustable footrests and new clutch pedal on 4 h.p. Hobart.

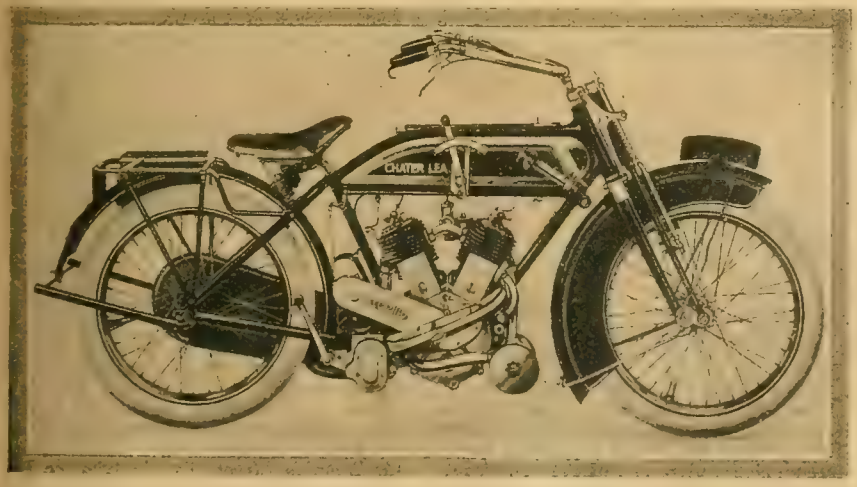
show great ingenuity, for the cast aluminium expansion box is carried rigidly on extensions of the crank case bolts and so cannot rattle. A short flattened extension pipe reaches forward, but the main egress is by a long tail pipe extending to the rear spindle. As with other Hobart models Best and Lloyd semi-automatic drip feed lubrication is used and the tank is finished in black with broad gold lines, giving the machine a very smart appearance. 26 × 2¼in. tyres are standard, and one model will be shown with all black finish.

The 4 h.p. machine, which is fitted with the single-cylinder 85×85 mm. Jap engine, has an overhead inlet valve, and has undergone only slight alterations which are chiefly in the nature of refinements. The frame has been lowered and the head-lug considerably improved. The front wheel guard now has extensions continued to the front end, and adjustable footrests will considerably increase the rider's comfort. A 2¾ h.p. engine of 74×81 mm. bore and stroke will in future replace the 2½ h.p. to a large degree, and the latest type has radiating fins arranged to give a pear-shaped look to the cylinder casting.

Handle-bar controlled magneto, glass top filler caps, enamelled fork springs, and encased pannier bags will be standard on all types, and pan seats will be fitted to all machines except the lightweight.



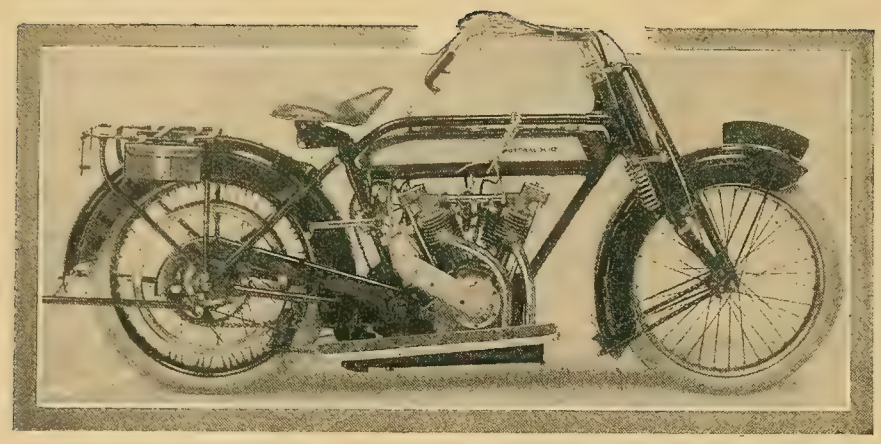
The 6 h.p. Motosacoche sidecar outfit, showing the exceedingly neat wind screen and well upholstered sidecar.



The 8 h.p. Chater-Lea has been entirely re-designed. The frame has a cut away top tube, thus affording lower riding position, a shorter wheel base, enclosed chain drive, and a three-speed counter-shaft gear.

6 h.p. MOTOSACOCHE SIDECAR.

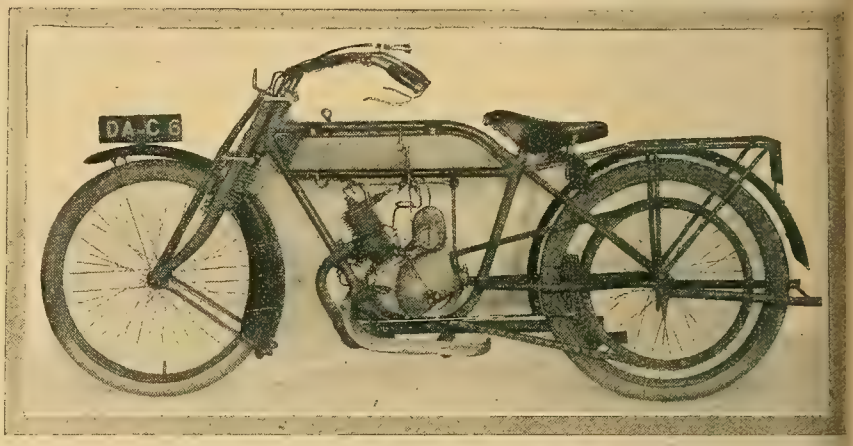
Fitted with the celebrated 6 h.p. M.A.G. twin-cylinder engine and a superbly finished sidecar, the combination sold by Motosacoche, Ltd., for 1914 must take rank as one of the finest passenger-carrying outfits on the road. Comfort for both driver and passenger has been most carefully studied, and the provision of an Xl'All saddle and dropped frame renders the driving position ideal. The M.A.G. engine has been so fully described in these pages that it is hardly necessary to refer to it again, but attention may be called to the exceedingly neat coverings to the inlet valve rockers, clearly shown in the illustration. 650×65 mm. light car type Hutchinson tyres are fitted to the machine. The sidecar is beautifully upholstered throughout, and one of the neatest wind screens we have inspected is fitted to protect the passenger. A neatly carried out cane border runs round the body, and the sidecar may be taken as typical of the high degree of excellence to which builders have brought sidecar construction at the present time.



Valve side of 6 h.p. Motosacoche, showing the neat manner in which the overhead valves are protected. The long footboards and hand starter are noticeable features.

THE TWO-STROKE CLYNO.

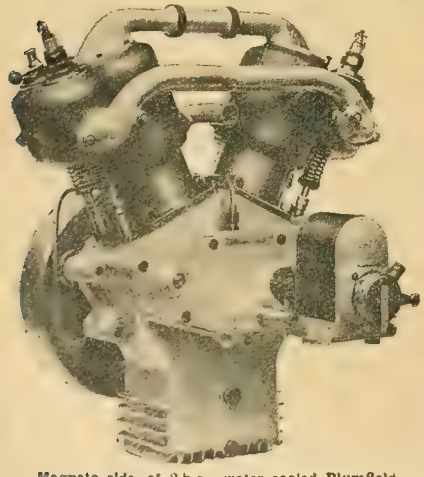
The lightweight two-stroke engine seems to be in for a run of great popularity during 1914. One of the most interesting designs is that of the Clyno, which embodies a power unit consisting of a two-stroke single-cylinder engine, with the cylinder sloping forward, and a two-speed gear box integral with the base chamber. The outside flywheel is covered by an aluminium shield. The Ruthardt magneto is carried on the top of the gear box. The drive is by belt on large diameter pulleys. The unit is bolted into a strong and neat loop frame. It will be remembered that this little machine has performed meritoriously on the notorious Alms Hill, near Henley. The original dimensions of this baby Clyno were 70 × 70 mm. bore and stroke, which gives a capacity of 269 c.c., but we understand that the makers are slightly enlarging the engine for the coming year.



Near side of the latest two-stroke Clyno which will make its debut at the Show.

TWIN BLUMFIELD ENGINE.

A big twin engine, which can be obtained with both air and water-cooled cylinders, is being manufactured for 1914 by Messrs. Blumfield, Ltd., Birmingham, specially for use on cycle cars. The b.h.p. of the engine at 2,300 is 18, and the total weight of the power unit is 100 lbs.



Magneto side of 8 h.p. water-cooled Blumfield engine. Observe the addition of radiating fins on the crank case.

It is a very solid job; the bore of the engine is 88 mm. and the stroke 90 mm., and has an outside flywheel fitted to a solid crankshaft. Lubrication is forced by a gear-driven pump fitted to the side of the crank case, the big ends of the connecting rods and main bearings having their supply of oil forced to them by this pump. The connecting rods have their ends split to enable any adjustment to the bearings to be made. The engine is most substantially constructed, and should be thoroughly up to the work for which it has been designed.

A SHOW RENDEZVOUS.

Mr. Norman Barrett, maker of the ingenious U and I sidecar, which we illustrated last week, informs us that his showrooms at 56, Oxford Street, W., the entrance of which is in Rathbone Place, are at the disposal of any motor-cyclists who care to avail themselves of the accommodation during Show week. Routes may be planned out, letters received, and the motor papers will be available.

1914 INDIAN ARRANGEMENTS.

Last Monday we visited the Hendee Company's new premises, 366-368, Euston Road, N.W., and found Mr. Wells superintending the fitting up of the new depôt. This is a building of five floors in the centre portion and three floors in front, with a frontage to the Euston Road of over 32ft. There is a side passage wide enough to admit a motor bicycle and sidecars, and two lifts. The showroom is being fitted up with black mahogany mouldings and birch panelling; the dados and ceiling are white; this should provide a striking effect when a good array of Red Indians are assembled on the floor. Part of the premises are fitted with machinery and benching for repair work, and we were very much struck with a little apparatus for cylinder lapping, which is responsible for the finely polished surface of the cylinders. This little apparatus is a jig which reciprocates the piston in the cylinder and revolves the cylinder at the same time, the polishing medium being crocus powder. The stores at this new depôt are splendidly arranged, and as complete as any in London.

A NEW TWIN-CYLINDER ARIEL.

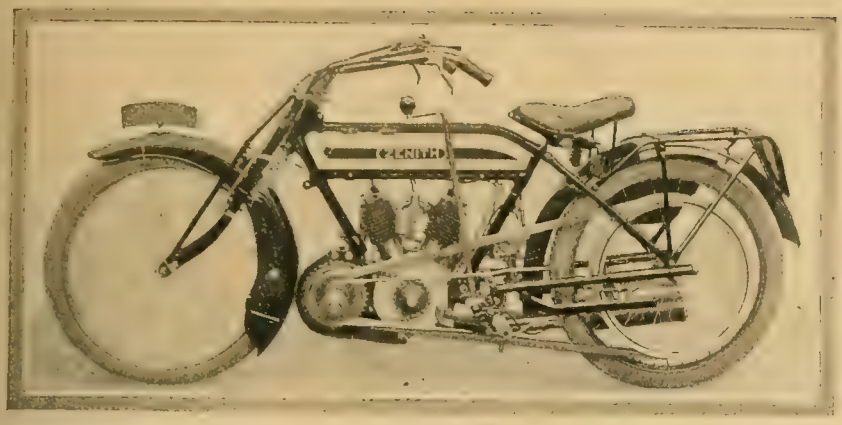
The 3½ h.p. Ariel has achieved extraordinary success in the big trials during this year, and for next year there will be a new model added to the list, a 5-6 h.p. twin, fitted with the Ariel countershaft, three-speed gear box, and free engine clutch. Combination chain and belt drive will be the method of transmission, and the machine is designed to be used as a powerful solo machine or for sidecar work. The new Ariel sidecar is a fine example of coachwork.

TWELVE-JET CARBURETTER.

Mr. J. H. Wilkinson, inventor of the twelve-jet carburetter bearing his name, informs us that his carburetter will be exhibited by Messrs. Rotherham and Sons, Ltd., Coventry, at Olympia. Readers interested should write either Messrs. Rotherham or the inventor, at 40, Jubilee Road, Doncaster.

Trade Excursion to Olympia.

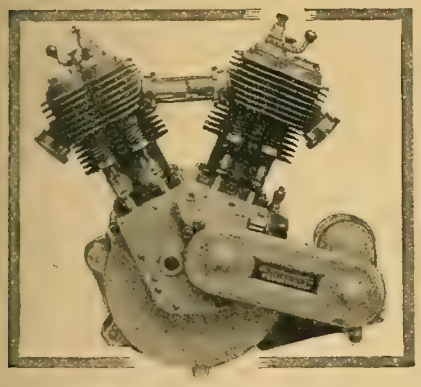
Arrangements have been made by the Birmingham centre of the Cycle and Motor Trades' Benevolent Fund, to run an excursion to London, on Saturday, November 29th, which is the last day of the Show at Olympia. Full particulars can be obtained from Mr. A. B. Williams, 13, Weaman Street, Birmingham, or Mr. J. Francis, Alexander [illegible] Cock's Green, Birmingham.



Showing the chain and belt drive of the 3½ h.p. 1914 Zenith, with counter-shaft gear mounted in front of the engine, and magneto placed high up to afford better protection.

THE TORMO MANUFACTURING COMPANY.

As well as the 2½ h.p. and 3½ h.p. single-cylinder engines, 5 h.p. and 6 h.p. twin-cylinder engines will also be marketed for 1914 by the Tormo Engineering Co., 67-68, Bunhill Row, London, E.C. The 5 h.p. has a bore of 74 mm. and a stroke of 85 mm.; the 6 h.p. a bore of 85 mm. and stroke of 85 mm. The valves are of the enclosed type, mechanically-



Valve side of the latest pattern 5-6 h.p. Sarolea twin-cylinder engine.

operated and side by side, and adjustable tappets are fitted. The angle of the cylinders is in both cases 50°. Ignition is by Bosch magneto driven by chain. The weight of the 5 h.p. engine with magneto is 88 lbs. and the 6 h.p. engine weighs 96 lbs. All the engines are beautifully finished, the radiating fins especially being cast very thin, enabling the engine to run very cool.

AUTO-WHEELS FOR 1914.

The auto-wheel has certainly arrived among that class of rider to whom the motor cycle proper does not appeal. During the year no fewer than 1,750 of these handy little attachments have been sold. For next year, however, 10,000 have been laid down, and of these 5,000 have been contracted for by the B.S.A. Co., which will be known as the B.S.A. auto-wheel modèle de luxe, and will command a slightly higher price. These will be ready for delivery in February. As regards alterations for 1914 these will be [illegible]

An efficient compression tap is now fitted to the top of the cylinder, and a quiet silencer will be incorporated in the crank chamber, while tyres of greatly improved quality are fitted.

The petrol tank is larger, and is secured to the frame by means of straps, while a sump has been added so that the last drop of petrol may be used. In the sump is a filter preventing any dirt from reaching the carburetter. The design of the exhaust valve lifter has been improved, and means for adjustment are now provided.

A new automatic carburetter, fitted with an easily adjustable jet, both dirt and waterproof, is now supplied with the *de luxe* model, All Wall auto-wheels are fitted with single lever control.

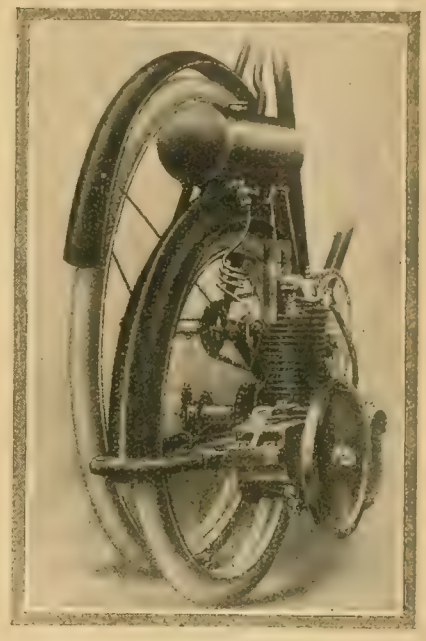
THE DAY-LEEDS.

The Day-Leeds machines, manufactured by Job Day and Sons, Ltd., Ellerby Lane, Leeds, claim attention. A new model is the chain-driven machine which is built for sidecar work or hard touring. The engine has a bore of 85 mm. and a stroke of 88 mm. and is fitted with an overhead inlet valve. Ignition is by Bosch magneto placed behind the cylinder. Transmission is by chain, a Phelon and Moore two-speed gear being fitted. Among other refinements are an easy-starting device, a Best and Lloyd lubricator, and footboards of a neat pattern.

OUTSIDE OLYMPIA.

The newest models of the Godiva sidecars will be on view in an upstairs showroom at 11, Hammersmith Road, during the forthcoming Olympia Show.

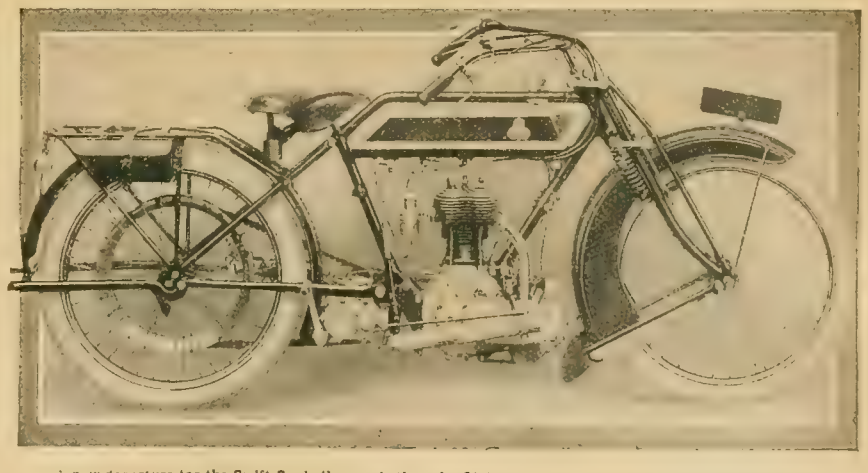
K. Portway and Co., Brantham, Manningtree, Essex, makers of the "Paragon" cycle car, have arranged to have a model on view during Show week, at the Olympia Garage, exactly opposite Olympia.



The Auto-wheel pedal cycle attachment.

The new Perry four-cylinder light car proves to be over the cycle car limit. It is to be outside Olympia next week.

A new two-stroke engined machine will be on view during the Show week at Burts, No. 8, Maclise Road, which faces Addison Road Station. Mr. W. T. Green, late of the Premier Cycle Co., is responsible for the design, which follows the most recent practice. The new Phaetonette sidecar will be on view at the same address.



[illegible] departure for the Swift Co. is the marketing of a 3½ h.p. three-speed counter-shaft geared model.

TIME TO LIGHT LAMPS.

Nov.	20th	...	5.2 p.m.
,,	22nd	...	5.0 ,,
,,	24th	...	4.58 ,,
,,	26th	...	4.56 ,,

84,579 Copies of "The Motor Cycle."

The circulation of our last issue was no less than 84,579 copies.

Olympia Show Report.

Next week's issue of this journal will contain a complete Show report in three sections, alphabetically arranged. The description of the various machines will be dictated by our own staff after a stand to stand inspection of the exhibits. The issue will be profusely illustrated.

A New Club in S.E. London.

The Blackheath and District M.C. was formed last week and has already thirty members. The opening run will take place on Saturday next to Leaves Green, and a paperchase will be held on December 6th. The hon. secretary is Mr. E. Lister Wilson, The Cedars, 8, Vanburgh Fields, Blackheath, S.E.

Olympia, THE Show.

Chicago, where things are generally done on a big scale, has just held a large motor cycle show, which an American contemporary describes as a great success. But when it mentions that on the opening day seven hundred persons paid for admission, and records the fact as something remarkable, we do not think the supremacy of Olympia as *the* Show of the world is likely to be seriously challenged. And it must be remembered that this Chicago Show is the show of the year in America.

Chief Constables and Rear Lighting.

The Auto Cycle Union has not allowed the grass to grow under its feet in connection with the imposition recently levelled at motor cyclists in connection with the rear red lighting alleged illegality. A few days ago Mr. T. W. Loughborough (secretary of the A.C.U.) addressed a circular letter to all the chief constables in the kingdom, asking them if it was their intention to prosecute motor cyclists until the Local Government Board had issued a fresh order on the subject. The chief constables of the following counties have replied stating that it is not their intention to prosecute motor cyclists until the Local Government Board issues a fresh order to cope with the recent decision of the Divisional Court: Denbighshire, Northumberland, Nottinghamshire, Monmouthshire, Durham, Shropshire, West Riding of Yorkshire, Huntingdonshire, Surrey, Staffordshire, and Essex

Sidecar Records.

Is it true that the A.C.U. intend to formulate a rule that all sidecar records must be accomplished with three wheels in contact with the ground?

Classification of Motor Cycles.

The A.C.U. has instituted a fresh class in connection with the classification of motor cycles, and in future Class A will be for 250 c.c. engines and Class A1 for 275 c.c. engines. This arrangement will be adhered to by all countries forming the F.I.C.M.

American Visitors to the Show.

Messrs. George N. Hendee and T. K. Hastings of the Hendee Co. will arrive in this country on Saturday next. Mr. Hastings will be remembered by some of our readers as a participant in the early A.C.U. trials on an Indian, first on a single-cylinder, and then on a twin. He is about to open an important branch in Australia for the Hendee Co.

Badges for Stand Attendants.

Our paragraph last week concerning the desirability of the attendants on stands at Olympia wearing distinctive badges has brought a reply from Messrs. F.N. (England), Ltd., who state that their salesmen will be equipped with a badge bearing the well-known F.N. trade mark. It is illustrated herewith. We understand that several other firms will adopt this useful method of enabling buyers and enquirers to locate those responsible for affording information.

REAR LIGHTS ON MOTOR CYCLES.

Important Announcement.

On going to press we learn from a most reliable source that the authorities are carefully considering the whole question regarding the regulations concerning red rear lights on *motor bicycles*, and we are pleased to be able to assure readers that in the very near future their anxieties in this direction will be over. We are in a position to state that the old order of things will most probably be reverted to. Although this exclusive announcement is in no sense official it is authoritatively believed in Government circles that the foregoing will be the outcome of the deliberations of the committee of the Local Government Board.

It will thus be seen that while there is a strong possibility that *motor bicycles* will be exempted from carrying red rear lights, it would appear that two track motor cycles will in the near future be required by law to show some form of rear warning light.

SPECIAL FEATURES:

BUYERS' GUIDE OF 1914 MODELS.
OPEN LETTER TO THE TRADE.
REAR LAMPS FOR MOTOR CYCLES.

Police Activity in Kent.

We understand from a reader that round Orpington, Kent, the police are very active, especially as regards "cut-outs." Several riders have been summoned lately for using a cut-out.

Club Life in the Antipodes.

The South Australian M.C.C. seems to be composed of a very active and enthusiastic number of members. The annual dinner took place on September 20th, and there was a record attendance. The opening run to the National Park followed on September 27th, and impromptu sports were held, over 300 motor vehicles of all sorts taking part. A hill-climb was held on October 8th on Sellicks Hill.

Rear Head Lights.

A correspondent writing to us in favour of rear lights says that he always carries a rear light because, no matter how slowly he rides he always finds someone else riding slower still. How his rear light helps him in such a case we are at a loss to imagine, unless he rides backwards and looks (as he talks) through the crown of his hat.

London-Exeter-London Christmas Run.

The following are the entries to date:

N. H. Pearson (7 Indian sc.)
C. W. Meredith (3½ Bradbury sc.)
R. Chesterfield (7 Indian sc.)
B. A. Hyem (18 Bedford)
H. Petty (10 Singer c.c.)
C. Dickinson (3½ Ariel sc.)
R. G. J. Charlesworth (5 Zenith sc.)
C. M. Keiller (8 G.W.K. c.c.)
A. T. Tamplin (8 G.W.K. c.c.)
J. T. Wood (8 G.W.K. c.c.)
J. A. Hilger (2¾ Douglas)
P. D. Panling (7 Swift c.c.)
W. G. Coleman (3½ B.S.A.)
P. D. Walker (8 Harding Summers c.c.)
A. G. Cocks (2½ Connaught sc.)
T. J. Ross (3½ Triumph)
J. A. Hoult (7 Matchless sc.)
H. G. Digby (4 Triumph)
Hugh Gibson (6 Bradbury sc.)
H. Karslake (3½ Rover sc.)
V. Olsson (7 Zenith sc.)
H. Bashall (Morris-Oxford light car.)
J. T. Bashall (6 A.J.S. sc.).
A. Bashall (8 Morgan cycle car).
F. Millar (sidecar).
B. Alan Hill (7 Indian sc.)

Riders who are not members of the M.C.C. should note that the date for the last election of members for this run is December 1st.

Cycle Car or Light Car?

A Midland firm of cycle car manufacturers has produced a four-cylinder four-seated light car, the chassis and engine capacity of which are within the A.C.U. definition of a cycle car.

A.C.U. Notes.

The governing body has granted permits to the Bristol M.C.C. to hold a twenty-four hours reliability trial on December 26th, 1913, and to the Liverpool A.C.C. to hold a reliability trial on January 23rd, 1914.

The Car Show.

If interest in the car exhibits during the exhibition at Olympia last week can be taken as a reliable guide of the enthusiasm in motoring generally, the Motor Cycle and Cycle Car Show at Olympia next week will be another huge success

Motor Cycling in South Africa.

A reader called at our office last week to enquire if the law with regard to lamp lighting is the same in South Africa as it is at home. We could not answer the query exactly, and shall be interested to hear from any reader who knows whether there are laws with regard to lamp lighting in South Africa on motor vehicles.

A Club for Ladies only.

We are informed that it is intended to form a ladies' motor cycle and cycle car club with London as the headquarters, whence trials and competitions will be run. It is hoped that gymkhanas will be organised, and that the intended club will have a team to represent them in open competitions. There will be open events in which men will be allowed to compete, and, if permission can be obtained, members will race at Brooklands. The club will be affiliated to the Auto Cycle Union. It is hoped that ladies who would like to join will send in their names to Miss Mary Ellis, 35, Portland Place, London, W.

FUTURE EVENTS.

Dec. 26-27.—MOTOR CYCLING CLUB Winter Run from London to Exeter and Back.
" 26-27.—Bristol M.C.C. Open 24 hour Trial.
" 27.—Birmingham M.C.C. Reliability Trial to York.

1914.

Jan. 14.—A.C.U. Annual Dinner.
Mar. 7.—A.C.U. Spring One Day Trial.

A Cow in a Sidecar.

One of the dailies last week published a paragraph headed "Kissed by a Cow in a Sidecar." The paragraph referred to a remarkable accident which occurred to a Mr. C Sims of Holbeach, Lincolnshire, while sidecaring in South Lincs. with Mrs. Sims in a sidecar. The paragraph states that a cow moved across the road in front of the motor cycle, and was taken up in the sidecar, where it reposed on Mrs. Sims's lap. The cow is alleged to have given Mrs. Sims a somewhat violent kiss on the cheek, which, it is said, "Left a headache." The paragraph goes on to say that the extra weight then tipped up the sidecar, and the cow slid off its seat. The above may be humour, but if the paragraph had said that the motor cycle and sidecar ran into the cow, which then collapsed on to the sidecar seat, and hit Mrs. Sims on the cheek, it would have been more to the point. This alleged humorous method of twisting ordinary road accidents into so-called amusing paragraphs is, to our mind, somewhat puerile, as the lady might easily have been seriously injured. Motor cyclists should always approach uncontrolled cattle on the highroad with the greatest caution, as one never knows when they will move right across the tracks of the machine.

Taxation of Cycle Cars.

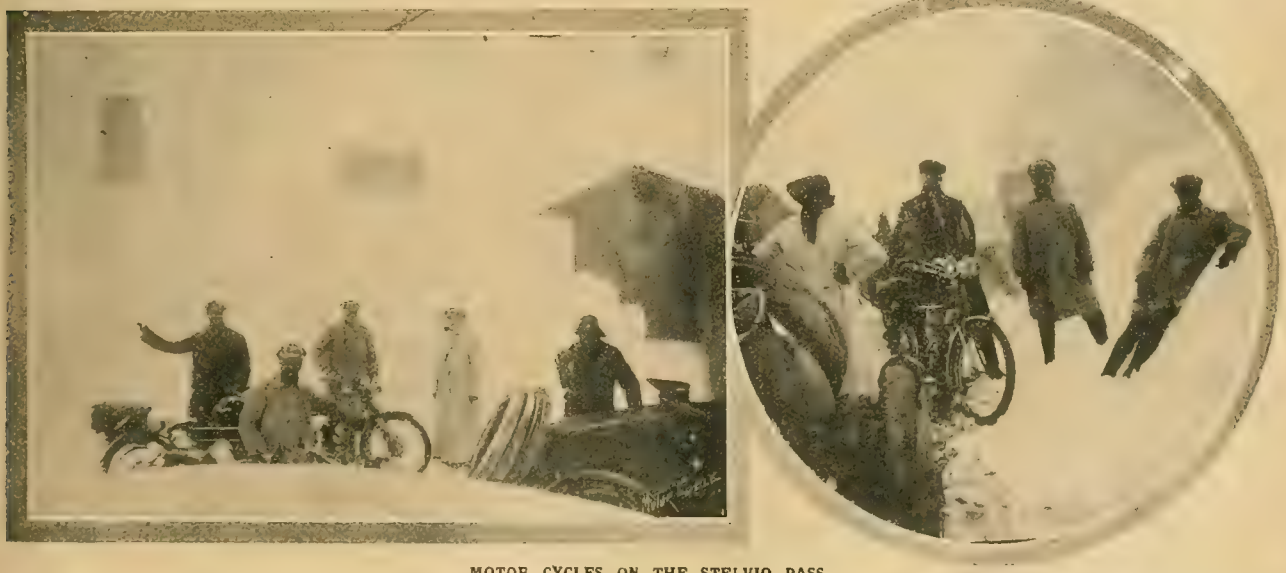
Readers who are contemplating the purchase of small cars or cycle cars will be interested to know that the maximum size allowed for a four-cylinder engine under the two guinea tax is 51 mm. bore, and for the three guinea tax 69 mm. bore. In other words the taxation for any small four-cylinder car with an engine over 51 mm. bore is three guineas.

Frivolous Police Interference.

Six motor cyclists were summoned at Auckland (Durham) last week for a technical breach of the Motor Car Act, to wit, having the identification mark on their motor cycles in the wrong position. It transpired that all six riders obtained their machines from the same dealer, who attached the numbers. The size of plate, letters,, and numbers were in strict accordance with the law, but they were too close to the base of the plate. Ye gods! Motorists beware! Your coat buttons will soon be the subject of legislation. Will the police soon be provided with micrometers to measure the sizes of registration marks?

Burmese Reliability Trial.

Reliability trials are almost as ubiquitous as motor cycles, and now we have particulars of a trial recently held in Burma, consisting of a speed trial, flexibility trial, and a distance trial, spread out over three days. Bat, Rudge, Triumph, and P. and M. machines performed conspicuously, and several other English makes figured in the competitions. It is interesting to note that in a very full report of the trials in *The Burma Magnet*, great stress is laid by the judges on the necessity for a good ground clearance, who say that footboards are a mistake for such countries Automatic carburetters are condemned as unsuitable for such varying conditions of climate, and chain drive is strongly approved of. Belts are stated to wear well, but slip in the wet season which renders them unsuitable for Burmese conditions.



MOTOR CYCLES ON THE STELVIO PASS.

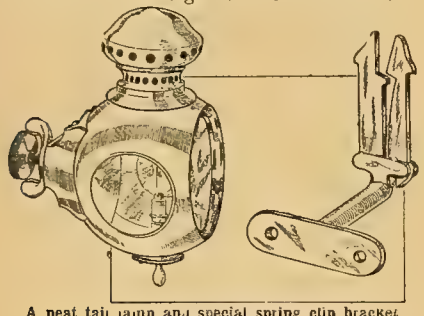
On the border line between Italy and Austria. The boundary stone is seen in the background.

Motosacoche, Sarolea and N.S.U. machines at the top of the pass—9,045 feet high. The photographs were kindly sent us by Mr. Oreste Casale of Geneva.

More Examples of Rear Lights for Motor Cycles.

A Neat Motor Cycle Tail Lamp.

QUITE one of the most solidly made and excellently designed tail lamps for motor cycles or cycle cars we have inspected is being marketed by Messrs. Rippingille's Albion Lamp Co., Ltd., Aston Road, Birmingham. Two features of this lamp that stand out prominently are the strength of its construction and the great ease with which it



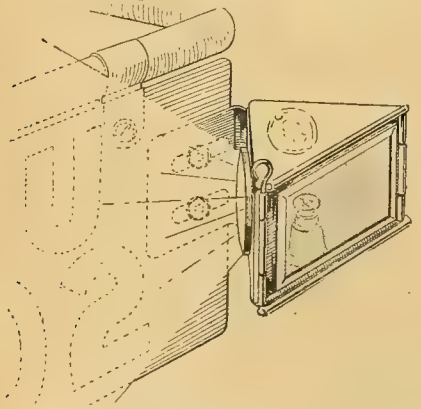
A neat tail lamp and special spring clip bracket made by Rippingille's Ltd.

can be cleaned, the whole lamp being constructed of one piece of solid brass. In view of the fact that anywhere in the neighbourhood of the back wheel of a motor cycle vibration is at its greatest, strength is a necessity in such lamps.

This firm also make a very smart patent tail lamp bracket. No screw fitment is required on the lamp, as the slot is merely pushed over the bracket, which expands by means of a spring, and the bracket being provided with notches near the end, the lamp cannot slip off when once fixed.

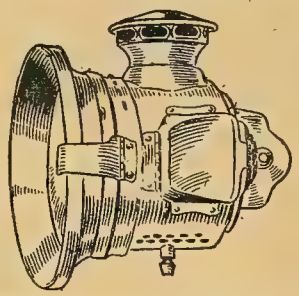
The F.R.S.

F.R.S. head lights have long been known as one of the most powerful front light givers on the market, and now the makers have turned their attention to the other end of the machine and produced an exceedingly neat tail lamp and number plate illuminator combined.



The F.R.S. rear light showing method of attachment.

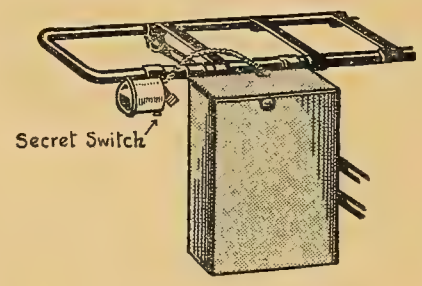
The light to the rear is red and the one shining on the plate is white. It is well constructed and can be very easily cleaned, both outside and inside. Our sketch shows clearly the construction and method of attachment of the new F.R.S. production.



Lucas sidecar lamp, which shows a white lamp forward and a red one to the rear.

An Electric Lamp.

A neat little electric tail lamp is sold by Messrs. A. H. Hunt, 115, Cannon Street, London, E.C., which has the advantage that it can be easily fixed to any machine, and is quite clean and does

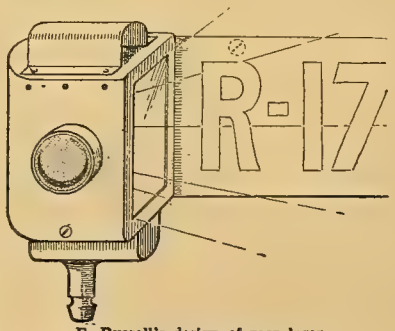


A. H. Hunt's electric rear lamps.

not interfere in any way with carriage of luggage. The lamp is provided with a secret switch under the lamp. The case carries a dry battery, which is able to withstand vibration and is of considerable capacity.

Russell's Rear Lamp.

We have received particulars of a simple rear lamp, the invention of Mr. E. Russell, who is open to negotiate with

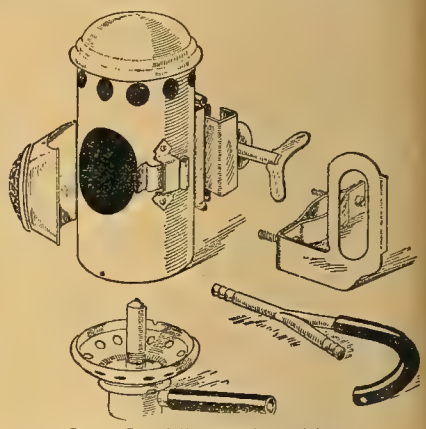


E. Russell's design of rear lamp.

manufacturers with a view to placing it on the market. The lamp is formed by bending an extension of the back number-plate and fitting a top and base. It therefore requires no fitting and should be very cheap to manufacture, at the same time, it cannot be loosened or dislodged by vibration.

A Lamp by Brown Bros.

The great firm of Brown Bros., Ltd., is ever to the fore with new ideas, and in view of the decision of the Courts *re* rear lights has now placed on the market a tiny acetylene rear lamp, so small as to be quite unobtrusive, but at the same time of sufficient size to give warning to an overtaking vehicle. To facilitate clean-



Brown Bros.' tiny acetylene tail lamp.

ing, the lamp is made with a number of detachable parts, so that it can be easily dismantled, as shown in the illustration. It is fed from the head light generator by means of a forked connection to the gas tube.

IMPORTS AND EXPORTS.

British imports and exports of motor cycles, as we have recorded many times in these columns, are still on the increase, and it will suffice to publish a bare list of the figures from which the various proportions will be noted.

IMPORTS.

	Month ended 31st Oct. 1911	1912	1913

THE NORTH-WESTERN AUTOMOBILE ASSOCIATION.

AT the meeting which we reported in our last issue, p. 1481, the following notes were adopted:

1. That the name of the Association shall be the North-Western Automobile Association.

2. That the Association shall be composed of motor and motor cycle clubs whose headquarters are in the North-western counties of England and Wales and the West Riding of Yorkshire.

3. That the objects of the Association shall be to hold social events and competitions.

4. That the competitions other than open events held by the Association shall only be open to *bona fide* members belonging to the Association.

5. That there shall be no individual member or members of the Association.

6. That the Association shall be governed by a management committee composed of representatives nominated by each club belonging to the Association, each club being entitled to one representative on the Management Committee.

6a. That the representative shall be appointed by each club for twelve months, but in the event of him being unable to attend the committee meetings a proxy can be nominated, this proxy having the right to vote instead of the official representative.

7. That the officials of the Association shall be appointed by the Management Committee out of their number, and their titles and duties fixed by the committee.

8. That a meeting shall be held once in every twelve months, at which everything in connection with the Association shall be open to discussion and shall be voted upon if necessary. That each club shall have the power to nominate three delegates to represent them.

9. That the annual payment to the Association required from each club shall be one guinea for the first fifty members or part thereof. Any additional members shall be paid for at the rate of 6d. per head.

10. That the Chairman of the Management Committee shall not have a casting vote, but shall only be entitled to his vote as a delegate.

11. That no club delegate can attend and vote until all moneys due to the Association from his club have been paid in full.

The first meeting of the Management Committee of the Association will be held on Saturday, December 6th, at five p.m. at the St. George's Restaurant, Redcross Street, Liverpool, and all clubs wishful to join the Association are requested to signify their intention in writing to appoint their delegates, and to remit one guinea. Mr. S. W. Carty has been asked to act as hon. sec. *pro tem.*

A.C.U. CERTIFICATE OF PERFORMANCE.

A Trial of a kick-starting device fitted to a 3½ h.p. Phelon & Moore motor bicycle.

DESCRIPTION OF KICK-STARTING DEVICE.—On the right-hand or outer face of the valve gear pinion on the crankshaft teeth are cut. Corresponding teeth are cut on the inner face of the sleeve mounted on a prolongation of the crankshaft, which are normally kept out of mesh with the pinion by a spring.

These teeth are undercut, so that when the sleeve is in engagement and rotating the crankshaft it tends to remain in engagement. Mounted on the frame of the machine to the rear of the engine is a semi-circular segment rotatable through about 45° by means of a crank with a hinged pedal pin. The periphery of the segment is smooth, and to each end of it is attached a chain which passes over a twelve-tooth chain wheel attached to the sleeve on the crankshaft. A movement of the crank therefore causes the sleeve to rotate, and at the same time a spring pawl on the outer end of the crank strikes against the outer end of the sleeve, forcing the sleeve into engagement with the crankshaft pinion. When pressure on the crank pin is removed the crank is returned by a spring to its normal position. Stops are provided to limit the travel of the crank in either direction, the backward stop taking the form of an adjustable spring buffer. Means of adjusting the tightness of the chain or the lateral position of the segment are also provided.

TRIAL.—On Wednesday, November 5th, a standard 3½ h.p. P. and M., cylinder dimensions 84.5 mm. bore, 88.9 mm. stroke, was selected at random by a representative of the Union from amongst five machines then in stock at the London showroom. This machine was immediately wheeled to the official garage and locked up.

At 10-30 a.m. on Thursday, November 6th, the garage was unlocked. The driver opened the oil drain tap and drained off the oil in the crank case. The lubricating oil and petrol tanks were also emptied. The petrol tank was then filled with petrol (Shell No. 1 brand, specific gravity .725 at 10.8° C. temp.) The oil tank was filled with one quart of Price's Motorine A oil, purchased from stock. Two pumpfuls of oil were injected.

About a teaspoonful of petrol was injected into the combustion head. The carburetter was flooded and the engine freed with three strokes of the kick-starting device, the exhaust valve lifter being raised. With the carburetter controls set with the gas full open and the air shut, the half-compression device in action and ignition fully advanced, an attempt was made to start the engine at 11.6 a.m., the atmospheric temperature being 11.3°C. After eight attempts the carburetter was again flooded. On the twenty-fifth attempt the engine fired continuously, two minutes having elapsed since the first attempt. Within the following two minutes and with the same carburetter, ignition, and half-compression settings, the engine was started by the kick-starting device twenty times in twenty-three attempts. The engine was then allowed to cool, until the exhaust valve cap temperature fell to 18°C. at 11.29 a.m. About a teaspoonful of petrol was injected. The carburetter was flooded, and the carburetter ignition, and half-compression device controls set as before. Within 45s. from the first attempt, and on the sixteenth attempt, the engine fired continuously. Between 11.30 a.m. and 11.32 a.m. the engine was started twenty-one times in twenty-two attempts, controls being set as previously, except that after the tenth attempt the air lever to the carburetter was slightly opened. The engine was again allowed to cool, until the exhaust valve cap temperature fell to 18°C. at 11.55 a.m. About a teaspoonful of petrol was injected. The carburetter was flooded, and all controls set as for the first test. Within 40s. from the first attempt and on the thirteenth attempt the engine fired continuously. Between 11.56 a.m. and 11.58 a.m. the engine was started twenty-five times in twenty-five attempts, the last fifteen attempts being with slightly open air lever.

At mid-day the machine left the official garage with a sidecar attached, which was occupied by the official observer. It proceeded by a circuitous route to the top of Netherhall Gardens, N.W., and back to the official garage.

During the above run eight traffic stops were encountered, and the machine was also stopped by direction of the observer on the steep part of Fitzjohns Avenue. In each of the above nine cases the engine was restarted by the kick-starting device on the first attempt.

The machine was locked up from 12.45 p.m. until 2.36 p.m., by which time the temperature of the exhaust valve cap had fallen to 16°C. About a teaspoonful of petrol was injected. The carburetter was flooded and the engine freed with three strokes of the kick-starting device, the exhaust valve lifter being raised. With controls set as for the morning's tests, an attempt was made to start the engine at 2.37 p.m. Within 26s. and at the sixth attempt, the engine fired continuously. Between 2.38 p.m. and 2.40 p.m. the engine was started twenty-five times in twenty-five attempts, no alteration being made.

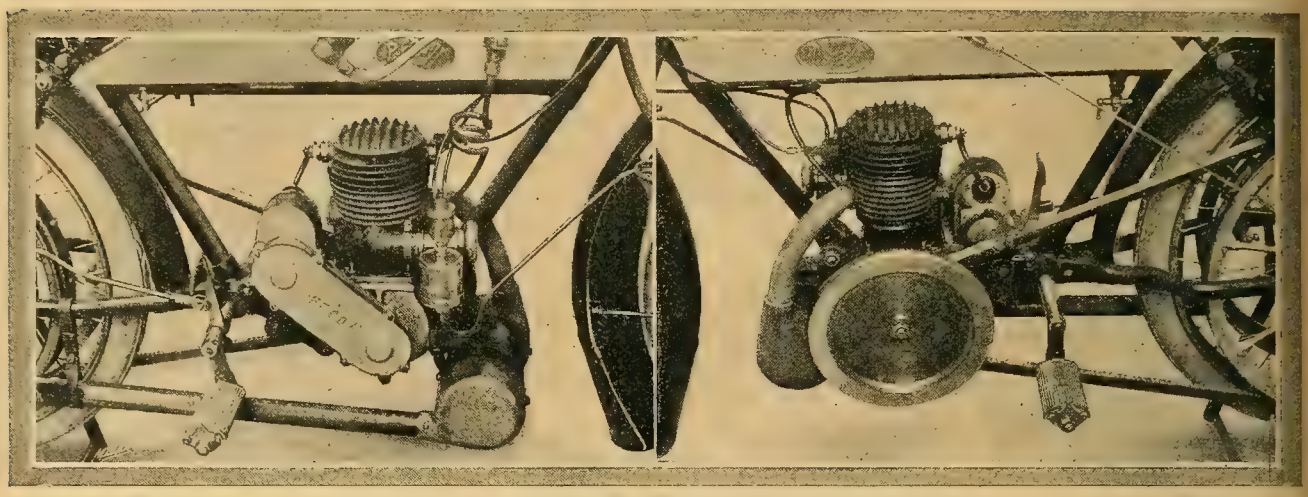
No adjustment or lubrication was made to the kick-starting device either before or after the trial. At the conclusion of the trial the sparking plug was examined, and the minimum spark-gap found to measure about .07in.

The weather throughout the trial was fine, the sun was shining, the atmosphere was humid, and the temperature was steady at about 11.5°C.

(Signed) E. PERCY GREENHILL.
Chairman, Competitions Committee.
(Signed) T. W. LOUGHBOROUGH.
Secretary.

D 2

NEW TWO-STROKE ENGINES.



Both sides of the Peco two-stroke single-cylinder engine described on this page.

DAYTON TWO-STROKE LIGHT-WEIGHT.

The Day Manufacturing Co., 221, High Street, Shoreditch, E., is marketing a 1½ h.p. motor cycle called the Dayton, the design of which is very thorough.

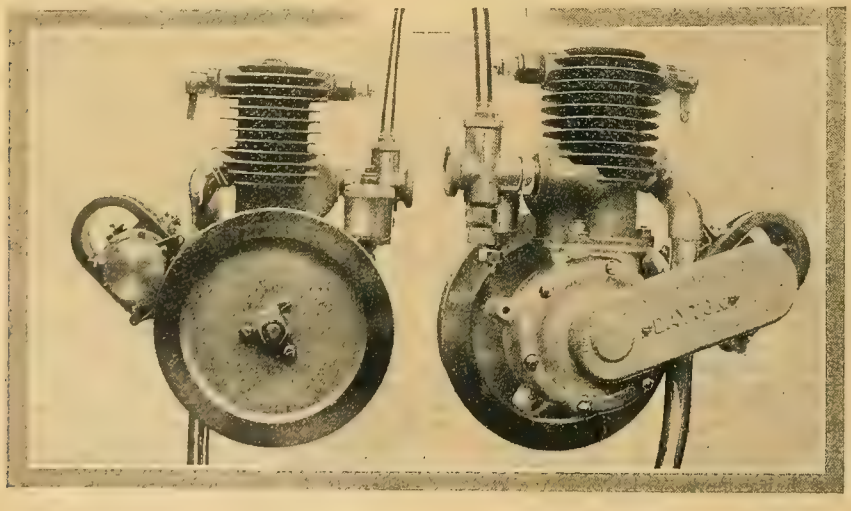
The engine is a 1½ h.p. two-stroke single-cylinder (57 mm. bore × 63.5 mm. stroke), and is fitted with caged ball bearings. Transmission is by a ⅝in. V belt, and there is no jockey pulley. An Amac two-lever carburetter is used. The outside flywheel is of ample dimensions and of the dished type. The diameter is 8½in. and the rim measures 1in. across the face, the thickness being ¾in. The engine has three-point suspension and is fitted to the frame by neat clips of ample strength, and the magneto, situated in front of the engine, is a U.H. The brake system also claims attention; the usual front brake is fitted, but the rear brake operates upon the rim of the wheel and the belt rim simultaneously and with equal force.

A special frame is being made to enable the engine to be fixed as low as possible. Lubrication is effected by a "foolproof" device, which prevents either too much or too small an amount of oil being given.

Altogether the machine is an engineer's job, and should appeal to those who go short journeys for either business or pleasure; also to those who study that important question, cost of upkeep and first cost, as the price is only twenty guineas.

THE PECO TWO-STROKE ENGINE UNIT.

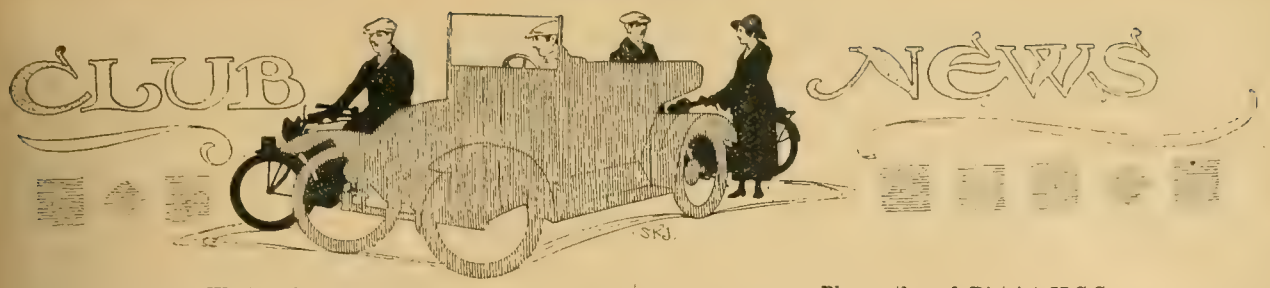
Yet another make of two-stroke engine will be exhibited at the forthcoming Motor Cycle Show, and it is an engine with some very interesting features. The Peco engine, which derives its name from Mr. D. A. Pearson and Mr. Cole, its sponsors, is rated at 2¾ h.p., and has a single-cylinder of 75 mm. bore and 79 mm. stroke. The three-port principle is employed, and the transfer pipe is cast with the cylinder, though provision is made for machining the port from the outside. The compression release is situated in the front of the head, and a passage in the casting leads to the exhaust pipe. The crankshaft is made in three pieces and roller bearings are employed throughout, auxiliary plain bearings being utilised to retain the crank case compression. A Bosch magneto is carried on an extension of the box chamber behind the cylinder, and an enclosed chain is used for its rotation. Lubrication is somewhat unusual, for oil is led from a drip feed to a ring round the outside of the cylinder. This ring is composed of two fins cast close together and closed by a piece of wire which is drawn into the intervening space. Oil holes from the ring allow the lubricant to pass straight to the piston, the surplus passing into a ring in the crank case castings and thence through leads to the main bearings. The latest type of Amac carburetter is fitted facing forwards, and in future models the float chamber will be carried on the inside. The complete engine unit with silencer, etc., will be marketed. Mr. Pearson's present address is School Road, Moseley, Birmingham, and he may be interviewed by those interested at Stand 181 at Olympia. We hear that the new Comet will show a model fitted with the Peco engine and that the Trump have an experimental model. As a test, the first model was taken over the old Wyche Cutting with ease on an 11 to 1 gear, which proves that these little engines possess plenty of pulling power.



Two aspects of the Dayton 1½ h.p. two-stroke engine, which has an outside flywheel and bore and stroke of 57 × 63.5.

In our mention of the new Rex-Jap models last week, Great Brook Street was mentioned as the site of the works wherein the machines are made. This should have been Aston Road. Druid forks are fitted as standard.

The new 6 h.p. twin-cylinder Star, described and illustrated in our last issue, has a three-speed counter-shaft gear box.



Westmorland M.C.C.

The annual dinner, prize distribution, and smoker will take place on December 11th.

Oxford M.C.C.

The annual dinner will take place on December 4th at the Hotel Buol, Oxford, at 7.30 p.m.

North Birmingham A.C.

The result of the last flexibility hill-climb was as follows: 1, E. H. Bayliss (8 Chater-Lea sc.); 2, R. W. Lovegrove (7 Indian); 3, F. Bowers (2½ Levis).

The second annual dinner and prize distribution will take place on Saturday, December 20th, at the Woolpack Hotel, Moor Street, at 7 p.m.

Public Schools M.C.C.

Speed trials for members only, will be held at Brooklands, at 2 p.m. on the 29th inst. By the courtesy of Major Lindsay Lloyd, each member will be officially timed over the flying kilometre. The following classes will be run off:

Machines not exceeding 350 c.c.
Machines not exceeding 500 c.c.
Machines not exceeding 1,000 c.c.

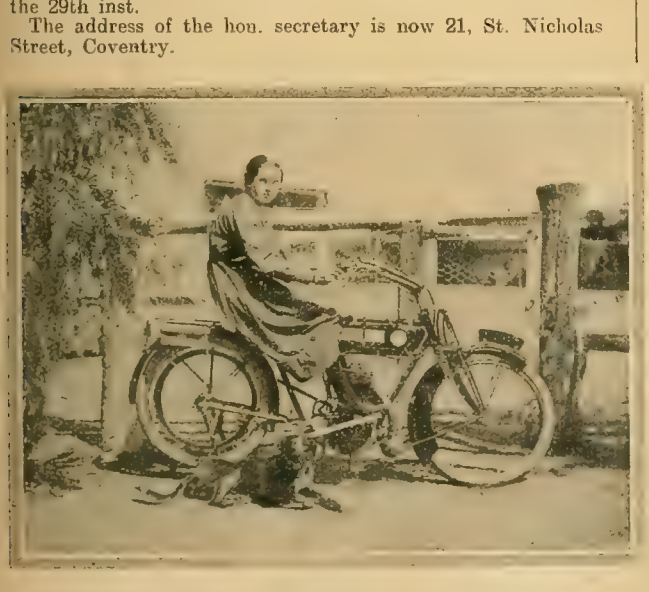
If there are sufficient entries, there will be two sidecar classes: (1) not exceeding 560 c.c., (2) not exceeding 1,000 c.c.

Suitable prizes will be given to winners of each class, together with the title of the Club Champion.

The first annual dinner will be held at the Waldorf Hotel at 7.30 p.m. on Friday, December 12th. The chair will be taken by Major F. Lindsay Lloyd, R.E. Tickets can be obtained from Mr. Clive Prean, 17, Basinghall Street, E.C.

Assuming that most members will be present at the Motor Cycle Show at Olympia next week, it is hoped that those living at a distance from headquarters may seize this opportunity of meeting one another. Members are therefore requested to meet at Stand No. 133 at 1.30 p.m. on Saturday, the 29th inst.

The address of the hon. secretary is now 21, St. Nicholas Street, Coventry.



Miss M. Weigh on the first 3½ h.p. Humber to arrive in Bonila, Queensland. The machine belongs to her brother, W. T. Weigh.

Plymouth and District M.C.C.

The distribution of prizes took place on the 12th inst. followed by whist and music.

Motor Cycling Club.

The annual dinner and presentation of prizes will take place at the Trocadero on Saturday, December 13th, at 6 p.m. The president, Mr. Charles Jarrott, will take the chair.

Brooklands A.R.C.

The following dates have been decided upon for Brooklands meetings for 1914: Easter Monday, April 13th; Whit Monday, June 1st; Saturday, June 27th; Bank Holiday, August 3rd; and Saturday, September 26th.

Coventry and Warwickshire M.C.

The first social evening in connection with the above club is announced for Thursday, January 1st, in the shape of a whist drive and dance at the Masonic Hall, Little Park Street, Coventry.

Essex M.C.

On Wednesday, December 3rd, at the Royal Automobile Club, Mr. Douglas Leechman will read a paper, giving his impressions of the Motor Cycle Show at Olympia, and this will be followed by a discussion. All motorists are cordially invited to attend and contribute to the discussion. Cards of invitation can be obtained from the hon. secretary, Mr. Harold Fuller, 51, Pulteney Road, South Woodford, Essex. The chair will be taken at 8 p.m.

The annual dinner will take place on January 3rd, at the Great Eastern Hotel, E.C. The chair will be occupied by Mr. Stenson Cooke.

LONDON-EXETER RUN.

Innovations in the M.C.C. Christmas Reliability Trial.

Several desirable alterations will be made in the regulations for the London-Exeter run this year. In the first place the start and finish will be at the Bridge House Hotel, Staines; thus the uninteresting and atrocious road from Hounslow will be cut out of the trial. In the case of passenger machines it will be necessary that a passenger accompany the driver throughout—no empty sidecars will be allowed. The silencer regulations will be more strictly enforced, the use of cut-outs and noisy driving will entail disqualification, and no machine which, in the opinion of the officials, is likely to cause annoyance will be allowed to start. In order to qualify for a gold medal entrants must sign the checking sheets at Exeter and the finishing sheet at Staines within fifteen minutes early or late of their schedule time. The ascents of Chard Hill on the outward journey and Trow Hill on the return must be made non-stop, without dismounting, and passengers must be carried on passenger machines. The checking sheets at the tops of these hills must be signed not more than fifteen minutes late of schedule time. Silver medals will be awarded to all finishing within twenty-four hours who do not qualify for gold medals.

The route will be as last year, including the detour through Lyme Regis and Bridport on the return journey. The club's competitions are open to members only; therefore, all riders, not already members, who wish to take part in the winter run, should at once apply to the hon. secretary, Mr. Southcomb May, 34, Gower Place, W.C., as no application for membership, for the purpose of participating in the winter run, will be entertained after the end of this month. For all information respecting the run application must be made to Mr. H. Karslake, 10, Grove Place, Hampstead, N.W.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Excessive Garage Charges.

Sir,—Relative to the letter in last week's issue, on "Excessive Garage Charges," I quite agree with your correspondent, Mr. A. H Hill, that 1s. per day for garaging a solo motor cycle is most excessive when spreading over a long period. Many firms only charge 1s. per day for cars; and at least half a dozen bicycles could be put in the space required for a car. Had it been for one day only no grumble would be necessary, but 7s. per week for two months is exorbitant.

When staying at Frinton this summer, where garage room is more scarce than house room, Messrs. Priest Bros. only charged me 3s. 6d. per week for housing my A.C. Sociable Mr. Wilson, of the Falcon Motor Works, says he is "not in business for his health," but should he charge all stray motorists as he did Mr. Hill's friend, the health of his business may not improve.

C. FERDINAND JESSOP.

Sir,—I would very much like to see the subject of garage charges ventilated in your columns. It is one which demands attention at your hands and I am sure that nothing but good to motor cyclists could result from your dealing with it, and allowing readers to voice their experiences in the matter Only quite recently I garaged my motor bicycle in the neighbourhood of Victoria station. I left it for barely two hours, pushing it into a corner out of everyone's way and removing it myself, so that none of the employees were asked to lift a little finger in attending to the machine. I was charged one shilling, and the foreman left me in no doubt whatever by the manner he adopted, that a tip was expected in addition to the charge. Having on innumerable occasions garaged machines in various parts of the country at the rate of 6d. *per diem* (viz., a whole day or any part thereof), I thought this rather "tall." It was at the rate of 6s. per day, not 6d. LIGHTWEIGHT.

Lubricating Two-stroke Engines.

Sir,—I notice the letter of the Bordesley Engineering Co. in your last issue, which bears out what I myself felt after reading your description of the Triumph two-stroke motor cycle, namely, that the article meant to convey that the system of lubrication—mixing oil with the petrol—constituted something new. Your editorial note at the foot of the letter referred to, however, disposes of the point and removes any misapprehension regarding it.

As a rider of the Connaught I am interested in this subject of lubrication and would say that, in my experience—comprising some 3,000 miles since June, practically all of it with coachbuilt sidecar and 9 stone passenger—this system of lubricating the engine is in every way satisfactory and more economical than the ordinary hand pump method.

I have had my cylinder off twice, and on each occasion have found an amplitude of oil on every part requiring it. It is best, I think, to use a thin grade of oil. Personally, I use Vacuum T.T. exclusively.

The work which can be got out of these very simple little two-stroke engines is marvellous, and the rate at which they will "rev." without heating up is equally to be wondered at. Tyres and belt (the latter only ¾in.) seem destined, like Tennyson's Brook, to "go on for ever" in spite of the sidecar and passenger. I have no interest of any kind in the production of the Connaught, but I am of opinion that the best of manufacturers will have a hard job to beat it. CHAS. S. LAKE.

Sidecar Alignment.

Sir,—Concerning the recent correspondence *re* "Drag" of sidecar, I have discovered that the only way to prevent this tendency, or rather, minimise it, is to adjust the sidecar wheel so that it is slightly out of the straight. This method, with the wheel pointing slightly inward, also lessens the tendency of the outfit to gravitate towards the kerb, but it has the one serious disadvantage of being harder on tyres and bearings, so that of the two evils the former is the lesser.

Now for one or two growls. Why is it makers are still fitting filler caps on the wrong side of the tank of sidecar machines? They should be fitted on the outside of machine (right side)—this would make the filling up process so much easier.

Why is it that in the majority of cases the radiators or fins of V engines are still of the old pattern, and not like the Motosacoche, as, for cooling purposes, the latter design far exceeds the former as regards efficiency?

When are makers going to coat their machines all over with a rustless composition pleasing to the eye, say French or engineers' grey?

Why are sidecars not fitted with a band brake, actuated by a Bowden wire? This is particularly desirable, considering the uselessness of the average front wheel brake, when nearly all the strain is borne by the back wheel brake.

How much longer will we have to wait for a really sensible motor cycle lamp, giving a maximum of light for at least ten hours, with a minimum of trouble?

By the way, will some unbiassed rider of a 1912 or 1913 four-cylinder F.N. with two-speed gear kindly give me some information concerning its general behaviour, whether it keeps its compression well, how often it is necessary to change the engine springs, inlet and exhaust, and if they are easy to change, etc. VICTOR TRAVERS.

Cycle Cars v. Light Cars.

Sir,—We are extremely interested to note the letter of Mr. H. G. Morgan on this subject, and, seeing the point is raised and our name mentioned, we think it may be of interest if we give our views on this somewhat perplexing question.

Really our attitude in regard to the cycle car definition is a somewhat independent one, as years before the term "cycle car" was coined, or its definition formulated, we had been producing in large numbers, our substantial little three-wheeled Sociable, which happens to conform to this definition.

Arising out of the cycle car boom, we have more recently produced a much more ambitious four-wheeled vehicle, which, by careful and compact design, we have succeeded in keeping within the cycle car definition without, we think, sacrificing any of the robustness and reliability which has always characterised all our vehicles.

We take some credit to ourselves for this, because most of our competitors in the four-cylinder field appear to have found it necessary to forsake the A.C.U. weight limit in order to obtain these qualities. This is not to say that we consider the A.C.U. definition of any great importance, and we do not think the public will ultimately trouble themselves to enquire if the vehicles they buy are within the definition or not, and we think they will not be far wrong. At the present moment, however, we find our position advantageous, in this respect, that a man who wants a vehicle of the "light car" type which is yet a "cycle car" obtains both in the four-cylinder A.C.

AUTO-CARRIERS (1911), LTD.

The Effect of Benzole on Tanks.

Sir,—Having read in your issue of the 30th ult. that you had been enquiring from your readers *re* the action of benzole on tanks, I thought my experience might be interesting. I used for a very short time a mixture of benzole and petrol, 50% of each, and found that my machine would not run owing to the jet continually choking up. I strained all the benzole after taking it from the tank through extra fine gauze, and found a tremendous lot of sediment, evidently composed of minute particles of tin, or of whatever the inside of the tank consists. It also spoilt the cork float by taking off the shellac covering and crumbling the cork itself. Since discontinuing the use of benzole I have had no further trouble in this direction. E.E.S.

An Undesirable Practice.

Sir,—I have been interested in the recent comments on carrier-riding which have appeared in *The Motor Cycle*.

As one who has had some experience in this so-called "Undesirable Practice" without the slightest mishap, may I say that I think much of what has been said is unfair to those who have derived much pleasure from the practice.

There are persons who give motoring generally a bad name; this does not conclude that the whole thing is bad, but the fault lies with a few who appear willing to risk their own necks as well as other people, by gross carelessness.

Anything can develop danger, and the fault lies with the user, not the use.

I think, provided the machine is suitable—good carrier-seat fitted, and clutch essential—there is no more risk than with the use of sidecar.

I find my machine is far more comfortable, and as a matter of fact, easier to steer, when I have the passenger on carrier. I have seen people riding in a manner dangerous to themselves and to others. The police are supposed to look after these.

It is not carrier riding that should be condemned, but random driving generally. J. BARKER.

Sir,—I have read with interest all the correspondence published in your paper on the subject of carrier riding, and should like (if I may claim a little of your valuable space) to support "CH 759" in his views on the subject. Although still practically an amateur at motor cycling I have ridden many miles with a passenger of the fair sex on my carrier, and my experience has been that the machine is as easy, if not easier, to control than when riding solo. I must admit that there is a slight danger on very greasy roads, but when negotiating traffic I do not experience the slightest difficulty in managing my machine. The increase in petrol consumption when riding two up is very slight indeed, and I find my 3½ h.p. Triumph will climb almost any hill with the load.

I think the practice (which, I regret to see, has been so denounced) is a distinct advantage to those who are not able to afford a sidecar, as one is able to enjoy the company of a passenger, with very little extra expense, and I should be more than sorry to see it prohibited by law.

KEEN MOTOR CYCLIST.

Sir,—I am not only a reader but a subscriber to your paper, and for some years now have enjoyed reading articles by "Ixion," but he should remember that it is not only the "Nut" who gives the loan of his carrier occasionally to a passenger. For instance, I myself own three cars, besides motor cycles, and upon any fine Sunday afternoon if I ask my wife if she would like a run down to Brighton or any other coast resort within, say, seventy or eighty miles, in a car or on the carrier of the "Zenith" or "Indian," she invariably answers, "On the carrier," and *she* knows the danger if such exists, just as well as "Ixion" does, if not better.

He cites as an instance a man on the carrier with a driver, probably quite green at such a pleasureable pastime, who on a very greasy road has a spill. Now does not a solo rider often get a spill, in fact even our crack riders at times on greasy roads come off, more or less ungracefully, and may not this rider have come off had he been riding solo under the same circumstances, and yet "solo riding," to use the words of Ixion, "is very tolerably safe." It would therefore be cruel, I think, to draw attention to what even "Ixion" himself says on the very next page (No. 1362, October 23rd).

Say for instance that carrier riding were made illegal, and a man is out sidecaring, which, "Ixion" does not object to; the sidecar axle breaks several miles from a railway station, the side-carist, being an expert motor cyclist, disconnects the sidecar and takes his passenger home on the carrier—would "Ixion" consider that he should be prosecuted and fined?

WITHAL AN "EIGHTEEN STONER."

A Medium-powered Twin

Sir,—As a regular reader of your most interesting journal I have derived much pleasure and useful information, and therefore gladly send you my experience of a 3¼ h.p. Lea Francis in reply to the query of "W.M.J.," but I can only speak of solo work.

Consumption, 3,420 miles, 38 gallons=90 m.p.g.

Reliability.—I find the machine absolutely reliable and use it on my journeys as a commercial traveller in the N.W. of England, including the Lake District.

Durability.—My only mechanical stop was through breaking a spring in the shock absorber, which threw off the magneto chain and sheared the key on the magneto shaft. Messrs. L. and F. made same good, free of charge.

Hill-climbing.—This machine will climb any hill that is rideable. I have ridden over Buttermere Hause from Buttermere to Keswick, and I weigh 14 stone.

I have ridden four makes of motor cycle, single and twins, and am simply delighted with the L. F. and especially with the *most excellent* way it is mudguarded.

With all good wishes for the continued success of *The Motor Cycle*. VAL. TAYELOR.

Some Experiences with a Big Twin.

Sir,—There has been such a lot of controversy lately on "the 3½ h.p. single *versus* 2¾ h.p twin" that the claims of the 7 h.p. twin for solo work have quite been eclipsed. I have had three 3½ h.p. T.T. Triumphs since 1910, which were wonderfully reliable, but not ideal in all weathers. Wanting more power I bought a 1913 h.p. T.T. clutch Indian, with single gear and unsprung rear wheel, and have never regretted it. Most of the present "big twin sidecar 'buses" are almost unrideable solo on greasy roads, owing to the great weight, but I have never ridden a twin to equal my Indian for all round work, including London traffic and occasional sidecaring over ordinary roads—not precipices!

The principal reason for abnormal wear on small engines is that they are often driven "all out" for long stretches at a time, but this is never the case with a big twin on average British roads. A big low compression twin, ticking round on quarter throttle, never overheats or "dries up"; and none of the working parts are stressed to their limit. The loads per square inch of bearing surface must be an infinitesimal fraction of those with a "konking" 3½ h.p. T.T. single or a small twin "revving at 3,000." The Indian mechanical oil pump keeps the front cylinder properly lubricated and the roller bearing big ends save undue wear, two very valuable points on most V twins.

Having previously owned an early twin of foreign make, which broke nearly everything possible—except its unfortunate owner's neck—I vowed never to get another V twin, as my bill for broken parts came to more than the machine cost me. *Mais nous avons changé tout cela.* There is an old Lancashire proverb to the effect that "Theer's nowt beats a good little 'un, except a good big 'un," and this is true with motors—cars or otherwise. The small super-efficient engine is never as comfortable, durable, or reliable as its big brother, and it requires far more attention to keep it in tune.

My first trip consisted of 250 miles in ten hours—two and a half days of cricket—and 150 miles of the return journey in five hours—and no trouble.

Personally, owing to business, I have little time to overhaul my machine or keep it in tune, and yet it has to be always ready to start off anywhere at very short notice. Last year I kept two 3½ h.p. T.T. Triumphs, now my 7 h.p. Indian has to do the work of both and haul a sidecar sometimes into the bargain. I find the high compression single wants the carbon removed, etc., every 500 or 600 miles. The twin has done 1,500 miles since last cleaned and still has the original tyres and chains after 2,500 miles, and they are good for much more; necessary replacements *nil;* only troubles, one choked jet, two punctures, and sooted back plug. Naturally,

the oil and petrol consumption are heavier than with a smaller engine, but pace and power must be paid for somehow, and they are well worth the small extra cost. A good big twin is the Rolls-Royce of motor cycles, and, until I can get a motor car proper (not a so-called cycle car, as I have done with belts and makeshifts), I hope to continue riding the most lively things on wheels. Usual disclaimer.

ROY. W. WALKER.

Scott Lubrication.

Sir,—During 1912, both myself and friends were much troubled with the lubrication, and it was a very common occurrence to consume a quart of Wakefield Castrol in 70 or 75 miles. Now after a series of experiments we get from 200 to 250 miles from the quart, and every part is continually and efficiently oiled, including the packing glands.

To begin with, the mushroom valve at the base of the pump is not sensitive enough, so I plug up the six small holes. Then sweat a collar on the valve stem. This stem is then turned a taper and the central hole in the valve is bored out to allow the valve just to drop on its seating; a fine spring may then be put in, and the appliance is now a drip feed and never need be opened more than a mere fraction of a turn. Never move the handle more than $\frac{1}{8}$in.

The above would not give a uniform feed on account of the weight of the plunger pressing on the valve, so to overcome this a collar is fitted on the upper part of its stem (the portion outside the barrel) so that on turning the small handle the piston is lifted up and the valve is free and allowed to open.

This can be regulated to allow about one drop every two seconds. I often run a whole day without touching either the pump or handle.

Another great advantage is to mix ten fluid ozs. of lubricating oil with two gallons of petrol.

I find the engine pulls stronger on equal parts of petrol and benzole, and for going all out all benzole, but it does not pick up so quickly. Since altering the pump and adding oil to the petrol it has been a real treat to drive, and with a heavy Montgomery sidecar passenger and $\frac{1}{4}$ cwt. of luggage will face any normal hill beyond speed limit.

F.S.Sc. (London).

Reckless Driving.

Sir,—I hope your old-established paper will do all it can to discourage the present reckless way in which so many youths drive motor cycles with and without sidecars. To this fraternity speed and noise seem the chief desiderata. If they only endangered themselves it would not matter so much, but the total lack of judgment displayed in passing cars which are themselves passing other vehicles, makes one doubt if such people ought to be allowed to drive at all. I am frequently on the Portsmouth Road between Pain's Hill and Godalming on Sundays when there is an immense amount of motor traffic about, in fact this road resembles a London street rather than a country road, and this is the occasion when the objectionable type I refer to abounds in considerable numbers.

It used to be, and, I believe, still is, an established custom that in certain circumstances, one must slow up behind a slower vehicle which is being passed or about to be passed by another, before attempting to overtake it. Not so, however, with the reckless motor cycle gentleman; he appears ready to go through anything, even when he has a girl with dangling legs across the carrier, a practice which I, having seen a bad accident through this, consider the last form of madness.

It is impossible, I am afraid, to prevent by law people abusing the pleasures of the road and endangering others. The only method is to create a sound public opinion on the matter and to educate these "nincompoops" to drive like gentlemen.

I am told that certain writers are much to blame, having always encouraged the lust of speed and opposed the silencing of motor cycles. I do not believe your paper has ever been guilty of this, and that is why I am writing to you, feeling sure that in the interest of the sport and for the comfort and safety of everyone who uses the roads, this form of recklessness will be discouraged by you.

I must add that I am an old motor cyclist myself, having had many machines since the early days, and am therefore in no possible way prejudiced against motor cycles as such

CAR-OWNER-DRIVER.

Small Twin and Sidecar.

Sir,—Doubtless many of your readers have noticed that the 3 h.p. Enfield, of 350 c.c. capacity, has covered 40$\frac{1}{2}$ miles in the hour with a sidecar on the track, and will have wondered what this machine can do with a sidecar on the road. My own machine is the standard type supplied to the public, having cylinders 60×75 bore and stroke, giving a capacity of 425 c.c., and with gears 5.16 and 8.94 to 1. I do not know what speed it is capable of on the level as I have never tried, but I have driven it up Handcross and Reigate hills with passenger in the sidecar, seated in the normal way. Reigate hill is, I think, about its limit in hill-climbing with these gears. I am fitting a smaller sprocket on countershaft, and this should result in faster average speed, as it will enable more hills to be climbed on top gear. As regard the running of this machine I can quite confirm everything stated by "Twin Enthusiast" in your issue of October 30th.

J. HART-SMITH.

Motor Cycles in Ceylon.

Sir,—Some little time ago a correspondent wanted to know what kind of machine to take out to Ceylon. As I intend returning thither myself in the near future, I have just obtained from Colombo the names of machines for which the two chief engineering firms are agents, as, personally, I prefer a machine well known in the island, and for two reasons: (1.) The engineers are more likely to be able to carry out satisfactory repairs, as they are more familiar with their own stock. (2.) Spares, unless in stock, take a month or six weeks to get from England. I remember riding up to the Triumph agency one day, and discovering with joy that the article I wanted was looking at me from a show case.

The names of the machines are as follow: Triumph, Indian, P. and M., Douglas, Humber, and Rover.

A two or three-speed gear should be used, as the central portion of the island is very mountainous, the chief sanatorium being at a height of 6,200 feet.

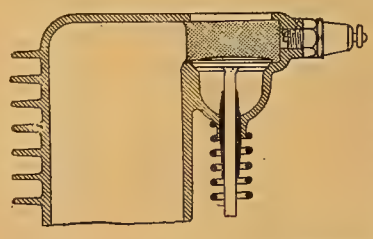
Finally, beware of bullock carts just out of sight round hairpin corners on steep gradients.

N 8134.

Conkitis.

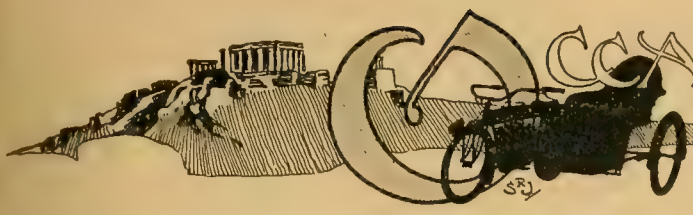
Sir,—In your issue of November 6th a problem is discussed by "Ixion," concerning a certain make of engine which is consistently prone to knocking. It is quite possible in this case, that neither the compression, nor the low power of the unit is responsible for the current state of affairs.

The design of the valve pockets is a very important factor, when cases such as this have to be considered, as when cramping in this direction is utilised, a phenomenon known as detonation often results. To explain clearly what detonation really is, it is necessary to make use of a diagram showing a section of a cylinder through the valve pocket. The principal point to be considered in this illustration is that the passage (shown shaded) between the sparking plug points and the cylinder proper is long and narrow, so much so, that the time taken for the gas filling it to burn sufficiently to transmit a flame to the main body of the charge is comparatively long. It is this slow combustion arising from badly designed ports that is the chief cause of detonation. When ignition occurs this little volume of mixture explodes, with a consequent expansion, which in its turn increases the compression of the main charge enormously.



The effect of this is such, that not only is explosion pressure very much greater, but it is also very much more rapid, owing to the large amount of heat generated from the extra compression. In fact, the force given to the piston by this ultra rapid combustion is so sudden that it can be compared with the blow of a hammer, and the noise produced is very similar. A plug, with a longer threaded portion, will often rectify this trouble, but if too long, pre-ignition through incandescent points will occur. Changing the position of the plug might rid the engine of this objectionable property, and the writer would suggest an exchange with the compression tap if it is possible.

T. W. PARKER



OCCASIONAL COMMENTS

BY 'IXION'

Do Sidecars Skid?

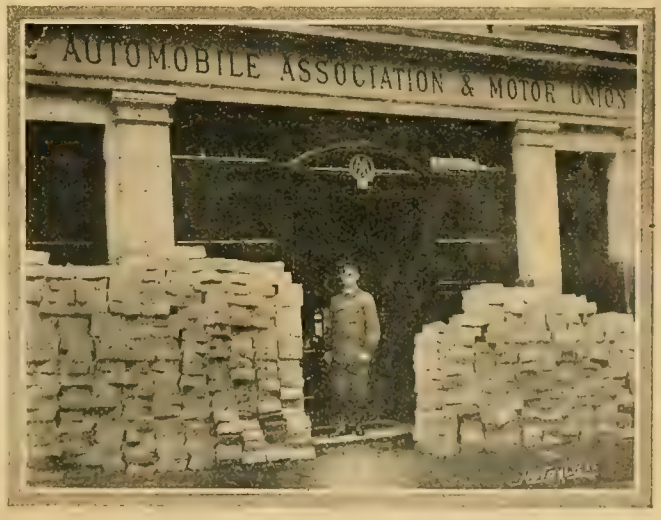
I have never been a great user of the sidecar, and my experience of it does not compare with that of many enthusiasts, but I can lay my hand on my heart and assert that in several thousand miles I have never had the tiniest semblance of a skid with a sidecar. Therefore I was a little astonished last week to hear a much practised sidecar driver assert that his sidecars skidded frequently. Pressed for details, he said that the tail of his outfits evinced strong desires to swing round whenever he was descending greasy hills with the valve lifted, and that the combination was very apt to slide across the road when he negotiated a sharp corner on grease, though neither occurrence produced quite such a state of utter helplessness as the drivers of two and four-wheelers may experience under similar circumstances. As it is commonly stated in technical journals that sidecars never skid, and as my own experiences confirm the disclaimer, it would be interesting to hear the careful statements of a few crack sidecar men. I will add that I have been present on most of the skiddiest days in the big trials, but I have yet to see any sidecar effect a genuine skid, though I have seen driving wheels revolve idly in the ascent of greasy hills.

"Twin-Jap's" Engine.

I am afraid that neither I nor anybody else can help "Twin-Jap" on paper. The theoretic explanations have been outlined for him, and he denies that they fit. He may have overlooked some simple application of the obvious principles, in which case he will probably kick himself and fail to inform us of the cure when he arrives at it; or he may be up against some rare and curious derangement which little short of a microscopic examination of his engine or ignition could detect. His best plan—short of a lucky encounter with an owner of a similar machine who has had the same trouble—would be to consult his manufacturers, who are uniformly courteous to clients in honest difficulties. Only one loophole is suggested by his last letter. He says that he has eased his pistons—I will not insult him by imagining that they are now too sloppy a fit; but *friction in any part of the engine* would produce just the symptoms he describes; if his crankshaft or camshaft is too tight, if the machining of any moving parts is untrue, if a valve stem is bent, if a spindle of the timing gear is short of oil, etc., etc., the engine will only rev. under the most favourable circumstances. A similar complaint was made to me in respect of a car last week, and after much tinkering we found that the last adjustment of the side brakes had left them a little "on" when the lever was "off." In the light of his last letter, friction in the engine or transmission is the most plausible diagnosis; but if he is habitually over-lubricating and can get no oil up past his piston rings (as shown by the engine's obstinate refusal to smoke), his flywheels may be braked by excess of oil.

What it Costs to Run a Cycle Car.

I have no objection to a balance-sheet which omits the items of insurance and garage, for many riders remain uninsured, and lots of us enjoy free garage. But I strongly object to any balance-sheet which does not so much as mention depreciation, though for obvious reasons the exact figures may not be procurable when the accounts are made up. On page 1452 in the issue of November 6th Mr. T. Wadsworth illustrates the running economy of a good cycle car; and his figures are emphasised in their interest by the fact that the standard Singer now exceeds the cycle car definition. He shows that a good sample of the miniature or light car can be run for its first season at an actual cost of less than 2d. a mile. But his accounts give us no information of the depreciation costs; there are very few second-hand Singers on the market as yet, which suggests that they wear sufficiently well for their owners to anticipate at least a second season with some confidence; but I have looked up the ruling prices asked for the few samples on offer, and the vendors' estimate of depreciation averages about 25%, an estimate which would increase Mr. Wadsworth's figures to nearer 3d. per mile, supposing the buyers agreed with the vendors, though my experience is that vendors normally quote higher prices than they expect to receive. Furthermore, he does not describe the potential mileage remaining in his tyres; as he has expended £8 on tyres during the season, I should expect him to hand over some very serviceable covers to the next owner, which would reduce his costs if he is not a seller. Once again, if a car is to be sold or used but little during the winter, either the whole, or nearly the whole, cost of licences, tax, and insurance should obviously be debited against the summer mileage. Otherwise the accounts should



A stack of pamphlets sent out by the A.A. and M.U. in favour of their new scheme of signposting. (See previous page.)

Occasional Comments—

include footnotes on these points. I hope others who send us similar experiences will make them complete, and a few instances of actual prices realised would be specially interesting. My own experience goes to suggest that the complete expense of running a light car can never be less than 4d. a mile, and that 6d. a mile is usually nearer the mark; but these figures allow of the heavy depreciation charges due to an annual sale. Some of the genuine cycle cars can show a far superior economy. For example, I know of a Morgan, which ran colossal distances on its tyres, and seldom fell below 50 m.p.g., and fetched £70 towards the end of its second season.

The Design of Chain Cases.

I have always felt proud of the fact that British machines are far more harmonious and artistic than the general ruck of machines produced by any other country; they are as beautiful as they are good. Of late I have felt a little uneasy when I have surveyed some of the extremely ugly chain cases adopted by too many devotees of the rigid transmission. Some of them afflicted me with a nightmare, in which I saw the offspring of a banjo and a dumb-bell reeling about in extreme intoxication; and my æsthetic soul has grown so sensitive that I am half afraid to visit Olympia. A badly dropped bottom bracket is usually the basic culprit. Don't let us imitate the bizarre aberrations of the smaller American makers by a complete disregard of appearance!

Inefficient Mudguards.

A careful scrutiny of the photographs of 1914 sidecars and cycle cars appearing in this journal will show that some designers are obviously fair weather riders, or don't ride at all. Every issue of this paper contains pictures of machines which are unfit for bad weather, and intending purchasers should keep the point well in mind at Olympia—the brilliant polish and glittering appurtenances of a Show stand are apt to banish mud and rain from one's mind. A sidecar outfit with inefficient mudguarding is a terrible thing to own, for it is the most difficult vehicle on the road to cleanse properly; inaccessibility is its bugbear in this matter. With cycle cars the case is altered a little. They possess a large superficial area, and the work of cleaning will absorb time, but every square inch is accessible. The sting of bad mudguards on cycle cars lies in the risk of the passengers being bespattered—I took a large clob of mixed filth bang on my mouth last week—and in the fact that the paint is seldom too good; some economy must be observed in the manufacture of a £100 vehicle, and the finish is seldom equal to that of a high-grade car. Furthermore, few cycle carists have the patience—some have not the hose and sponges—to sop the mud off; quite a common method is to take a handful of damp waste and wipe the dirt away when it is half dried, rubbing any obstinate patches with "neat" petrol or paraffin, both of which are fatal to varnish, though a very *little* paraffin in the dowsing water is useful. Consequently, an ill-mudguarded cycle car is likely to look extremely shabby after brief use; and its shabbiness will increase depreciation charges, both by deciding a wavering owner to sell after six months, and by reducing the market price. Cycle car coachwork should be cleaned very carefully.

Ixion and the W.P.B.

It is only once in a century that one of my comments is relegated to the w.p.b., but only lavish sub-editing saved me the other week. I had not been employed on the advance Show work, and so remained in complete ignorance of the 1914 Hendee programme. Simultaneously I was attacked by one of my prophetic moods, and in my innocence and pride I handed the editor what I regarded as a positively inspired paragraph, outlining the vast possibilities of electric lighting and starting dynamos as applied to motor bicycles. He mutely handed me galleys of the new Indian de luxe, and peered anxiously at his overflowing waste paper basket. Great minds obviously think alike.

It is a fair sample of fortune's cynicism that the welcome innovation must be confined for a time to the machines that need it least. When I bestride a high-powered sidecar outfit I can easily accommodate a car-size generator, two big cycle generators, or a cylinder of dissolved acetylene; but when I sniff the night air on a high-compression, stripped chassis, single-geared T.T., I am practically limited to a single generator of modest dimensions. Towards midnight, or a little later, according to the season, the lamp burns low, stinks, bobs up and down, and generally misbehaves itself. Failing the aid of a kindly moon, I face the noisome task of replenishing in Cimmerian darkness. I gouge out the odorous slush from the sump of the generator, and cover my clothes and hands with evil-smelling deposits; I remove the spare canister of carbide from my little Chemico holster, and a fine powder, never intended to be used as snuff, is wafted up my nose. I hope designers will not forget the medium-weight tourists—how we should revel in a compact little lighting dynamo about the size of a magneto! I particularly look forward to the solution of the lamp problem on these lines. We ought to arrive at a compact little head light capable of being mounted so low down on the front mudguard that it will dodge damage in the event of a fall.

Miss Dorothy Maxwell, of Barrow-in-Furness, on her 2¾ h.p. open frame Douglas, with her younger sister as passenger. They have ridden many hundreds of miles in this fashion.

SIDECARS

What to look for at Dunhill's Stands at the Show.

(No. 21 on Ground Floor and No. 229 in Gallery.)

Readers visiting the Motor Cycle Show should not miss calling at Messrs. Dunhill's Stands, where an extremely attractive selection of sidecars and accessories is being displayed. As every motor cyclist knows, Messrs. Dunhill's, as *Specialists* in motor equipment, are in a unique position to offer the most up-to-date and reliable innovations for the convenience of the motoring public; hence, purchasers of any of their exhibits at the Show have the confident assurance that the goods they buy are of first rate quality and are splendidly effective in use.

At Stand No. 21 on the Ground Floor, for instance, a show of Sidecars of great variety is to be seen. The visitor in search of a sidecar combination of undoubted dependability will find what he wants here —at Stand 21. These sidecars are exceptionally good specimens of skilled craftsmanship, and are certain to please by their attractive designs and their guarantee of strength and durability.

The Dunhill Chassis should on no account be missed. It is light, very strong, well-sprung, and thoroughly tested, and fitted with best quality tyres. The bodies are wrought in cane, or coachbuilt, with plenty of storing space, and can be upholstered to suit the requirements of the purchaser.

At Stand No. 229 in the Gallery Messrs. Dunhill's exhibit a selection of the latest accessories—all peculiarly attractive by reason of their extreme usefulness.

All Motor Cyclists will agree that paramount importance attaches to the kind of accessories carried when out for a run. The question of accessories enters largely into whether the trip is successful or disappointing. The right kind, in great variety, is to be seen at this Stand, and we mention a few of the newest items for the benefit of our readers.

An invention which ministers to the comfort of the passenger in the Sidecar is the new one-person Wind Screen, which is held firmly in position a few inches in front of the wearer by means of a very simple attachment. To ladies, especially, the new Wind Screen should prove a great boon.

The "Pharos" M.C. Head Light is an attractive accessory. This lamp is one of exceptional power, and its unique method of construction places it at once in the forefront of anything yet manufactured.

The lamp is made of stout gauge metal, heavily nickel-plated. Every joint and attachment is strongly riveted. The reflector is of the lens type, and is reinforced by a strong lens which takes the place of the front glass, thus giving a long and powerful beam. The Dunhill adjustable bracket enables the lamp to be always regulated to the point of maximum advantage.

A most interesting item is the patent "Lukin" Carburetter. The "Lukin" has the throttle on the atmospheric side, and NOT on the engine side, thus ensuring a correct proportion of petrol and air before they are mixed. The vacuum in the mixing chamber increases as the throttle is closed, providing a medium for the instant volatilisation of the petrol when it is most needed. It is absolutely automatic at all speeds, has no tuned jets, but is tuned for every speed by means of a shaped valve. There is but one moving part. Needles, dash-pots, tuned springs, and other delicate mechanisms are entirely dispensed with. It is a petrol saver of unique value, and will save its own price in a month. Adaptors are obtainable for almost every make of motor cycle.

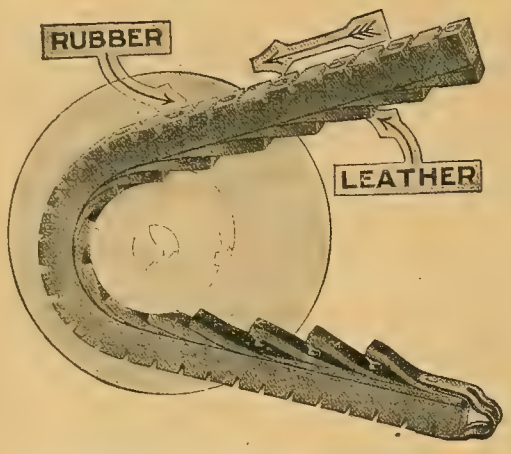
Two prominent novelties are an adjustable reed, called the "Amplificator," which, when introduced to the ordinary horn, is capable of trebling its sound; and a Petrol Brush for cleaning clothing or renovating the upholstery of the car.

The Tail Lights are undoubtedly the best thing on the market to-day, and will interest Motor Cyclists as being the requirement of the moment.

In the clothing section the new pattern Oilskins are a popular attraction. For clean finish, lightness, flexibility, and hard wear the new M.C. Oilskins are unrivalled anywhere, and motor cyclists will find them an extremely valuable part of their equipment. A new Cap of the same material should not be overlooked.

Fresh patterns in Racing Helmets are also prominently displayed, and there are other original exhibits which combine to make one of the most attractive and comprehensive selections of accessories that we have witnessed for some time.

A great boon to the Motor Cyclist is the new Magneto Lighting Attachment. It cannot be overdriven, and gives an ample light from four miles an hour upwards.



LYCETT'S "RELIABLE" Belt.
Guaranteed for 2,000 miles minimum.

In answering this advertisement it is desirable to mention "The Motor Cycle."

An Open Letter to the Trade.

By B. H. DAVIES.

ONCE again it is my pleasant duty to thank you, gentlemen, who direct the industry, for providing the readers of this paper with an exceedingly pleasant summer's riding. The machines with which you have furnished us have evinced a marked average increase in efficiency, reliability, comfort and economy, and we trust that our satisfaction is suitably reflected in your balance sheets. We desire to single out a few special causes for congratulation. We have never had so little trouble with our valves. You have contrived to introduce practically the whole community to the delights of variable gears. You have managed to fit us with better tyres without raising your prices. You have been singularly ingenious in devising engines that can stand long spells of work under heavy loads without getting tired. Here are three stiff problems solved; and your success inspires us with the liveliest anticipations for the future.

We are true Oliver Twists in that our gratitude for past favours does not prevent us asking for more: and we hope your response will be more generous than the workhouse master's.

Last year we asked for better springing; and alas, roads remain as pot-holey and frames as unyielding as ever. Until you have perfected your sprung frames, may we implore you to give a little more clearance under the saddle, so that we can sit low without indenting the print of the carrier on a part of our anatomy which, we admit, was designed to receive chastisement?

The Question of Transmission.

In the matter of transmission you have been exceptionally thoughtful. There are just two points we may timidly mention. One is that some of you, who are devotees of truly excellent chain drives, retain a singular prejudice in favour of the single-cylinder engine. A single-cylinder is delightful with belt drive; but surely, beyond all contradiction, a twin-cylinder is preferable with a rigid drive, no matter how cleverly the cushioning devices are executed. The other is that it is quite possible to fix up a three-speed hub so that a cover may be changed in less than sixty minutes, but I hear you have this point in hand.

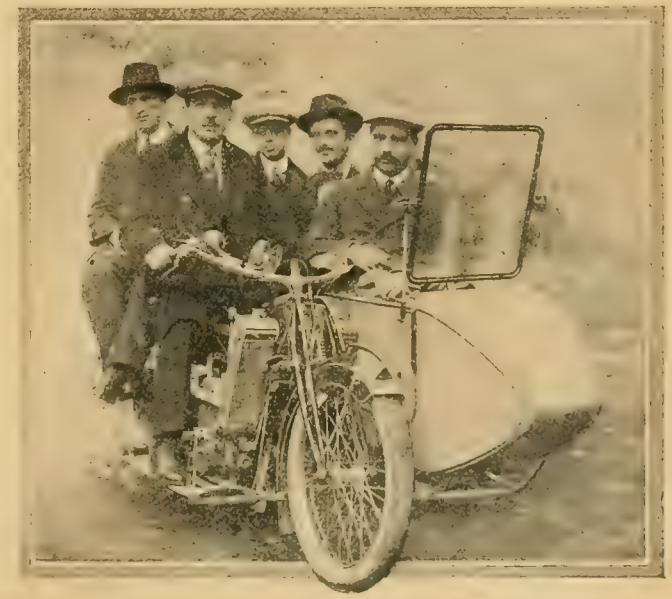
You are still of opinion that the days are not ripe for a general reduction of prices, and we cannot claim such a mastery of finance as you possess. But when we read the profits that some of you have made, we consider that motor cycling for the million is a little overdue, and we fear that a determined Yankee importation at cut prices may disturb the even tenor of your course before long. We venture to think that some of you pay ridiculously high commissions to your agents. Ten years ago an agent deserved a big "spiff," for his customers worried the life out of him: to-day, the sale of a good motor cycle causes an agent very little more trouble, either beforehand or afterwards, than the sale of a push bicycle, and we think his remuneration might be reduced a little.

The £100 Cycle Car.

We are a little disappointed with your comparative callousness towards the cycle car movement. The prices which some of you obtain for high-powered sidecar outfits *de luxe* prove the existence of a wide market for £100 outfits. Believe us, that when a £100 sidecar outfit has to compete with a £100 cycle car of equal efficiency, economy, and reliability, the cycle car will get the cheque every time because of its superior protection from weather, and comfort for the driver. We think some of your larger firms, which are in a healthy financial position, might have launched out more boldly into the cycle car sphere.

The 100 lbs. Motor Cycle.

We are charmed to see you displaying so much interest in the new bantam-weight class, and we agree with you that the two-speeded two-stroke has a tremendous future, no less in the 300 c.c. single-cylinder class than upon Scott lines. But we are the wee'est shade disappointed at the weight some of you pile on to these handy little runabouts. At 125 lbs. or so, they are really too heavy for our more corpulent constituents. Don't you think a hub gear, very little heavier than push bicycle types, might suffice for these even-pulling little engines? And if you could sling these gears on a counter-shaft so much the better. When you can produce a machine on these lines to scale no more than 100 lbs. at the outside, and to sell at £30, or better still £25, the day of leviathan outputs will dawn. At 125 lbs. you are getting perilously near the medium weight class,



A Williamson quintette in Italy. The owner, M. Lanfranchi, of Milan, is driving.

An Open Letter to the Trade.—

which is apt to grow too heavy and to remain too costly for the classes we want you to touch. Moreover, a £25 runabout would sell as a tender to big twins and 500 c.c. roadsters; lots of us could just afford to keep a dinghy as supplementing our present yachts, and we should prefer it for winter work.

Electric Lighting Installation.

We fear many of you have been caught napping by the 1914 Hendee programme—beg pardon, "program." We do not like to see our home makers outstripped even in that small department of the industry which caters for the ultra-heavy, high-priced outfit *de luxe*. We venture the opinion that electric lighting and electric starting have a big future in this class; and we implore you to see that electric lighting, at any rate, is applied as soon as possible to ordinary roadsters, while we trust your characteristic restraint not to saddle us with untested complications.

Don't think us petty if we linger awhile on a few minor details. We dislike miniature key-locks that jam under strain or at the entry of dust. We are

J. Woodhouse, on the 7 h.p. Quadrant on which he competed in the Streatham and District M.C.C. trial. The sidecar is one of his own design.

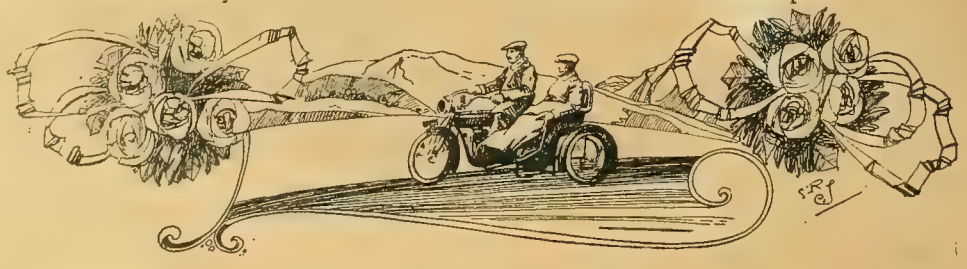
sick to death of hand pump lubrication, in which some of you carry conservatism too far. We should like to see more machines sold completely equipped and ready for the road. When we take delivery we have to hurry round to the nearest accessory shop and load up our handle-bars with a job lot of odds and ends, which spoil the neat *tout ensemble* planned by your designers. Please list and quote for equipped machines, if only as an option. It is difficult to clip a speedometer gear wheel to your front wheel spokes in absolute truth; please standardise a fitting on a hub flange and deliver it to all your customers. Some of your back brakes are not too powerful, and we might have scrapped front brakes long ago but for the law, as the expert seldom uses them, and they are perilous for the novice; please increase the power of the belt rim shoe where necessary.

Handle-bar Controls.

Your handle-bar control of the ignition is seldom genuinely satisfactory, and our numbers include many duffers who are completely puzzled when it jams, as it usually does after one wet ride. Many of your petrol tanks are too small. Some of your gauges don't gauge; what is the matter with the three-way "warning tap"? Engines are growing a little cleaner, but we still await the clean crank case, cast smooth and devoid of mechanical excrescences and embossed advertisements. Tall riders encounter the old difficulty in housing their legs, despite adjustable footrests. The merits of the handle-bar clutch are still unrecognised by your majority; the foot clutch ought to join the dodo immediately, or, if possible, sooner. Some of you take too little account of weight; we can put up with 180 lbs. on solo machines, but the 250 lbs. solo is obviously designed by a man who doesn't ride. Please make all your designers do their 5,000 miles per annum on the products of their own brains. We consider that every sidecar should be fitted with check clips to facilitate its being driven with an empty chair. Surely there are better spring forks to be invented than those which some of you refuse to surrender? We believe in a low emergency gear ratio as opposed to piling up power, which includes piling up weight. We could wish a few of you were more honest in stating delivery dates, for disappointments in this respect are very trying.

The Shamateur.

We think some of you are too liberal in providing the lesser lights among competition riders with cheap machines. Two years ago one of your number fitted out the speed merchant of every tuppenny ha'penny club with a half-price machine, and there are rumours that there have been other sinners. We respectfully suggest that we have to pay the cost of these concessions, and that they produce an artificial drop in second-hand prices, which hits us in turn at the end of the season. The shamateur is no true friend to us or to you. Some of you deliver your machines in very poor tune, in some cases because you leave us to run the engine in, in others because the viewing is careless, and the testing scamped. Believe us, nothing will pay you better than to give every engine a most scrupulous bench test, to be most thorough in your shop gauging, and to maintain a well paid corps of clever roadmen. The machines you deliver should be every whit as good as those you enter for a Six Days; and the more successful of you have proved that this policy pays—righteousness *always* pays. These concluding grumbles must not be taken as diminishing aught from either our gratitude or esteem; we would not change you for the directors of any other industry in the world; you have won, and you will retain, our confidence and our respect.



THE MOTOR CYCLE BUYERS' GUIDE OF 1914 MODELS

COMPLETE SPECIFICATIONS of all MOTOR CYCLES, SIDECARS, and CYCLE CARS on the BRITISH MARKET.

This Guide, first published in 1906, has become a regular and popular feature of the issue of "THE MOTOR CYCLE" preceding the annual Show. The possession of this copy will enable readers to make a thorough examination of the various exhibits without asking the busy stand attendants for information, which, even if they are able to give, they must be very tired of giving. A straight-edge or piece of folded paper renders the line more easy to follow. In studying the guide, the following notes should be borne in mind: when only one gear ratio follows the name of a three-speed gear it must be understood that the high gear only is given and that the usual ratios given by that gear are provided. The Armstrong Hub has ratios 1, 1.49 and 2.30, giving gears roughly 5, 7½ and 11½; the Sturmey-Archer ratios are 1, 1.57 and 2.42 or 5, 7⅞ and 12. All information has been supplied by the makers, and every effort has been made to avoid inaccuracies, but we cannot be held responsible for any errors which may have occurred.

Some Sidecar Attachments for the Show.

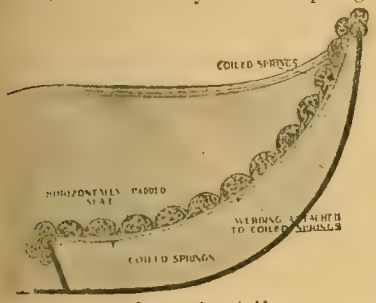
Supreme Sidecars.

A luxurious addition to the range of "Supreme" sidecars takes the form of a new seating arrangement, which is carried out on the lines of a hammock.

The firm's quick attachment is, of course, retained, and also the adjustable

Supreme Sidecar Co.'s coach built model.

wind screen which is one of their specialities. A cheaper line in coach-built sidecars is also to be listed for next year. This new model forms the subject of our illustration, and, in spite of the reduction in price, it retains all the best features of the more expensive models. Four points of attachment are provided, and the body is well sprung,



The Supreme hammock seat sidecar.

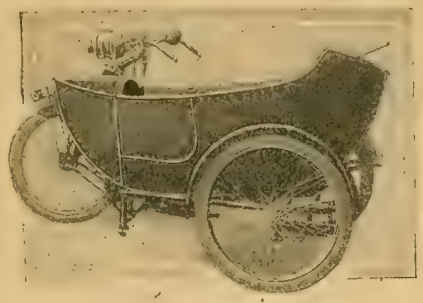
the upholstery being in Pegamoid of any shade desired. The two standard colours for the body are dark green and French grey. A map pocket is fitted in the side of the body and a lamp bracket is part and parcel of every chassis. The wheel is well guarded, a large valance protecting the body. A special line in box carriers will also be supplied.

A Clever Sidecar Coupling.

A well-designed, safe, and neat sidecar coupling is marketed by the County Cycle Co., 307, Broad Street, Birmingham. Our illustration shows clearly how this simple device works. A peg and hole coincide on the two halves, and, when fitted together, a spring-controlled sleeve slides over the two halves, holding them firmly together. Small handles are provided to pull back the spring, which is naturally a strong one, and the whole device is very compact and has practically no part to give trouble.

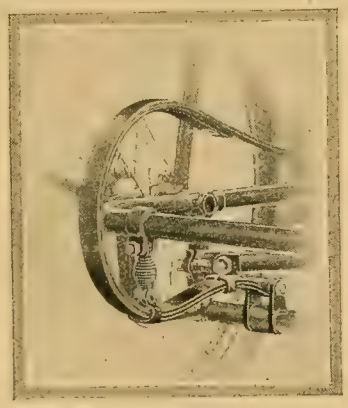
A Folding Sidecar.

Those sidecar users who are forced, through possession of narrow gateways, to detach their sidecar every time they take their machines in or out will be



Watsonian coach-built folding sidecar.

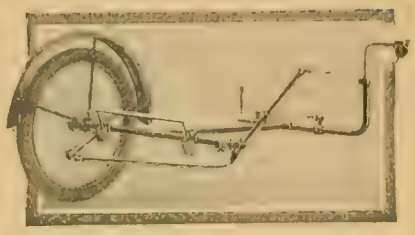
glad to hear of the patent folding sidecar made by the Watsonian Folding Sidecar Co., Ltd., Conybere Street, Birmingham. This machine has a folding body and chassis which enables it when folded to pass through a doorway 2ft.



Novel method of springing the rear of the Watsonian sidecar.

8in. in width, thus making it possible to take the combination through practically any doorway. The folding of this sidecar takes only a few seconds, and it is not necessary to detach any portion of it to carry this out. It is very strongly made, and it is claimed that no loss of strength whatever is involved by this process of manufacture. This company also manufacture a folding tradesman's sidecar van which will also pass through an equally narrow doorway. Several different types of chassis and a large range of bodies can be fitted.

The readily detachable sidecar fittings patented by the County Cycle Co.



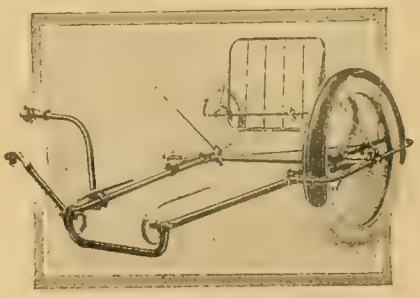
Chassis of the Watsonian folding sidecar.

Speedwell Sidecars.

A special feature of the Speedwell sidecars is the quickly detachable wheel which is supported on both sides by parallel tubes, giving great strength and rigidity; the mudguarding is carefully carried out. The body, supported on leaf springs fore and aft, which makes for comfortable riding without sidesway, is

Speedwell sidecar, the axle of which is supported on both sides.

constructed of four-ply wood and well upholstered; the backs are wide and heavily padded, and, in the case of the more expensive models, sprung in addition. Cape cart hoods and wind screens are fitted to order as well as storm aprons and tool boxes. The Speedwell quick

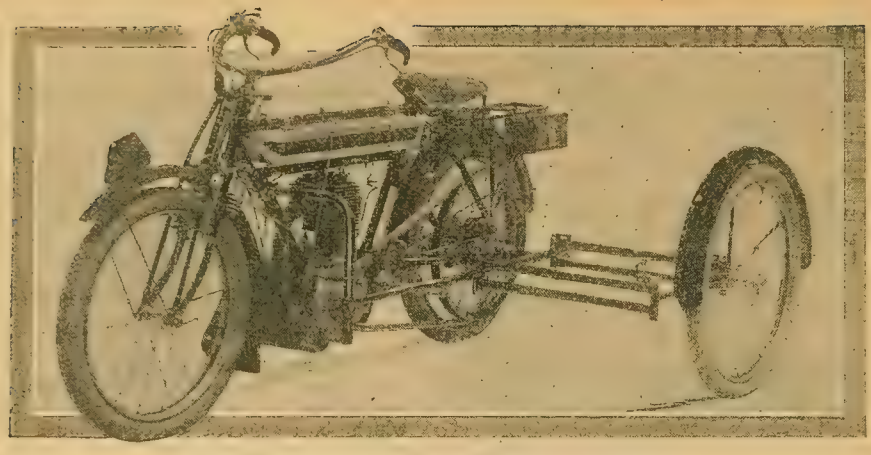


Chassis of the Speedwell sidecar, showing folding luggage grid.

four-point attachment has been designed by an engineer and is thoroughly secure when fastened. The luggage-carrier is so arranged that it gets the benefit of the rear springs, and a Hutchinson 26×2¼ mm. tyre is tandard. The makers are the Speedwell Manufacturing Co., Abbey Works, Alcester.

The Middleton Sidecar.

Great strength combined with an attractive appearance are claimed to be the features of Middleton Sidecars, 27, Stroud Green Road, Finsbury Park, N., a special feature being made of the construction of the axle and wheel

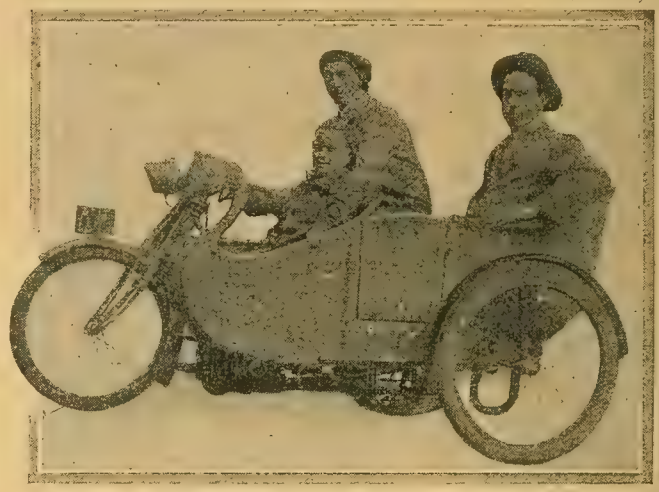


The Paragon folding sidecar chassis in position for fitting the body.

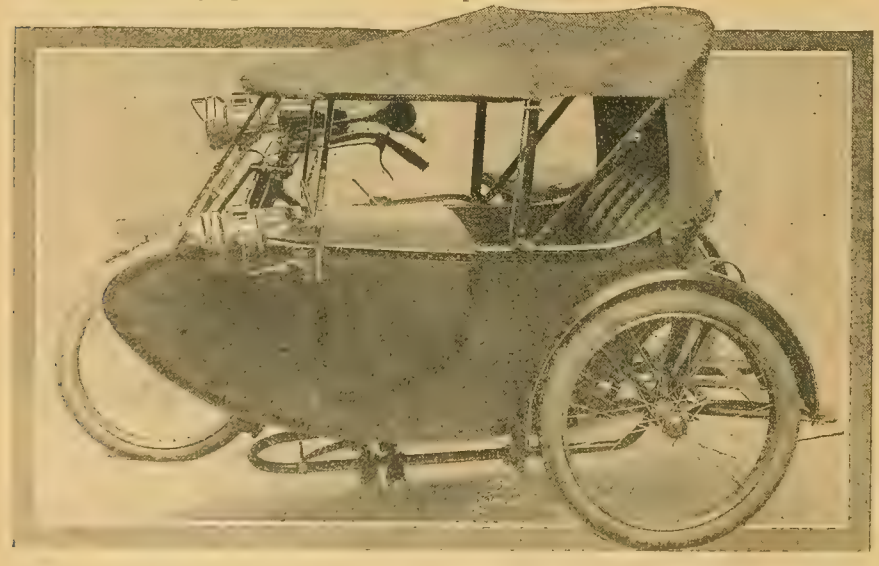
spindle. This is of the stepped pattern, and the lug is greatly strengthened by webs at the bends. A wide variety of racing and touring models will be shown, and on the former a large number of sidecar events have been won at Brooklands. The touring models are exceedingly graceful in appearance and moderate in price, and are coachbuilt or made in art cane. A special light model is made, suitable for medium-powered machines. The products of this firm bear the stamp of careful design and admirable workmanship.

A Double-seated Sidecar.

An excellent example of sidecar for two is marketed by Mr. Edward Bowser, 50, Park Lane, Leeds, and is designed for use with powerful motor cycles. Great care has been taken with the balancing of this attachment, so that there should be no undue drag on the steering of the motor cycle. The front seat can be removed entirely if desired, and ingress to the back seat is obtained by folding up the passenger's seat. The bodywork, which is made of cane, is very graceful in design, and slung low, and the spindle of the back axle is supported by both ends to give the necessary support when carrying a full load. The body is sold, if desired, separately from the chassis at the price of £7, and waterproof twill aprons can also be supplied if desired.



The G.K. Swan sidecar which has a child's seat in the front, the head acting as a protection against wind.



The Hercules coach-built sidecar showing hood, wind screen, and luggage grid

A Wide Range of Sidecars.

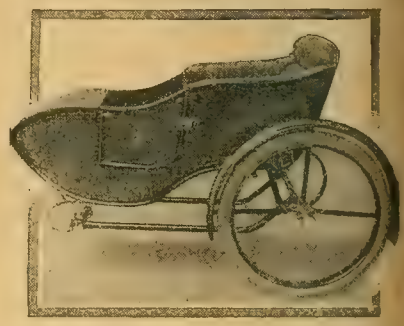
A wide choice of sidecar models is offered by M. J. Varley, Forward Works, Stoney Lane, Sparkbrook, Birmingham, and a speciality for next year will be a coachbuilt canoe shaped model, fitted with four point attachment. The coach work is suspended on C springs front and rear, and a very neat celluloid wind screen with the frame all in one piece is fitted to the dash board; a hood can be fitted to special order. A wide door is provided to the body, and the wheel is built to take a 26×2¼in. tyre. A tool box is fitted under the wind screen, and a feature of the sidecar is that the seat can be adjusted to different positions, which will add considerably to the comfort on a long journey. Useful fitments also marketed by this company are petrol cans fitted to carriers, which can be attached to any sidecar chassis. These petrol cans are sold in one and two gallon sizes. Detachable luggage carriers are fitted.

A Swan Neck Sidecar.

The G.K. sidecar is produced by the G.K. Sidecar Body Works, and is a novelty in design. The model we illustrate has an extra child's seat and in front is a swan's neck, head, eye, and beak, all complete. It is arranged so that the child sits in a comfortable seat in front with its feet resting on the swan's neck. It is pointed out by the makers that the head acts as a protection for the child, and a wind-cutter withal. It is doubtful if this novel sidecar will be at the Show.

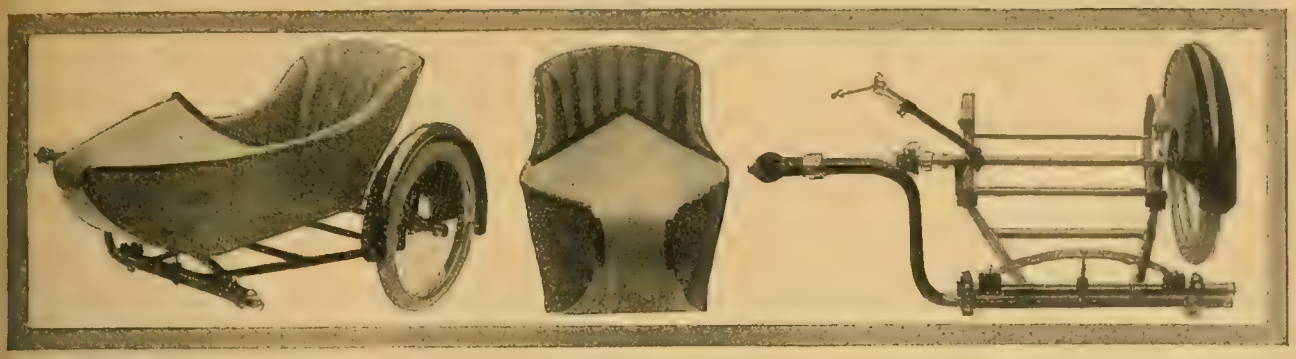
Mills-Fulford Sidecars.

The name of Mills-Fulford is known wherever sidecars are to be found, and we illustrate two of the most recent productions of this firm. One is a Tandem sidecar, which is designed



Mills-Fulford "Pinnace" sidecar.

throughout for carrying two adult passengers. The feature of this attachment is that the frame is built on the cantilever principle to give great strength,



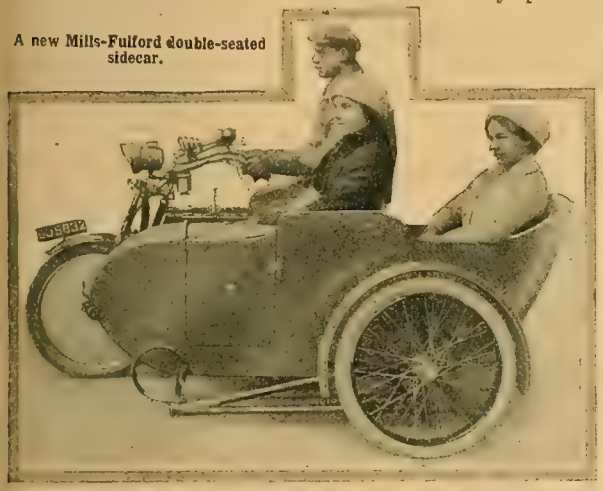
(1) A Montgomery body, chiefly notable for its reclining seat. (2) Front view of the same body. (3) Chassis showing transverse laminated front spring.

and it has been subjected to the most severe tests before being placed on the market.

Our other illustration shows a new light model known as the "Pinnace," which has been specially designed to meet the requirements of those users who desire a light sidecar at a popular price, as it retails at ten guineas. It is finished in style expected from such a well-known firm.

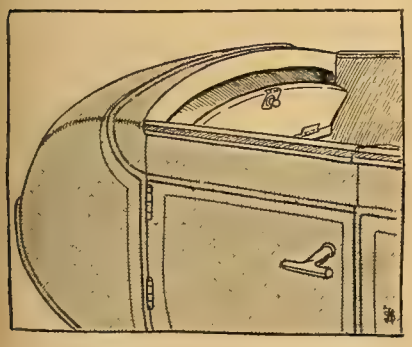
front as well as a good space under the seat. The chassis has a main frame which entirely surrounds the body, and is very stoutly constructed. Four points of attachment are provided and the tube clips are hinged, an unusual feature, which reduces the number of loose parts. We hear that one of these sidecars is to be on view on the Hazlewood stand at Olympia.

A new Mills-Fulford double-seated sidecar.

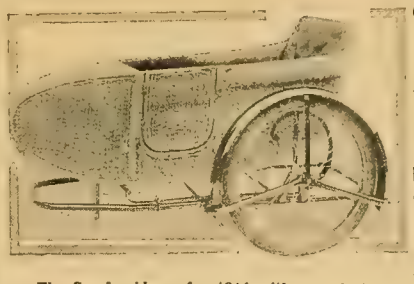


A SMART SIDECAR.

A very taking looking sidecar was shown us on the occasion of a recent visit to the Coventry Sidecar Co., of Stoney Stanton Road. The machine is known as the "Limoulette," and the body is excellently finished and contains a locker in



The convenient locker in the front of the Limoulette coach-built sidecar.



The Comfy sidecar for 1914 with cane body.

THE C.C.R. SIDECAR.

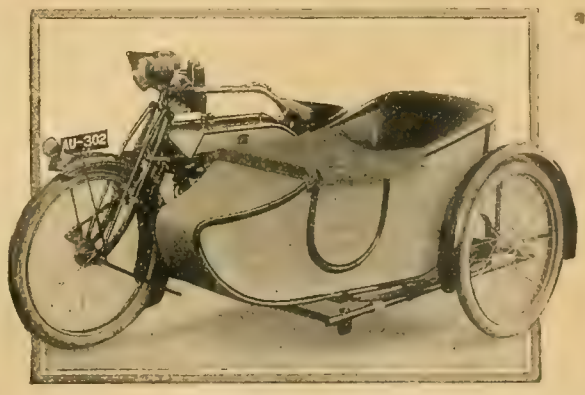
A handsome and well-constructed sidecar, known as the C.C.B., is made by Messrs. Smith Bros., C.C.B. Motor Works, St. Ann's Well Road, Nottingham. The chassis is underslung, and a feature is the provision of a hub to the wheel which is claimed to be absolutely water and grit proof. The couplings and springs are of a special design, and a large luggage grid at the rear and very strong mudguard connections are notable points in this attachment. The body is coachbuilt, and is finished in any colour desired by the purchaser, but French grey, blue, and red are standard colours. The cushion is fitted with spring upholstery, there is a tool box under the seat, and the whole is turned out in excellent style. The price of the sidecar complete is £13 13s. It is illustrated herewith.

5-6 h.p. MONTGOMERY DUETTE.

Known for many years as makers of sidecars, Messrs. W. Montgomery and Co., Coventry, have just entered the lists as makers of complete passenger outfits. They are marketing a very interesting and novel 5-6 h.p. horizontally opposed twin-cylinder machine, particulars of which were published in *The Motor Cycle* of 9th October. It will be remembered that the outstanding feature of this engine is the fitment of the pulley to the solid camshaft. This does away with a chain, and gives a seven-inch pulley, by which, of course, belt slip is practically eliminated.

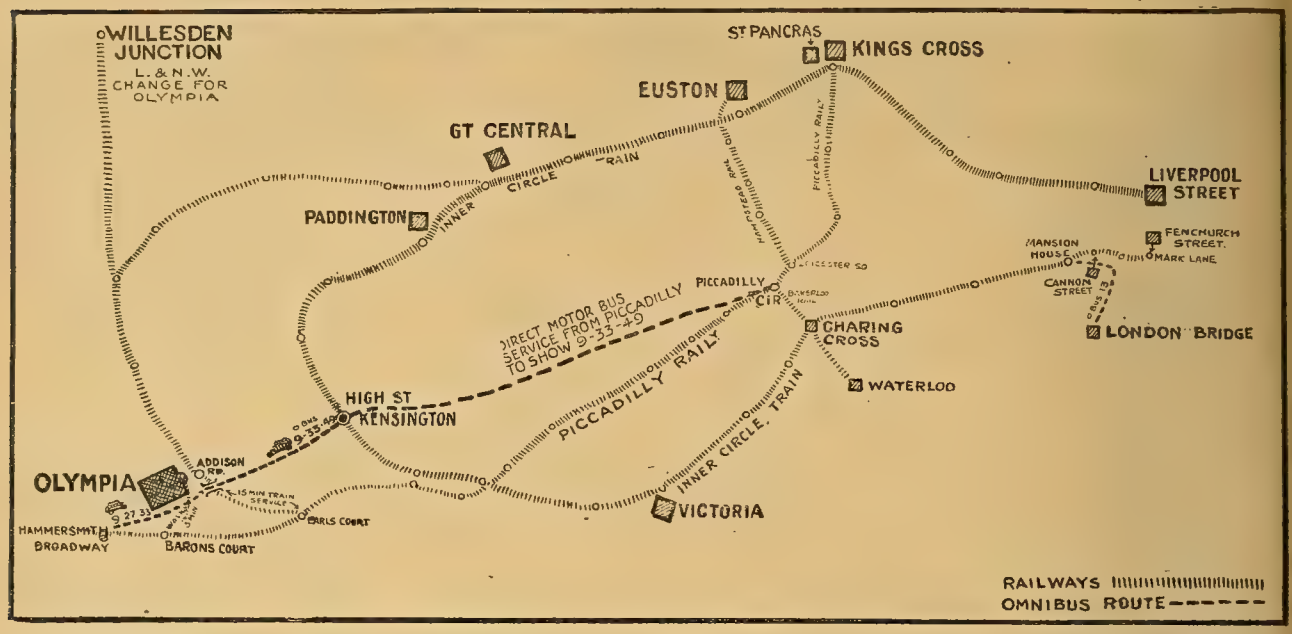
Messrs. Montgomery have produced a very nice coach-built sidecar specially for this machine, and the combination is to be known as the "Duette," and sold, complete with two lamps, horn, speedometer, touring bags, spare petrol can, wind screen, overall apron, etc., for 88 guineas.

Other sidecars, both coachbuilt and cane models, varying in price between £8 and £21, are listed by Messrs. Montgomery and Co. for 1914. The above are but a few of the large range of models made by Messrs. Montgomery, of which we give three views above.



An attractive C.C.R. sidecar outfit.

HOW TO GET TO OLYMPIA.



WE publish above a map of the various London railways, showing how to reach Olympia from the different London termini, and below we give the best method of accomplishing these journeys. It will be seen that occasionally the whole journey can be covered by train, while in other cases combined services of train, tube, or motor omnibus are the best means of reaching the Show.

To Olympia by Motor Omnibus from the Principal London Termini.

RAILWAY TERMINI AND NUMBER OF OMNIBUS SERVICE.

Liverpool Street (G.E.R.)—Nos. 9 and 33.

Charing Cross (S.E.R. and L.C. and D.R.)—Nos. 9 and 33.

London Bridge (S.E.R. and L.C. and D.R.)—No. 13 to Piccadilly Circus, then Nos. 9 and 33.

Paddington (G.W.R.)—No. 74 to the top of Holland Road, then No. 49 down Holland Road to Hammersmith Road.

Marylebone (G.C.R.)—No. 74 to the top of Holland Road, then No. 49 down Holland Road to Hammersmith Road.

By Tube and District Railway.

Olympia is best reached by Tube or District Railway in the following manner:

Liverpool Street (G.E.R.)—Inner Circle train to High Street, Kensington, thence omnibus, Nos. 9, 33, and 49, to Addison Bridge.

London Bridge (S.E.R. and L.C. and D.R.)—Omnibus No. 13 to the Mansion House, thence by Inner Circle train to High Street, Kensington, and omnibus to Olympia.

Charing Cross (S.E.R. and L.C. and D.R.)—Either Bakerloo Railway to Barons Court (five minutes' walk, change at Piccadilly Circus), or by District Railway train direct to Barons Court.

Waterloo (L. and S.W.R.)—Tube as from Charing Cross.

King's Cross (G.N.R.) and St. Pancras (Mid.)—Tube to Barons Court (thence five minutes' walk).

Euston (L. and N.W.R.)—Tube to Barons Court, change at Leicester Square.

Marylebone (G.C.R.)—Inner Circle train to High Street, Kensington, thence by omnibus, Nos. 9, 33, and 49, to Olympia, or Metropolitan Railway direct to Addison Road.

Paddington (G.W.R.)—Inner Circle train to High Street, Kensington, thence by omnibus, Nos. 9, 33, and 49.

Fenchurch Street (G.E.R.)—Mark Lane Station, then Inner Circle train to High Street, Kensington, thence by Nos. 9, 33, or 49 omnibus.

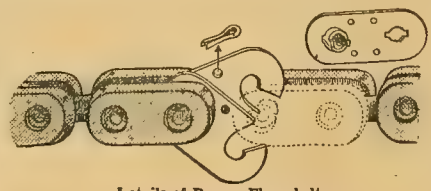
Cannon Street (S.E.R. and L.C. and D.R.)—Inner Circle train to High Street, Kensington, and thence by omnibus as above.

Willesden Junction.—For North country and Midland visitors arriving in London by L.N.W.R., it will be found most convenient to change at Willesden Junction, whence frequent trains run direct to Addison Road, adjoining Olympia.

Victoria (L.B. and S.C.R.)—Tube to Barons Court.

A NEW CHAIN BELT.

Chain belts have been experimented with at various times by many firms, and there is on the market now a very excellent leather link belt, but no one has yet succeeded in making a chain belt with V rubber blocks. The Flexo belt is, therefore, of special interest. This belt is made up of chain links riveted together. The centre links have pen steel bushes over which fit the side plates. The blocks are vulcanised on, and no amount of hard work will loosen them. The connecting link by which the belt is joined and adjusted is an ingenious fitting. As will be noticed the slots in the links are inclined. In the position in which they are sketched they are about to be closed, which action draws the ends of the belt together. The belt cannot possibly be put on the pulleys at a tension, that is, "run on" by wheeling the machine backwards, so the connecting link is made to draw the ends of the belt together a matter of three-sixteenths of an inch. If further adjustment be required a spare link is provided, which affords approximately the same amount of adjustment as the half link of an ordinary chain.



Details of Downs Flexo belt.

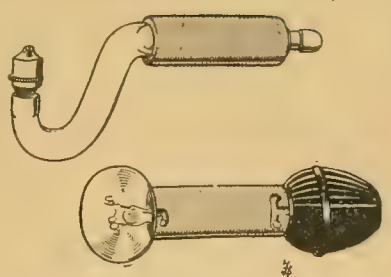
Mr. R. W. Downs, the manager of the Flexo Belt, Ltd., 116, Great Portland Street, W., explained to us that the wedging action is greatly increased in comparison with an ordinary belt, owing to the fact that no stretching takes place. It will be exhibited at Olympia, and is being made at present in $\frac{3}{4}$in., $\frac{7}{8}$in., 1in. and 1$\frac{1}{8}$in. sizes.

A CONVERTIBLE ACETYLENE-ELECTRIC LAMP.

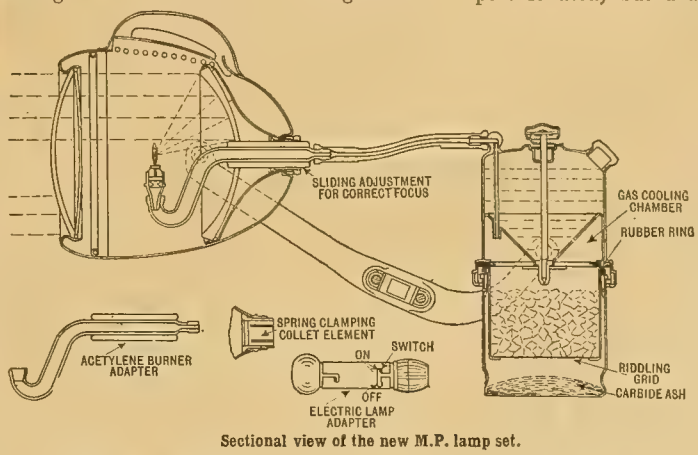
THERE are many riders who require a good light for long distance work at night, but dislike the trouble of lighting up and the consequent cleaning out of acetylene generators. To such the new lamp manufactured by the M.P. Co., of Bordesley Green, Birmingham, will strongly appeal. This lamp is specially constructed for use with either acetylene gas or electric light, and the conversion from one system to another is merely a matter of moments. The lamp itself has a pleasing appearance, and the body is made out of one piece. All necessary fittings, such as the hood and hinges, are very strongly made, and are riveted firmly to the body in such a manner as to prevent rattles. A Mangin mirror reflector is fitted so that it can be readily detached, if necessary, and allowance is made for expansion. Here, again, the possibilities of rattle have been eliminated so far as is possible. The mirror has a circular hole cut in its centre so as to allow either the electric bulb holder or the gas jet holder to pass through the back of the lamp, in which position they can be fixed by a thumb nut, which tightens up a split collar in such a way as to grip the body firmly.

The M.P. acetylene lamp and generator, showing neat method of fixing the connection to the head lamp.

The bulb holder is combined with a switch, and the burner is held by a flattened tube so as not to affect the reflected light at all. Lateral adjustment is provided in each case for obtaining perfect focus, but each holder will be marked correctly so as to enable the owner to find the focus at once. The most unusual feature about the generator is the metal-to-metal joint between the carbide chamber and the gas chamber. The container fixes with a breech block joint, and its edge is thus forced up against a very thin metal plate. This plate is so ductile that it follows the slightest indentation in the edge of the container, and so makes a gas-tight joint. The walls of the water chamber are utilised to cool the issuing gases, and the generator is so arranged that only a very short length of rubber tubing is needed. The usual type of forked support is used, but a feature is made of the fact that it only needs ½in. of the steering tube to obtain its grip, thus handlebars need not be unduly raised. The generator may be detached in the usual way and a special 6 volt cell substituted, giving a light suitable for traffic or short distance work, though, of course, not such a brilliant beam as when acetylene gas is used.



Electric and acetylene attachments for the M.P. lamp set.

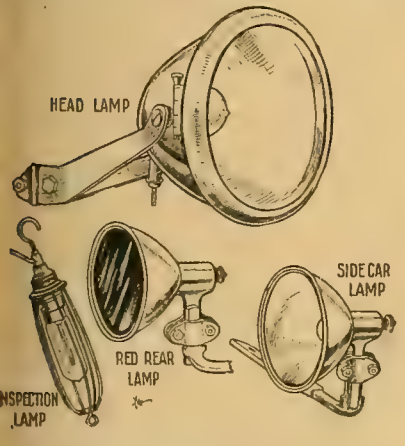


Sectional view of the new M.P. lamp set.

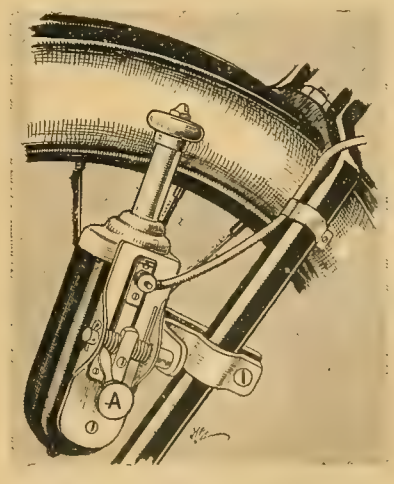
MOTOSACOCHE ELECTRIC LIGHTING SET.

IN these days of advancement, when electric lighting is coming to the front, great interest attaches to an ingenious little dynamo electric lighting set for Motosacoche machines. A dynamo, driven off the back wheel by a rubber disc running against the side of the tyre, supplies the current. The set includes a continuous current dynamo, totally enclosed, and running on ball bearings, attached to the back fork by means of a movable clip. A battery, consisting of three accumulators, is fitted in an aluminium box on the footboards, with the volt and ampère-meter showing through the lid of the box, on the top of which are two switches, one a press-button for throwing the volt-meter into circuit, and a safety plug. The lighting set includes a projector head light, a side-car lamp, a tail lamp, and also what is extremely useful, an inspection lamp for repair work in the dark. A feature of the fitment is that the acid in the battery is in jelly form, and this, in conjunction with the false tops and rubber caps over the vents of the accumulator, renders spilling of acid an absolute impossibility.

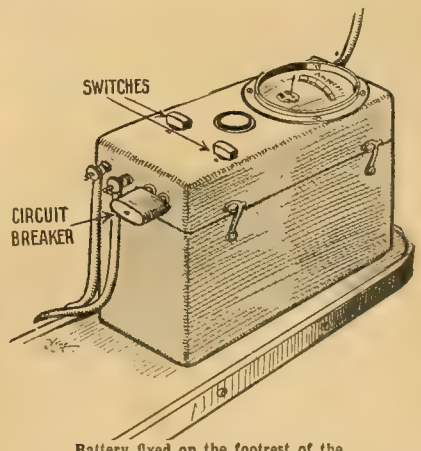
The set is sure to attract considerable attention on the Motosacoche stand at Olympia, for there is no reason why it should not be adapted to any existing Motosacoche.



The complete set of lamps for the Motosacoche lighting outfit.



The Motosacoche dynamo which is driven off the rear tyre. A—Screw to vary pressure of dynamo friction wheel against tyre. The wheel can be adjusted to clear the tyre when the light is not required.



Battery fixed on the footrest of the 1914 Motosacoche.

THE STREATHAM TOURING TRIAL RESULTS & AWARDS.

WE publish herewith the official awards in the Streatham and District M.C.C. One-day Touring Trial. The judge's report of the trial truthfully points out that much trouble would be avoided if competitors were to read carefully the rules. The report is strictly fair, and the following riders are commended for making fine performances on the track: R. G. Mundy (Triumph), 50.38 m.p.h.; F. Smith (5-6 Clyno sc.), 47.12 m.p.h.; Alan Roberts (3½ Blackburne), 48.53 m.p.h.; H. Gibson (5-6 Bradbury sc.), 43.75 m.p.h.; H. B. Willoughby (3½ Rudge Multi), 50.75 m.p.h.; A. B. Wade (5-6 Zenith), 56.37 m.p.h.; L. Martin (Singer c.c.), 52.66 m.p.h.; W. L. Barratt (2¾ Douglas), 42.94 m.p.h.; A. V. Sumner (3½ Zenith), 50.28 m.p.h.; S. Tubb (2¾ Humber), 43.02 m.p.h. and S. Crawley (Triumph), 53.05 m.p.h. B. A. Hill's 7 Indian is also specially mentioned for its silence.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Route round London.

Will you please give me the best route to take from Canterbury to Watford to avoid London traffic?—W.N.G.

To avoid London you will have to make a long detour. Your best route is: Canterbury, Faversham, Sittingbourne, Chatham, Rochester, Gravesend, cross the Thames by ferry to Tilbury, then go to Romford, Theydon Bois, Waltham Cross, Northaw, Enfield, New Barnet, Chipping Barnet, Elstree, Bushey Heath, Watford.

Safeguarding Against Skidding.

Can you inform me if there is any device on the market to ensure against skidding? Rubber studs are useful for a few journeys, but they soon wear off, and I cannot afford to scrap tyres on this account.—J.W.

There is no really certain device against skidding. The only thing to do is to use a good tyre and drive carefully on greasy roads. There have been devices made which were satisfactory provided they could be used quickly enough, but the trouble was that the machine would probably sideslip before there was time to put the non-skid into action. We advise you to try a combination rubber and steel-studded tyre.

An Ignition Difficulty.

I should be obliged if you could help me with the following difficulty. My machine is a twin-cylinder lightweight, and at low speeds fires only on one cylinder. No spark appears at the plug (several of which have been tried) when the back wheel is revolved by hand. When the engine is started up on free engine the faulty cylinder chips in occasionally, and when the revolutions are very high the firing is almost even. There are no air leaks. It is not the fault of the carbon brush or the wires, as those belonging to the sound cylinder have been tried, and still no spark. The platinums are in perfect condition, and appear to fulfil their function properly. Is it possible that the magneto can be at fault when it fires the one cylinder correctly?—B.H.H.

The symptoms of your machine are extraordinary. Have you tried varying the distance between the sparking plug points? We note that there are no air leaks in the carburetter or in the induction pipe, but this misfiring would certainly tend to point to the fact that there was a slight air leak in the cylinder in which misfiring takes place. If you cannot cure your trouble we should recommend you to return the magneto to the makers asking them to test it for you.

Leamington to Glasgow.

Will you kindly inform me the most direct route from Leamington to Glasgow, and what sort of roads are there in Lanarkshire, and is it a very hilly county?—C.L.R.

Leamington to Glasgow. Shortest route: Leamington, Kenilworth, Stonebridge, Coleshill, Lichfield, Rugeley, Stone, Newcastle, Knutsford, Warrington, Wigan, Preston, Lancaster, Kendal, Penrith, Carlisle, Lockerbie, Beattock, Abingdon, Glasgow. There are several good main roads in Lanarkshire, such as the above-mentioned. The ride over the Beattock summit is pretty, but bad as far as steepness is concerned; otherwise, the main roads are quite good

Ignition Difficulty on Old Machine.

I have a 3½ h.p. motor cycle about ten years old, with trembler coil ignition and make and break contact breaker. The engine is in excellent condition, but every thirty miles or so the power falls off mysteriously, and the machine will barely struggle up the smallest hill. Compression is excellent, coil, contact breaker, and carburetter properly adjusted, exhaust valve with ⅛in. lift, and engine well lubricated. I have also experimented with different lifts and springs for the automatic inlet valve, and fitted a new spring to the exhaust with no effect. Neither the piston nor bearings are too tight. I have been told that when an accumulator is a little run down a loss of power takes place. Is this true? My accumulator is four volts sixteen ampères, and the coil takes two ampères per hour, and whenever the loss of power has taken place there was a good spark at the plug. The accumulator was fully charged at the start. —R.D.J.

It is quite possible that the loss of power may be due to the coil being fitted with an inefficient condenser. This would cause the platinum points to burn very rapidly. Probably, after the period mentioned, the resultant wear on the contact breaker points would upset the adjustment and cause the symptoms of which you complain. If you could get hold of a second-hand magneto and fit it, the machine would run very much better.

General Information

I have a late 1911 Scott motor cycle, and I should be greatly obliged by your kind advice on the following points: (1.) One cylinder has much weaker compression than the other. The half-compression valve does not seem to lift rightly, and my idea is that it is not properly closing. (a) About what lift should there be? (b) Does it screw out for examination? (2.) The machine does not take extra air at any speed, but works as a single lever carburetter. Is this right, and is the air lever likely to be needed in summer? (3.) What repair outfit do you recommend for chains, and what lubricant? I have mixed black lead and vaseline, as the chains are difficult to remove and soak as is often advised. (4.) Do you consider paraffin or other cheap fuel could be used? (5.) With water-cooling, could not a good gas engine oil at about 3s. be used without harm? (6.) What do motor cyclists generally insure against? (7.) I intend fitting a sidecar for my wife. We only weigh about 18 stones between us. My present gears are, I believe, 3¾ and 7. What reduction would you advise? (8.) What kind of sidecar should I have? (9.) Would you advise a larger jet with sidecar fitted? (10.) Apart from solder, what is a temporary repair for (a) leaking radiator, to stand hot water; (b) leaking petrol tank, to stand petrol? (11.) What lights are required for sidecar? I ask this because I have seen reports of various byelaws in different parts of the country.—A.W.

(1.) We cannot tell you the exact amount of lift of the half-compression valve, but you may take it that that provided by the makers is sufficient, unless, of course, it is not lifting properly through the Bowden wire being too slack. To the best of our recollection it can be removed for examination. (2.) The trouble here may be that the jet is partially choked. Full extra air should be required at high speeds only. (3.) There is a splendid chain lubrication by Messrs. Price's Patent Candle Co., Ltd., Belmont Works, Battersea, S.W., which is very satisfactory, and, as regards repair outfit, we

should recommend a stud remover and a few detachable links, which can be obtained from most dealers, or from Messrs. Hans Renold, Ltd., Progress Works, Brook Street, Manchester. (4.) We should not think that paraffin would be suitable for this machine. (5.) We can hardly recommend gas engine oil; our advice is to use the best lubricant obtainable. It is always best to be advised by the makers' experts, because what might suit one water-cooled engine might not suit another. (6.) Motor cyclists insure against third party, accidental damage, fire, burglary and theft, and transit, but almost any insurance company will issue a policy for third party risks only. (7.) You would have to gear a little lower, say about 5 to 1, when using a sidecar. (8.) We should recommend a light cane sidecar. On the whole, the rigid sidecar is the most satisfactory. (9.) Slightly larger; we should advise you to experiment when you have the sidecar fitted. (10.) Some accessory firms sell little blocks of fibre which are pressed together by means of a spring running through the radiator cells. This spring keeps the block tight up against the faulty leak, and is actually used as a standby. A leaking petrol tank may be cured temporarily by strapping up the tank securely and smearing soap over the injured portion, or by applying Cæmentium and paper. (11.) It is best to use a light on the sidecar to show the width of the vehicle and a reflex at the rear.

Lincoln to Portsmouth.

Would you kindly give me the best main road route through all the large towns (but missing London) from Lincoln to Portsmouth? I intend to do the trip on a 3½ h.p. Rover combination. I should be glad if you could tell me the mileage.—CHARLES W. KENDALL.

Your best route would be as follows: Lincoln, Grantham, Greatham, Oakham, Uppingham, Rockingham, Kettering, Northampton, Towcester, Brackley, Oxford, Shillingford, Reading, Odiham, Alton, Petersfield, Cosham, to Portsmouth. The distance is approximately 195 miles.

Leicester to Hastings.

I should be obliged if you could let me know the shortest and quickest route from Leicester to Hastings. I should like to avoid London and all large towns as much as possible, as my machine will be a single-geared 3½ T.T.—C.H.W.

The most direct way from Leicester to Hastings is, of course, right through London. If you want to avoid London you will have to make a detour. Try the following: Leicester, Northampton, Stony Stratford, Fenny Stratford, Dunstable, St. Albans, Watford, Uxbridge, Colnbrook, Staines, Chertsey, Cobham, Leatherhead, Dorking, Reigate, Redhill, Westerham, Sevenoaks, Tonbridge, Lamberhurst, Battle, Hastings.

The Cut-out Question.

Will you please tell me what the law is relating to silencers and cut-outs on motor cycles, as I have had my name and address taken through my machine making a noise due to the exhaust box being broken, but there was no cut-out on the machine?—A.S.

The law states that the exhaust gases must be led to a silencer or expansion chamber, and that no cut-out be fitted on the pipe between the engine and the silencer, but at the same time if a cut-out is fitted at the end of the silencer remote from where the pipe enters it, the noise must not be excessive, and if it is so in the opinion of the law officers you are liable to prosecution. Certainly a broken silencer would be tantamount to a cut-out in our opinion.

Taxation of Traveller's Motor Cycle.

I have just bought a motor cycle, which I use to carry samples in the course of my business as a commercial traveller. Shall I be exempt from Inland Revenue tax if I have my name and address painted on the tank and only use it for business, and to whom must I apply for exemption?—W.H.J.

We think you ought to be exempt from the local taxation licence if you have a special box constructed on your carrier and your name and address painted on the tank in letters not less than 1in. in size. The machine, however, must not be used for your own pleasure on any occasion whatever. You must apply to the nearest Inland Revenue authorities for exemption.

Richmond (Yorks) to Manchester.

Could you oblige me by telling me the best route from Richmond (Yorks.) to Manchester, avoiding large towns where possible?—J.H.

Your best way of avoiding large towns must necessarily be somewhat circuitous. Follow the London Road south to Boroughbridge and Wetherby; soon after Wetherby and close to Boston Spa, turn right and continue through Harewood, Otley, Ilkley, and Skipton, to Colne and Burnley; then through Accrington, Haslingden, and Bury to Manchester, or through Bacup and Rochdale to Manchester. In the neighbourhood of Manchester you cannot very well avoid large towns, and in some parts you will find the roads bad.

A Big Sidecar Load.

I think of having a new sidecar, and shall be glad if you will help me in the following I want a good 3½ h.p. machine and sidecar, and wish to take my wife and boy of six years in the sidecar, and a girl on the carrier. Would a 3½ h.p. single-cylinder do that on any reasonable hill?—R.O.

We should not recommend a 3½ single-cylinder motor cycle being utilised for such heavy work as you propose to use it for. If you wish to carry at times no less than four persons, you will certainly want at least 6 h.p. and two cylinders if you wish to make sure of climbing hills easily. A change-speed gear will be absolutely necessary, and three speeds are better than two for such work. A strong back tyre must be fitted.

READER'S REPLY.

Cheshire to Olympia.

Referring to your reply to "R.F." I would suggest that the route from Derby to Leicester should read: Derby, Kegworth, Loughborough, Leicester. I know this district well.—J. A. TYLER.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

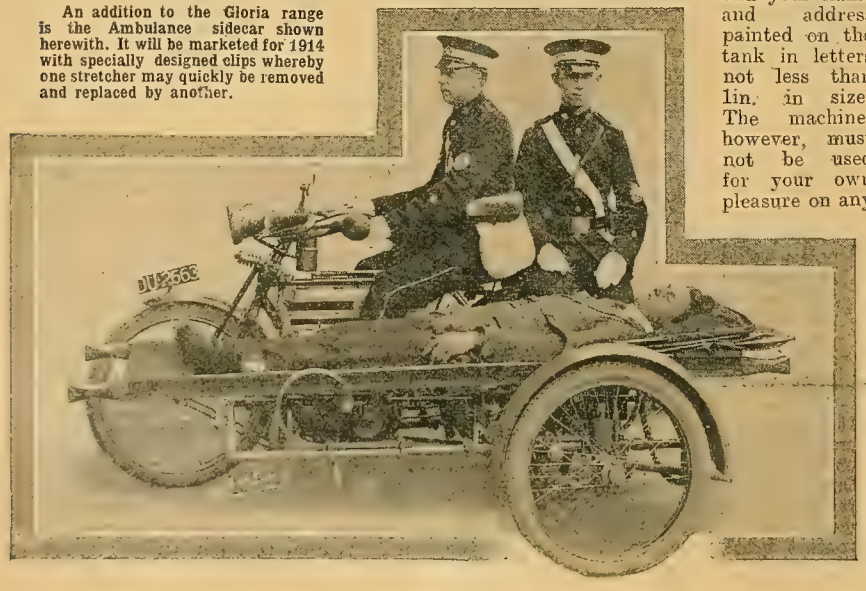
"N.H." (Hull).—Brampton gear, on any 3½ h.p. sidecar combination.

"E.B." (Portsmouth).—1911 5-6 h.p. twin Rex with sidecar.

"F.S." (Lancashire).—2½ h.p. Wulfruna and Levis.

"W.P." (Heworth).—1913 3½ h.p. Premier with Armstrong gear. Reliability and economy.

"A.A.R." (Kent).—1911 four-cylinder F.N. Reliability and consumption. Reliability of folding or collapsible sidecars.



An addition to the Gloria range is the Ambulance sidecar shown herewith. It will be marketed for 1914 with specially designed clips whereby one stretcher may quickly be removed and replaced by another.

OLYMPIA.

Next week's issue of **"THE MOTOR CYCLE"** will contain a full description of the motor cycle exhibits at Olympia, written by our own staff.

P&H HIGHEST GRADE

AT OLYMPIA, STAND 182 (GALLERY)

THAT'S the stand to call at for LAMPS!

—for that's where you'll find the popular "P. & H." Models—the British-Made "QUALITY" Lamps of "Highest-Grade" and "Highest Value."

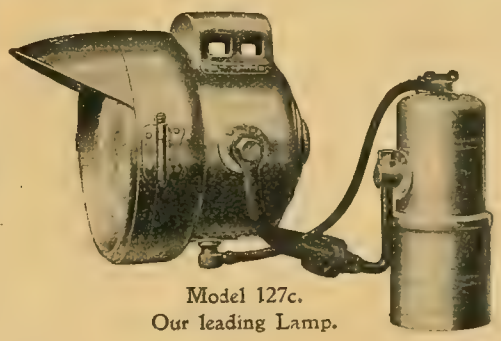
—WE specialize on "LAMPS" *only*—we have done so for upwards of 30 years—and our unique knowledge and experience is concentrated on producing highest QUALITY, EFFICIENCY, and VALUE in each and every model—hence the world-wide popularity and marked superiority of "P. & H." productions.

—Note the models here illustrated and their specifications—such a combination of valuable and desirable features as embodied in each model cannot be obtained elsewhere:—

Model 125c. 7in. PROJECTOR; has 5¾in. Front with large hood reflector; best quality Mirror Reflector; "RONI" Burner; 4½in. plate glass bevelled Convex Lens. Special GENERATOR. Can be easily cleaned and recharged, with extra strong Double Carrier, complete with best quality grey rubber tubing. Can be easily fitted on handle-bar stem or bracket. Nickel or Ebony finish .. .. Price **27/-**

Model 128c. 7in. PROJECTOR; has 5¾in. Front; powerful Real Mangin Mirror Reflector; "RONI" Burner with special focussing adjustment; 4½in. plate glass Convex Lens. Special GENERATOR, easily cleaned and recharged, with adjustable stamped steel Double Carrier of special design, complete with best grey rubber connection. Can be fitted on handle-bar stem or bracket. Nickel or Ebony finish .. .. .. Price **30/6**

Model 127c. Extra large size PROJECTOR; has 6½in. Front; powerful 5in. Real Mangin Mirror Reflector; Bray "RONI" Burner, which cannot crack lens or mirror, with patent focussing adjustment; 5½in. plate glass Convex Lens. Special GENERATOR, easily cleaned and recharged, with adjustable stamped steel Double Carrier of new design and exceptional strength, complete with best quality grey rubber connection. Can be fitted on handle-bar stem or bracket. Nickel or Ebony finish Price **36/6**



Model 127c.
Our leading Lamp.

—Call and handle our models—note their superior quality, sound construction, and fine finish—and see how well we substantiate our claims to Lamp-Supremacy.

—Failing a call, please write for "Lamp Booklet"—and examine our models at your Agents—then you can't go wrong in buying.

8th Flotilla,
HAWICK.

Dear Sirs,

I should be much obliged if you would send me your catalogue of Whittle Belts, as I am thinking of fitting one to my new Triumph. I ran one of your Whittle Belts on my Douglas with great success, and I was very pleased with the way the belt behaved.

Yours truly,
C. SEARLES WOOD,
Sub. Lieut., R.N.

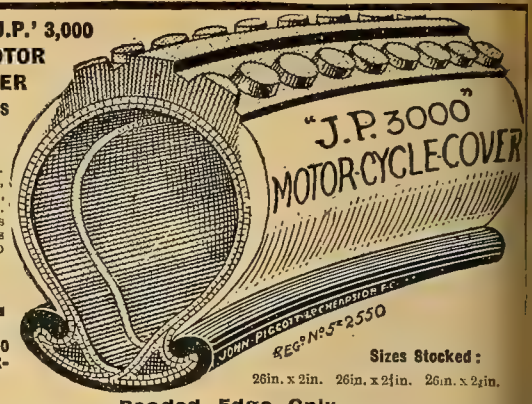
The 'J.P.' 3,000 MILE MOTOR CYCLE COVER

The Cover that HAS stood the Test.

TESTIMONIAL.

Barnsley, June 18th, 1913.
Dear Sirs—Please send per return, two 26 x 2¼in motor cycle covers, for which I enclose P.O.O. for £3. The last cover I got from you has now done over 3,800 miles, and is the first tyre I have had to do so much on my back wheel.



YOUR LOCAL AGENT will not advise you to buy a 'J.P. 3,000 Mile Tyre for **30/-**

BECAUSE you must deal direct. '3,000 MILES' for 30/- allows for no INTERMEDIATE PROFITS.

Sizes Stocked:
26in. x 2in. 26in. x 2¼in. 26in. x 2½in.

Beaded Edge Only.

This cover is made on the same principle as a heavy motor car tyre, viz., under hydraulic pressure, and not as the usual motor cyle covers which are usually a glorified cycle tyre. It is composed of the best Para rubber, and fitted with a new non skid tread which has been thoroughly tested and found to be an absolute preventive of skidding.

We are so confident of the wearing properties of this tyre that we are guaranteeing it for 3,000 Miles.

A Written Guarantee enclosed with every Cover as follows: **30/-** **Guaranteed 3,000 MILES. With or without sidecar.**

ARMSTRONG

"Tourist Trophy" MOTOGEAR, Mark VII., AT "STAND 187" GALLERY.

¶ MECHANICAL PERFECTION as portrayed in "The ARMSTRONG" is the outcome of pre-eminent merit in design and constructional refinement in details.

— "STRENGTH — SIMPLICITY — EFFICIENCY" is the keynote of "The ARMSTRONG" MOTOGEAR — backed by sterling "QUALITY" of materials, workmanship, and finish.

— Our sectional view reveals its working parts — those parts, it should be noted, are few, ESSENTIALS ONLY — and their fewness admits of MAXIMUM STRENGTH for each.

— By virtue of these features and the fact that it is the PIONEER 3-Speed Hub Gear, it ranks literally FIRST and BEST; and, inferentially, for its selection by all expert riders, its overwhelming successes in all competitions — with its crowning achievement in the TOURIST TROPHY RACES (winning the 1913 JUNIOR T.T.; FASTEST LAP, and RECORD TIME for the Course) — and its inclusion on the foremost machines of the day.

FIRST AND BEST

¶ FITTED BY ALL THE LEADING MANUFACTURERS!

MOTOR CYCLISTS—PLEASE NOTE!!!

Copy of Letter from Chairman of Competitions Committee A.C.U.

November 13th, 1913. Carew, Walton-on-Hill, Surrey.

Sirs,

Having used a "Watford" Speedometer during the past year, fitted to three different makes of motor vehicles, a "Bayard" light car, a "G.W.K." cycle car, and a "Premier" motor bicycle, I should like to say that I have found your speed indicator the most reliable, accurate, and generally satisfactory that I have ever used.

For steadiness of the needle as well as for the silence and lasting qualities of the gear box and transmission I do not think it can be surpassed.

I am, yours faithfully
(Signed) E. Percy Greenhill,
Chairman of Competitions Committee A.C.U.

AT THE SIGN OF THE WYVERN

Stand 73, Ground Floor, Olympia Show, Nov. 24 to 29

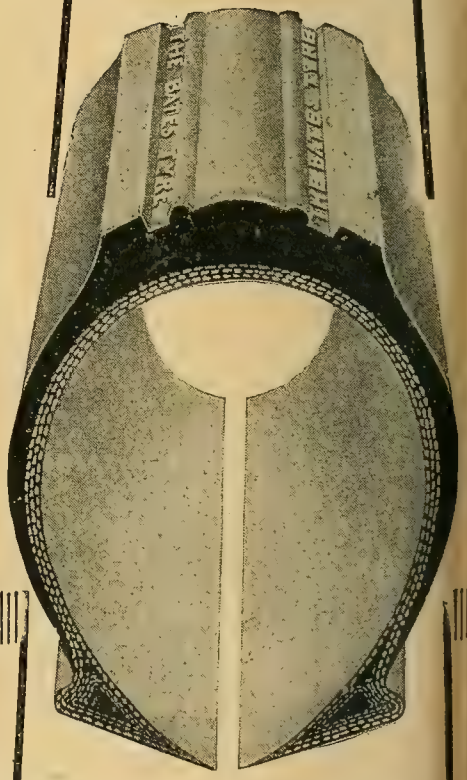
you will find an interesting display of our motor cycle tyres, belts, gaiters, covers, etc., for 1914, amongst which the No. 1 Pattern Tyre should claim your special attention. It has been aptly termed the "Worry-proof Tyre" on account of its puncture and skid-resisting qualities.

You will notice the side ridges which "bite" the road when there is danger of side-slip, but which are protected from unnecessary wear by the thick dome-like centre.

The construction of the "dome," together with the pure Para rubber used, give the tyre a peculiar resilience which acts in a similar way to a shock absorber, affording a smooth, easy running even at high speed.

In addition to the usual sizes supplied last season, including the 26×2½ to fit 2¼ rims, and the 26×2¾ to fit 650×65 rims, we are introducing 28×2½ and 28×3 tyres to fit Indian Rims and 26×2 Special Heavy for the driving wheel of Douglas machines. We shall also show the studded pattern.

As the majority of motor cycle manufacturers are prepared to fit tyres and belts to suit their patrons, riders should specify "Bates" when ordering their machines, and see that they get them.



Bates Super Rubber TYRES

The Trend of Design.

THE Olympia Show is interesting to the student of design in a wider sense than that it merely displays the latest and best in self-propelled machines, for it also shows in what way the wind blows and in what way it has ceased to blow. Those readers who file for reference our annual Buyers' Guide Number may well spend an interesting and instructive evening comparing the specifications of this year's products of the chief factories with their previous efforts, and if they do so they will find one or two very striking facts.

First and foremost is the general gravitation towards three speeds, and for this we have largely to thank the great popularity of the sidecar, and also, in a great measure, the A.C.U. and the Edinburgh and District M.C.C. for selecting such severe courses for their respective Six Days Trials. Incidentally, the counter-shaft gear and two step drive record a marked increase. Another point in which real advance has been made is in the efficiency of transmission. Chains are now almost universally guarded, while advance in ball bearing and bevel cutting manufacture has improved the efficiency of the shaft drive enormously. Belts have had a wealth of attention paid to their construction, with the result that even large capacity engines find the large section modern belt a suitable method of transmitting their power to the wheel. A year or so ago we should have lent our ears with some degree of sympathy to rumours that chains were ousting belts, but now we feel very safe in asserting that the belt is so firmly established, owing to its general excellence, that it will hold its sway for some considerable time to come.

Perhaps the feature of the Show is the introduction of electric lighting and electric starting in the motor cycle world. Everyone will watch the behaviour of this innovation with interest. While welcoming any novelty that may benefit riders, we prefer to withhold criticism of this fitment till we have seen its performances in open competitions, and the coming London-Exeter-London M.C.C. Christmas run will prove an admirable test for such installations. With regard to engines, no one size holds a preponderating position, though the 500 c.c., both in single and twin-cylinder form, still asserts itself valiantly, but some of the makers, hitherto most staunch adherents of this type of engine in its single-cylinder guise, have now increased the capacity of their motors.

A significant advance has been made in two-stroke engines, especially of the small single cylinder type, and we believe this pattern will continue to enjoy a growing popularity, unless, indeed, the rotary valve comes with a rush, in which case we believe the two-stroke will be hard put to it to maintain its position. Unfortunately, inherent difficulties have still to be overcome in making satisfactory air-cooled two-stroke engines of 500 c.c. or over, but in the lower powers they are admirable.

Perhaps the most striking feature of the pastime at the present time is the wonderful popularity of the sidecar. Nearly every motor cyclist, whose means and machine permit of it, sooner or later takes to the sidecar. The attachments themselves may now be purchased equal, if not superior to, small cars in comfort and excellence of finish Far from being a pastime of the young and athletic, as is often stated in the lay press, change-speed gears, comfortable sidecars, spring forks, frames, and large saddles have made motor cycles pleasant means of getting about even to those long past their first flush of youth.

For 1914 many makers are seriously tackling the question of cleanliness, and when the day arrives when motor cycles are as efficiently mudguarded as are cars, about the last objection to our favourite mounts as all weather vehicles will have vanished. Cycle cars, we are happy to record, have been immeasurably improved in design in the last twelve months, and for the first time the A.C.U. definition has been rigidly enforced, which has resulted in a number of light cars being debarred from the exhibition.

We are glad to see the progress accessory makers have made, for a wealth of attention has been devoted to making machines more convenient and comfortable for their users.

TIME TO LIGHT LAMPS.

The Silence of Motor Cycles.

To show how successfully the Rudge Co. have tackled the problem of silence on their 1914 models, which are now the type being delivered to the public, the firm inform us that they have received a notice from the Coventry police authorities requesting that employees use efficient horns when out testing; so efficient are the new Rudge silencers.

The Motor Cycle in Canada.

A Canadian correspondent writes from Thackery (Sask.) that there are already a few motor cycles used on the prairie, chiefly Indians. The roads are being rapidly improved, and the "trails" mostly make a fairly good road for motor cycling. The country is indeed a difficult one where motor cycling cannot be employed to advantage in some form.

Critical Articles on the Show.

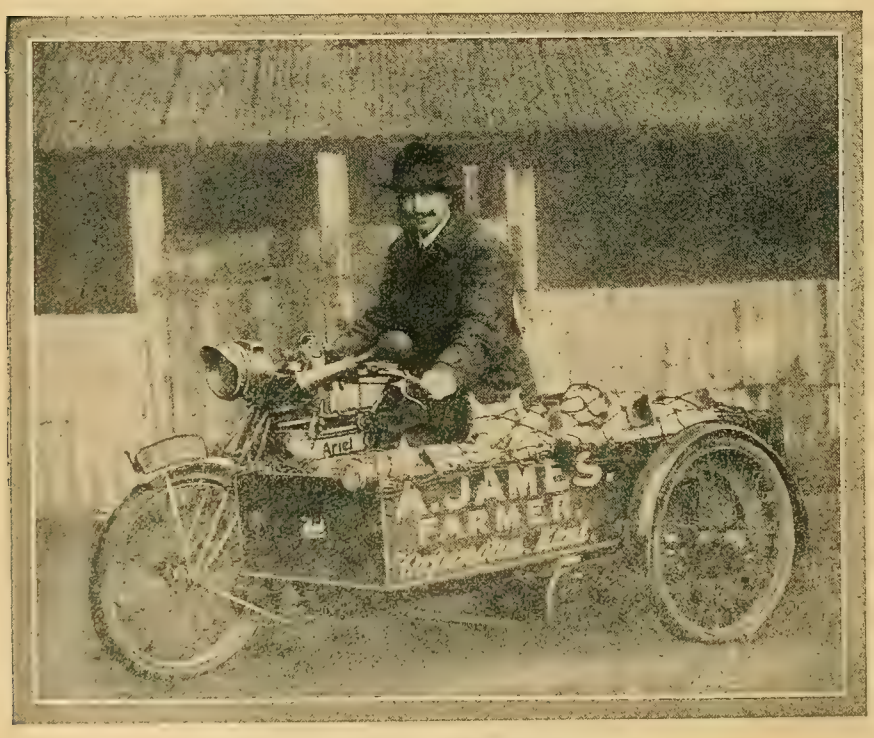
In succeeding issues of this journal, critical articles on the Show exhibits by well-known experts will be published.

A.C.U. Membership.

Two hundred and sixty-five touring, fourteen country, and six town members, making a total of two hundred and eighty-five, were elected at the conclusion of the last month.

A.A. and M.U. Notes.

INVISIBLE SPEED LIMIT NOTICES.—The A.A. and M.U. has already been instrumental in obtaining the removal of speed limit signs so placed that motorists could not see them from the roadway. Last month a member informed the Association that the speed limit notice at Letchworth, on the Hitchin side, was invisible to motorists owing to its position behind a tree. The county surveyor, after correspondence with the Association, has now arranged to erect a warning board about seventy yards west of the existing board.



HOW FIVE LITTLE PIGS WENT TO MARKET!

The difficulty of conveying farm stock from one place to another has apparently been solved by an Orpington farmer, who has fixed a suitable sidecar body to his 3½ h.p. Ariel, and is seen with a complement of pigs

SPECIAL FEATURES:

OLYMPIA SHOW REPORT.
Profusely Illustrated.

A TRIP IN THE NILGHERIS.

Activity at Brooklands.

Over a score of records were broken at Brooklands last week, mostly long distance figures up to ten hours.

"The Motor Cycle" Show Report.

The descriptions of the various Show machines in our pages this week were dictated to shorthand writers by our staff at Olympia at the press view during the week-end.

It can thus be taken that *The Motor Cycle* Report, written on the spot, is as reliable as it is possible to get it.

Excessive Wear of Highways.

At the annual meeting of Messrs. Humber, Ltd., last week, the Chairman (Mr. Edward Powell) protested against the manner in which the roads were being used by heavy traction engines and the manner in which excessive wear of the highway is being caused by the great and increasing amount of heavy vehicular traffic.

Gometz-le-Chatel Hill-climb.

The third annual "Course de Côte de Gometz-le-Châtel" will take place under the auspices of the Autocycle Club de France on December 7th. The competition is open to motor cycles, tricars, sidecars, and cycle cars. On account of the Paris Salon having preceded the event, this year's climb will cau increased interest, as nearly all the competitors should be riding new models

Tickets for Olympia Motor Cycle Show.

The A.C.U., as in previous years, has been able to arrange for the supply of tickets of admission to the Cycle and Motor Cycle Show this week at the reduced price of 6d. each, to affiliated club members.

Special trains in connection with the Show are being run from practically all quarters.

A Correction.

Owing to the similarity of names there was some confusion in two announcements in our Club News pages last week. The Public Schools M.C.C. (London) will hold speed trials at Brooklands at 2 p.m. on the 29th inst., while the Public Schools M.C. (Birmingham) have a meeting at Olympia Stand, No. 133, at 1-30 p.m. on the same day. The present address of the hon. secretary of the latter club is 21, St. Nicholas Street, Coventry.

Olympia on Monday.

The Show opened in promising style on Monday, and towards evening the gangways were fairly well packed. The building is more brilliantly lighted this year. We constantly heard of foreign agents being present at the Show inspecting the exhibits. Judging by Monday's attendance there is no question of the success of the Show.

A.C.U. Notes.

WATER CHARGES.—The Auto Cycle Union has received communications from several of its members who own cycle cars, to the effect that they are being charged the same water rate for water used in the washing of their vehicles, as is now in force in the case of motor cars. It is obviously unfair that the owner of a cycle car should be expected to contribute in the same proportion as a car owner, when on the other hand, for water used for the cleansing of a motor cycle and sidecar no charge is made. The Auto Cycle Union is placing the matter before the Metropolitan Water Board.

RED REAR LIGHTS ON MOTOR CYCLES.—The Auto Cycle Union has been in communication with the County and County Borough Chief Constables of the United Kingdom on the question of red rear lights on motor cycles. While we are awaiting the decision of the Local Government Board it is interesting to note that no action will be taken, until the Local Government Board has considered this matter, by the Chief Constables of the following counties, in addition to those published last week: Cornwall, Lancs, Leicester, Kent, Oxford, Cumberland, Westmorland, Brecknock, East Riding of Yorkshire, Lincoln, Isle of Ely, Derby, Rutland, West Suffolk, and Merionethshire. A similar reply has also been received from the Commissioner of Police of the Metropolis.

The Chief Constables of the following counties have also promised to give the A.C.U. communication their careful consideration: Cambridge, Glamorgan, Pembroke, East Sussex, Hants, Hertford, Berks, North Riding of Yorkshire, Norfolk, West Sussex, Gloucester, Carnarvon, Worcester, Cheshire, Dorset, and Wilts.

Power plant of the 6 h.p. Ariel showing gear striking lever, kick starter, counter-shaft gear, foot boards, and combined drive.

FUTURE EVENTS.

C. T. Newsome (3½ Rover sc.)
G. M. Watkins (6 Zenith sc.)
J. D. Drysdale (6 Hazlewood sc.)

Over thirty applications are to hand from persons who desire to be elected at the next committee meeting, with a view to competing in this event. Entries close on December 8th, and under no circumstances will any entry be accepted after that date.

Motor Cycling in Ceylon.

The popularity of the motor cycle in the East is growing by leaps and bounds, and nowhere more rapidly than in Ceylon, where the fine roads and the beautiful scenery make the motor cycle a most delightful mode of locomotion. An illustration of the way in which the motor cycle is coming to the front is the announcement that a reliability trial for motor cycles, with and without sidecars, and cycle cars, is to be held in the island on the 27th of December next. The route is a circular one from Colombo to Kegalle and back, a distance of 114 miles, and including a stiff hill-climb—the climb, however, being optional. The road has an excellent surface most of the way, but here and there are some bad patches which will test the tyres, if nothing else, and at the end farthest from Colombo there is a fine stretch of winding, undulating road buried in trees, which ought to give the competitors a chance to show what they and their machines are made of. The run is being organised by the Ceylon Motor Cycle Club, but is open to all comers, the only qualification being residence in the island.

A Record Issue.

This issue of *The Motor Cycle* creates a new record in connection with motor cycle topics, forming the biggest number ever offered to the public. Among the wealth of reading matter, mainly in connection with the Show, there are over 400 illustrations. Moreover, the circulation of this issue actually exceeds 90,000 copies.

A Meagre Address.

To show how widely *The Motor Cycle* is known, we have just received a letter from an Italian reader in Milan, the address of which read:

"*The Motor Cycle*,
Thursday."

The communication was not delayed as the Italian postal authorities, knowing this journal, pencilled "Inghilterra" on the envelope, and, after that, matters were simple, and the letter came safely into our hands.

Birmingham M.C.C. Cycle Car Trial.

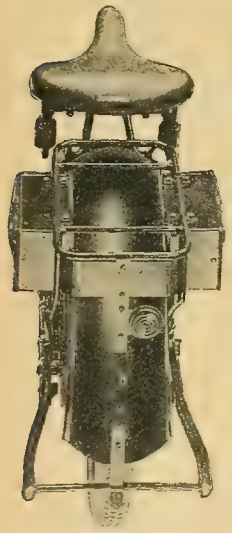
The Birmingham M.C.C. is holding an open reliability trial on Saturday, December 13th, over a secret course of 120 miles, for cycle cars and light cars. Competing machines must come within the A.C.U. cycle car definition and must carry two or more persons. The committee state that the route selected will be a simple one, and that no freak hills or abnormal surfaces will be encountered, but the actual route selected will be kept a secret till the start. In order to give the public as much opportunity as possible to observe the machines during the trial, the event will be decided on a circular course of forty miles, which will be covered three times, and which will all lie within fifteen miles of Birmingham. Competitors will be timed by their own watches, which will be placed in sealed cases provided by the Club, and with the exception of the lunch interval of 1½ hours, the trial will be a non-stop one throughout.

Bombardier Wells, the heavyweight champion of Great Britain, is in training for the coming match with Carpentier, and among his recreations is included motor cycling. He is seen mounted on a 2¾ h.p. Douglas, which he uses daily.

A.J.S., No. 40.

6 h.p. twin MODEL: 74 × 81 mm.; m.o.v.; Amac carburetter; enclosed chains; three-speed counter-shaft.

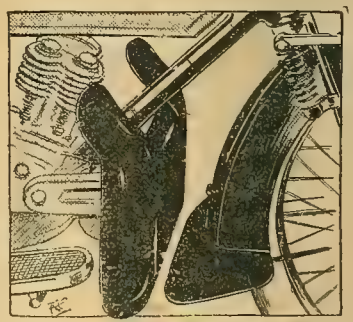
A. J. STEVENS AND CO., LTD., Retreat Street, Wolverhampton.—The centre of attraction on the A.J.S. stand is a 6 h.p. three-speed machine fitted with a fine coachbuilt sidecar specially designed for use with the A.J.S. machines. The sidecar is finished black with fine gold lines and upholstered in French grey, and is fitted with hood and screen, luggage carrier, and an exceedingly neat khaki waterproof apron. The most striking alteration in design for this year in the engine is the abolition of detachable cylinder heads, the cylinder and head now being cast in one, but the cylinder is still held down by overhead yokes and rods anchored to the crank case. Tapered valve springs are employed, and an ingenious system of lubrication is adopted by means of which oil is fed directly through the hollow main shaft to the big ends. This was described in a recent issue. The three-speed gear box, situated behind the engine, is a substantial piece of work, and is fitted with a kick starter carried in an extension of the box casting. The chain casing is extremely well carried out and it is noticeable that, in addition to the transmission protection and efficient mudguarding, Messrs. A. J. Stevens and Co. have made a great step towards providing a weatherproof machine, nickel plating being reduced to an absolute minimum; the rims, spokes, hubs, and fork springs are of unrelieved black, the effect of which is very smart. Well-designed black sheet metal mudshields are fitted in front of the rubber-covered footboards. They are so shaped as to allow a sufficient current of air to pass for cooling purposes.



Rear view of the A.J.S. sidecar machine, showing reflex light, wide mudguard, and metal-lined pannier tool-bags.

2¾ h.p. MODEL: 70×91 mm; side by side valves; Amac carburetter; enclosed chain; two or three-speed counter-shaft.

This model, as regards the standard touring type, remains practically unaltered from last year, except that, like the 6 h.p. twin, detachable heads are no longer fitted to the cylinder. An innovation is manifest in the 2¾ h.p. T.T. model. This machine has been slightly lightened and footrests are fitted instead of footboards, while the back chain is only partly enclosed, but at the same time provision is made for preventing wet or grit from the back wheel falling on to the upper or back parts of the chain. The engine is fitted with a lightened piston and connecting rod, and a higher compression is employed than on the standard model. Three sets of sprockets are supplied, so that the machine can be used either for speed work, touring, or hill-climbing, and Mr. Stevens informs us that speeds up to 64 miles an hour



The mud shield protecting the rider's feet and magneto on the new A.J.S.

RÉSUMÉ OF THE SHOW.

THE Fourth International Cycle, Motor Cycle, and Cycle Car Exhibition was opened to the public on Monday last, and again we are happy to be able to record a distinct advance in the design, workmanship, and utility of the machines displayed, which is as it should be. To enumerate in a nutshell the features which stand out prominently as denoting the most marked advance we direct attention to the

(1.) Increase in two-stroke engines.
(2.) Standardisation of weather-proof transmissions.
(3.) The luxury of modern sidecar outfits.
(4.) The improvements in lubrication systems.
(5.) Growing popularity of counter-shaft gears.
(6.) The advance in lightweight motor cycles.
(7.) Accessibility.

The above, of course, does not by any means exhaust the improvements to be met with, for in a lesser degree one cannot help but be impressed with the strides the outside flywheel has made, likewise the unit system for engine and gear box, and last, but by no means least, the marked improvement in cycle car design. On cycle cars belt transmission has in many cases been replaced by a chain or shaft; accessibility has been more carefully studied, the brakes improved, both in their power and method of adjustment, but still one cannot close one's eyes to the fact that several are still not out of the experimental stage.

We should like to make it clear that at the present Olympia Show, for the first time, cycle cars are not overshadowed by light cars, for at last the authorities have ensured that the 6 cwt. chassis weight has been observed by examination and signed declarations.

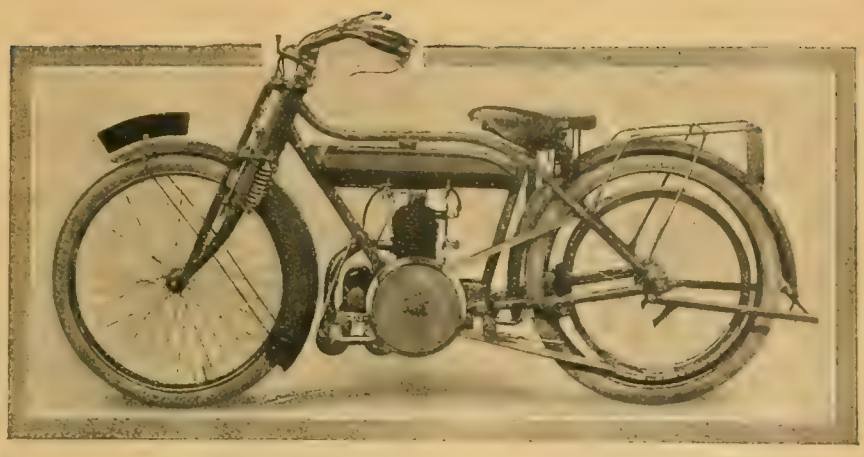
The Olympia Show.—

have been obtained by this small engine. A noticeable feature is the long exhaust pipe with the silencer fitted at the extreme end.

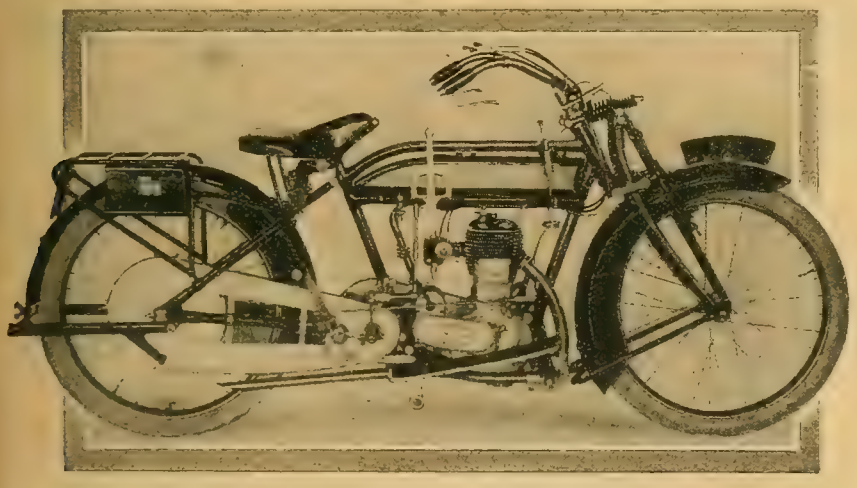
ALLDAYS, No. 77.

6 8 h.p. MODEL: 85 × 88 mm.; side by side valves; Senspray carburetter; chain: three-speed counter-shaft gear.

ALLDAYS AND ONIONS, LTD., Matchless Works, Birmingham.—The big twin Alldays is a particularly interesting machine, for the cylinders are slightly staggered and the connecting rods work on separate cranks, which are set at such an angle as to obtain even firing. All the valves are enclosed in neat aluminium covers, and the gear driven magneto, which lies behind the engine, has now been rendered more accessible by the fact that the timing gear cover is divided and the rear portion can be removed without disturbing anything else. The shafting and operation of the three-speed counter-shaft gear box has been strengthened and simplified, and longitudinal adjustment is provided to take up the slack of the driving chains. The front chain is entirely enclosed and an excellent partial covering is designed to cover the rear chain, the cover being divided at the back to provide for quick detachment of the rear wheels. A kick-starter is fitted, and the striking gear for the gear box has been greatly improved; the lever, which is mounted on the off side of the tank, works in a neatly designed gate quadrant. The Best and Lloyd semi-automatic drip feed is employed as a means of lubrication, and glass topped filler caps are used for both petrol and oil. Mudguarding has been excellently carried out. Wide valances are fitted for each wheel. Rubber covered footboards are sprung at each end, and the specification is completed by two stands, Saxon forks, and metal covered pannier tool bags, a third tool bag being fitted behind the saddle tube. The machine is finished in two shades of green with a gold line, and is attached to a prettily designed sidecar painted to match.



Flywheel side of the entirely new two-stroke Alldays Lightweight.



The 1914 model 3½ h.p. three-speed counter-shaft geared chain-driven Alldays.

3½ h.p. MODEL: 85 × 88 mm.; side by side valves; Senspray carburetter; chain; three-speed counter-shaft gear.

The 3½ h.p. Alldays follows the lines of the larger model already described in practically every detail except for the fact that it has a single-cylinder engine and Brampton Bi-flex forks. The 3½ h.p. is also shown fitted with a belt driving a Sturmey-Archer three-speed gear; a model with the Villiers clutch; and a single gear T.T. model. In the case of the single-cylinder models, the magneto is placed behind the engine and driven by a short chain. The belt driven type has a neat belt protector surrounding the driving pulley.

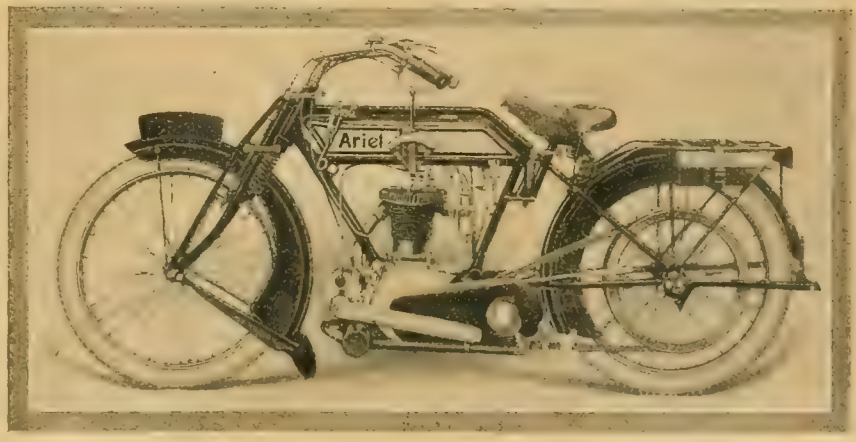
3 h.p. MODEL: Two-stroke; Amac carburetter; belt.

Quite a novelty of the Alldays firm is the little two-stroke exhibit on their stand. The engine is of the usual three-port type, employing crank case compression. An outside flywheel is fitted on the left-hand side, and a double silencer is employed. The engine is lubricated by mixing a small quantity of oil with the petrol. The frame is dropped both at the head and at the rear, and gives a very low riding position.

ARIEL, No. 87.

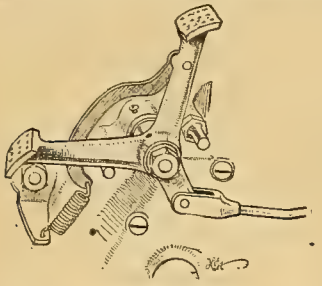
3½ h.p. MODEL: 86.4 × 85 mm.; side by side valves; Brown and Barlow carburetter; belt or belt and chain transmission; Ariel counter-shaft three-speed gear.

COMPONENTS LTD. (ARIEL DEPT.), Bournbrook, Birmingham.—An example of each Ariel model is displayed, and in



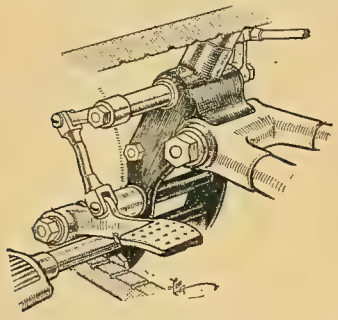
Transmission side of the 3½ h.p. three-speed counter-shaft geared Ariel, with kick starter, and belt and chain drive.

The Olympia Show.—view of Ariel Six Day Trials successes this year, they all deserve particularly close study. The 3½ h.p. designs are well enough known, but a new model is the 5-6 h.p. twin with enclosed chain to a three-speed gear box, thence by belt running over large pulleys to the back wheel. This gear box, which is a feature of Ariel design, is also being fitted on the single-cylinder 3½ h.p. Combined with it is a plate clutch with cork inset and tooth quadrant foot-starter. In the case of the gear box fitted on the



Decompressor control on the 3½ h.p. Ariel.

twin the ratios are 4¼, 7¼, and 13½ to 1. For the single-cylinder 5¼, 8¼, and 16 to 1. In both cases the shafts are carried on ball bearings, and the fine workmanship of the mechanism can be viewed

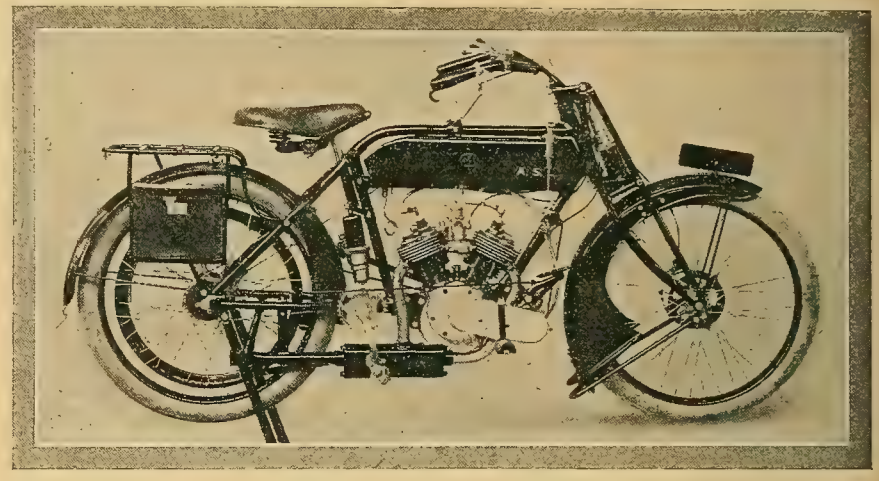


Foot brake mechanism on the T.T. Ariel.

by removing an inspection cover at the top. The ratios, it will be seen, allow a sufficient reserve for emergencies or freak hills, while, needless to say, the workmanship is up to any demands.

5-6 h.p. Model: 67×95 mm.; side by side mechanical valves; B. and B. carburetter; chain and belt transmission; three-speed counter-shaft gear.

The 5-6 h.p. is also adapted to neat sidecar arrangement. The system of mudguarding is well carried out, while a



Valve side of the twin-cylinder spring frame A.S.L.

characteristic of Ariel design should be mentioned in the comfortable pattern spring seat pillar.

On Stand No. 282 (Gallery) the firm is showing several Ariel motor bicycles which are identical with those shown on the Ariel stand, No. 87, in the main hall.

A.S.L., No. 55.

3½ h.p. Model: 85 × 88 mm.; side by side valves; B. and B. carburetter; belt transmission; Sturmey-Archer hub gear.

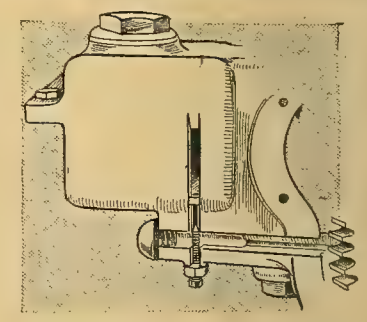
A.S.L. Manufacturing Co., Ltd., Stafford.—These machines have been much improved since last year. The air spring forks remain much as heretofore; in the rear the saddle pillar only is sprung and not the frame, and an ordinary motor cycle saddle is fitted instead of the padded seat used previously. One advantage of the air spring principle is that the spring may be adjusted to the weight of the rider. Lubrication is by Best and Lloyd semi-automatic drip feed.

Other models are fitted with a 3½ Precision twin engine and the 5-6 h.p. Fafnir; the general arrangements being as already described. Two machines are shown attached to sidecars.

AUTO-WHEEL, No. 53.

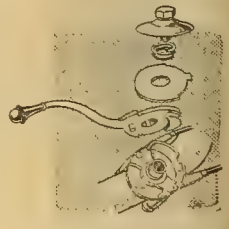
1 h.p. Model: 52½×52½ mm.; automatic inlet valves; special make carburetter; chain transmission.

The International Auto-Wheel Co., Russell Road, London.—The Auto-wheel is a little attachment by which an ordinary pedal bicycle can be converted

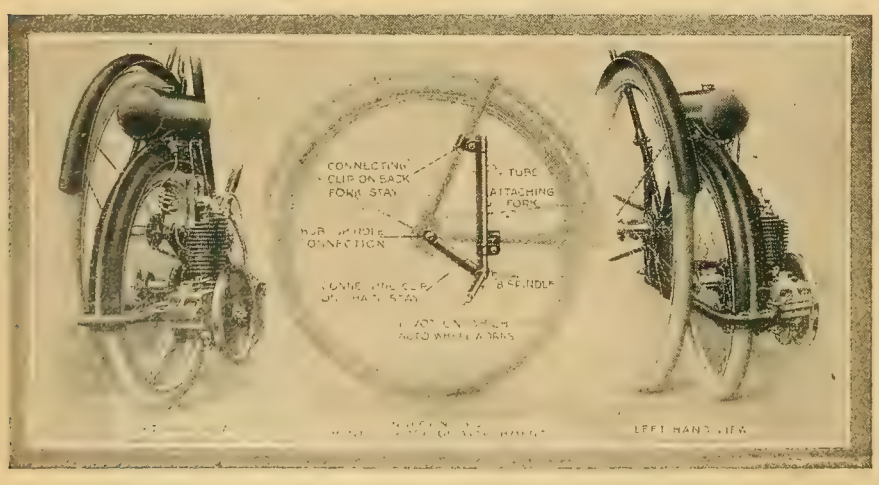


Part section of the oil channel into the base chamber of the Auto-wheel engine.

into a lightweight motor cycle. It is attached to the rear stays by a special bracket. It is interesting to note that Messrs. the B.S.A. Co. and Messrs. Lea and Francis turn out bicycles with lugs brazed to the frame to take this small power unit. A single lever controls the whole mechanism. When pushed to the right it keeps the exhaust open. The lever is then brought to the left, closing the exhaust and opening the throttle. The petrol tank is placed above the mudguard, and the oil is



The single lever handlebar control to the Auto-wheel



Details of the Auto-wheel, showing method of attachment and general design.

Indian

WHEN YOU BUY A 1914 INDIAN WE *GIVE* YOU SERVICE

The word "service" is so loosely applied these days that we cannot emphasise too strongly that INDIAN service is real, and represented by efficient men, adequate plant, commodious premises, ample capital, and backed by a genuine regard for your welfare.

Our sincerity can be gauged from the fact that our stock of spare parts alone is valued at £10,000. Our new London Headquarters is worthy of the largest exclusive motor cycle factory in the world.

Come and see the silent red INDIAN—now electrified—at Olympia, Stand No. 123.

HENDEE MANUFACTURING CO.,

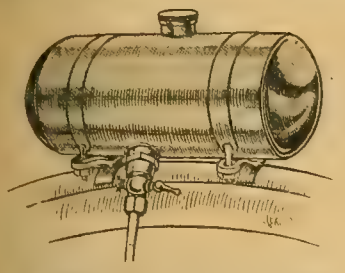
In answering this advertisement it is desirable to mention "The Motor Cycle."

The Olympia Show.—

carried in a compartment adjoining the crank case, to which it is fed by needle control. The weight of the entire attachment is 40 lbs.



Improved petrol tank secured by means of straps above the mudguard of the Auto-wheel. Observe the petrol sump.

BAT, No. 89.

4½ h.p. MODEL : 70 × 85 mm. ; side by side valves ; Amac carburetter ; chain and belt ; two-speed counter-shaft gear.

THE BAT MOTOR MANUFACTURING CO., Kingswood Road, Penge, S.E.—The 4½ h.p. Bat is a new model designed primarily as a solo mount, although quite capable of being used for sidecar work. In this machine the frame is not sprung. Transmission is by chain to a two-speed counter-shaft gear box, thence by belt to the back wheel

6-7 h.p. MODEL : 76 × 85 mm. ; side by side mechanical valves ; Amac carburetter ; chain or belt and chain ; three-speed counter-shaft or Armstrong hub gear.

In this size the Bat machines are made either with or without spring frames, the springless machines constituting new models. The chief feature about these is the three-speed gear box, in which the drive on the third speed is not transmitted through gear wheels. The second speed is through a sliding gear, while the first speed gears are always in mesh. On the two patterns in which chain-*cum*-belt drive is employed, the former is neatly enclosed in a casing, quickly detachable merely by undoing a thumb screw, while the footboards can be made to swing clear also by undoing a single screw. The clutch, too, has been modified, and its diameter is now much increased. The wheels, which have been designed with the view of being easily withdrawable, are also worth studying.

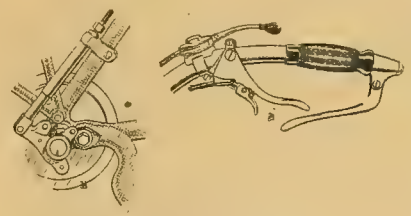
7-8 h.p. MODEL : 85 × 85 mm. ; side by side valves ; Amac carburetter ; chain and belt ; three-speed counter-shaft gear.

These, in their varieties and main characteristics, are identical with the 5-6 h.p. machines, and are of specially fine design suitable for sidecar work. Some examples of sidecars are shown attached both to the 6 h.p. and 7-8 h.p. types, and these are of Gloria or Mills-Fulford make

BLACKBURNE, No. 41.

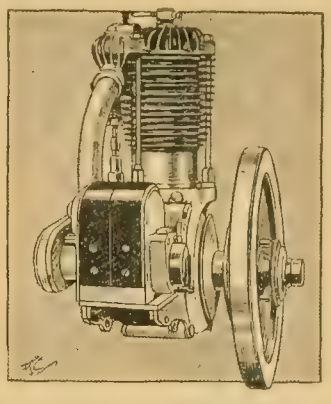
3½ h.p. MODEL : 85 × 88 mm. ; side by side valves B. and B. carburetter ; belt ; Sturmey-Archer.

BURNEY AND BLACKBURNE, Tongham, Surrey.—Two complete models of the Blackburne machine are shown, and an engine ; also a selection of engine parts are on view. The feature of the Blackburne engine is the large outside flywheel fitted, which gives extraordinarily smooth running, and, in fact, one of the main features of this engine is its ability to fire quite evenly at very low speeds. The fitting of the outside flywheel enables a solid crankshaft to be used, and this runs in very large phosphor bronze bearings, and undoubtedly these bearings, in conjunction with the outside flywheel, are largely responsible for the sweet running of this motor. The Blackburne is a comparatively newcomer among motor cycles, but on its first appearances in public com-



Handle-bar control mechanism of the clutch on the Blackburne machines.

petitions it gained a gold medal in the A.C.U. Six Days Trials and the London-Edinburgh M.C.C. Trial. The equipment in most details follows standard practice, but a recent improvement carried out on these machines is the fitting of an easily adjustable pulley between the flywheel and the engine, enabling the gear ratio to be altered at will. The method of operation of this adjustable pulley is a patent of the firm. The Blackburne machines are tastefully finished in either grey or black to option, and one of each colour is shown on the stand, the black one being fitted with a Bramble sidecar.



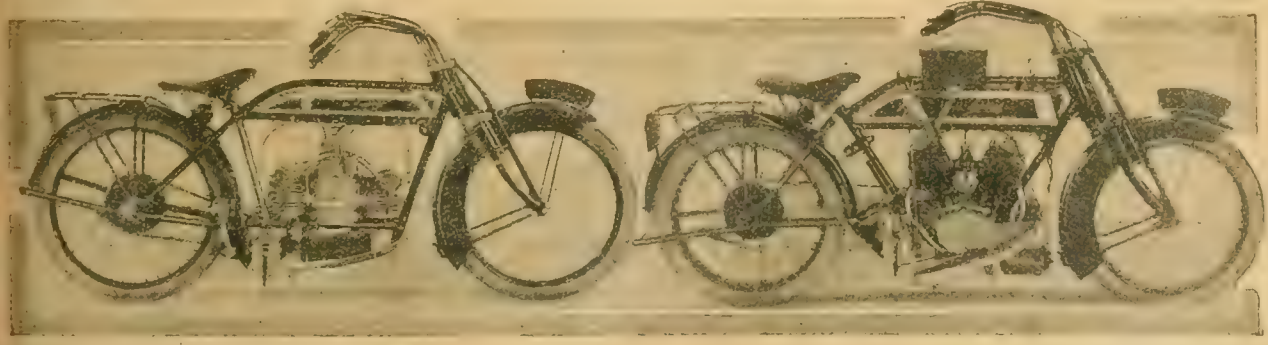
The 3½ h.p. single-cylinder Blackburne power unit, showing flywheel and method of fixing the magneto.

Messrs. Burney and Blackburne make a point of turning machines out completely equipped, and the price includes Lucas lamp and generator, Lucas horn, Terry's spring links for the Druid forks, and a spare valve is sent out with every machine. This is a point which buyers will doubtless appreciate. Kempshall 2⅜in. tyres are also fitted. The Blackburne may also be obtained as a T.T. model, and an excellent point to be noticed is that the back wheel, fitted with a three-speed hub, is interchangeable with a plain wheel used on the T.T. models, the forks on both being the same. Thus any Blackburne machine may be supplied with a three-speed hub and a fixed wheel. Either of these may be utilised by substituting one for the other, a matter of only a short time. A minor but exceedingly neat point about this machine is the tapered handle-bar ; at the crown head the diameter is one inch, while the bars are gracefully tapered to ⅞in. at the grips.

BRADBURY, No. 57.

3½ h.p. MODEL : 68 × 68.7 mm. ; side by side valves ; B. and B. carburetter ; chains or chain and belt ; three-speed counter-shaft gear.

BRADBURY AND CO., LTD., Wellington Works, Oldham.—The 3½ h.p. Bradbury with horizontally opposed cylinders is a most interesting machine The magneto, as is usual with engines of this type, is



Two twin-cylinder Bradburys for 1914. Left—The 3½ h.p. horizontally opposed air-cooled three-speed counter-shaft geared model. Right—Valve side of the 6 h.p. model. A three-speed counter-shaft gear and chain drive are employed.

The Olympia Show.—

carried centrally above the crank case. The transmission is by chain to a counter-shaft which contains a three-speed gear, giving ratios of 4, 7, and 12 to 1 respectively, and a cork insert clutch. The drive to the rear wheel can be either belt or chain. The kick-starter operates through the counter-shaft. An internally expanding brake is fitted in the back wheel. Lubrication is Best and Lloyd semi-automatic. The mudguard is hinged in the rear of the carrier so as to facilitate tyre repairs.

3½ h.p. MODEL: 89×89 mm.; side by side valves; B. and B. carburetter; belt; Bradbury two-speed gear on engine-shaft.

This is the large single-cylinder Bradbury model which has been so successful for sidecar work, to which is fitted a kick-starter working on the counter-shaft, and operating by chain direct to the engine. The aluminium footboards are fixed at a very convenient angle. This machine is also shown attached to a tradesman's sidecar, which is fitted with a movable basket of very solid construction. In this case the gear is fitted in the counter-shaft, and the transmission is chain and belt. The clutches of all Bradbury machines are now operated from the handle-bar.

6 h.p. MODEL: 74.5×86 mm.; B. and B. carburetter; chain drive; three-speed counter-shaft gear.

This machine has plated cylinders with detachable heads and light cast steel pistons. The three-speed gear is operated through a gate, and both chains run in aluminium covers, which are unlikely to rattle. The tool bag is placed on the tank in a convenient position. The machine is provided with sidecar lamps, and has a dark green coachbuilt sidecar attached, fitted to a dropped chassis. The tyres are Dunlop, 650 × 65 mm.

BRAMBLE, No. 132.

THE BRAMBLE MFG. CO., Coventry.—A display of sidecars is made on this stand, several models being shown. All are of the coachbuilt type, possessing neat and appropriate lines, and in all cases they are provided with hinged side doors. In the principal model the sidecar axle tube is enclosed within the body panelling, and a notable feature is the complete mudguarding of the wheel. Owing to this method of construction the passenger's weight is carried very low in order to ensure stability on corners. In the front attachment an additional form of suspension is employed, embodying two coil springs working on rods. Some of the models are equipped with folding front screens.

BROWN, No. 160.

2½ h.p. MODEL: 70×76 mm.; side by side valves; B. and B. carburetter; belt.

BROWN BROS., LTD., Great Eastern Street, E.C.—This is a handy lightweight machine to which a two-speed gear can be fitted to order. The mudguarding is well carried out. Druid forks are fitted, and the machine is well equipped.

3½ h.p. MODEL: 86×86 mm.; side by side valves; B[and B. carburetter; belt; three-speed Sturmey-Archer gear.

This is a well-known 3½ h.p. model which has behaved consistently for many years. It has been gradually brought up to date by improvements in detail. It is well equipped and well mudguarded.

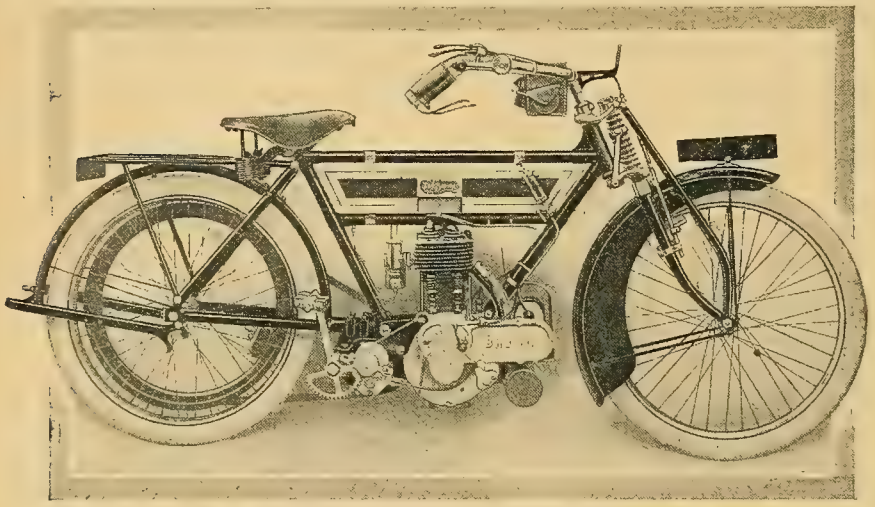
3½-4 h.p. MODEL: 63×89 mm.; side by side valves; B. and B. carburetter; belt; Armstrong three-speed gear.

This is a twin-cylinder of medium horse-power, designed for the tourist who likes a multi-cylinder motor cycle. It is well designed and well equipped, and should be capable of touring in any part of the country.

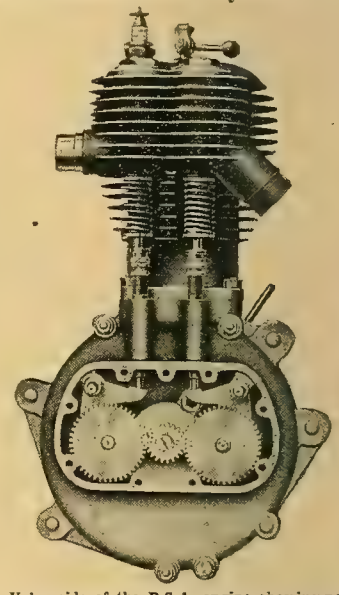
B.S.A., No. 58.

3½ h.p. MODEL: 85×88 mm., side by side valves; B.S.A. carburetter; chain and belt; B.S.A. three-speed counter-shaft gear.

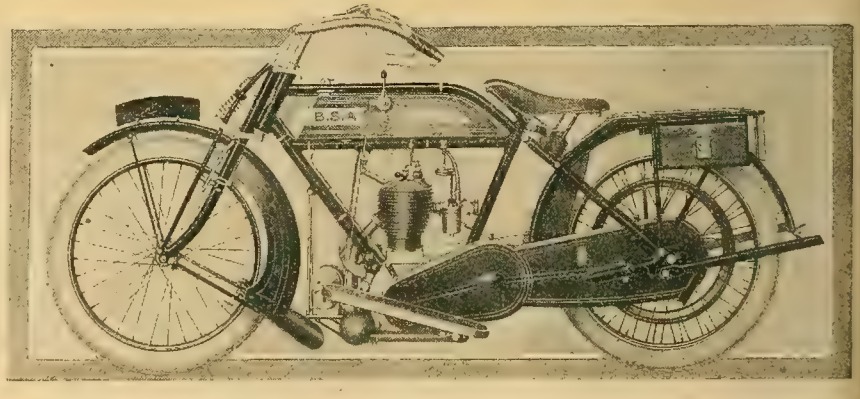
THE BIRMINGHAM SMALL ARMS CO., LTD., Small Heath, Birmingham.—The B.S.A. machines were fully dealt with in our last issue, therefore all that is necessary now is to refer briefly to the exhibits. The 3½ h.p. machine is but little altered, except for the fitting of the new counter-shaft gear box. The engine is provided with adjustable tappets; Best and Lloyd semi-automatic lubrication and Ruthardt magneto are standard fittings. The three-speed gear box is shown with



Valve side of the 3½ h.p. single-cylinder Brown fitted with the latest pattern Bowden counter-shaft gear and clutch. Observe the original design of spring forks.

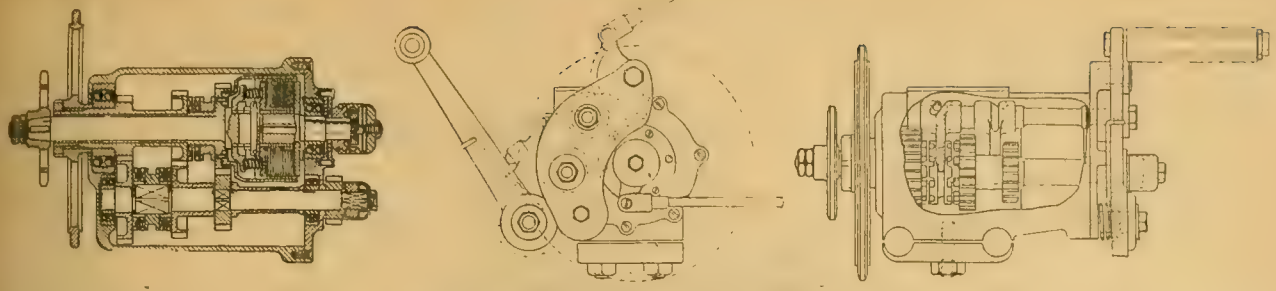


Valve side of the B.S.A. engine showing neat timing gear mechanism and valves operated by internal cams.



Transmission side of the 3½ h.p. chain-driven B.S.A., with counter-shaft gear and long footboards.

The Olympia Show.—



Sectional views of the B.S.A. three-speed counter-shaft gear.

the top removed: the interesting method of operating the striking mechanism is thus clearly visible. A glance at this model will convey more than a long description. It will, therefore, suffice to mention that a single revolving rod operates both sliding dogs at the same time.

556 c.c. MODEL: 85×98 mm.; side by side valves; B.S.A. carburetter; chains; B.S.A. three-speed counter-shaft gear.

This is the new model for 1914, and it should prove an excellent sidecar machine. The general features are as on the 3½ h.p. machine, but the drive is by chain throughout, a desirable point in the estimation of many, especially when a sidecar is attached; 2½in. tyres are fitted. The B.S.A. sidecar chassis is upturned at the rear, and the springing should be examined by all those who are interested in sidecars. An illustration of this appeared last week on page 1510. The B.S.A. carburetter is made on the straight through principle, and, contrary to usual practice, the petrol is fed to the float chamber through the top. Both front and rear mudguards are furnished with side flaps.

B.S.A. compensated brake action.

CALCOTT, No. 108.

2½ h.p. MODEL: 70 × 75 mm.; side by side valves; B. and B. carburetter; belt; with or without Sturmey-Archer three-speed or Villiers two-speed gear.

CALCOTT BROS., LTD., Gosford Street, Coventry.—The 2½ h.p. Calcott lightweight is exhibited in its three models, that is to say, with direct belt drive, with Villiers free engine hub, and with Sturmey-Archer three-speed gear. Also we understand the firm fit Armstrong gears. The arrangement of the engine with its appurtenances is very neat, both waterproof Bosch magneto and carburetter being placed behind the cylinder, and the silencer in front. The latter is furnished with an exceptionally long extension pipe measuring some 2ft. Pedals are fitted on this machine, and the extension of the crank bracket to take the engine is a particularly neat and compact bit of design. This is one of the few motor engines with offset cylinders. Handle-bar control is fitted for the carburetter, and the front wheel brake is actuated by an inverted lever. In both the variable-speed gear models a separate brake rim is spoked to the right-hand side of the back wheel, but in the single-speed design the belt rim itself is employed, the brake blocks in both cases bearing on the inner circumference of the rim. The whole machine, which has been built to give a low centre of gravity and afford good strong construction, constitutes a very clean design.

CALTHORPE, No. 116.

2 h.p. MODEL: 60 × 60 mm.; m.o.i.v.; Amac carburetter; belt; Precision two-speed gear.

THE MINSTREL AND REA CYCLE CO., Birmingham.—This model is fitted with the Precision lightweight unit, incorporating a two-speed gear operated by a rocking pedal. One of the most interesting features is the method of fixing the engine in the frame, the bottom bracket lugs being a specially fine piece of work. These lugs also act as supports for the wide and comfortable aluminium foot plates. These little machines are particularly well equipped, having a neat luggage carrier with acetylene welded joints and carrying two tool boxes.

2¾ h.p. MODEL: 70×90 mm.; side by side valves; Amac carburetter; belt; Sturmey-Archer three-speed gear.

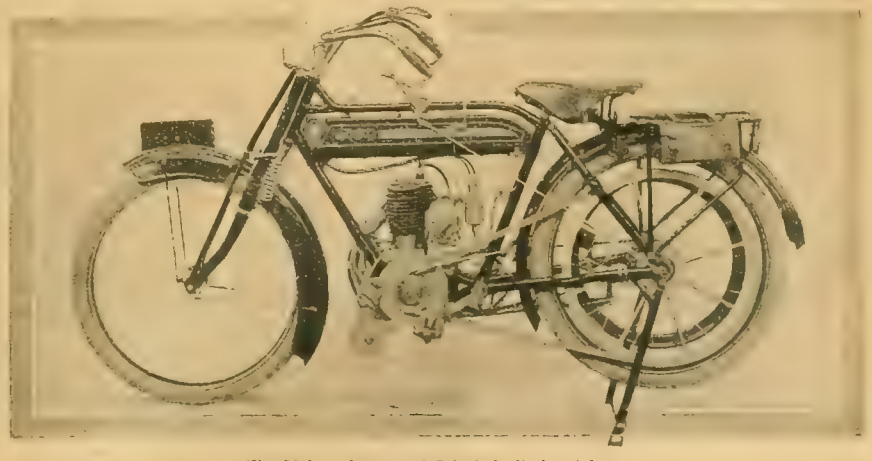
The cubical capacity of this engine is 346 c.c., and the whole is a well-designed medium-powered single-cylinder. As a Sturmey-Archer three-speed gear is fitted, this should be capable of going anywhere. The mudguarding of both front and back wheels is well worthy of mention. A similar model is also shown fitted with a single gear, and a Senspray carburetter instead of an Amac.

4¼ h.p. MODEL: 89×96 mm.; side by side valves; Amac carburetter; belt and chain; Calthorpe counter-shaft two-speed gear.

This model is intended more especially for sidecar work, and is fitted with the Calthorpe two-speed counter-shaft gear. The change of gear is operated by means of a side lever which expands rings by means of wedge bars. Comfortable footboards are provided, and the mudguarding has been particularly well carried out. A spring-operated lubricator is fitted, and the magneto, which is carried in front of the engine, is well protected. A kick starter is also provided. It is interesting to note that extra lips are fitted to the mudguards to catch any splash from the belt, and the tool bags are enclosed in metal cases. A similar model is also shown furnished with a Senspray carburetter.

5-6 h.p. MODEL: 75×85 mm.; side by side valves; Senspray carburetter; chain and belt; Calthorpe two-speed counter-shaft gear.

This machine is specially intended for heavy sidecar work, and has lugs for the attachment of the sidecar brazed on to the frame. Special features are the provision of an aluminium cover for the chain and extra long foot plates. The same excellent mudguarding and all the other features referred to in the previous models are embodied in this machine.



The 2¼ h.p. three-speed Calcott in its latest form.

The Olympia Show.—

4 h.p. twin-cylinder MODEL: 70 × 70 mm.; side by side valves; Senspray carburetter; belt transmission; Armstrong three-speed gear.

This model is intended for the rider who likes the smooth running of a twin-cylinder and does not want excessive power. Fitted as it is with the three-speed Armstrong gear, it should be a machine capable of travelling in any part of the country. It has all other details possessed by the models we have already described. Several of the machines are shown attached to sidecars, one of which is fitted with a hood and screen, and another with a luggage carrier and spare tyre carrier. Another of the sidecars possesses a wicker body which is covered with leatherette, thereby rendering it easy to clean, and having some appearance of being coachbuilt.

CAMPION, No. 20.

6 h.p. twin-cylinder MODEL: 76×85 mm.; side by side valves; B. and B. carburetter; chain; Jardine two-speed gear.

THE CAMPION CYCLE CO., LTD., Robin Hood Street, Nottingham.—These well-known machines are exhibited at Olympia for the first time, and embody a number of distinctive features. The Jardine two-speed gear box and kick starter is fitted, and the machine is finished in a most tasteful pale grey, lined green. An exceedingly fine sidecar to match, complete with waterproof cover and green upholstery, is fitted. The axle of this sidecar is very strong, and is underhung to a considerable extent. There is ample space to fit a large luggage carrier on the chassis at the rear, as the framework is carried right round the sidecar, the C springs being inside the framework. The sidecar wheel is excellently mudguarded with a very deep valance on the inside, and the whole construction is strong, and at the same time graceful.

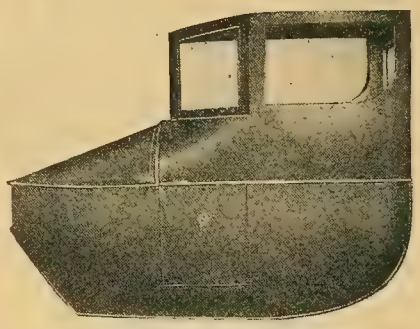
8 h.p. twin-cylinder MODEL: 85 × 85 mm.; side by side valves; B. and B. carburetter; chain; three-speed Jardine gear.

Another model, fitted with an 8 h.p. Precision engine, is shown complete with a sidecar, and this model is chiefly noticeable because it is fitted with the new Jardine three-speed counter-shaft gear and kick starter. This gear is of most substantial construction, but at the same time does not take up an undue amount of space. The gears are changed by means of a lever working in a quadrant on the top of the tank. An excellent feature of the gear is the provision of a very large oiler on the top of the box. The drive is by chain throughout. A shallow, but very wide, tank with neat aluminium red-lined panels contains a very large supply of fuel, and the whole machine is turned out in first-class style. The sidecar is of exceedingly graceful design, painted in French grey, with green lining, and a large grid to carry a trunk is fitted at the back.

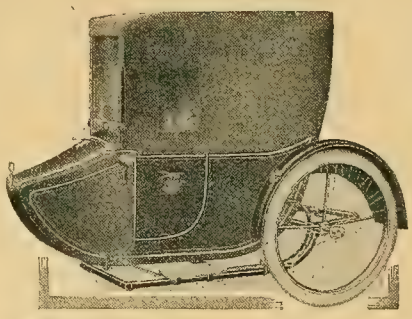
Another model shown by this firm is fitted with a 3½ h.p. water-cooled Green-Precision motor, 85×88 mm., and a Jardine two-speed gear box, the drive being by chain. A neat auxiliary water tank is carried on the top tube to replenish the supply to the motor when loss of water occurs through evaporation.

Models of the Jardine gear box are also shown, both complete and in section. The Campion machines have gained an excellent name in competitions, and their display is a striking one.

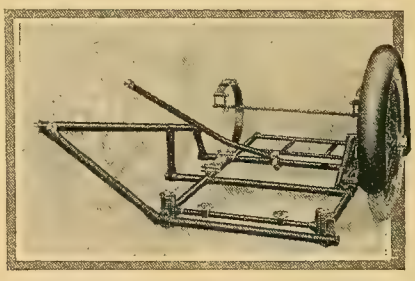
SOME EXAMPLES OF TYPICAL SIDECAR BODY AND CHASSIS WORK.



The Compeer Cabriolet sidecar, the top of which is detachable.



The Supreme sidecar with a neatly fitting hood and wind screen.



The Sparkbrook sidecar chassis. Four-point suspension and straight tubes throughout are notable features.

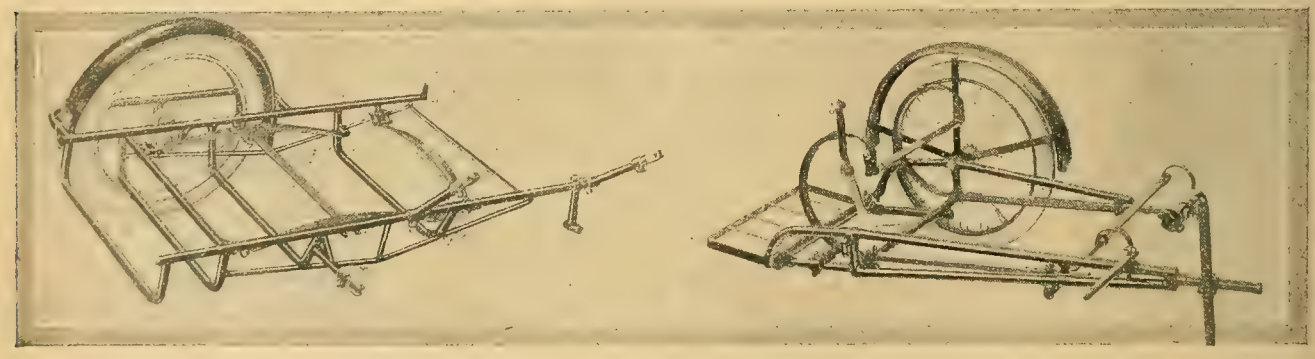
CANOELET, No. 42.

MEAD AND DEAKIN, LTD., Tyseley, Birmingham.—The speciality of this firm is sidecars, and they are shown in a variety of colours. This sidecar has proved itself one of the most popular on the market, and is remarkable for the cleanness of the design and the comfort of the suspension. The chassis is extremely simple, and is carried at a considerable distance beneath the axle. The body is slung on C springs, and the chassis members are carried right up the back of the sidecar, the shackles at the end of the springs providing very comfortable riding. All the models are coach built, and are tastefully finished in both dark and light colours, and the upholstery is excellently carried out, and four-point attachment is used.

CENTAUR, No. 140.

3½ h.p. MODEL: 84×90 mm.; side by side m.o.i.v.; B. and B. carburetter; belt transmission; Sturmey-Archer speed gear.

THE CENTAUR CYCLE CO., LTD., Stoke, Coventry.—The principal exhibit on the Centaur stand is a 3½ h.p. sidecar combination on which the engine is of the air-cooled type with cylinders pronouncedly offset. Lubrication is by semi-automatic drip, taking its supply from a tank of elliptical section. A kick-starter



Sidecar chassis with dropped frames. (1) The Williamson. (2) The Chater-Lea.

The Olympia Show.—

is fitted on the chain stays, and consists of a crank driving the Sturmey-Archer gear through a chain and sprocket. The footboards are of large size and covered with indiarubber. A neat feature in the design of this machine is the inclusion of the Bowden cables which operate the throttle, advance spark, and exhaust lift mechanism, inside the handle-bars, into which they are conducted by a short branch tube.

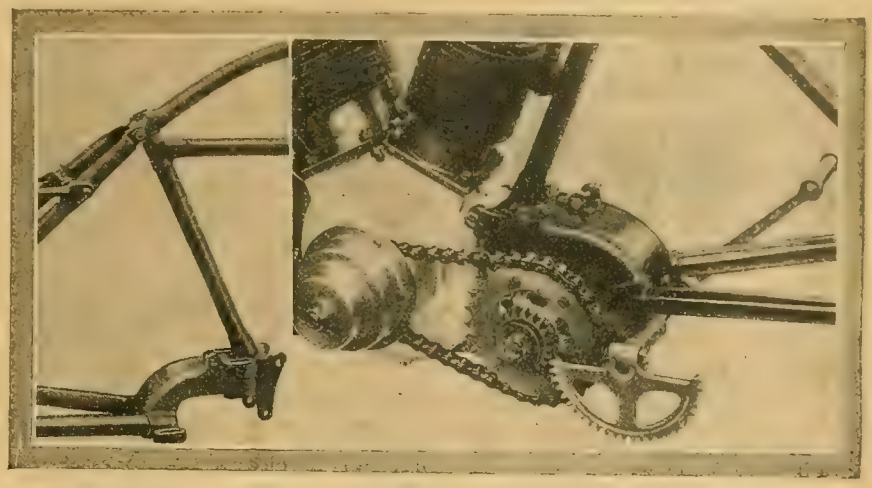
2¾ h.p. MODEL: 60.75×60 mm.; side by side m.o.i.v.; B. and B. carburetter; belt transmission; Sturmey-Archer speed gear.

The 2¾ h.p. model is fitted with a neatly designed engine with offset cylinders, and in general follows the specification of the 3½ h.p., having a dropped frame and elliptical section tank. It is also exhibited in a single-geared type. The 2 h.p. single-geared lightweight, with a bore and stroke of 60×60 mm., is also shown, but in this case the control wires are taken outside the handle-bars and not inside as in the previously mentioned model. Pedalling gear is fitted on this type.

CHATER-LEA, No. 54.

8 h.p. MODEL: 85 × 85 mm.; side by side valves; B. and B. carburetter; chain; Chater-Lea three-speed gear.

CHATER-LEA, LTD., Golden Lane, E.C. —Although this machine is primarily a sidecar machine, it yet can be used as a solo mount by those who require something very powerful indeed. The principal alterations for this year are a dropped top tube which gives a four inches lower saddle position. The oil and petrol are in the same tank, which is large enough to hold 2¼ gallons of petrol and is fitted with the Enots automatic drip-feed lubricator. The kick starter is fitted to the counter-shaft. The rear brake is of the internally expanding type, and the timing gear has adjustable tappets. The Chater-Lea counter-shaft gear, which gives three speeds—4, 6, and 12 to 1—is operated by a gate change. Tyres are 650 × 65 mm. Clinchers with cross grooves. The magneto is pivoted to facilitate chain adjustment, and the driving chains are enclosed in metal cases. The Chater-Lea sidecar bodies are fitted to a dropped frame chassis, and are either cane or coachbuilt. One sidecar has an extra seat at the rear, the back of which closes down when not in use, so making a very useful luggage receptacle. The sidecar wheel is very well guarded. These machines can be obtained with either foot or hand-operated clutch.

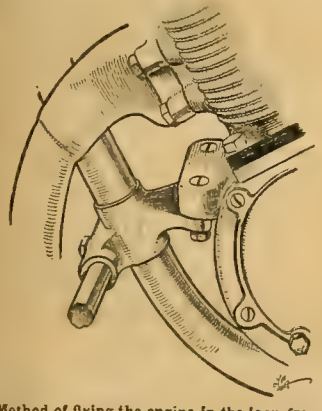


Special frame construction of a Chater-Lea model to accommodate the counter-shaft gear.

CLYNO, No. 25.

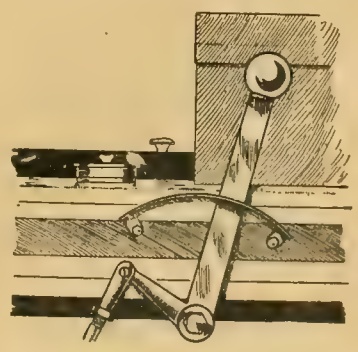
5-6 h.p. twin-cylinder MODEL: 75 × 82 mm.; side by side valves; Amac carburetter; enclosed chain drive; three-speed gear, sliding type.

THE CLYNO ENGINEERING CO., Wolverhampton.—The Clyno has been largely redesigned for 1914, chiefly in the matter of detail. No machine has gained a greater reputation for sidecar use, and its successes in large trials, and particularly in the hands of Frank Smith, one of the partners, have been too numerous to give in detail. One of the outstanding features of the Clyno is a quick detachable wheel, and so satisfactory has this proved in the past that it has been found quite unnecessary to alter the design in any way. For 1914 larger tanks are fitted and 2¼ gallons of petrol can now be carried, a most desirable feature in the case of powerful machines capable of drawing heavy sidecars and much baggage. The gears are now changed by means of a gate instead of by a quadrant as in the past, and the height of the saddle has been slightly lowered. The machines exhibited are finished in French grey, and a point worth noticing is that the hubs are painted to match the frame. Exceedingly neat valve covers, held on by wing nuts, protect the valve springs from wet and dirt. Sidecar lugs are brazed on to the frame, and a minor detail is the provision of little sliding caps to fit over the oiling holes of the spring fork shackles. Throughout the whole design care has been taken to render the machine as weatherproof and foolproof as possible. The sidecar shown is a beautiful piece of work, painted grey to match the machine. A well-designed hinge-up scuttle dash is fitted, on the end of which nearest the passenger is mounted an adjustable wind screen, while a Cape hood, fitted with side curtains, in which are placed talc windows, renders the sidecar quite weatherproof when storm-rigged. The wheel is of the Clyno patent detachable type, and a spare wheel is mounted on a dummy hub on the back panel. A large luggage carrier and petrol can carrier are found at the back. A tasteful finish is given to the outfit by a cane panel running round the body.



Method of fixing the engine in the loop frame of the two-stroke Clyno. The engine cradle is suspended in the front on a lug brazed to the frame.

Neat timing gear mechanism on the 1914 5-6 h.p. Clyno.

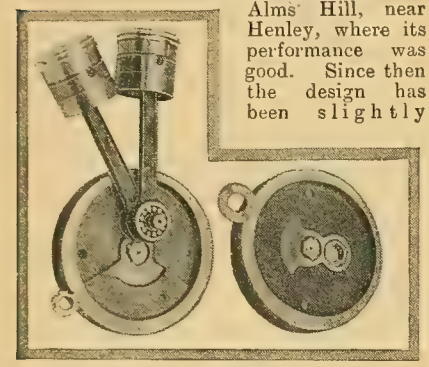


Clyno gear operating lever and tool case on top tube.

The Olympia Show.—

2¼ h.p two-stroke MODEL: 70 × 70 mm.; Amac carburetter; belt; two-speed gear integral with engine.

The Clyno two-stroke made its first appearance during the past summer at a hill-climb held at Alms Hill, near Henley, where its performance was good. Since then the design has been slightly

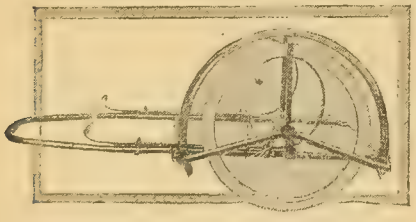


Pistons, flywheels, and connecting rods of the latest Clyno, showing roller bearings to big end.

modified, the chief difference being that the belt drive has been transferred from the right to the left side. The engine is carried in a loop frame and is inclined forward at an angle of 50° from the vertical. The power unit is complete in itself, consisting of an engine, two-speed gear box and clutch, the gears being changed by a lever working in a gate on the off side of the tank, the whole casing containing only six gear wheels. The magneto, which is a Ruthardt, is mounted directly on top of the gear box. The clutch is operated from the left handle-bar. The machine is finished in the same style, as regards colour, as the larger models, and is shown fully equipped with lamp and horn. The weight complete is 140 lbs. and the price £40.

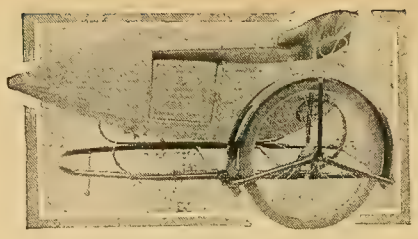
COMFY, No. 17

THE COMFY SIDECAR CO. (JOHN WARD), High Road, Leytonstone.—A large selection of wicker sidecars is displayed, and one coachbuilt, cream-coloured model fitted with hood and screen, the upholstery being well carried out in brown leather. The special feature of these sidecars is the construction of the chassis, the axle being deeply stepped, allowing a very low position for the body to be adopted. The axle of the wheel is supported on both sides, the outside tube being



One of the features of the Comfy sidecar is the strengthened support for the axle. As will be seen, tubes are brought from the chassis round the outside of the wheel to the hub spindle

very substantial and forming part of the main chassis. A special quick detachable spring locking device is used, and strength, combined with lightness, is found in these sidecars.

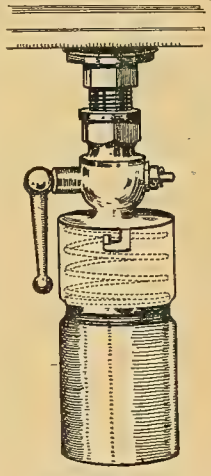


Another pattern Comfy sidecar with semi-streamline body.

CONNAUGHT, No. 126.

2½ h.p. MODEL: 73 × 70 mm.; no two-stroke valves; Amac carburetter; belt; Sturmey-Archer three-speed gear.

THE BORDESLEY ENGINEERING CO., LTD., Birmingham.—When it made its first appearance last year the Connaught created something of a sensation, chiefly on account of its new system of oiling, which consists of mixing a certain amount of oil with the petrol, the amount being measured by a special measure which is screwed on below the oil tap. One of the latest models is shown fitted to a sidecar provided with a light wicker body. A Sturmey-Archer three-speed gear is fitted and kick-starter, the spindle of which is eccentrically mounted so that the adjustment of the chain may be readily effected. The handle-bars are wide, and should render the riding position comfortable. The particular model shown is provided with an auxiliary tank under the main tank, and in this



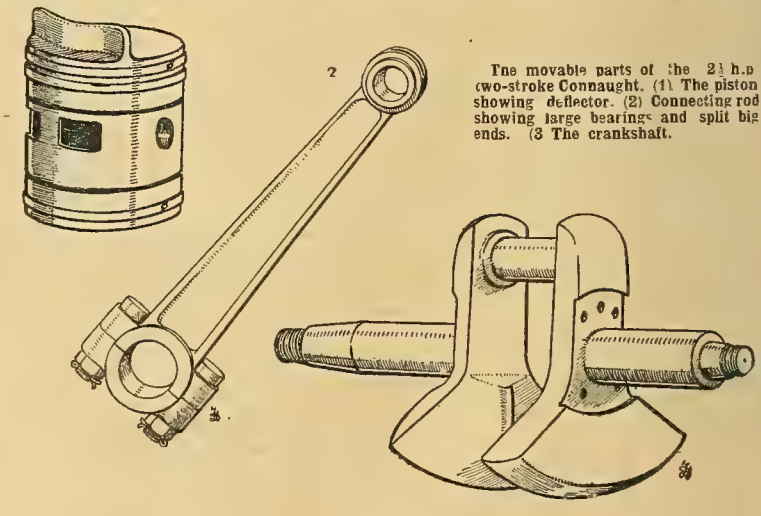
Oil receptacle carried underneath the tank of the Connaught, showing bayonet joint fixing.

is carried the petrol, the main tank being filled with paraffin. To enable the paraffin to be vaporised properly, a special type of Amac carburetter is fitted, provided with a warming jacket connected to the exhaust port. After the engine has been running for a few minutes the petrol may be turned off, and it will continue to run on the heavier fuel. Other models shown are single-geared and three-speed solo machines, designed to run on petrol only. Still another model is fitted with combined chain and belt drive and Albion two-speed gear. Quite a novelty for the Bordesley Engineering Co. is a lady's machine, which should especially appeal to the fair sex on account of its simplicity. There is only one tank, in which the oil and petrol are mixed, and usually only a single gear is provided, but an Armstrong three-speed gear may be had if desired. The engine is well out of the way of the rider's skirt, and we hear that a large number are already in use throughout the country. We may also mention that the price at which it is sold is very low.

DAY-LEEDS, No. 94.

3¾ h.p. MODEL: 85×88 mm.; side by side overhead inlet valves; B. and B. carburetter; chain; two-speed counter-shaft gear.

JOB DAY AND SONS, LTD., Ellerby Lane, Leeds, and London.—Except for the transmission, both models of the Day-Leeds at Olympia are similar as regards specification. In the single-cylinder engine, the inlet valves are placed on the right-hand side, operated by tappet rockers, and located over the exhaust, and a feature of the valve mechanism is the method of releasing compression. This, it is claimed, will enable the engine to continue firing at a walking pace. The mechanism this year is placed outside, so that its working is visible. A chain-driven kick starter is fitted to act directly on the crankshaft of the engine, which on the right-hand side is extended for this purpose, and supported in a bearing. The chain sprocket on the engine-shaft engages with dog teeth similar to those in the starting gear of a car, and when out of operation slides along the shaft against the outer bearing. Thus there



The movable parts of the 2½ h.p two-stroke Connaught. (1) The piston showing deflector. (2) Connecting rod showing large bearings and split big ends. (3 The crankshaft.

The Olympia Show.—

is no severely worked free-wheel mechanism involved. In the chain-driven model a P. and M. type of two-speed gear is adopted, while in the belt-driven design a spoked wheel pulley is employed to transmit the power.

DIAMOND, No. 16.

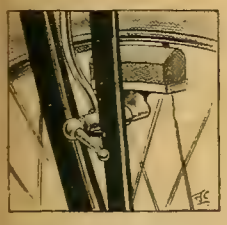
2¾ h.p. MODEL: 75×79 m.m.; overhead inlet valve; Amac or Senspray carburetter; shaft and silent chain transmission; Diamond two-speed gear.

The D. F. AND M. ENGINEERING CO., Wolverhampton.—The Diamond power unit is one of the most ingenious constructions on the market. Two pairs of bevels provide the gear, which is contained in a casing and runs in an oil bath. The inlet valve is situated over the exhaust valve, both facing forward. The final drive is by a single chain. With the exception of the power plant the machine follows standard practice.

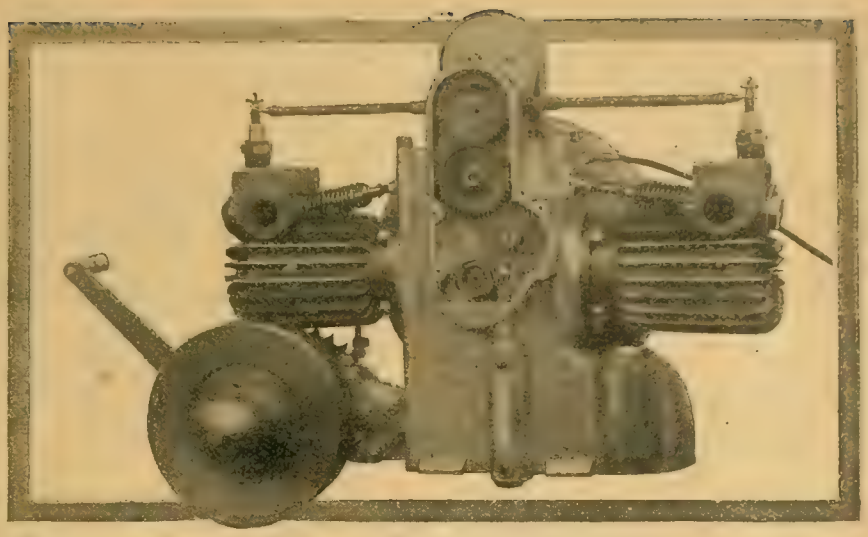
DOUGLAS, No. 84.

3½ h.p. MODEL: 68×68 mm.; side by side on top; Amac carburetter; chain and belt; two-speed countershaft gear.

DOUGLAS BROS., Kingswood, Bristol.—The present exhibition marks the first public appearance of the 3½ h.p. horizontally-opposed Douglas. Since our last description of this machine it has only been altered in detail. Our readers will remember that below the crank case was a large oil sump, from which the lubricant is drawn by a spiral pump driven from the crankshaft. This pump raises the oil to troughs below the big-end bearings, the surplus being returned to the sump through strainers. It is impossible to overfill the oil well on account of the position of the valve cap, and the contents are sufficient to last for at least a thousand miles. The valve gear is now enclosed by a neat sheet metal cover, and a hot air-jacketed carburetter is now employed. Accessibility is a great feature of the design, for any part which it might become necessary to replace, or which might require attention, can be reached with a minimum of trouble. The gear box is attached to a sliding platform at the back of the crank case, and is capable of instant adjustment. The gear is of the sliding dog type, and a material faced cone clutch is employed to transmit the drive. The primary drive is by chain to the gear box, the chain being protected by a cover. Final belt drive has a neat guard over its upper side. The mudguard has received special attention, and besides the usual valances, side wings are fitted to the front wheels. The front brakes are fitted with a neat thumb nut adjustment by which the shoes can be removed without damaging the enamel on the frame. The magneto is carried right on top of the crank case, and the whole engine and gear unit may be withdrawn by detaching two nuts and the usual pipe connections. The silencing arrangement has been somewhat altered, and now there is a tubular expansion box for each cylinder across the frame. Neat footboards are fitted on either side, and one example of a machine is shown attached to an excellent sidecar, the chassis of which is particularly strongly carried out. The side members consist of two tubes in the form of a bow, and the chassis is four-point suspended. The body is roomy, and is suspended on three full elliptic springs which should provide smooth and comfortable riding.



Douglas front brake shoes showing simple method of adjustment.

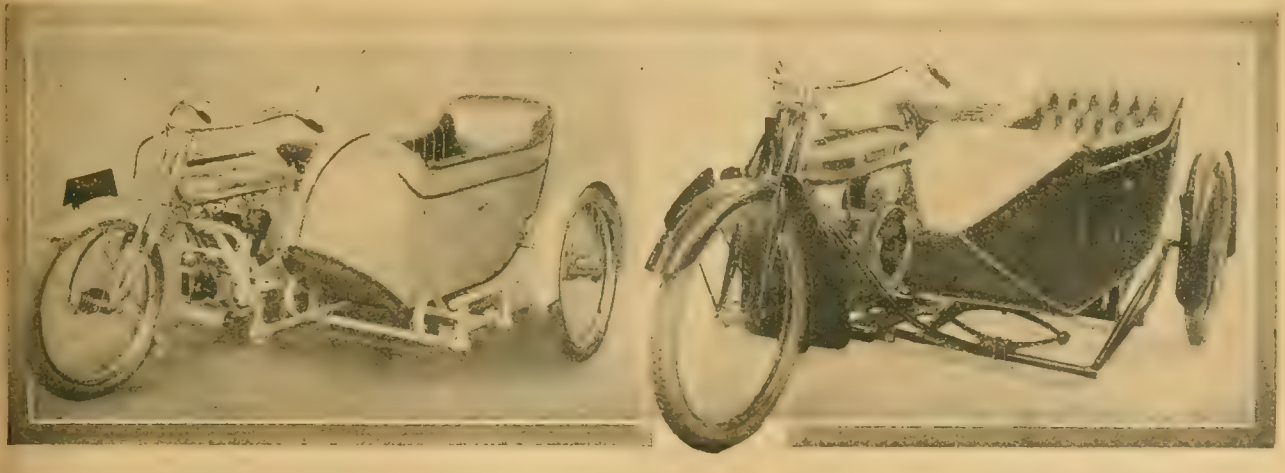


Pulley side of the 3½ h.p. Douglas with timing gear case removed.

This model is also shown in the form of a T.T. machine.

2¾ h.p. MODEL: 60×60 mm.; side by side valves; Amac carburetter; belt and chain; two-speed countershaft gear.

The 2¾ h.p. Douglas has undergone practically no alteration, and is already so well-known that it hardly needs our description. A mudguard is fitted above the top layer of the belt, and the pannier toolbags are totally enclosed. Besides this the only important alteration lies in the fact that the hubs have been considerably increased in size. It is shown as a touring machine and a



Left—a smart sidecar outfit exhibited by the Campion Co., and finished in French grey. Right—the new 3½ h.p. Douglas sidecar combination.

The Olympia Show.—

T.T. machine, and in both forms is beautifully finished. The open frame model also remains practically unaltered. It is extremely neatly designed, and very suitable for such ladies as desire a reliable and handy two-wheeled vehicle.

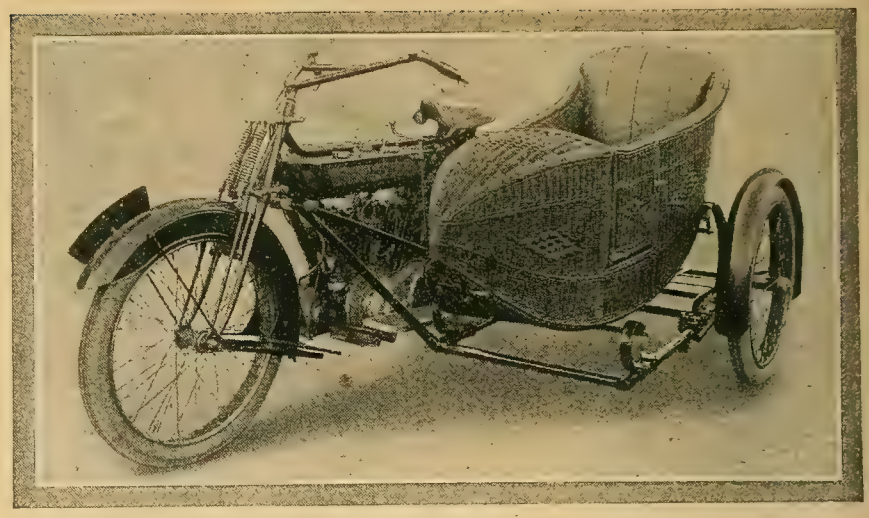
DUNHILL, No. 21.

ALFRED DUNHILL, LTD., Euston Road, N.W.—A magnificent coach-built sidecar finished in natural wood with raised dark green mouldings and fine gold lines, and upholstered in a most luxurious manner in Bedford cloth with deep cushion back is the feature of a fine exhibit of sidecars. A neat little electric lamp of torpedo shape is attached to the side of the body. This is one of the finest sidecars in the Show, and should on no account be missed. A wide range of other sidecars are on view, with both coach-built and cane bodies, and one of the most interesting is a pretty featherweight model in cane of egg-shape. It is extraordinarily light, and may be used with satisfaction with moderate-powered motor cycles. A luggage boot is provided at the rear, capable of carrying quite a large quantity of articles. Practically any design of sidecar can be supplied by Messrs. Dunhill, for machines of any power and weight, with either three or four-point attachment.

EDMUND, No. 39.

3½ h.p. MODEL: 64×77 mm.; overhead inlet valves; Amac carburetter; chain; Enfield two-speed gear.

CHARLES EDMUND AND CO., Chester.—The outstanding feature of the Edmund is the manner in which the rear of the frame is sprung on long curved laminated springs. The motor fitted is the M.A.G., which is rapidly coming into prominence. It is a beautifully constructed piece of work, the feature being the neat manner in which the rocking gear operating the overhead inlet valves is enclosed. Brampton Biflex spring forks are fitted. The transmission is by chains through an Enfield two-speed gear, and a kick-starter is fitted in front of the engine on the left hand side. These machines may also be obtained with a 6 h.p. M.A.G. engine, 72×91 mm. bore and stroke, and are eminently suitable models for sidecar service.



The Enfield Co., of Redditch, will market a cane sidecar body for 1914, in addition to the coach-built type.

ENFIELD, No. 88.

6 h.p. MODEL: 76×85 mm.; side by side mechanical valves; Amac carburetter; chain transmission; countershaft two-speed gear.

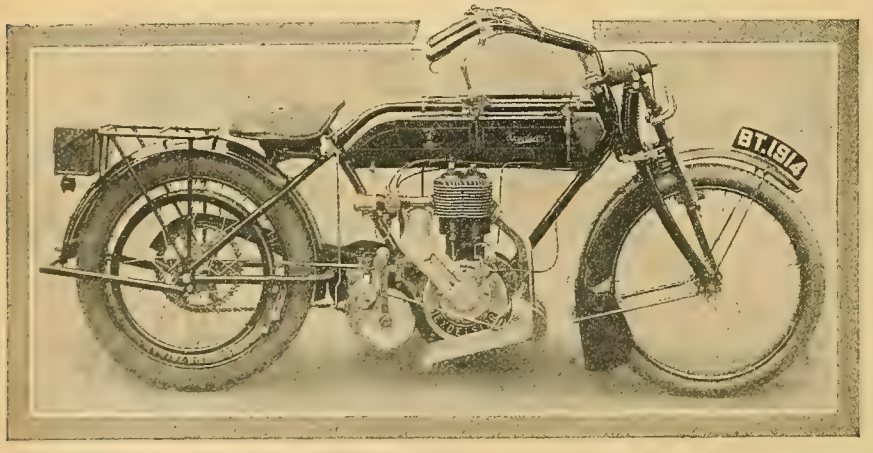
THE ENFIELD CYCLE CO., LTD., Redditch.—The Enfield machines have made the form of transmission embodied in them quite a distinct type by now, and there is no need to debate upon this point beyond mentioning the patent cush drive hub. The chief modifications in the 6 h.p. for 1914 lie in the frame, which has been reduced to give greater comfort in riding and better position for the rider, while aluminium gear casings are fitted over gears and chains. 650×65 mm. Palmer cord tyres are provided. Although the sidecars can be made with cane bodies if desired, a roomy coachbuilt body is standard, with tool box under the seat and a luggage grid is included in its equipment.

3 h.p. MODEL: 60 × 75 mm.; overhead inlet valves; Amac carburetter; chain transmission; two-speed counter-shaft gear.

Like all Enfield models a twin engine is adopted on the 3 h.p., and in this size the Royal Enfield is made in two models, one the ordinary roadster design, the other a T.T. model. Both embody practically the same specification as is found on all the Enfield machines, which includes the patent expanding clutch combined with two-speed gear and free engine. In the roadster model the kick-starter has been redesigned, and the magneto is now chain-driven, while Palmer cord 26×2¼in. tyres are fitted and Brooks B 170 saddle. The T.T. model, the price of which is the same as the touring type, has no kick-starter or front stand, the handle-bars are slightly dropped and a Senspray carburetter is fitted.

2¾ h.p. MODEL: 54×75 mm.; side by side mechanical valves; Amac carburetter; chain transmission; two-speed counter-shaft gear.

This model, which practically follows Enfield practice throughout, including exceptionally thorough mudguarding arrangements, is unaltered from last year's pattern except in the matter of price, which is now reduced to £45. It may be added that in all the Enfield models a spring handle-bar can be fitted if desired.



Valve side of the 5-6 h. p. three-speed counter-shaft geared Excelsior. Chain drive and Brampton Bi-flex forks are fitted.

EXCELSIOR, No. 122.

3½ h.p. MODEL: 85 × 88 mm.; side by side valves; Senspray carburetter; belt; Sturmey-Archer three-speed gear.

BAYLISS, THOMAS, AND CO., Coventry.—The 3½ h.p. is an ideal single-cylinder model for touring purposes. An interesting feature of this machine is the "all black" finish. New footboards of aluminium are fitted; these are rubber covered, and have the ends turned up so as to protect the feet from mud. We also noticed the manner in which the oil is led to the side of the cylinder so as to ensure perfect lubrication of the piston.

4½ h.p. MODEL: 86 × 112 mm.; side by side valves; Senspray carburetter; belt; Sturmey-Archer three-speed gear.

In most details the 4½ h.p. resembles the 3½ h.p. except that 650×50 mm. tyres

The Olympia Show.—

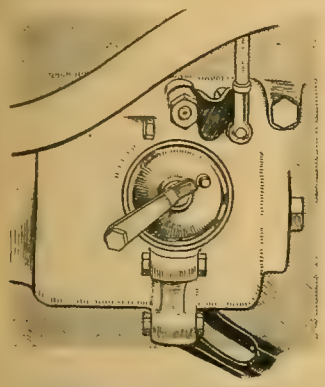
are fitted to voiturette rims. The most powerful model is the 5-6 h.p. 96×112 mm., which, however, resembles the types we have just described in most details.

Mention must also be made of the chain-driven types, which are supplied with the various sized engines enumerated above. In these the front chain is entirely enclosed and the back chain partially protected. Two types of counter-shaft gears are fitted, both made by Jardine and Co., of Nottingham. One, the lighter model, fitted to the 3½ h.p., gives two speeds and incorporates a free engine clutch, while the other, suitable for the 5-6 h.p. machine, is more substantially constructed, and contains three speeds and a neatly enclosed kick starting device. Its design follows car practice throughout.

F.N., No. 115.

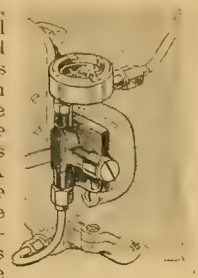
7 h.p. MODEL: 52 × 88 mm.; m.o.v.; Zenith-F.N. carburetter; shaft and bevel; sliding gear.

F.N. (ENGLAND), LTD., Great Portland Street, W.—We gave a brief description



Inspection cover on the gear box of the four-cylinder F.N.

of the new 7 h.p. four-cylinder F.N. in our description of the Paris Show exhibits, but it is impossible to give this interesting machine its just due without first examining carefully the sectional model. This is a most excellent piece of work, with all possible portions cut away to show the interior, and yet so carried out that the whole engine and transmission can be made to work by turning a handle. We will first deal with the separate cylinder T-headed engine (52×88 mm., 748 c.c.), by which is meant that the exhaust valves are arranged on one side and the inlet valves on the other. Looking at the front of the engine, it will be seen that the timing wheels are of large size. Also in the front the mechanical oil pump is found, and above it the indicator, consisting of a small round glass-topped case, which contains two star wheels which are visible from the saddle, and continue to revolve as long as the oil circulates. A glimpse through the glass-sided crank case discloses a false bottom in which troughs are moulded, while across it are long thin strips of gauze let in. The oil drawn up from the base of the sump is delivered through holes in the delivery pipe, and sprayed therefrom over the ball bearings of the main shaft and all over the moving parts. It drops into the troughs and is picked up by the big ends, while any excess falls through the gauze insets back into the sump. The large crankshaft, almost big enough for a small car, and the adjustable big ends are also seen through this window. The flywheel, which is infinitely larger than in the older model, contains a multi-disc clutch, part of which is cut away so as to show the plates. The gear box, which contains three speeds, is an excellent piece of work. Both shafts are carried on ball bearings, and the moving gear wheel slides on a splined shaft. The gear ratios are 4½, 7, and 11 to 1. There is a large inspection plate at the side of the gear box, which allows the gears to be examined, while there is a similar inspection plate in the bevel gear casing. The kick starter pedal is situated right under the saddle so that the rider can exert the maximum amount of pressure on it. This pedal is attached to a rod operating a quadrant in front of the engine, which engages with a free-wheel pinion on the main shaft. Both brakes are applied to the rear wheel, of which one is contracting and the other internal expanding in the same drum, while the fact that the rear wheel is easily detachable is a point worthy of special mention.



Oil pump and indicator on the four-cylinder F.N.

2½ h.p. MODEL: 65 × 85 mm.; m.o.v.; F.N. carburetter; shaft and bevel; sliding gear.

This model, on which R. O. Clark broke so many records at Brooklands on November 6th, has been recently described in these pages. It possesses many of the features of the larger machine, and is a handy go-anywhere mount.

5 h.p. MODEL: 52.5×57 mm.; a.o.i.v.; F.N. carburetter; shaft and bevel; sliding gear.

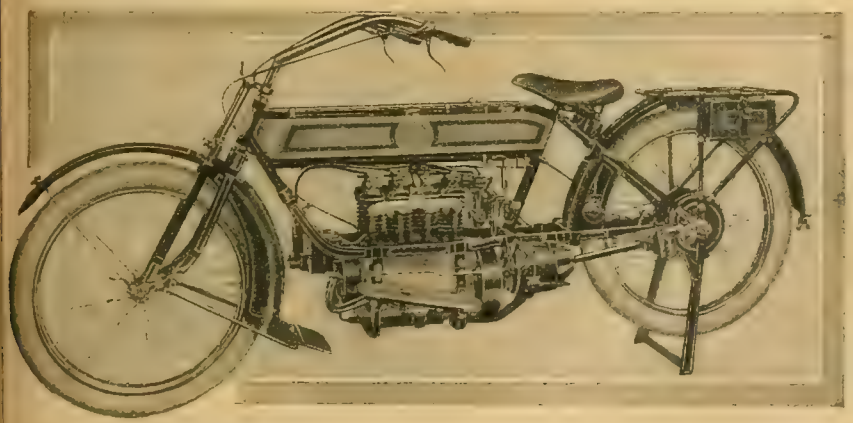
Like the 2½ h.p., the 5 h.p. four-cylinder F.N. is well known to our readers, many of whom have appreciated its silence and smooth running. It has stood the test of time, and is, moreover, less expensive than the larger four-cylinder model.

GLORIA, No. 63.

THE GLORIA CYCLE CO., LTD., Much Park Street, Coventry.—The Gloria is probably one of the best known sidecars on the market at the present time. Altogether eight models are exhibited, and these comprise a very wide range suitable to almost any taste. The No. 5 machine is an excellent example of Gloria work, and a general description is given. The chassis is particularly powerfully built, and carries a trunk in a rear luggage carrier. This trunk is divided into two compartments, each of which contains an adjustable tool bag. Provision is also made for carrying petrol and oil cans. The usual type of leaf spring suspends

A type of Gloria coach-built sidecar for 1914.

a pretty coachbuilt body which is fitted with wind screen and hood. An ingenious feature is the springing of the chassis, which is carried on a curved arm pivoted to the frame at the front end and enclosed in a spring box at the rear. The attachment to the cycle is unusual, and so designed that the main fixings grip two cycle tubes at once. A fourth point of attachment has been added. Another feature of this model is the excellent accommodation for tools or luggage both under the seat and in the rear of the body. The projectile model has been considerably improved, and leaf springs now replace the coil springs, which were found to cause slight roll. The back of the body has been somewhat raised to give increased comfort, and the whole outfit has been lightened by almost 50 lbs. A luggage carrier is also fitted. Three sidecars are shown attached to 4 h.p. Triumph motor cycles, and to Sunbeams, Zenith, and Bat motor cycles. The mudguarding is excellent.



Transmission side of the new four-cylinder F.N., showing footboards, counter-shaft gear, and shaft drive.

Three Examples of Powerful Chain-driven Twins.

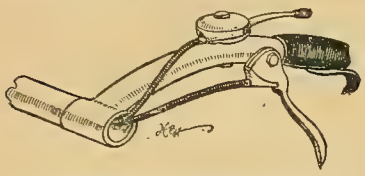
The Olympia Show.—

GRANDEX-PRECISION, No. 64.

6 h.p. MODEL (twin): 76×85 mm.; side by side valves; Amac carburetter; chain drive; two-speed selective clutch gear.

GRANDEX-PRECISION CO., 86, Gray's Inn Road, London, W.C.—The latest model Grandex machine is fitted with the Enfield two-speed gear, the front chains being carefully guarded and the rear chain covered on top. A rubber cushion shock-



The partially enclosed Bowden wires on the handle-bars of the Grandex-Precision.

absorbing device is fitted to the rear hub. Mudguards are fitted with ample side wings, which in conjunction with long rubber-covered footboards afford good protection for both rider and machine. A semi-automatic drip feed lubricator is fitted, and front wheel springing is by Saxon forks. The handle-bars are carried out in a somewhat unusual manner, for they have a straight front through which a control wire is passed, giving a neat appearance to the machine.

4 h.p. MODEL (twin-cylinder): 66×88 mm.; side by side valves; Amac carburetter; belt; Sturmey-Archer three-speed gear.

The 4 h.p. model, as is the case with all the exhibits on this stand, is fitted with a Precision engine. In this instance, the new 500 c.c. twin is neatly carried in a frame designed on the standard lines. It may be remembered that the cylinders of this engine are so constructed as to be interchangeable, and flanged joints are fitted to both inlet and exhaust pipes. The kick starter, which works through the hub, is neatly carried out, a special lug being cast in the right hand chain stay to carry the pedal and starting sprocket. A substantial aluminium expansion box is fitted behind the engine, and a tail pipe leads to the rear wheel. A small sump is let into the petrol tank, which, besides facilitating drainage, acts as a trap for any foreign matter which may find its way in with the petrol.

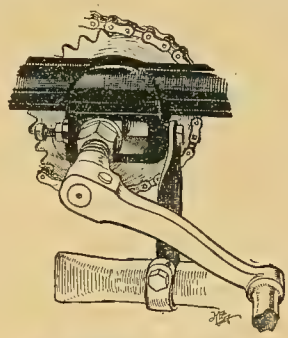
2 h.p. MODEL: 60×60 mm.; horizontal overhead valves; Amac carburetter; belt drive; two-speed with engine gear.

The 2 h.p. model is known by the firm as the "Pup," and is fitted with the Precision Junior, described in a recent issue of *The Motor Cycle*. It is sufficient to remind our readers that the two-speed gear is constructed as part of the engine, and that the valves are placed overhead, and are actuated by long rockers from the primary gearshaft. This unit is carried in a light frame with a dropped top tube, and is fitted in every detail as a miniature motor cycle. Besides the above models a 4¼ h.p. single, 3¾ h.p. single, 2¾ h.p. single, and a 2½ h.p. single are all shown, and also a kick, or hand, starter, which may be attached to practically any motor bicycle on the market.

HAZLEWOOD, No. 124.

2¾ h.p. Jap MODEL: 70×76 mm.; m.o.i.v.; B. and B. carburetter; belt transmission; Armstrong three-speed gear.

HAZLEWOODS, LTD., West Orchard, Coventry.—This model is a serviceable lightweight, following standard practice in every detail. Particularly noticeable is



Slot adjustment for kick-starter chain on the Hazlewood.

the silencer, which is of ample size, also the comfortable aluminium footboards with a ridge to prevent the heel slipping off. The head lug is particularly substantial and is worthy of notice. The dummy belt rim, on which the back brake acts, is of special design, constructed to fit into the grooved brake shoe. A simple type of lubricating pump, provided with a two-way tap, is fitted.

5-6 h.p. MODEL: 70×85 mm.; m.o.v.; B. and B. carburetter; belt and chain; Armstrong three-speed hub gear.

The 5-6 h.p. model is a handsome machine, highly suitable for sidecar work. Among the noteworthy features we may mention the flexible tubing employed for the exhaust pipes, which is led into the spacious expansion chamber, at the end of which there is a short exit pipe. The chain from engine to counter-shaft is partially enclosed and the counter-shaft itself is carried in an eccentric, so that the chain may be easily adjusted. The foot brake is of ample dimensions, designed to be self-aligning and acting on a dummy belt rim. It will be interesting to note also that the shoe is lined with Ferodo. Special attention has been paid to the mudguarding, and a front wheel stand is fitted.

3½ h.p. MODEL: 60×76 mm.; m.o.i.v.; B. and B. carburetter; belt drive; Armstrong three-speed.

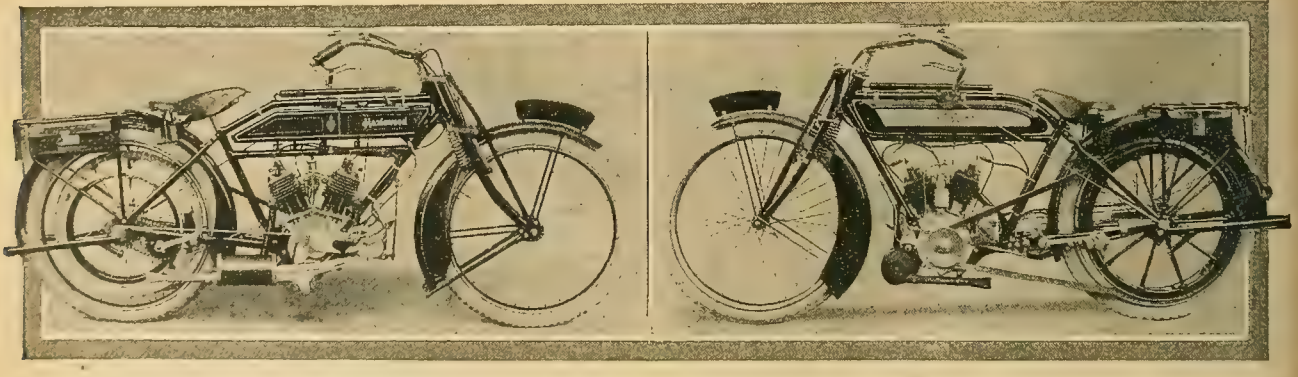
Like the 5-6 model a kick starter is fitted. The chief difference lies in the fitting of an Armstrong three-speed gear, driven direct by means of a belt. The lubrication is by hand pump and two-way tap, and the same exhaust pipe arrangement is incorporated. Like the other models, the machine is well mudguarded and equipped with a front wheel stand. The exhibit consists of the three separate models, which we have briefly described, and includes several examples of the 5-6 h.p., two of which are fitted with sidecars. Of these the one enamelled in French grey has a particularly pleasing appearance.

Induction pipe on the four-cylinder Henderson, showing arrangement for obtaining an even feed.

HENDERSON, No. 119.

8-10 h.p. four-cylinder MODEL: 67×76 mm.; m.o.i.v.; Schebler carburetter; bevel gearing and chain; two-speed epicyclic gear.

ROBERTSON'S MOTOR AGENCY, Great Portland Street, W.—Six models of this interesting machine are staged. A de-



Valve side of the new 3½ h.p. twin-cylinder Hazlewood with Armstrong three-speed gear, footboards, and flexible exhaust pipes.

The 2¾ h.p. three-speed twin-cylinder Humber in its latest form.

Lycett's "Armour-plated" Tool Bag.

Lycett's "V.A." Pan Seat.

When at OLYMPIA

— don't fail to call and inspect "The Good Lycett Lines"— the latest and best productions for the efficient equipment of the modern Motor Cycle — at

Stand "177" Gallery

— HERE we are showing a comprehensive range of Saddles and Accessories — including many new lines that embody certain exclusive patented features, all making for the highest utility and comfort of the rider awheel.

— Chiefly to be noted are the items here illustrated, viz.:

The "RELIABLE" Belt. Built of Rubber and Leather—expressly designed to afford greater grip, flexibility, strength, speed, long life, and absolute reliability under all conditions. The "RELIABLE" Belt has proved its supremacy, indisputably. In the A.C.U. 6 Days' Trials, machines fitted with the "RELIABLE" gained 11 GOLD MEDALS, 5 SILVER and 10 BRONZE—a total of 26 out of 61 medals that were gained by Belt-driven machines. Prices: ½in. 2/-, ⅝in. 2/4, 1in. 2/4 per foot. FASTENER 1/- extra.

The "ARMOUR-PLATED" Tool Bag Made of best quality leather, hand-sewn and lined with Flaxite. Encased in stout metal. Fall front and Patent Spring Lock. Made to strap or clip on carrier.

LYCETT'S "V.A." Pan Seat. Our new improved saddle. Its VERTICAL ACTION SPRINGS, anatomically shaped top, covered with selected Pigskin. luxuriously padded with best felt, roomy seat, and exceptionally LOW RIDING POSITION, comprise points which, combined, kill all vibration, and ensure perfect COMFORT awheel.

— We have a host of good lines to show you — lines that offer you positively the "highest quality" and "highest value" in uniformly reliable Accessories.

— Don't fail to call at "Stand 177" — or, if not visiting, please write for "The Saddle Book," post free.

Hutchinson "Rubber Studded"

New Pattern for 1914.

The Hutchinson "Rubber Studded" has been considerably improved to meet the requirements of the present-day Motor Cycle. The Rubber Studs are now placed much closer together, giving high gripping efficiency. They form an effective non-skid and the wearing surface is greatly strengthened. The Beads have been reinforced also, and for all-round durability and reliability this pattern cannot be equalled.

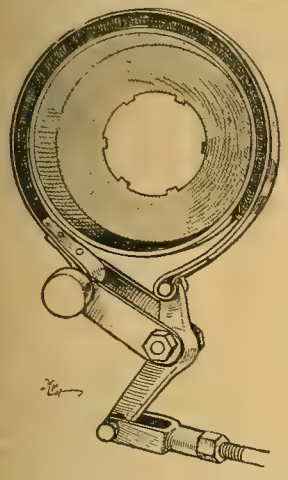
HUTCHINSON TYRE CO.

In answering this advertisement it is desirable to mention "The Motor Cycle."

The Olympia Show.—

tailed description of the latest model appeared in a recent issue of *The Motor Cycle*, but we may remind our readers that the Henderson is one of the most powerful four-cylinder motor cycles made. The engine has four separate cylinders, with the exhaust valves on the off side; the inlet valves are of the overhead pattern. It may also be remembered that the inlet pipe is an exceedingly neat piece of work, as its



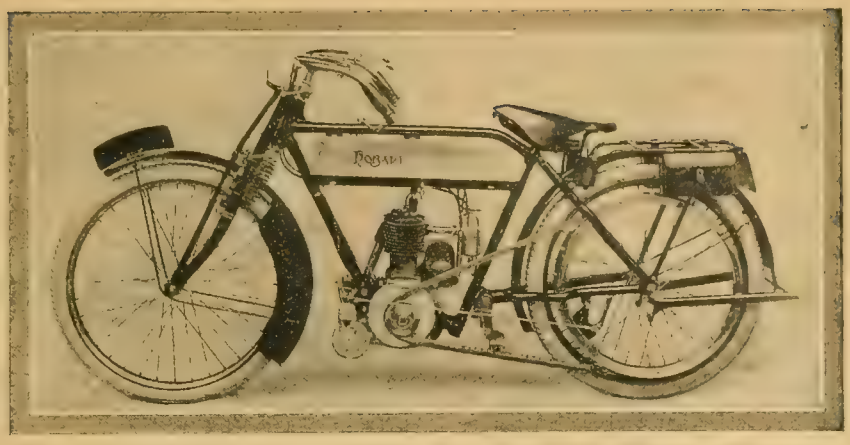
New Henderson foot-operated band brake with improved lever action and adjustments.

interior is an intricate piece of casting, so designed as to allow each cylinder to receive as nearly as possible an equal supply of gas. The warming of the carburetter is also carried out in an interesting manner, as the warming pipe runs right through the expansion chamber of the exhaust gas, and thus effectively heats the induced air. With the new models an epicyclic two-speed gear is fitted, and it is interesting to note that 28×3in. Englebert tyres are supplied with this machine. The speedometer is neatly driven off the back wheel, and to one of the models shown a handsome Bramble sidecar is fitted.

HOBART, No. 67.

4 h.p. MODEL: 85 × 85 mm.; inlet valve over exhaust; Senspray carburetter; belt; Sturmey-Archer three-speed hub

HOBART BIRD AND CO., LTD., Coventry.—The engine of the 4 h.p. is a J.A.P. carried by a very stoutly constructed frame, which has a dropped top tube. The usual fitting of two stands, carrier and pannier tool box, is supplied, the latter being completely enclosed except at the front. New features for 1914 include Best and Lloyd semi-automatic drip feed lubrication, adjustable footrests, and an extremely neat finish in black and gold. The brake and clutch pedals are in each case carried on rods separate from the footrests, so that in case of a fall there is little fear of their being damaged. The clutch control rod is supported close to the rear wheel by a neat lug brazed to the frame. This model is also shown as a single-geared machine, the specification, with the exception of the hub, being identical



Belt side of the 2¾ h.p. T.T. Hobart for 1914.

2¾ h.p. MODEL: 74 × 81 mm.; side by side valves; B. and B. semi-automatic carburetter; belt; Sturmey-Archer gear.

The 2¾ h.p. Hobart is built on similar lines to the 4 h.p. already described. The engine, however, has the magneto mounted directly behind the cylinder, and is gear-driven. The cylinder of this model has been re-designed, and the radiating surface considerably increased. Air ports are now arranged behind the valve chests. The radiating fins are formed pear-shaped. The machine is shown also in the form of a single-geared T.T. machine, and either a Ruthardt or Eisemann magneto is standardised.

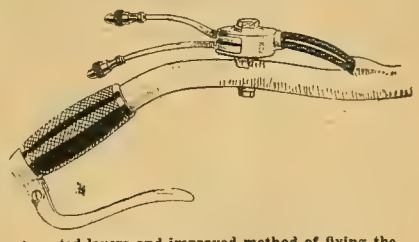
6 h.p. twin-cylinder MODEL: 75 × 85 mm.; side by side valves; B. and B. semi-automatic carburetter; chain drive; two-speed selective clutch.

The 6 h.p. model forms an entirely new exhibit of this company. It is solidly constructed and intended primarily for passenger work, sidecar lugs being brazed to the frame. The gear is of the Enfield type, and the two front chains run in an oil bath, the rear chain being protected by a cover. Very long footboards are fitted, and below them is mounted a cast aluminium silencer, which is firmly bolted to the engine, so that it cannot rattle. A long tail pipe leads the exhaust gases to the rear of the machine and an auxiliary release is formed by a short pipe pointing forwards. In finish and frame details it resembles the models already described, but in this case the mudguards have wings extending completely round the length of the guard. A taking sidecar it attached to this model, and examples of other suitable sidecars are exhibited, making altogether an excellent display. A 3½ h.p. twin-cylinder engine is also staged. It resembles the type known as the 4 h.p. during the past year, and has a bore and stroke of 65×76. Adjustable tappets are now fitted and the cylinder has been re-designed to give improved cooling.

HUMBER, No. 134.

3½ h.p. MODEL: 84×90 mm.; side by side m.o.v.; B. and B. carburetter; belt; special Sturmey-Archer gear.

HUMBER, LTD., Coventry.—The 3½ h.p. Humber is shown in two forms, viz., water and air-cooled, the former having been made to furnish a machine particularly suitable for sidecar work. This model is shown as a sidecar combination, the specification of the two types being almost identical. The engine has a cast water jacket of large dimensions, through which a thermo-syphon circulation is maintained in conjunction with an inclined gilled tube radiator which forms a downward extension of a large capacity water tank, which is set across the front end of



Inverted levers and improved method of fixing the controls on the 1914 Humbers.

the petrol tank. The volume of the latter has been considerably increased. Lubrication is by Best and Lloyd semi-automatic drip. A simple and efficient form of kick starter is used, and the handlebars have a transverse tube.

2¾ h.p. twin MODEL: 60.75 × 60 mm.; side by side valves; B. and B. carburetter; belt; Sturmey-Archer gear.

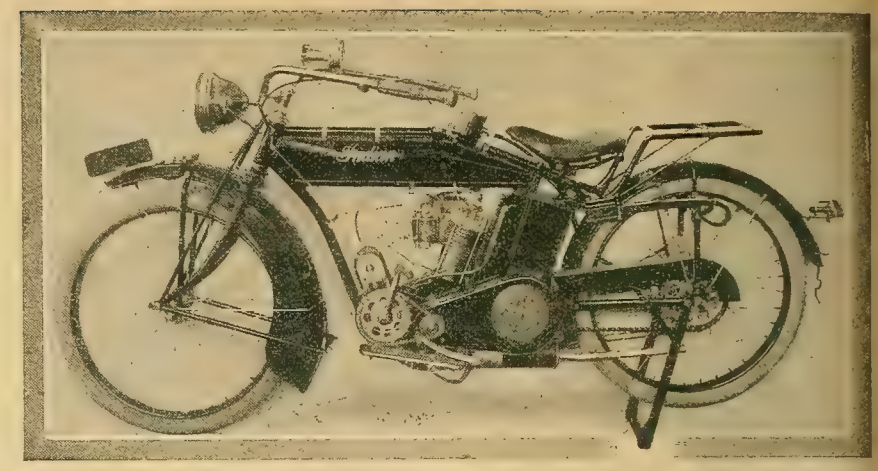
The 2¾ h.p. Humber is shown both in T.T. form and as a standard machine with pedalling gear. It has not been found necessary to incorporate any improvements in this popular model, in which the prominent feature is the offsetting of the cylinders. The frame is pronouncedly dropped. The neat silencer consists of a large expansion chamber, from which the gases flow through a short length of pipe terminating in a fan-shaped nozzle. The 2 h.p. lightweight model, with single-cylinder engine of 60×70 mm. bore and stroke, also remains unchanged, and is shown both in single-geared form and fitted with a S.A. hub. It is a matter of some disappointment to find that a new three-cylinder horizontal opposed Humber engine is not on view, but we understand that the company are so busy with their existing models that it has been decided to postpone any further development of new types.

The Olympia Show.—

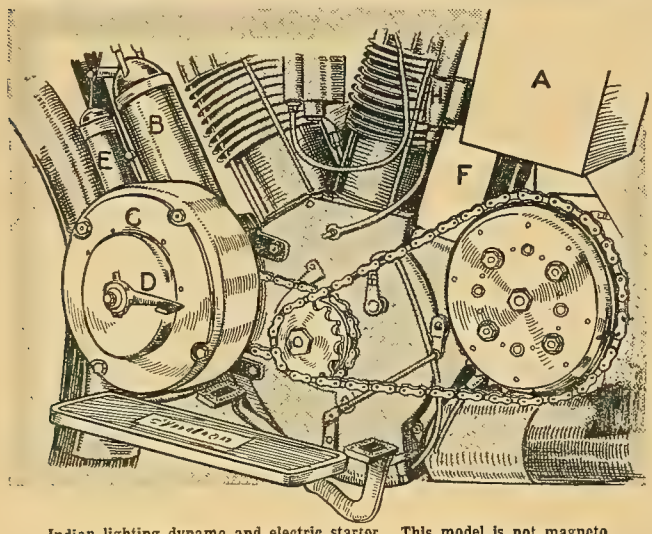
INDIAN, No. 123.

3½ h.p. MODEL: 82.5×93 mm.; overhead inlet valves; Indian carburetter; chain; two-speed Indian gear.

THE HENDEE MANUFACTURING CO., Euston Road, N.W.—The 3½ h.p. is a very handsome model, finished in Indian red, which colour is employed for all other machines on this stand, and is the standard colour for 1914. The new models have been previously described in a recent issue, but we may remind our readers that the same excellent silencing arrangements and efficient form of back springs are still retained, as well as the mechanical lubricator, which has long been such an attractive feature of this machine. It is interesting to note that the Splitdorf magneto, one of the best made American magneto machines, is fitted as a standard. The position of the speedometer just in front of the saddle is also worthy of mention, as the instrument is placed in a visible position, and the drive is taken off the back wheel, the driving ring being mounted with the brake drum. The speedometer is the Corbin, a handsome instrument. This is the ideal place to carry a speedometer, as the flexible shaft has no bends.



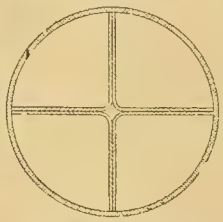
Chain side of the 3½ h.p. single-cylinder Indian, with electric lighting set.



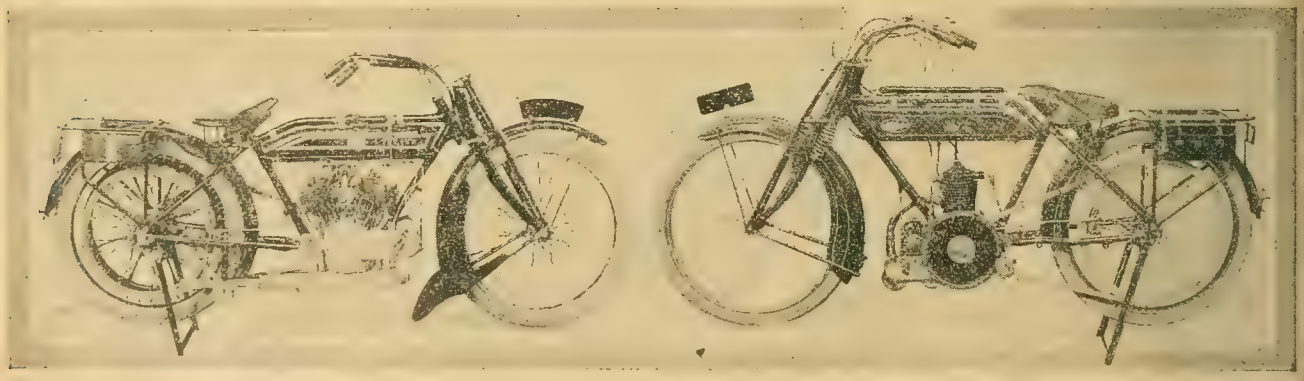
Indian lighting dynamo and electric starter. This model is not magneto ignited.
A. Battery case containing unspillable accumulators. B. Induction coil. C. Electric starter. D. Dynamo starting pedal. E. Automatic cut-out switch or dynamo governor. F. Oil reservoir. H. Hand oil pump.

7 h.p. two-cylinder MODEL: 82.5 × 93 mm.; overhead inlet valves; Indian carburetter; chain; Indian two-speed gear.

The latest model 7 h.p. Indian is undoubtedly one of the features of the Show, being the first machine to be turned out with electric starter and electric lighting. The whole outfit is worthy of the closest study. We may begin by explaining that the dynamo, which is driven by chain off the engine-shaft, is controlled by a switch incorporated with a controller on the top tube. When it is desired to start the engine the exhaust lifter is raised, the action of which then releases a catch, which allows the switch to be pushed over into the "off" position. Thence it can be pushed forward, allowing the motor to start the engine. As soon as the engine has attained a certain number of revolutions the exhaust valve is dropped and the switch pushed right back, with the result that the motor is converted into a dynamo and supplies current for the contact breaker and also to charge the batteries. The whole electric arrangement is very carefully thought out. The wires are conveyed in covered cables to a distribution board, while the lead to the tail lamp, which also illuminates the back number plate, passes through the offside head of the rear mudguard. It is also interesting to note that the dynamo is provided with an automatic cut-out to prevent overcharging. The fact that the Corbin speedometer is capable of being disconnected by pushing back a milled nut is also worthy of mention, so that the speedometer need not register while the engine is being run on the stand. The type of head light fitted is also worthy of special attention, as it is provided with a scientifically constructed reflector.



Section of tubing of the Indian frame showing method of reinforcement.



Valve side of the 5-8 h.p. twin-cylinder three-speed Ivy-Precision.

Pulley side of the two-stroke single-cylinder Ixion

The Olympia Show.—

IVY, No. 41a.

6 h.p. twin MODEL: 76×85 mm.; side by side valves; B. and B. carburetter; chain and belt; Jardine two-speed gear.

S. A. NEWMAN, Lichfield Road, Birmingham.—A fine sidecar combination is shown on this stand equipped with the above details, the colour scheme being French grey with dark green panels. The sidecar is noticeable for a very deep scuttle dash. An adjustable wind screen is mounted right up to the passenger, and the space between the scuttle dash and the wind screen is filled in with a neat detachable waterproof covering. A Cape cart hood is also fitted, and the upholstery is well padded. The transmission on the machine is arranged so that the final drive is by belt running over a very large pulley, thereby enabling easy detachment of the back wheel to be made. Brampton Biflex spring forks are fitted, and the whole turn-out has a most workmanlike appearance. Another sidecar is shown fitted with a 4¼ h.p. single-cylinder Precision engine, the drive being by belt to the back wheel which is fitted with a Sturmey-Archer three-speed hub.

2¾ h.p. MODEL: water-cooled Green-Precision; overhead; B. and B. carburetter; belt; Brampton variable gear.

This is a speedy looking machine of the T.T. type, the engine being a Green-Precision with radiators mounted at the sides of the cylinder. On the top of the tank is mounted a small copper reservoir connected by a rubber tube with the radiators to keep up the water supply. Brampton forks are fitted, and a curious feature is the connection by means of a flexible pipe between the timing case and the carburetter, allowing a small amount of oil vapour to be taken into the carburetter. The machine is beautifully finished, and should prove very speedy. Other models shown are fitted with 3½ h.p. single-cylinder and 3½ h.p. twin Precision engines, the drive in both cases being by belt.

IXION, No. 136.

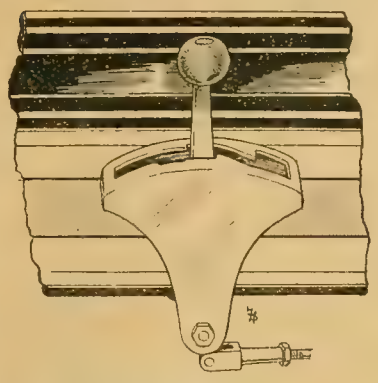
4¼ h.p. MODEL: 89×96 mm.; side by side valves; Amac carburetter; belt; Sturmey-Archer three-speed hub.

IXION MOTOR MFG. CO., Ladywood, Birmingham.—The 4¼ h.p. Ixion machine is shown as a very taking sidecar combination, for which purpose the frame

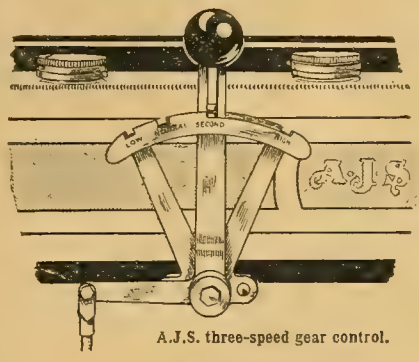
Double silencer and extension pipe on the two-stroke Ixion.

is suitably reinforced where necessary; the sidecar lugs are permanently fitted. The joints employed are of a patent quick detachable type, and have a self-locking action. A specially designed change speed lever is employed, and is carried on the lower frame tube below the tank.

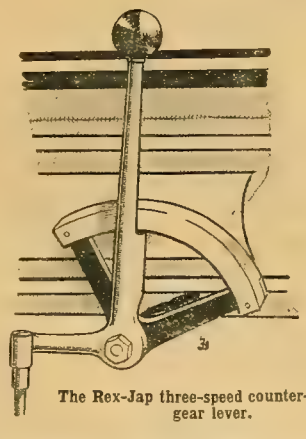
TYPES OF GEAR CHANGE LEVERS ON 1914 MODELS.



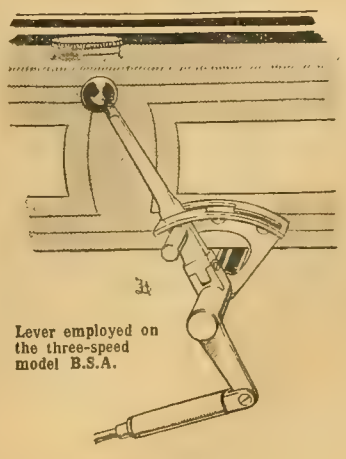
Rover gate change for S.A. gear.



A.J.S. three-speed gear control.



The Rex-Jap three-speed counter-shaft gear lever.



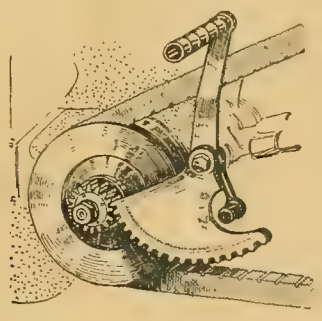
Lever employed on the three-speed model B.S.A.

It is claimed that, owing to its length and disposition, it greatly facilitates gear changing. The foot brake is of the floating (or compensated) type, and is placed so that it does not interfere with the withdrawing of the rear wheel. The seat of the sidecar is hung like a hammock on twenty small coil springs.

The 3½ h.p. model, with a bore and stroke of 85×88 mm., is similar to the above in all essentials, both having Precision engines, Sturmey-Archer gear, and handle starting devices.

2¾ h.p. MODEL: overhead inlet valve; Amac carburetter; belt; Villiers two-speed gear.

This model, which is shown in solo form and also as a light sidecar delivery van, is fitted with a 2¾ h.p. Villiers engine, which combines a two-speed gear in the crank chamber. The enclosed clutch is capable of being operated either by foot or by a lever on the handle-bar. A kick starter is fitted, and this comprises an adjustment device so that the teeth of the rack and pinion can be kept suitably in mesh. Druid spring forks are used, and the footboards on this and all the other Ixion models are of cast aluminium.



Kick-starter acting directly on the belt pulley of the Ixion.

Another 2¾ h.p. model is made, in which the engine is again a Villiers, but of the two-stroke type, having dimensions of 70×70 mm. This model is made with both the fixed and the two-speed gear with chain and belt drive, the box being attached to the bottom bracket. In this machine a special construction of the head is employed to do away with the necessity of using a rail below the tank.

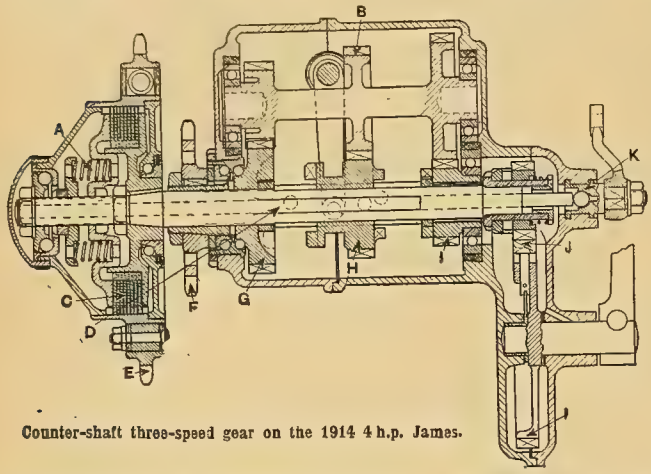
JAMES, No. 61.

4¼ h.p. MODEL: 96×103 mm. side by side valves; B. and B. or Amac carburetter; chain; three-speed counter-shaft gear.

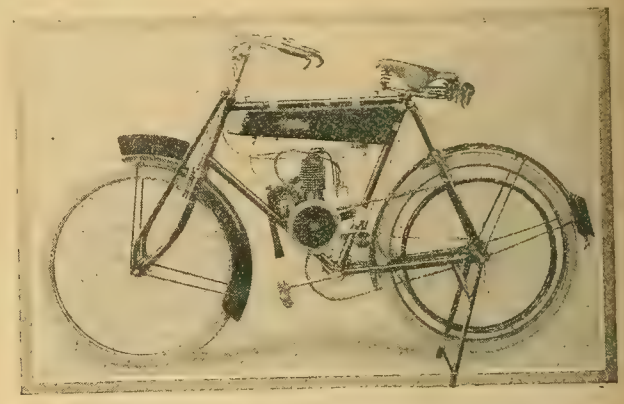
THE JAMES CYCLE CO., Greet, near Birmingham.—The big single will again be a feature of 1914. It has performed so successfully during the past that it has not been considered necessary to make any extensive alterations. The size of the engine has been somewhat increased, and there are some slight improvements in the valve ports and radiating fin design. Both driving chains are enclosed in neat pressed steel cases, which are arranged so as to be easily removable and still leave the rear wheel easy of access. A new feature is the fitting of a spring shock absorber in the

The Olympia Show.—

rear hub. It has been found that this type, besides removing all engine shocks, considerably reduces the wear on tyres. The big James is particularly popular for sidecar work, and in consequence it has been found advisable to fit a front hub constructed to run on Timken roller bearings to withstand the extra side thrusts. This is a most admirable point, and is worthy of attention. Attached to this model is a well-finished sidecar, and also to a similar machine a coach-built delivery body, built for newspaper work. As is pointed out by the manufacturers, although the machine is primarily intended for passenger work, it is by no means too heavy or clumsy to be used occasionally solo. The three-speed counter-shaft gear is extremely well designed, and is operated by a stout lever on the right-hand side of the tank. Though not on view at Olympia, belt-driven models may also be obtained.



Counter-shaft three-speed gear on the 1914 4 h.p. James.



A lightweight with the J.E.S. auxiliary motor set—probably the lightest machine in the Show.

3½ h.p. MODEL: 64×77 mm.; side by side; B. and B. or Amac carburetter; chain; three-speed counter-shaft gear.

The 500 c.c. twin James is a striking-looking mount, and has many interesting features. The James staggered radiating fins are, of course, retained, and air passages are formed round the valve chests. An excellent feature is noticeable in the magneto chain adjustment, the sprockets being formed with radial slots, which allow a very fine adjustment. The magneto is chain-driven, and placed behind the engine, where it is extremely accessible, and at the same time well protected from the elements. As in the 4½ h.p. model, a three-speed gear box is employed. This box is very neatly designed, and is of small proportions, though the wearing surfaces have not been reduced in any way. Both driving chains and the kick starter are enclosed, and a simple adjustment is provided for chain stretch. Both James models are fitted with multiple-disc clutches, mounted on the counter-shaft and controlled from the handle-bars. The finish of all models is excellent, and sight feed drip lubrication is employed in each case, assisted by a pump for emergencies.

J.E.S. MOTORCYCLETTE No. 36.

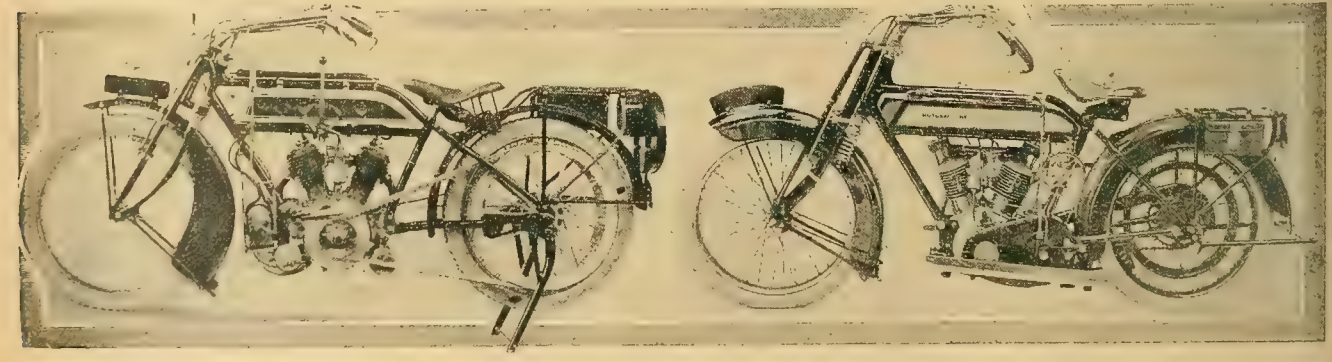
50 × 52 mm.; automatic inlet valve; J. E. Smith's patent carburetter; belt; single speed tranmission.

J. E. SMITH, AUXILIARY MOTOR WORKS, Gloucester.—This little machine is probably the lightest and smallest of any on the market at the present moment, the complete power unit weighing about 24 lbs., and either a complete machine or the power unit alone can be supplied. The motor is so light that it can be fitted to any standard roadster pedal cycle, but at the same time it is capable of attaining a speed of thirty miles an hour, if desired, and runs 180 miles on a gallon of spirit. The control of the carburetter is by means of Bowden wires from the handle-bars in the usual style, and the complete machines shown are fitted with girder forks of the rigid type. The ignition is by Fisher magneto and an outside flywheel is fitted. A jockey pulley is provided to take up the slack of the belt The lubrication is by an ordinary hand pump, and oil is delivered into the timing gear case, and thence it runs into the base chamber. This little machine is very compact, and is in every sense a genuine lightweight. We understand that the company have under test a miniature two-stroke 2 h.p. motor, but this was not on the stand at the time of our visit, though it was hoped that it would be finished in time for exhibition later in the week.

KERRY-ABINGDON, Nos. 222 and 34.

3½ h.p. MODEL: 85×88 mm.; Amac carburetter; side by side valves; belt; Armstrong three-speed gear.

ABINGDON ECCO, LTD., Tyseley, Birmingham.—Amongst the most interesting features embodied in the 1914 models of the Kerry-Abingdon is the crank case, the design of which is very clean. A new kick starter is also fitted. The general design of the machine is pleasing, and it is worthy of note that a mudguard is provided for the magneto, and side shields are fitted to the front mudguards, while the footrests are ad-



TWO 6 H.P. TWINS FOR NEXT YEAR.

(1) The three-speed model Kerry-Abingdon with direct belt drive and Mark VII. Armstrong gear.

(2) Gear side of the two-speed chain driven Motosacoche

The Olympia Show.—

justable. This model is shown attached to a sidecar.

6 h.p. MODEL: 67×95 mm.; side by side valves; Amac carburetter; belt transmission; Armstrong three-speed gear.

The new engine designed by Mr. Blumfield is an excellent piece of work, and the fine finish of the crank case casting should be carefully noted. It has also an ingenious device for priming both cylinders simultaneously. Messrs. Kerry-Abingdon also are showing a handsome sidecar, the wheel of which is suspended at two points, while the frame is built in one tube, bent so that it forms the outline of the chassis, the tube being strengthened by cross members. A very neat, quickly detachable fitting is also supplied with this sidecar. The portion attached to the sidecar frame consists of a spindle, the end of which is grooved; the part attached to the bicycle is provided with a fork clip, which fits tightly over the groove and is afterwards held in position by a spring bolt rendering the fastening perfectly secure. There is a minor point, but one well worth noticing, on this model, and that is the provision of two anchor plates to the hub gear, one on each back stay. By this means twisting of the gear is entirely obviated, however much it may be abused.

6-8 h.p. twin MODEL: 73×95 mm.; side by side valves; B. and B. or Amac carburetter; chain and belt; Armstrong Mark VII. on counter-shaft gear.

The 8 h.p. twin-cylinder is an entirely new model designed specially for sidecar work. The general lines of the engine follow standard Kerry-Abingdon design, but a number of interesting features are to be found on the machine. The transmission is by chain and belt, both of which are protected, and an Armstrong Mark VII. gear is placed on the counter-shaft, adjustment being provided by mounting the gear on a strong swinging cradle; 3in. tyres are fitted, and a long steering head is used to avoid steering troubles with a heavy sidecar. Generous fuel provision has been made, no less than 2¾ gallons of spirit and over half a gallon of oil being accommodated in the tank. The back mudguard is 7in. wide, and for serious touring the machine should prove ideal.

LEA-FRANCIS, No. 68.

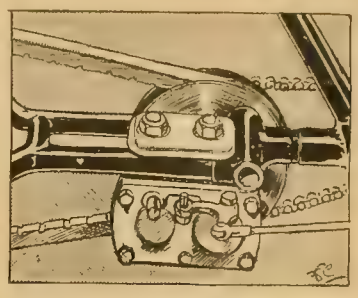
3½ h.p. MODEL: 60×76 mm.; side by side valves; Amac or Everset carburetter; chain; two-speed counter-shaft gear.

LEA AND FRANCIS, LTD., Lower Ford Street, Coventry. — Six machines are shown on this stand, all being to all intents and purposes identical. The engine is a 50° twin J.A.P., and transmits the power through a spring shock absorber to a two-speed counter-shaft gear box. The gear box is mounted in a hollow bottom bracket, and provision is made for chain adjustment by rotating the box, which is eccentrically mounted. Final drive is also by chain, and the transmission is thoroughly well enclosed throughout, the chain cases being quickly detachable. The mudguarding has been very thoroughly carried out, and the rear part of the back guard can be swung away, which, together with a removable rear spindle, permits a ready wheel adjustment for tyre repairs. Long curved footboards are fitted at each side of the machine, and have a useful mud splasher mounted across the front. One of the most unusual fittings of this machine is the front brake, which is of a similar pattern to the rear brake, consisting of a shoe acting on the inside of a V-type brake rim. The magneto lies directly behind the engine, and is driven by chain direct from the crankshaft. A new type of handle-bar having a very pleasing appearance has now been standardised, and the only other new feature is a neat inspection door in the rear chain case. An interesting feature of the stand is a section of the transmission gear, by means of which the whole driving system can be easily seen. All parts exposed to mud and rain are blacked, and three instances are displayed with handle-bars finished in black. In every case a single lever carburetter is supplied. An interesting case showing Lea-Francis parts is displayed, and a particular feature is the new weather-proof detachable hub which is mounted on Skefko ball bearings.

LEVIS, No. 23.

2¼ h.p. two-stroke MODEL: 62 × 70 mm.; Amac carburetter; belt.

BUTTERFIELDS, LTD., Stechford, Birmingham.—The 2¼ h.p. Levis in its simple single-speed model remains practically unaltered, and is about as simple a form of motor cycle as it is possible to imagine, while the weight, of course, is kept extremely low by the absence of any complications. This is also made with a special open frame model for ladies, and the one exhibited on their stand is finished throughout with nickel plate, and forms a very striking exhibit. The upper half of the belt runs in a tube, which completely prevents the rider's dress being entangled or soiled by contact with the belt.



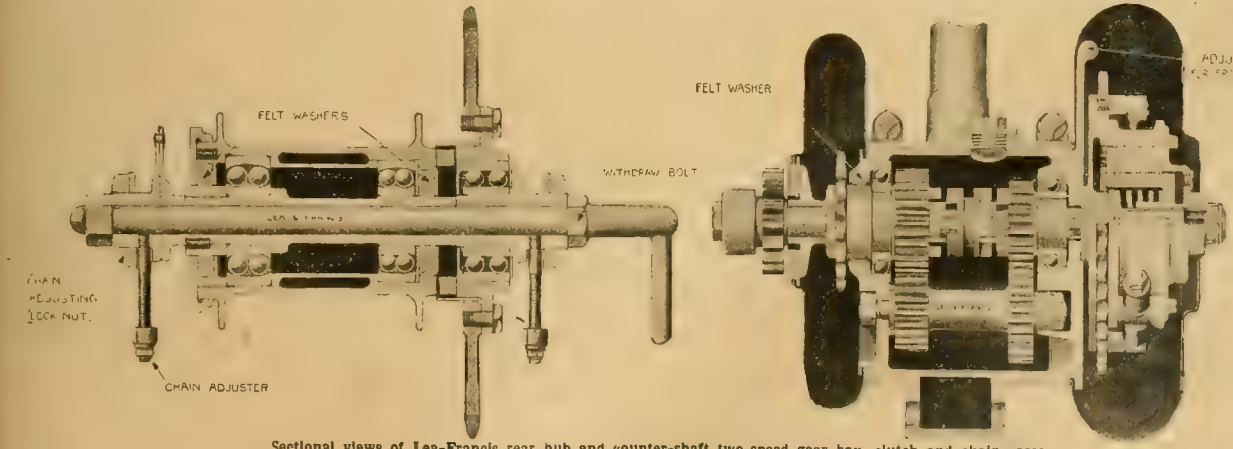
The compact counter-shaft two-speed gear on the Levis, which is readily detachable and adjustable.

2½ h.p. two-stroke MODEL: 73×70 mm.

This forms a more powerful edition of the "Baby," the engine being more powerful, and the wheelbase extended, and larger petrol capacity being given. The filler caps to the tank call for comment, being of the extended or chimney type. The frame of this model is so designed that it may be obtained, if desired, fitted with the Levis two-speed counter-shaft gear, an example of this gear being shown on Stand 27 fitted with a sidecar.

2¾ h.p. two-stroke MODEL: 75 × 79 mm.; Amac carburetter; chain and belt; two-speed counter-shaft.

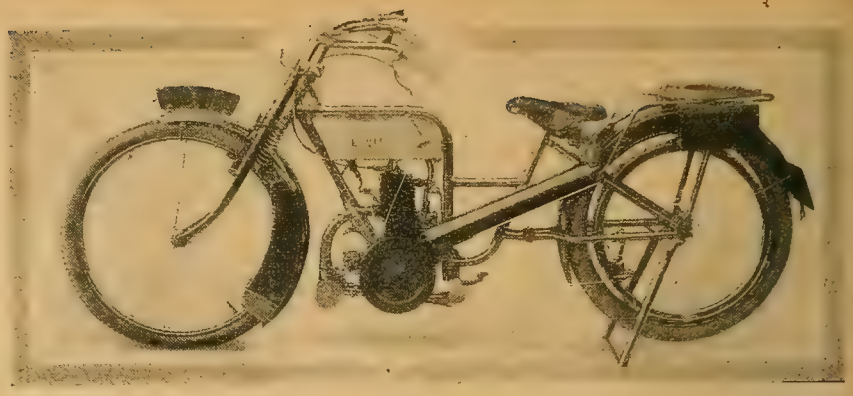
The engine of this machine is identical with the one that ran so satisfactorily in the Junior Tourist Trophy Race, and the machine is specially designed for use with a light sidecar. The gear box is extremely compact, and although not shown on the stand, Messrs. Butterfield are bringing out an expanding ring clutch, which will be fitted to the flywheel. Adjustment for the high-speed driving chain is provided by allowing the gear box to be moved along the slot, very substantial locking nuts being provided. The gear is changed by a quadrant situated horizontally on the top tube. Lubrication is by a semi-automatic Best and Lloyd. The



Sectional views of Lea-Francis rear hub and counter-shaft two-speed gear box, clutch and chain cases

The Olympia Show.—

machine is shown fitted with a Watsonian coachbuilt sidecar, painted and upholstered red. A very interesting novelty is the 1¼ h.p. "Levisette," which is practically a push cycle fitted with a 1¼ Levis engine, 58 × 66 mm. (174 c.c.). The drive is by direct belt, and it is not necessary to employ a jockey pulley in the transmission. The total weight of the machine ready for the road will be under 75 lbs. A late arrival on the Levis stand was a 2¾ h.p. two-speed mount, complete with a sidecar. The latter is made specially for a lightweight machine, and has a single tube frame, the body being suspended on Brooks's patent compound springs. It weighs complete but 46 lbs.



Quite one of the most attractive machines in the Show is the Ladies' Model Levis, which is silver-plated throughout and has ivory handlegrips.

LINCOLN-ELK, No. 125.

2¾ h.p. MODEL: 76×77; m.o.i.v.; B. and B. carburetter; belt.

JAMES KIRBY, Broadgate, Lincoln.—This model may be described as a lightweight "runabout," following standard lines in every detail. As regards the engine, both valves are of large diameter and each is operated by its own cam through independent rockers. Although there is no change-speed gear, a variable pulley is fitted.

3 h.p. MODEL: 79×82 mm.; m.o.v.; B. and B. carburetter; belt.

3½ h.p. MODEL: 85×88 mm.; m.o.v.; B. and B. carburetter; belt.

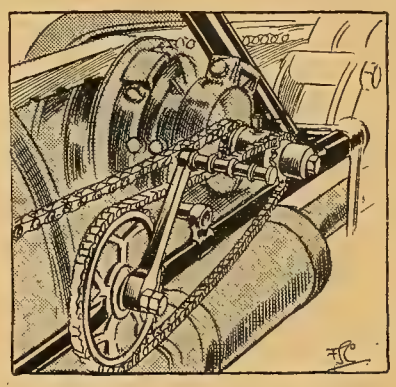
Both the 3 h.p. and the 3½ h.p. models are similar in detail to the 2¾ h.p., being single-geared mounts, and sold to the public at a very moderate figure.

4¼ h.p. MODEL: 89×90 mm.; m.o.v.; B. and B. carburetter; chain and belt; two-speed contracting band counter-shaft gear.

This is a machine capable of taking a sidecar practically anywhere. The transmission is by chain to the counter-shaft, the chain being partially enclosed in an aluminium case. The high gear drive is by belt to a large pulley on the back wheel, a separate chain being used for the low gear. In the case of each gear the drive is taken up by means of contracting band clutches, while a kick-starter is also fitted. The action of the change speed lever, situated on the off side of the tank and within easy reach of the driver's hand, is well worthy of attention. Comfortable aluminium footboards are fitted, while the petrol tank is of ample dimensions.

6 h.p. MODEL: 76×85 mm.; m.o.v.; B. and B. carburetter; chains and belts; two-speed contracting band counter-shaft gear.

Except that a 6 h.p. twin engine of 770 c.c. is fitted, the details are practically the same as the 4 h.p. We may mention, however, that an Enots lubri



The kick-starter on the Lincoln Elk operating on the gearshaft.

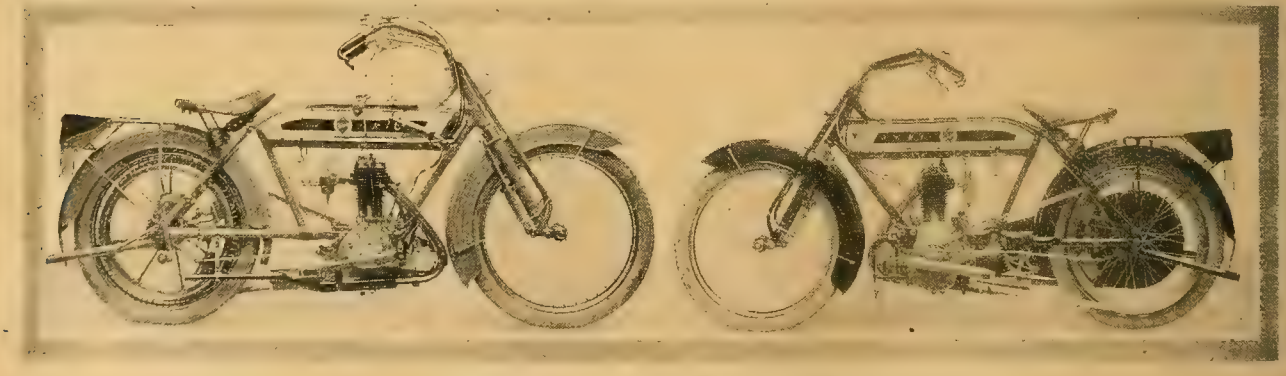
cator is fitted, and 26in. × 2½in. Palmer tyres are standard. The saddle is the comfortable Brooks's B 170; Druid forks are fitted to all models.

Two sidecars are shown on this stand, one of which is a torpedo model specially designed for racing.

L.M.C., No. 70.

4 h.p. MODEL: 89 × 92 mm.; side by side valves; B. and B. or Senspray carburetter; belt and chain; two-speed selective clutch.

THE LLOYD MOTOR ENGINEERING CO., LTD., Monument Road, Birmingham.—The 4 h.p. L.M.C. is specially designed for sidecar work. The engine has undergone only slight alteration, but a mechanical decompressor has been added to the timing case, and is operated by a control lever on the tank through the medium of a coil spring, so that should the cam be in the wrong position to engage, the lever can be set to operate it, and as soon as the engine is turned the decompressor comes into action. The L.M.C. two-speed gear is now well-known, the high gear being by direct belt drive, and the low gear a combination of two chains through a counter-shaft. The operation is carried out by separate clutches of the expanding type, connected by a single pedal placed in a convenient position at the front of the right footboard. A new silencer is now employed, and consists of a large expansion chamber placed immediately below what is usually the pedal bracket, and having an extension pipe towards the rear axle. The spring forks have undergone slight modifications, and the spring is set so that it absorbs both compression and recoil actions. This type of machine can also be procured with the Auto-Varia gear, or Sturmey-Archer three-speed hub. One machine has attached to it a neatly constructed sidecar.



TWO MODELS OF THE L.M.C. FOR 1914.
(1) Valve side of the 3½ h.p. three-speed model. (2) The two-speed counter-shaft gear type with chain and belt drive

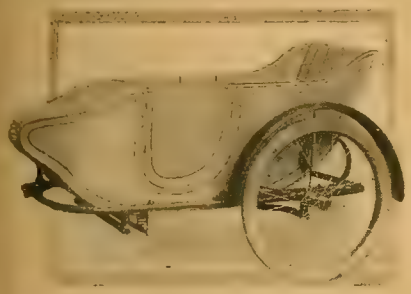
The Olympia Show.—

3½ h.p. MODEL: 85 × 88 mm.; side by side valves; B. and B. or Senspray carburetter; belt and chain; two-speed selective clutch gear.

The 3½ h.p. model follows strictly on the lines already described, and can be obtained with either L.M.C. two-speed, Auto-Varia, S.-A. three-speed hub, or fixed gear. The last-named model is shown as a Tourist Trophy racer, and has a very pleasing appearance. The design of the L.M.C. front forks does not lend itself to the use of a front wheel brake, consequently both rim brakes work on the rear wheel, and are placed one above the other. A very pretty grey-finished machine is staged, and in all there are seven machines on view.

McKENZIE, No. 18.

THOMAS MCKENZIE, Bath Passage, Birmingham.—The display of coach-built and cane sidecars is comprehensive. The most striking is coach-built, fitted with a Cape hood, the colour scheme being khaki with fine dark lines, and the upholstery in a pale shade of leather. A useful flap pocket is provided in the side. The axle is stepped. Suspension is by Cee springs at the rear and coil springs in front, and three-point attachment is provided. These



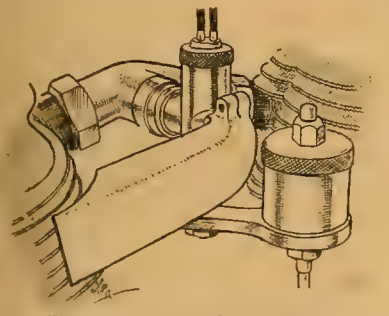
A new McKenzie coach-built sidecar.

sidecars are light in weight, and very deep seats are provided.

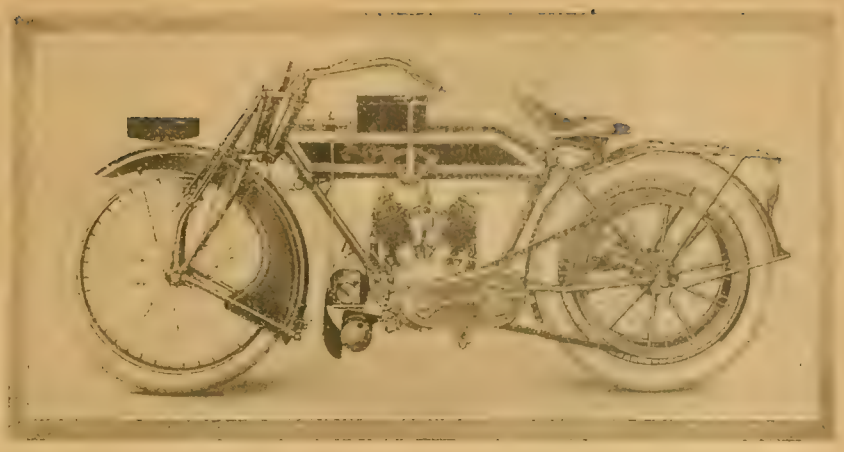
MATCHLESS, No. 50.

7 h.p. MODEL: 82 × 94 mm.; overhead inlet valves; Amac carburetter; chain; three-speed counter-shaft gear.

H. COLLIER AND SONS, LTD., Plumstead, S.E.—This interesting machine presents several new features. The engine is the now well-known M.A.G. Overhead inlet valves are employed, and the operating mechanism is entirely en

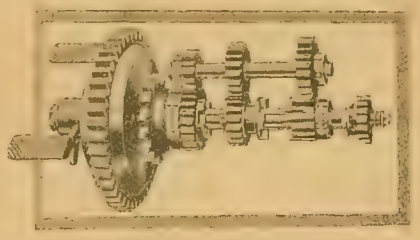


Hot air collector pipe fitted to Amac carburetters on 3½ h.p. Matchless.



3½ h.p. twin cylinder Matchless-Jap with chain and belt drive and hub gear

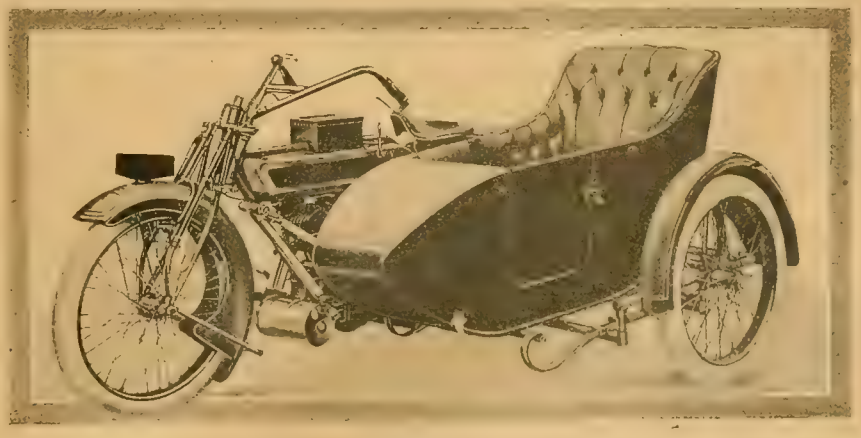
closed and lubricated from the engine through the tubes in which the tappet rods work. This method of construction also prevents air leaks, and consequently enables the engine to run at very slow speeds when required. A special release valve, fitted in the timing gear case, prevents the emission of the oil. The waterproof magneto is carried behind the engine well out of the way of mud and wet. The three-speed counter-shaft gear follows car practice, the direct drive being on top gear. The gears slide on a castellated shaft accurately machined and hardened. The whole gear box can be readily detached from the machine. The transmission is by Renold's silent chain from engine to gear box, and roller chain to the back wheel, a shock absorber being fitted on the engine-shaft. All chains are enclosed in oil-tight cases and lubricated by an overflow pipe from the engine. The back tyre, 650 × 75 mm., has been specially manufactured for Messrs. Collier by the Hutchinson Tyre Co. This is essentially a sidecar model, and the following dimensions are interesting. Entire length 74in., height of saddle 30in., full width 56in., highest point 42in. The tank has a capacity of 2½ gallons of petrol and three pints of oil, and is fitted with large filler caps and semi-automatic drip feed lubricator. Inverted levers are used for brake and valve lifter, which gives a neat appearance to the V-shaped handle-bar. Two pairs of footrests and pan seats make for the comfort of the driver. The standard gear ratios are 4½, 7⅓, and 11½ to 1.



Internal mechanism of the Matchless two-speed counter-shaft gear.

3½ h.p. twin-cylinder: 70×64.5 mm.; side by side valves; Amac carburetter; chain and belt; three-speed Armstrong hub gear.

This model was introduced last year and met with a large measure of success. The two-step drive enables a fairly large pulley to be used without causing the

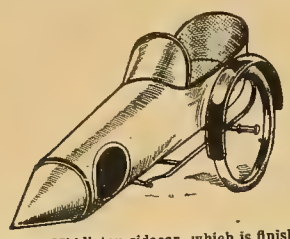


The latest 7 h.p. Matchless sidecar combination.

The Olympia Show.—

top gear to be unduly high, the standard gear being 4½ to 1 on top with usual Armstrong reductions. The engine is a J.A.P., and, like all the engines fitted by this firm, is a twin-cylinder.

The Matchless sidecar is especially built for use with Matchless machines, and is of the same grey colour lined in green and gold. The chassis is built up entirely of straight tubes and provided with four-point fixing and a stand. The body is constructed of three-ply mahogany on a bent wood frame, and supported on long flexible C springs. A small locker is fitted for carrying spares, and provision is made for a petrol can in the rear. The tyre is a 650 × 65 Hutchinson.



The Flying Middleton sidecar, which is finished in yellow and black, has a most striking appearance.

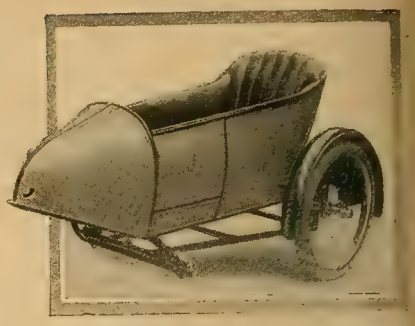
MILLFORD, No. 60.

Mills-Fulford, Ltd., Stoney Stanton Road, Coventry.—One of the oldest established sidecar firms in the country is Mills-Fulford, Ltd. Their exhibit this year is particularly interesting. A new and particularly simple chassis is being produced, the chief features of which are its rigidity and the low position which it affords, permitting the use of practically any type of body. All the side members of this frame are triangulated, and the wheel is mounted at the apex of the triangle. A spring wheel model is shown in which the wheel spindle is mounted between buffer and recoil springs at each side, providing a very easy motion for the chassis. A special model is made to suit spring frame machines, such as the Indian, and excellent mudguards are fitted with deep valances on the inside to protect the rider and bodywork. Unless especially ordered, three points of attachment only are provided except in the case of the tandem-seated body, which is attached to a specially strengthened chassis. The body of this model is neatly arranged so as to provide ample room for both passengers without the body being unduly long. Several very fine bodies are exhibited, both in coachwork and wickerwork. The shapes vary through a very wide range, and provide a very large choice for the purchaser. Parcel delivery bodies are also shown. Models are exhibited attached to Zenith, P. and M., Rudge, A.J.S., and Indian motor cycles. Out of nineteen models exhibited, all but four are coachbuilt, which clearly shows the type of sidecar body required by the public.

MONTGOMERY, No. 111.

5-6 h.p. Twin: 75×78 mm.; horizontal valves on top; B. and B. carburetter; belt; hub three-speed gear.

W. Montgomery and Co., Gosford Street Coventry.—Although the new Montgomery machine had not arrived at the time of our visit, it is one that will claim a good deal of interest. It has horizontally opposed twin cylinders working on a two-throw crankshaft which, like the camshaft, runs on two-row Skefko ball bearings. This camshaft, with cams solid with it, is exceptionally massive, because through it the power is transmitted geared down sufficiently to enable a 7in. pulley to be used. The magneto is on top of the crank case, and is chain-driven from the camshaft. The big end constitutes a notable point in design, for in the connecting rod a slot is cut downwards so that both brasses can be inserted from underneath, they are then held in position in the slot by bolts passing through both jaws of the connecting rod slot and the brasses. Best and Lloyd drip feed lubrication is used. The radiating fins are pear-shaped, and the engine has an outside flywheel. This model has been designed essentially for sidecar work, and is finished in all black with gold lines. It can be fitted with a special design of sidecar finished to match, in which form the combination is known as the Montgomery Duette, the whole equipment being fitted with speedometer, two lamps, horn, luggage grid, and leather valise, together with all accessories and spares, at an inclusive price. Many designs of sidecars are on view, the latest pattern showing the wheel completely mudguarded on the inner side of the top half, while great attention has been given to rendering the fittings adjustable to various types of machines. As far as possible all the framing tubes are straight, and careful provision is made for locking all the attachments. The car body itself is



A type of Montgomery coach-built sidecar.

carried on a transverse plate spring at the front, and shackled to Cee springs at the back.

MOTO-REVE, No. 118.

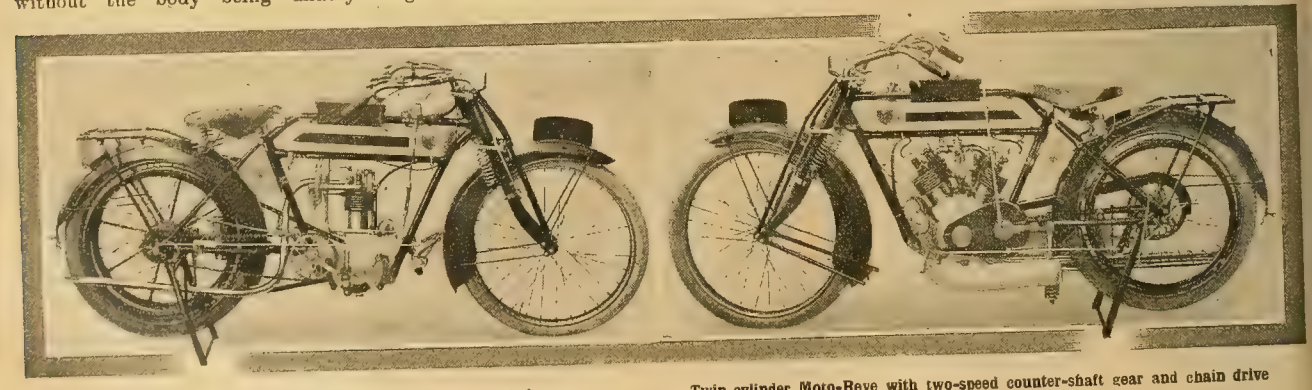
4 h.p. Twin: 63×80 mm.; overhead inlet valves; B. and B. carburetter; chain; Enfield gear.

The Moto-Reve Co., Ltd., Alperton, Middlesex.—On this model chain drive is employed, the front chains being covered in, an Enfield two-speed gear being fitted to the counter-shaft. Both exhaust valves face one another, and the inlet valves are of the overhead type. The operating mechanism of the inlet valves is particularly substantial. Druid forks are provided and also comfortable footboards, and it is worthy of mention that the magneto drive is by gear in a beautiful aluminium case; in fact, the whole finish of the engine is particularly good. The machine is well equipped, and attention is being paid to the mudguarding, while two stands are fitted. There is no silencer, but the two long exhaust pipes have flattened ends. A tool bag is fitted on the top tube. The single-cylinder model is practically a small replica of the above. The Moto-Reves are exquisitely finished and are most attractive machines.

MOTOSACOCHE, No. 90.

6 h.p. Twin: 72×91 mm.; overhead inlet valves; Amac carburetter; chain transmission; two-speed counter-shaft gear

Motosacoche, Ltd., College Park, Willesden Junction, N.W.—A considerable amount of detail relative to the Motosacoche models has already appeared in *The Motor Cycle*, and, as promised

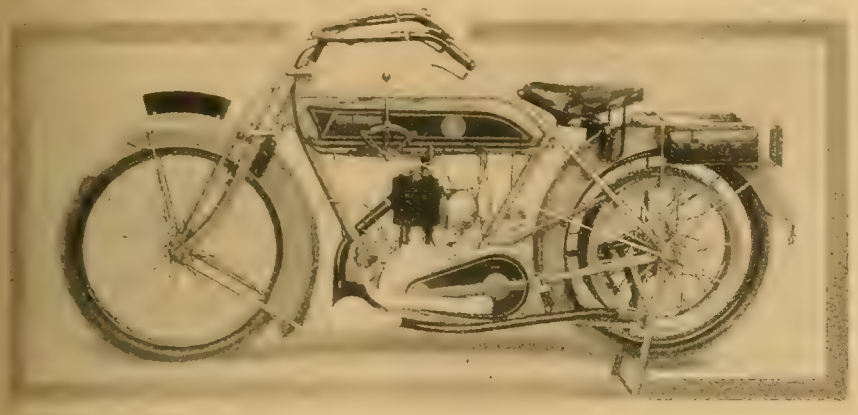


Alp model single-cylinder Moto-Reve with three-speed hub gear

Twin-cylinder Moto-Reve with two-speed counter-shaft gear and chain drive

The Olympia Show.—

in our last number, we now give particulars of the 6 h.p. Motosacoche, one example of which is shown for solo work and another fitted with a well-designed coachbuilt sidecar comfortably upholstered with a spring cushion and wind screen. This machine is fitted with a twin-



Transmission side of the three-speed chain and belt-driven 4 h.p. New Hudson Show Model.

cylinder M.A.G. engine in which the inlet valves are at the side above the exhausts, and the long tappet rod and complete rocking mechanism by which they are operated is neatly enclosed, not only to exclude dust, but also to ensure lubrication by suction of the oil from the crank case up the casting surrounding the valve tappet. Drip feed lubrication of the Best and Lloyd type is provided. Transmission is on Enfield lines, as also is the chain driven kick-starter. A point to be observed is that the guard over the chain from counter-shaft to back wheel does not have to be interfered with in the case of the removal of the wheel, which is facilitated by the design of the rear mudguard, which is hinged and divided so as to swing back clear of the wheel. Incidentally, the mudguarding arrangements on this machine are quite admirable, as the guards are wide and fitted with deep side wings. Voiturette tyres are supplied. One of the items which will attract most interest is the electric lighting equipment. A tiny neat and compact dynamo secured to the right-hand back stay is friction-driven from the side of the back wheel tyre, and from it current is obtained to charge a six volt accumulater capable of keeping alight four lamps (head, side, tail, and inspection). The machine in more respects than one embodies some notable features of design.

3½ h.p. twin: 64×77 mm.; side by side valves; Amac carburetter; chain transmission; two-speed counter-shaft gear.

This twin-cylinder machine with de Lissa valves has lately been described in some detail in *The Motor Cycle*, and we would refer our readers to that description.

2½ h.p. Model: 64×90 mm.; side by side valves in front; Motosacoche carburetter; belt transmission; Motosacoche speed gear.

This is a single-cylinder machine driving by the already well-known Motosacoche belt transmission with jockey pulley.

NEW HUDSON, No. 56.

3½ h.p. Model: 85×88 mm.; side by side valves; B. and B. carburetter; belt; Armstrong hub gear

The New Hudson Cycle Co., Ltd., Summer Hill Street, Birmingham.—This machine is fitted with the new Armstrong Mark VII. hub, the gear lever of which is attached to the tube below the tank, and is a most substantial affair. The aluminium footboards are nicely turned up in front. The Bosch magneto is mounted in the rear of the cylinder between the engine and the carburetter. The black and gold finish on this machine is most attractive. Another machine of the same pattern is finished with a serviceable drab colour. The sidecars attached to these machines are most tasteful in appearance, being painted to match the prevailing colour on the machine to which each is attached.

6 h.p. twin: 76×85 mm.; automatic side by side valves; B. and B. carburetter; chain and belt; Armstrong Mark VII. hub gear.

In this machine the drive is first taken to the counter-shaft by means of a chain, thence to the back wheel by belt. This enables a conveniently low ratio to be used on top gear without using an unduly small pulley. By this means the life of the belt is considerably lengthened. The kick starter is fitted at the rear, driving direct to the clutch and fitted with a free wheel. Lubrication is by Benton and Stone semi-automatic drip-feed, the pump of which is neatly enclosed in the tank. The tyres are 650×65 mm. An interesting exhibit on this stand consists of the New Hudson engine in part section, showing the timing gear, valves, piston, flywheels, and magneto drive.

NEW IMPERIAL, No. 78.

8 h.p. twin Model: 85×88 mm.; side by side valves; Amac carburetter; chain transmission; three-speed counter-shaft gear.

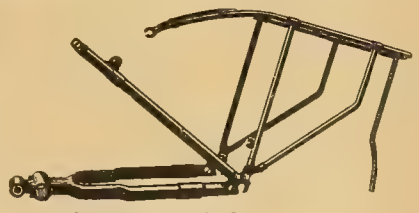
The New Imperial Cycles, Ltd., Princip Street, Birmingham.—The 8 h.p. new Imperial has been designed especially for sidecar work, and, with this end in view, has been carried out on substantial lines, the sidecar lugs being made with the frame. Both chains are partially enclosed, care being taken to protect the most vital points. On the engine-shaft is mounted a slipping clutch device to absorb the shock of the explosion, and thence a roller chain transmits the power to a three-speed counter-shaft gear. The gear has two sliding members, and the clutch is of the plate type having fork inserts. Aluminium footboards are arranged to give comfortable riding position, and the side guards for both front and rear wheels form an excellent protection. The rear guard is detachable from the fork, and can be swung out of the way to facilitate tyre repairs. An entirely new model is a 3½ h.p. twin with a bore and stroke of 70×64.5 mm. In details, however, it is similar to the model just described, though, of course, the frame and fittings are in proportion. The only radical change is the fitting of a two-speed counter-shaft gear instead of the three-speed. Another model, which is also similar except for the engine, is the 4½ h.p. single, which has an engine of 90×93 mm. bore and stroke.

3½ h.p. single: 85×85 mm.; side by side valves; Amac carburetter; belt transmission; Sturmey-Archer three-speed gear.

The 3½ h.p. single-cylinder machine is an excellent example of a touring roadster. The engine is fitted with a decompressor, and the kick-starter is arranged on the rear chain stay. As in most new Imperial models the Best and Lloyd semi-automatic drip feed lubrication system is employed. The filler cap is arranged to act as a petrol gauge, for it has a glass top and a conical enamelled tube within, so that the petrol level may be judged at a glance.

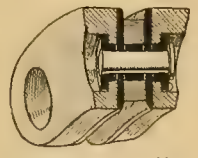
2½ h.p. Model: 70×76 mm.; side by side valves; Amac carburetter; belt.

The 2½ h.p. model is worthy of especial notice, as it is of a particularly simple and clean design, manufactured



Rear portion of the Imperial frame.

with the intention of placing a lightweight motor cycle on the market at a very moderate price. In this the manufacturers have succeeded admirably, for the machine, though having no startling innovations, is thoroughly well carried out on standard lines, having two stands and a full equipment in every respect. The silencer is particularly neat, for an aluminium expansion box is carried aft of the engine, and a tail pipe extends backwards. The Flexo steel and rubber belt is displayed on this stand, and a selection of sidecars of good design is shown. These latter are designed to suit such New Imperial models as are constructed for passenger work. The finish of the machines is well carried out.



Flexo steel and rubber belt shown on the New Imperial stand. The black portions are steel bushes.

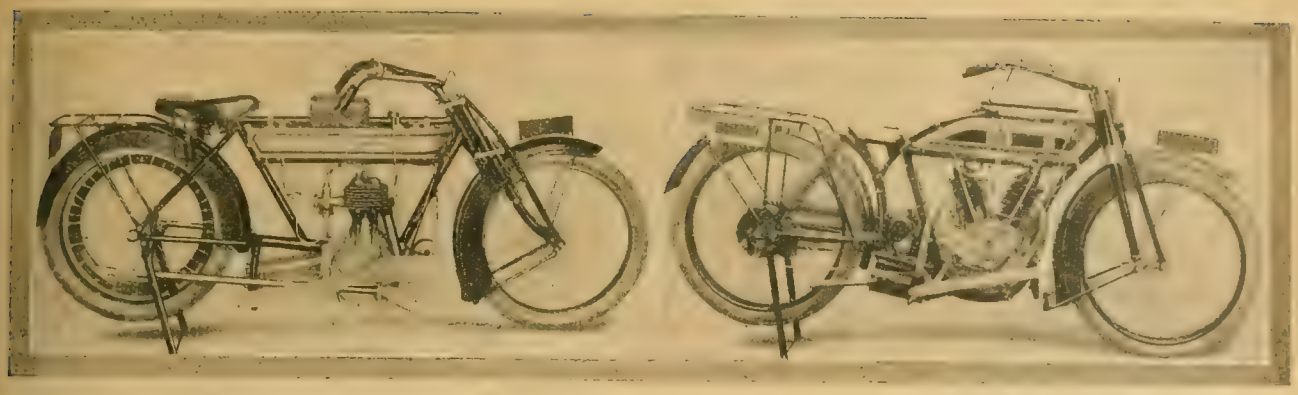
The Olympia Show.—



1914 model 4 h.p. Norton with long adjustable footboards.

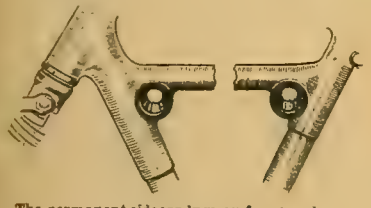
Twin-cylinder N.S.U. with new type of spring frame.

NORTON, No. 29.

4 h.p. MODEL: 82×120 mm.; side by side valves; Amac carburetter; belt; Sturmey-Archer three-speed gear.

NORTON MOTORS, LTD., Sampson Road North, Birmingham.—The feature of the Norton stand is the big 4 h.p. single-cylinder machine, the cubic capacity being 636, and the engine is chiefly noticeable for the long stroke employed. The crank case is neatly cast, the exterior being particularly clean. Very large capacity tanks are fitted with screw-hinge filler caps, and the petrol cap is fitted with a glass top. The change-speed control is on a special bracket, giving great strength and neatness, and which in the event of a fall, is exceedingly unlikely to sustain damage. Very large rubber-covered footboards are fitted, adjustable as to their position. The handle-bars are covered with black celluloid, and the machine has a most serviceable weatherproof appearance. A special

Design of rear fork end on the Norton, with horizontal slot to facilitate refitting back wheel.



The permanent sidecar lugs on front and rear of the Norton frame.

feature of the Norton exhibit is the Brooklands special model, and each machine leaving the works is guaranteed to have exceeded sixty-five miles per hour for one lap at Brooklands, and a Brooklands certificate to this effect is supplied with each machine of this type. The dimensions of the engine fitted to this model are 79×100 mm. bore and stroke. A point to be noted in the three-speed machine is the fact that by a special construction of slots in the rear forks the back wheel does not drop out, for a ledge is afforded by these slots upon which the spindle rests. This saves a considerable amount of time, particularly in replacing the wheel. On the sidecar model, six pints of oil as well as two gallons of petrol can be carried. The holes for taking the lugs for the sidecar attachments are situated where two tubes meet, in order

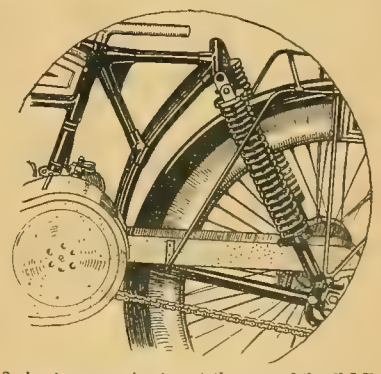
The single ring grooved piston fitted to T.T. Nortons.

to gain the greatest possible strength an extra long steering head is fitted, and the Druid type forks are provided with very long pins at the shackles. Tool kits are carried in serviceable leather wallets on the top tube. For Colonial work the Norton machines have the engine raised slightly higher in the frame to give extra ground clearance.

N.S.U., No. 62.

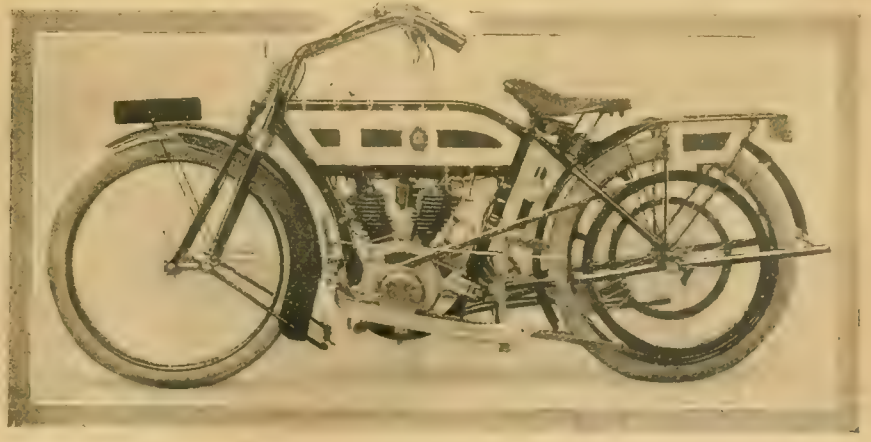
7-9 h.p. two-cylinder MODEL: 80×99 mm.; inlet over exhaust valves; N.S.U. carburetter; chain drive; three-speed counter-shaft gear.

THE N.S.U. MOTOR CO., LTD., Great Portland Street, W.—The 7-9 h.p. model



Spring frame mechanism at the rear of the N.S.U. showing extra long spiral springs

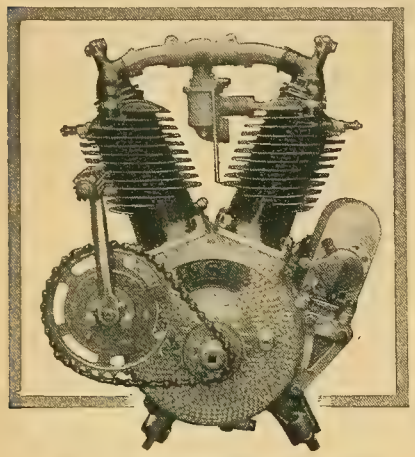
is quite a new type for this firm. The engine is on the well-known N.S.U. lines, with radiating fins arranged parallel with the ground, and, as usual, the inlet valve placed over the exhaust. The lubrication is somewhat unusual, as a plunger pump



Belt side of the 3½ h.p. twin N.S.U. Observe the large footboards upturned at the front to protect the rider's feet.

The Olympia Show.—

forces the oil through a sight-feed drip, whence it is carried through a lead pipe to the front piston. The surplus drains to the crank case, and is splashed in the usual way. From the engine a chain transmits the power to a three-speed counter-shaft gear, which works on the usual sliding principle, the sleeve having a dog at either end and a gear wheel in the centre. This gear is controlled by a lever working horizontally over the top tube, and a multi-plate clutch is fitted. The final drive is also by chain, but whereas the front chain is totally enclosed, the rear chain is covered over



Kick-starter side of the twin-cylinder air-cooled N.S.U. engine.

one side. In this model the N.S.U. spring frame has been somewhat modified, for two sets of springs are employed, one on either side of the frame, and in each case these springs are longer than was formerly the case. The rear brakes are particularly powerful, and consist of a foot brake working inside a drum with a hand brake contracting on to the outside of the same fitting. Specification of the 6-7 h.p. twin is similar except that in this case the bore and stroke of the engine are 75 and 94.

3½ h.p. MODEL (twin): 63×80 mm.; inlet over exhaust; N.S.U. carburetter; belt; engine-shaft two-speed gear.

The 3½ h.p. twin N.S.U. has undergone some modification, and is a strikingly well carried out machine. The well-known N.S.U. engine-shaft gear is now enclosed and is operated by a lever on the handle-bars. The low gear is introduced by raising this lever as far as possible. In a middle position free engine is obtained, and when allowed to drop fully the high gear is engaged. As on other N.S.U. models, long aluminium footboards, covered with rubber, are fitted, and a neat kick starter revolves the engine through the timing gear, a pedal being placed on the near side. An unusual feature is the fitting of metal tool cases, both behind the saddle tube and pannier fashion on the carrier. The lubrication is similar to that described in the previous model. The 3½ h.p. single follows the above specification, but has an engine of 85×88 mm. bore and stroke. Besides this model a 3 h.p. twin, a 3 h.p. single, and a 2 h.p. single are exhibited, all following N.S.U. lines in their general features. In every case in which a kick starter is fitted the pedal is arranged to fold out of the way when not in use. A full equipment is fitted which complies in every way with standard specification.

A special type of sidecar with tandem seat is shown on this stand. The speciality of it is that the chassis, which is of special design, is welded in one piece, and is claimed to be the first sidecar chassis which is made without a single lug. It is interesting to note that in testing the welded joints both in tension and bending the 12 gauge steel tube gave way before the joints. Samples of the tests can be examined on the stand.

N.U.T., No. 37.

2¾ h.p. MODEL (twin): 60 × 61.5 mm.; side by side or overhead m.o. valves; Amac carburetter; belt; Armstrong Mark VII. gear.

SIR WILLIAM ANGUS, SANDERSON, AND CO., Newcastle-on-Tyne.—No motor cycle has sprung into prominence quicker than the N.U.T., which achieved such wonderful success in the last T.T. Race in the hands of Hugh Mason, and which also performed remarkably well in the last severe A.C.U. Six Days Trials. These machines can be obtained with either 2¾ h.p., 3 h.p., or 3½ h.p. J.A.P. motors, and the firm are also making 4½ h.p. and 6 h.p. models which are not exhibited at Olympia. All models have twin-cylinder engines. The general finish and appearance of the machines are extremely neat, the standard finish being nut-brown with gold lines. All models are fitted with belt drive and the Armstrong Mark VII. gear, while kick starters and handle-bar control to both magneto and carburetter are also part of the equipment. It is evident that a very large amount of attention to detail has been devoted to these machines, such details as the well carried out heel-operated brake, which on the T.T. model is fitted on both sides, being specially worth attention. The machine which broke all records at Brooklands recently for 100 miles to six hours in Class B is exhibited on the stand. The firm are experimenting with a counter-shaft gear box with chain-cum-belt drive, chiefly in response to the demands of colonial agents, but Hugh Mason himself informed us that he was thoroughly convinced of the efficiency of belts in conjunction with three-speed hubs, and believes that this is the best form of transmission for machines of the N.U.T. type.

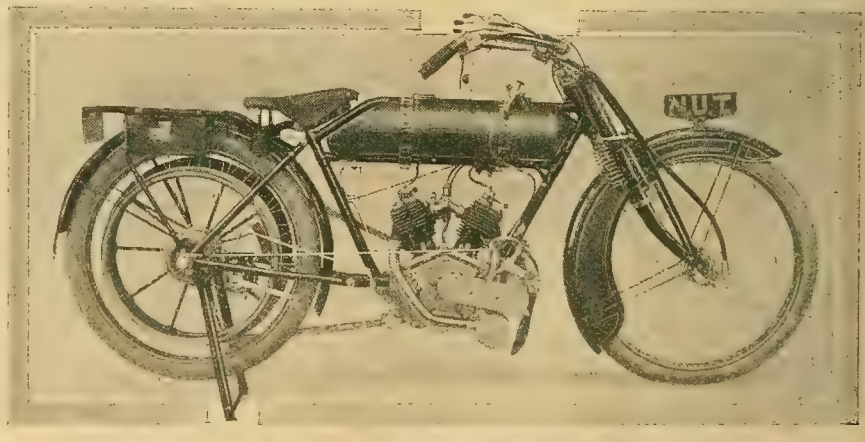
O.K., No. 95.

2 h.p. MODEL: 58×72 mm.; overhead inlet valves; Amac carburetter; chain and belt; two-speed counter-shaft gear.

HUMPHRIES AND DAWES, LTD., Birmingham.—The little 2 h.p. O.K. Junior affords a very neat design. The magneto platform is in one with the casing of the gear for driving. This magneto is a waterproof Ruthardt. Both valve tappets are adjustable. The two-speed gear carried under the chain stay bracket is very compact and is of the dog clutch type and fitted with ball bearings. It gives ratios of 6 and 12 to 1 as standard, which, however, can be varied to suit the rider. The remarkably small size of the engine is a point to note, its cubic capacity being only 190 c.c. From the gear box a belt transmits the power to the wheel pulley, which is spoked independently to the rim of the wheel. Lubrication is delivered by one of Best and Lloyd's gravity feed drip sight oilers.

3½ h.p. TWIN: 63×80 mm.; side by side valves; Amac carburetter; belt and chain; two-speed counter-shaft gear.

The twin-cylinder engine has a capacity of 499 c.c., and in many of its features follows the same practice as the Junior—for instance, in its magneto mounting. The cylinder cooling fins are placed horizontally for the maximum of draught effect. Oil is mechanically forced from a plunger pump on the engine up into the tank, and thence past a sight feed down to the engine, feeding the forward cylinder separately. The handy kick starter drives direct on to the engine, and not through any of the transmission, which latter comprises a chain from the engine to a simple counter-shaft dog clutch type of two-speed gear mounted in ball bearings, and giving ratios of 6 and 12 to 1. With this gear unit is included a cork insert clutch, affording large frictional surface, which is handle-bar controlled.



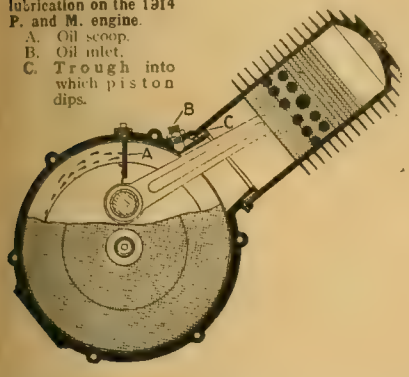
Valve side of the 2¾ h.p. N.U.T., showing clutch control and method of fixing the tank.

The Olympia Show.—

P. AND M., No. 69.

3½ h.p. MODEL: 84.5×88.9 mm.; side by side valves; P. and M. carburetter; chain transmission; two speed selective clutch gear.

PHELON AND MOORE, LTD., Cleckheaton, Yorks.—Owing to the excellent finish of these machines the exhibit is as attractive

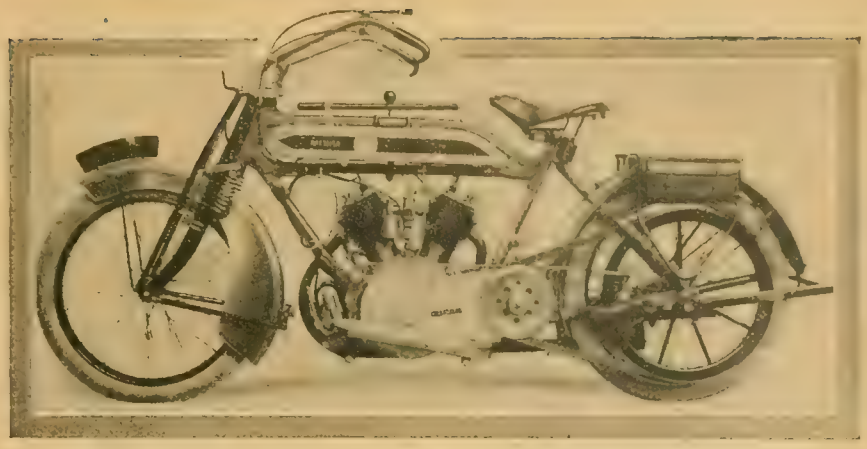


The new system of lubrication on the 1914 P. and M. engine.
A. Oil scoop.
B. Oil inlet.
C. Trough into which piston dips.

as ever, added to which there are several interesting new features to be seen. One of the most important alterations is the fact that the oil is led into the crank case in such a position that it immediately reaches to the piston. Thence it flows to the crank chamber, and is splashed in the usual way, but a scoop is fitted to the crank case between flywheels, which deflects a large amount of the lubricant directly on to the big end bearings. Both chains are now totally enclosed, the front being lubricated through a hole in the crankshaft, and the back by a crank case release. The tank has been somewhat increased in size, and large glass-top screw and hinged filler caps are fitted. Somewhat of an improvement has been fitted in the gear, for the clutches are now expanded from both sides, thus providing a large gripping surface. It will be remembered that the P. and M. carburetter lies directly below the tank, and thus it has been difficult to

Plan view of the 1914 mode 3½ h.p P. & M. showing general arrangement

Expanding rings on the redesigned P. and M. two speed gear.



The 1914 model 7-9 h.p. Premier with chain and belt drive and two-speed counter-shaft gear

arrange the cables neatly. However, the difficulty has been solved by carrying the wires over pulleys, the whole being encased in neat castings. The actuation of the rear brake is extremely well carried out, and the band is contracted from both sides at once. The rear guard is now provided with a hinged rear flap, which is made with a number plate and swings sideways, allowing free access to the

End view of the P. and M. gear, showing the new oil feed.

wheel and tyre. As usual, a metal tube case can be supplied fitted to the rear carrier. Alterations to the frame are very slight, and comprise the addition of sidecar lugs and a slightly lower saddle position. Two colonial models are also shown, but with the exception of having a larger ground clearance, they are practically identical with the standard machine.

POPE, No. 43.

7 h.p. MODEL: 76×89 mm.; overhead valves; Schrebler carburetter; chain; Pope free-engine clutch gear.

THE POPE MOTOR CYCLE AGENCY, Golden Lane, E.C.—The Pope is a well-known machine in America, and is fitted with a very powerful looking twin-cylinder motor with overhead valves. The back of the machine is sprung by means of large coil springs, situated vertically over the rear fork ends, while a leaf spring is employed to spring the front forks. A free engine clutch operated by a long lever on the left side of the tank is fitted on the counter-shaft, and the drive is by chain throughout. The handle-bars are absolutely free from any external fittings, control being by twisting grips. The machine is finished in neat French grey, and is a taking-looking mount.

PREMIER, No. 133.

3½ h.p. MODEL: 85×88 mm.; side by side valves; B. and B. carburetter; chain and belt; Premier three-speed gear.

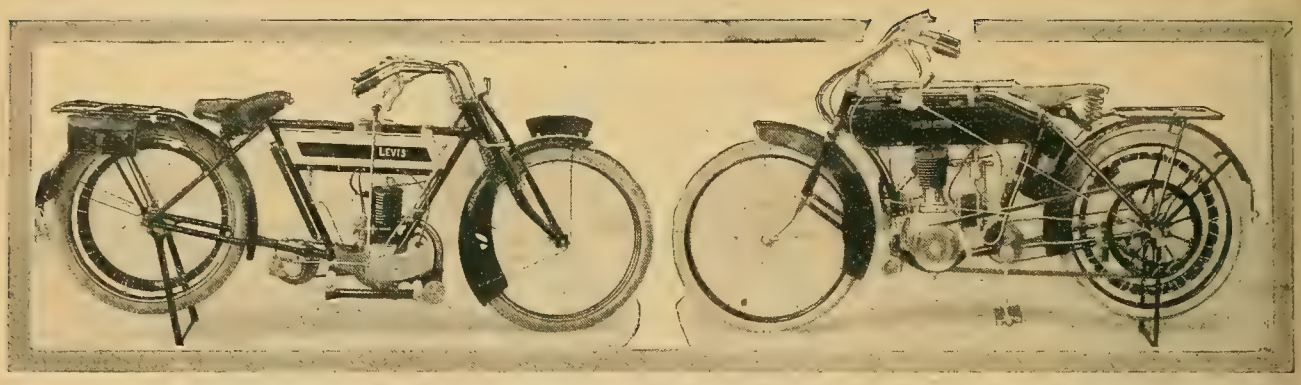
THE PREMIER CYCLE CO., LTD., Read Street, Coventry.—Amongst the features which distinguish the 3½ h.p. Premier is the use of a subsidiary automatic exhaust release which comes into action when the piston uncovers a port at the bottom of the stroke. The chain from the engine to the two-speed gear, which is carried behind the saddle tube and furnished with an aluminium case, is enclosed in a neat aluminium guard which is attached at its forward end to the crank chamber. A kick starter employing a chain and sprocket carried on the lay shaft of the gear box is used. The clutch is operated by a rocking pedal placed immediately above the right footboard, which is of cast aluminium studded with rubber pads. The gear change lever is carried on a quadrant bracket supported from the top frame tube. The same model is made in three distinct forms, the other two being respectively a single-geared type, and one fitted with an Armstrong three-speed hub gear.

2½ h.p. MODEL: Side by side valves; B. and B. carburetter; belt; Armstrong Mark VI.

The design of this machine follows the lines of the 3½ h.p., of which it is a

Three-speed counter-shaft gear on the 3½ h.p. Premier machine.

The Olympia Show.—



Left—the 2¼ h.p. single-cylinder two-speed Levis two-stroke. Right—the three-speed belt-driven Puch (the only Austrian representative).

reduced facsimile. It is made with a three-speed gear, as above specified, and also in single-geared form. Footrests take the place of footboards, and pedalling gear is employed. A notable feature in the design of the engine is the large amount of cooling surface placed round the valve pockets. Druid spring forks are fitted, and careful attention has been paid to the construction of the brakes. The 7 h.p. model, with a bore and stroke of 85×88 mm., follows the same lines as the 3½ h.p., and is fitted with a two-speed counter-shaft gear box driven by chain from the engine and transmitting the power through a belt. This model is shown in the form of a sidecar combination of very pleasing appearance, and is fitted with a complete equipment. In this model the auxiliary exhaust release is not used, but the silencer is of notable dimensions.

PUCH, No. 19.

3 h.p. Model: 68 × 85 mm.; side by side valves; B. and B. carburetter; belt; Armstrong three-speed gear.

H. W. Sidley and Co., Fore Street, London.—The Puch machine comes from Austria, where it has been a very well-known make for a number of years and, in fact, it figured prominently in the International Motor Cycle Race held there some years ago. The outstanding features of these machines are the undergeared pulley and the method by which the magneto is driven from the camshaft, the magneto itself being situated at the rear of the base chamber just in front of the pedalling gear chain sprocket. The spring forks are of special design made by the Puch Company, and are telescopic in action. Although there is a distinctly Continental appearance about these machines a number of English fitments may be found upon them, notably the Armstrong three-speed gear and Brown and Barlow carburetters and Bowden wire control, the last-named feature being remarkable in that the magneto control lever is mounted on the same clip as the air and gas lever. Thus all three are operated by the right hand. On the left handle-bar is the exhaust valve lifter, the magneto switch operating on a wire inside the handle-bar.

4 h.p. Model: 84×90 mm.; o.i.v.; B. and B. carburetter; chain; B.S.A. two-speed gear.

This machine is of semi-T.T. pattern. The motor is obviously designed for speed, and in addition to the overhead inlet valve and large sized exhaust valve, an additional exhaust release is fitted in the front of the cylinder. It is fitted with an enormous exhaust pipe extending to the rear, and flattened at the end, but no silencer is otherwise fitted. The magneto is driven off the camshaft and situated behind the engine, as in the 3 h.p. The drive is by single chain from engine to back wheel. Girder spring forks of the firm's own design are fitted, and torpedo-shaped tank and dropped handle-bars. The machine is a racy-looking mount, but appears to be fitted with rather small mudguards and tyres for such a powerful and apparently fast machine.

QUADRANT, No. 42.

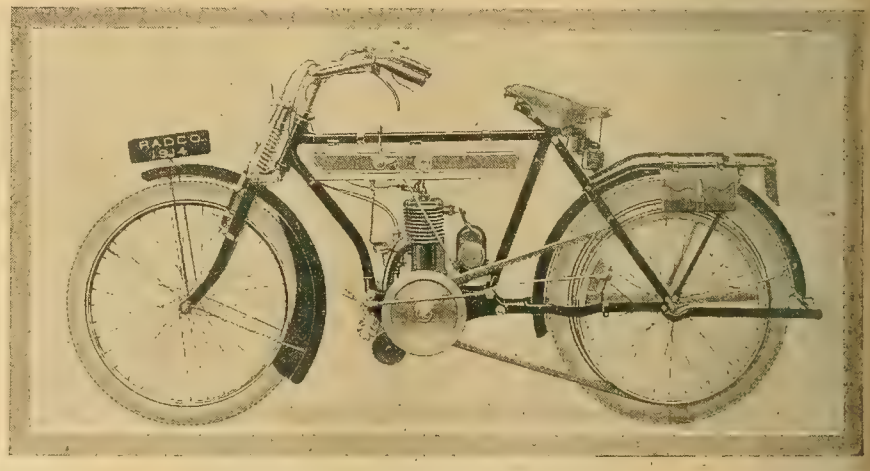
8-9 h.p. twin-cylinder Model: 87×95 mm.; overhead inlet valves; any make carburetter, optional; chain transmission; two-speed counter-shaft gear; handle-starter.

The Quadrant Cycle Co., Lawley Street, Birmingham.—One of the most powerful twin sidecar machines in the Show is the big Quadrant, the capacity of the engine being 1,129 c.c. It is shown with a massively constructed sidecar chassis, and those who wish to tour in the severest country with ample reverse of power will find this machine the very thing for their requirements. The engine is a splendid piece of work, the inlet valves being placed over the exhaust and operated by long rods. A silencer almost big enough for a small car is fitted under the footboard, with exits for the gases fore and aft. Ample fuel capacity is provided for, and any amount of luggage can be carried on the big carrier. Chain drive is used in conjunction with a two-speed selective clutch gear, a handle being fitted for starting.

RADCO, No. 224.

2½ h.p. two-stroke Model: 62 × 70 mm.; Amac carburetter; belt; single gear.

E. A. Radnall and Co., Dartmouth Street, Birmingham.—The magneto on this engine is placed behind the engine platform, to which it is so fastened that it may be slid backwards for the purpose of taking up any slack in the chain. The exhaust pipe runs between the engine plates, giving the exhaust a free passage into the silencer, which is neatly bolted on to the lower portion of the crank case. The lubrication is effected by pouring a measure of oil into the petrol, a system which is becoming increasingly popular among designers of two-stroke engines. A sight feed gauge is provided to allow the rider to see the amount of fuel in the tank from the saddle. This machine is fitted with the latest Radco spring forks,



Belt side of the single-cylinder two-stroke Radco.

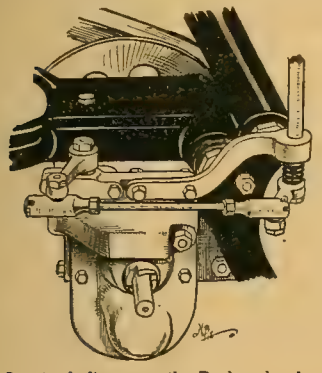
The Olympia Show.—

which have just been placed on the market. These have a parallel action and the portion attached to the forks themselves consists of telescopic tubes, surrounded by a powerful coil spring. The telescopic arrangement keeps the machine perfectly parallel and prevents side play, taking most of the side strain off the links. Means are provided to lubricate all moving parts.

RAGLAN, No. 121.

3½ h.p. MODEL: 85×88 mm.; m.o.v.; B. and B. carburetter; belt; three-speed Sturmey-Archer gear.

M. ADLER, LTD., Sampson Road North, Birmingham.—The 3½ h.p. model is quite a well thought out machine. The



Countershaft gear on the Raglan showing control mechanism.

engine follows accepted lines, and points of convenience have been well studied. Two bags are carried in metal cases, and side shields are fitted to both mudguards, also a front wheel stand. The silencer is of the increasingly popular pattern consisting of an expansion chamber with extension pipe.

The 3½ h.p. sidecar model is fitted with the same engine but has a combined chain and belt drive with an internal cone clutch on the engine-shaft. The transmission is by chain to the counter-shaft, and thence by belt to the rear wheel, while an efficient three-speed countershaft gear is fitted, manufactured by Juck, of Wolverhampton. The gear control is particularly well carried out, adjustable ball joints being fitted to the control mechanism.

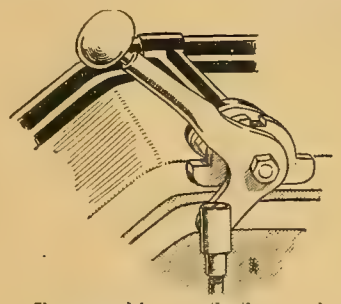
2½ h.p. MODEL: 65×70 mm.; m.o.v.; B. and B. carburetter; belt.

This is a handy little lightweight model following standard lines throughout. Lubrication is by means of a plain tapless pump, while pedals are provided. This firm is also showing a sectional model of a 3½ h.p. engine.

REX, No. 93.

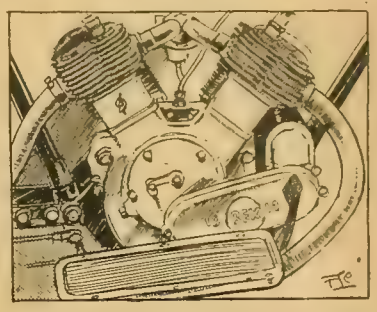
6 h.p. MODEL: 80×95 twin; side by side mechanical valves; B. and B. carburetter; belt; two-speed Roc type or three-speed counter-shaft gear.

THE REX MOTOR MANUFACTURING CO., LTD., Coventry.—With the exception of the engine, which has been practically redesigned, Rex practice remains for the greater part unchanged. The engine has a slightly larger bore and the valve tappet mechanism is enclosed in aluminium covers secured each by a single wing nut, while the valve lifter mechanism is now contained inside the crank casing. The chief characteristic lies in the securing of the cylinders to the crank case. The lower ends are deeply spigoted into the crank case, and in that part of the crank case surrounding them a channel is formed. Into these channels oil is fed, and thence the lubricant passes through holes drilled in the cylinder walls



Change-speed lever on the three-speed counter-shaft geared Rex.

to the pistons. Although a hand pump is fitted as an alternative, this oil supply is automatically obtained by suction, passing through a large sight-feed glass conveniently placed on the top of the tank. Another notable feature is the very large silencer fitted. This is of great length and has rounded ends, the whole affording a fine example of welding. Doubtless as a result of the A.C.U. trials, a 9in. extension pipe is fitted at the end. Most of the sidecars on these machines were exceedingly well equipped, the neat coachbuilt bodies being fitted complete with Cape cart hood, celluloid wind screen, a large tool compartment in the form of a metal valise, and comfortable upholstery. The three-speed countershaft gear also constitutes a departure in Rex practice.



The 1914 twin-cylinder Rex power unit, showing design of crank case and valve covers.

REX-JAP, No. 105.

6 h.p. MODEL: 76×85 twin; side by side mechanical; B. and B. carburetter; chain; three-speed counter-shaft gear.

THE PREMIER MOTOR CO., LTD., Aston Road, Birmingham.—In the Rex-Jap model of this exhibition we find only chain transmission employed, with chains entirely enclosed. The very compact three-speed gear box fitted in all cases is combined with a multi-plate clutch with cork inserts. In the twin-cylinder J.A.P. engine a feature lies in the oil feed, which is effected by force pump with a spring-controlled plunger. The 650×65 mm. Kempshall tyres are fitted. Druid forks and cantilever seat add to the comfort of travelling. These machines are essentially suitable for sidecar work, and the sidecars also embody characteristics worth attention. For passenger work, whether made for Rex-Jap or Indian machines, the body is formed with a pointed nose and an electric lamp neatly fitted in the nose. On the sidecar an equipment is also fitted, with a carrier for a spare petrol tank and for luggage. Admirable examples of sidecars with bodies for trade purposes are also on view. A kick starter is fitted to these machines.

TWO TYPES OF POWERFUL SIDECAR MACHINES.
Left—The three-speed chain-driven Rex-Jap. Right—The chain-driven countershaft-geared twin-cylinder Royal Ruby.

The Olympia Show.—

ROC, No. 143.

4¼ h.p. MODEL: 89 × 95 mm.; side by side valves; Amac carburetter; belt; four-speed Roc gear.

MESSRS. ROBERTSONS, 157, Great Portland Street, W.—One of the machines shown is equipped with a 4¼ Precision engine, and the chief point about it is the new four-speed gear box with internal expanding clutch. The gears are of the usual sliding type to be found on cars, and the change is effected through a patented gate in which the selectors are incorporated. The selecting gear is interlocking. The gears are also provided with kick starters.

A 6 h.p. model is also shown, fitted with the latest type of Roc gear. A new type of rear fork end is fitted, which allows the wheel to be quickly withdrawn, and great care is taken to exclude grit from the interior of the gear, and felt washers are provided to prevent grease from leaking out. The push pin operating the change is keyed, so that it cannot turn, thus minimising wear.

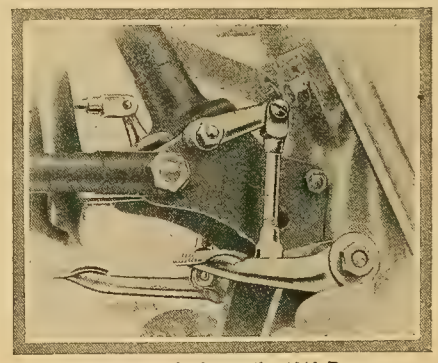
A 2¾ model is also shown, fitted with the lightweight type of gear, in which there are only three planet pinions instead of four. The low speed clutch is of the internal expanding type as fitted and similar to the clutch in the bracket gear.

A part sectional model of the two-speed gear is also shown, which clearly shows the substantial planet pinions employed.

ROVER, No. 107.

3½ h.p. MODEL: 85×88 mm.; side by side m.o.v.; B. and B. carburetter; belt; Sturmey-Archer three-speed hub gear.

THE ROVER CO., LTD., Coventry.—The above specification represents the 3½ h.p. Rover in its most elaborated state, as it is used for sidecar work; but, apart from transmission, one specification covers the entire Rover practice, as it is standardised. Besides the three-speed machines examples are also shown of models with free engine and Philipson hand-controlled pulley, fixed engine, and a T.T. model, which latter has somewhat higher compression, and is fitted with a foot brake that can be worked by both feet with the full weight of the rider. The chief characteristics of 1914 Rover design are in the somewhat altered shape of the tank, giving a very neat streamline effect, and, what is more important, more leg clearance. The back mudguard, which is jointed, so as to fold upwards, with carrier complete, clear of the wheel by the mere undoing of two nuts, is an admirable piece of design, as indeed is the entire mudguarding system, which is very complete. The foot brake



Heel-operated brake on the 1914 Rover.

is applied to a separate rim on the off-side of the back wheel. On this rim the V is reversed, and the brake block applied from the exterior, allowing the wheel more easily to be withdrawn. Another very neat characteristic is in the foot-rests, which are pivoted at about a quarter of their length from the front, and capable of being swung up clear of the pedals and engine. The top links of the Druid spring forks are fitted with coiled springs, so that horizontal road shocks are eliminated.

ROYAL RUBY, No. 44.

6 h.p. twin-cylinder MODEL: 76×85 mm.; side by side m.o.v.; B. and B. variable needle carburetter; enclosed chain; Jardine gear.

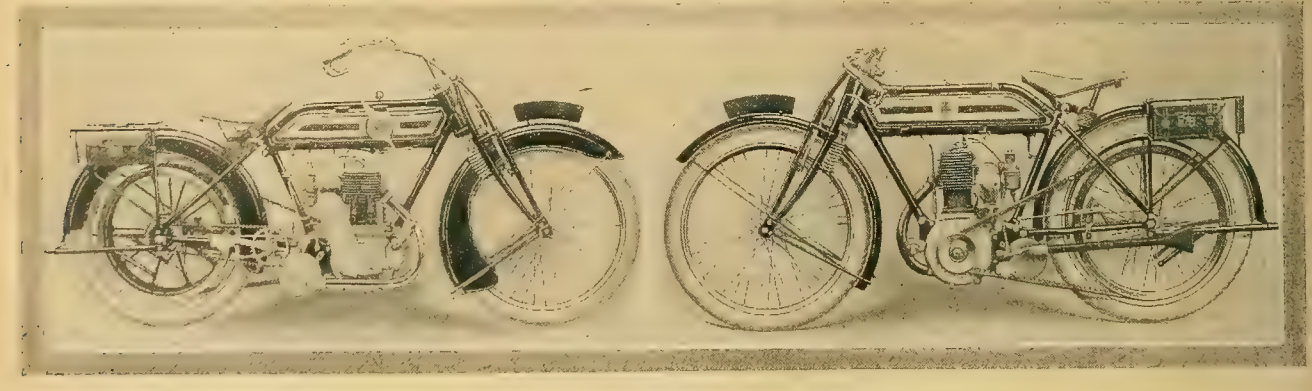
THE ROYAL RUBY CO., LTD., Ruby Works, Manchester.—The magnificent Show finish characterises this very striking machine. All the engines fitted to the Royal Ruby motor cycles are J.A.P.'s, and a very wide range of models is marketed by this firm; in fact, they can supply machines fitted with every type of engine made by Messrs. J. A. Prestwich and Co. The 6 h.p. model is fitted with a two-speed Jardine gear box, the front chain being adjusted by sliding the gear box in a very substantially constructed slot, and the back chain by the usual back fork adjustment. A heel and toe operated pedal works the clutch, and the gears are changed by means of a small lever mounted on the top tube, adjustment being provided. The finish of the machine is a pale French grey, with blue panels on the tank, and a word of praise must be given to the really admirable mudguarding provided, deep valances being fitted to both the front and back wheels. Another 6 h.p. model is shown, fitted with belt drive and Sturmey-Archer gear, and, while capable of being used quite satisfactorily as a sidecar mount, this machine is of considerably less weight than the chain-driven one, and therefore handier for solo work.

4½ h.p. single-cylinder MODEL: 85×95 mm.; m.o. overhead inlet; B. and B. carburetter; belt; Sturmey-Archer gear.

For riders who prefer the simplicity of a single-cylinder, and at the same time one with plenty of power for sidecar use, this model should prove most attractive. Specially large flywheels are fitted to ensure smooth running. The inlet valve is operated by a rod passing through the induction pipe, and thence by means of the usual rocking arm. A special feature of the Royal Ruby models shown is the fitment of the Extractor silencer, which, it is claimed, provides adequate silence without back pressure. Best and Lloyd drip feed lubricators are also fitted, and the ignition on both models is a Bosch enclosed magneto. Brooks saddles are also fitted.

3½ h.p. twin-cylinder T.T. MODEL: 70×66½ mm.; inlet and exhaust overhead valves; B. and B. racing type carburetter; belt; Sturmey-Archer gear.

The outstanding feature of this exhibit is undoubtedly the above model, as it is a perfect high speed touring machine. The engine is a J.A.P., and although the machine is primarily a speed model and is fitted with semi-dropped handlebars, it is at the same time a touring mount for riders who desire a fast machine. No clutch-operating mechanism is fitted to the hub, and the gear is changed by means of a lever on the right-hand side, very similar to that fitted to the Triumph. Each cylinder has its own exhaust pipe, each entirely



TWO TYPES OF ROVERS FOR NEXT YEAR.

(1) The 3½ h.p. three-speed touring model. (2) The T.T. single-geared model, which is supplied with Philipson pulley to order

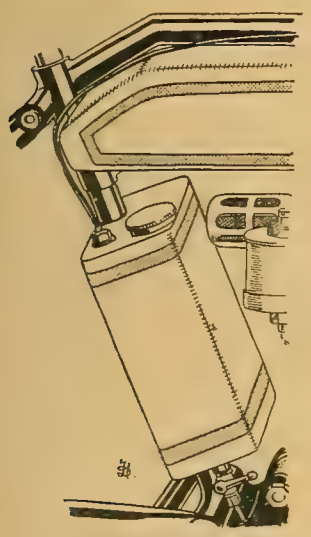
The Olympia Show.—

separate from the other, on opposite sides of the machine; a torpedo tank with large filler caps and Saxon forks are features of this machine. The tank is in red with gold lines, and even the springs and framework of the Brooks saddle and the belt rims are painted red to match—a minor point, but one which shows that great care has been exercised to get a really well finished effect. The back brake has a heel pedal fitted each side, so that in the event of a fall there is always another pedal available, and these pedals are mounted on a separate lug, not on the footrest. Other models shown are a 3½ h.p. single-cylinder and a 4 h.p. twin, both fitted with J.A.P. engines, Sturmey-Archer gears, and Druid forks.

RUDGE, No. 49.

3½ h.p. MODEL: 85×88 mm.; overhead inlet valves; Senspray carburetter; belt transmission; Rudge-Multi gear.

RUDGE-WHITWORTH, LTD., Crow Lane, Coventry.—The Rudge machines remain much as last year, only detail improvements having been found necessary. The multi gear is provided with a small screw on the rear hub by which the belt tension can be altered in a moment by the sidecar passenger while the machine is running. The Rudge spring stands and hinged mudguard flaps are retained on the single-geared machines. The belt rims are attached direct to the wheel rims, thus doing away with a large

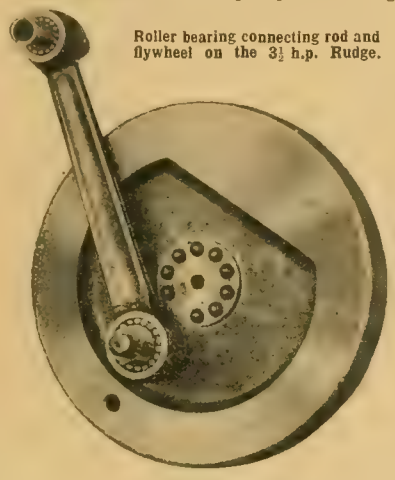


The oil tank fitted to the rear down tube of the Brooklands model Rudge

number of small spokes. Dunlop or Palmer grooved tyres are fitted, 650×65 mm. Speedometers and reflex lights are attached to some of the machines. One of these machines has a dark green sidecar attached. The chassis is attached to the bicycle at four points. This machine is fitted with the Sturmey-Archer three-speed hub in place of the multi gear. Special attention is being paid to this exhibit owing to the fact that the 3½ h.p. Rudge, ridden by Pullin and Green captured nineteen records last week at Brooklands, reference to which is made elsewhere in this issue.

5-6 h.p. MODEL: 85×132 mm.; overhead inlet valves; Senspray carburetter; belt transmission; Rudge-Multi speed gear.

These long-stroke machines follow the general lines of the lower powered model. In some cases a separate tank is fitted to contain the oil supply and attached under the saddle to the rear frame member. The pumps on Rudge



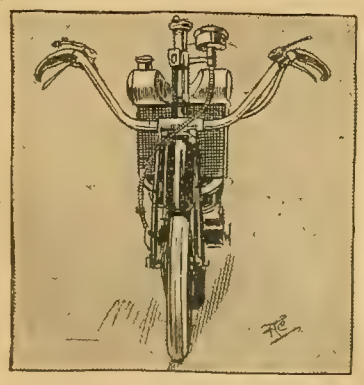
Roller bearing connecting rod and flywheel on the 3½ h.p. Rudge.

machines are for the most part operated by foot. The Ruthardt magneto is a standard fitting. This, although smaller than most magnetos, is claimed to be extremely efficient, especially at low speeds. Models of engines in section and a display of parts are to be seen.

SCOTT, No. 136a.

3¾ h.p. two-stroke MODEL: Scott carburetter; chain: Scott two-speed gear on counter-shaft.

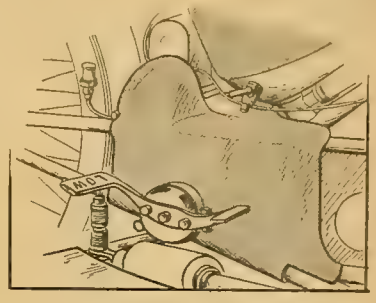
THE SCOTT ENGINEERING CO., LTD., Shipley, Yorks.—The Scott Engineering Co. continue their wise policy of concentrating on one model, of which several examples are shown on their stand. There are no radical alterations in the design



Curious position of the handle-bars on the Scott racing model. They are fixed to the base of the steering column.

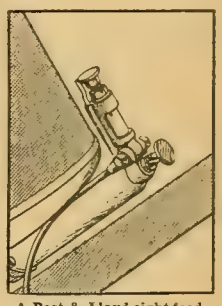
of the machine to record, but one or two interesting details have received attention. The lubrication system has been changed from the original type of forced feed to a semi-automatic drip feed, in which the flow of oil is visible through a glass

The pump plunger is spring-propelled and the rate of feed is adjustable. The pump and the drip feed are placed at the base of the petrol tank. Behind this is an oval-shaped metal tool case, which fills the



The case protecting the gear and magneto drive of the Scott. Also showing lubricator for gear.

otherwise wasted space behind the magneto. The transmission chains are neatly enclosed in detachable dustproof side pieces and a guard is also fitted over the top of the final driving chain. A front stand is fitted, in addition to the kick-up rear one, and is hinged to the engine crank chamber. Nail catchers of the rat-trap type are fitted over both the front and rear wheels. The spring forks, which are of the Scott patent type, have been improved by the fitting of screw-down grease caps by means of which the rollers are easily lubricated. A transverse bar for carrying a speedometer, etc., is fitted across the handle-bars, which are of the all-black covered type. The Scott machine on which H. O. Wood won the Tourist Trophy is an interesting exhibit on this stand

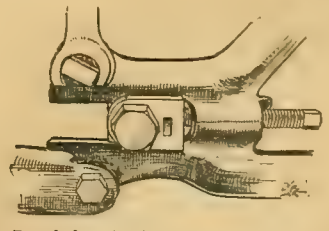


A Best & Lloyd sight feed lubricator, as applied to the new Scott.

SINGER, No. 83.

3½ h.p. MODEL: 85 × 88 mm.; side by side valves; B. and B. carburetter; belt; three-speed Sturmey-Archer gear.

SINGER AND CO. (1909), LTD., Coventry.—The 3½ h.p. Singer remains practically

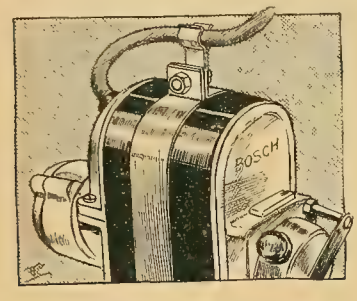


Rear fork ends of the chain driven Singer showing adjustment provided by means of a set screw.

unchanged. The touring machine is very completely equipped, the engine being carried in a stoutly constructed frame with Druid forks, two stands, and metal covered pannier tool boxes. The engine itself is on standard lines. The cylinder castings are particularly clean, and the

The Olympia Show.—

valve cover is produced so as to act as a trouser guard without interfering with the cooling of the engine. The magneto is carried high up in front of the motor, where it is well clear of mud and grit. This type is also shown in the form of a T.T. single-geared model. A rear brake pedal is fitted acting directly on the belt rim. A handle-bar controlled magneto



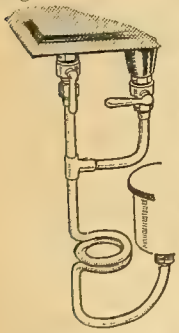
Neat method of fixing magneto and high-tension wire on the Singer.

is supplied to all types, and the levers which operate the controls are fitted with a neat form of ratchet, which automatically locks them in the desired position. The silencer is now provided with a fish tail exit pipe, and a neat double petrol pipe is fitted, which acts as a warning before the tank becomes empty. The 2½ h.p. model, which has bore and stroke of 69 × 80, follows the lines already described throughout. It is also shown both with three-speed gear and in the form of a T.T. racer.

G. E. Stanley's performances on Brooklands throughout the past year have been sufficient to draw the eyes of all the world to Singer machines, for he has probably secured more wins than any other rider during the past season. One feature on Singer models which has not already been mentioned is the new finish to the tank, which is carried out in black and grey, giving an extremely smart appearance. The finish of the frame, guards, and all detail work is excellent throughout.

4½ h.p. MODEL: 88 × 95 mm.; side by side valves; B. and B. carburetter; belt or chain; two-speed countershaft gear.

The 4½ h.p. models have undergone but slight alterations. The previous models have proved so satisfactory that it has been considered unnecessary to make any serious change. The 4½ h.p. has been somewhat increased in size, but its general design is exactly similar to previous types. An extension of the crank case casting forms the two-speed gear box, gear drive being employed to convey the power to the countershaft, on which is mounted a large diameter pulley, whence the drive is through a belt on the right-hand side of the machine to the back wheel. The same



The petrol pipes on the Singer act as a warning when the supply is nearly exhausted.

model is shown with a final chain drive, which is well encased. The gears are of the sliding dog type, operated direct by a firmly stayed control rod. The plate clutch is contained in the gear box, and is in such a position that no long operating rods are necessary. Altogether the unit is a particularly neat one.

SPARKBROOK, No. 92.

6 h.p. MODEL: 76×85 mm.; side by side m.o.v.; B. and B. carburetter; chain and belt; two-speed countershaft gear.

THE SPARKBROOK MANUFACTURING CO., LTD., Coventry.—In both the 6 h.p. and 8 h.p. the Sparkbrook characteristics for 1914 are the same. In both the aim has been to obtain simplicity and strength without superfluous gadgets, and the present designs are the outcome of long and scientifically carried out road tests. In both cases there is a twin V type engine, the drive being by chain on the near side to a counter-shaft gear, thence by a wide belt on the off side. The power is transmitted to the back wheel through a clutch, the plates of which are of hard steel carefully ground. The speed change

New type gear change lever on the Sparkbrook passenger machine.

works by dog clutches, the gear box being the firm's own make. The kick starter has been re-designed to enable the engine to be started with gear in neutral. The starter is of the toothed segmental type made strong enough for any amount of hard kicking. Both hubs are designed for removal of the wheels in about a minute, and though the wheel can be dropped out of the forks as soon as the solid centre wheel-pin is removed from the hub, the weight is taken on the larger diameter of the hollow wheel-pin. Ample provision is made for locking the large diameter hub cone, and really dustproof caps complete one of the finest hub constructions we have seen. Brakes have, of course, been designed to facilitate wheel removal. The tyres are 650×65 mm. Instead of ordinary connecting links on the Druid forks, the forged steel links are shouldered to work inside the lugs—a valuable point. The sidecar frame is built specially to suit the motor bicycle; perfect alignment is maintained by a straight tube chassis construction. The coachbuilt sidecar bodies are fitted with sprung upholstery, and under the seat is a roomy drawer. In the front is a locker containing an effective storm apron. A point deserving particular emphasis is the Colonial Sparkbrook model with 28in diameter wheels and 2½in. front tyre; the rear tyre is a 3in. This is a type that may be found useful on some of the rougher roads of this country.

8 h.p. MODEL: 85×85 twin; side by side m.o.v.; B. and B. carburetter, chain; counter-shaft two-speed gear.

Except for engine dimensions this larger design is identical with that of its smaller brother.

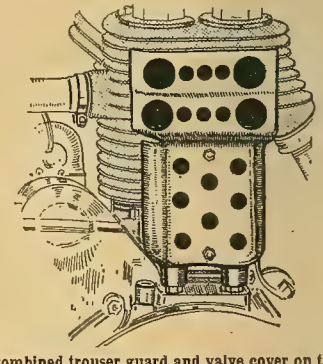
SPEEDWELL, No. 26.

THE SPEEDWELL MANUFACTURING CO., Alcester (Warwickshire).—Three different models of sidecar are displayed. The most taking is the Modèle de Luxe, which is fitted with a detachable wheel, luggage carrier, and instantaneous couplings to the four-point attachment. The upholstery is well sprung, and a neat hood and wind screen are fitted. Large C springs support the body at the rear and small similar springs in front. The coachwork is beautifully finished in tasteful light colours, and the outline is graceful. The Standard model has three-point attachment. A feature of these sidecars is the admirable mudguarding, deep valances being fitted each side of the wheel. The company also show complete back fork attachments fitted with Armstrong Mark VII. gears for fitting to any single-geared machine.

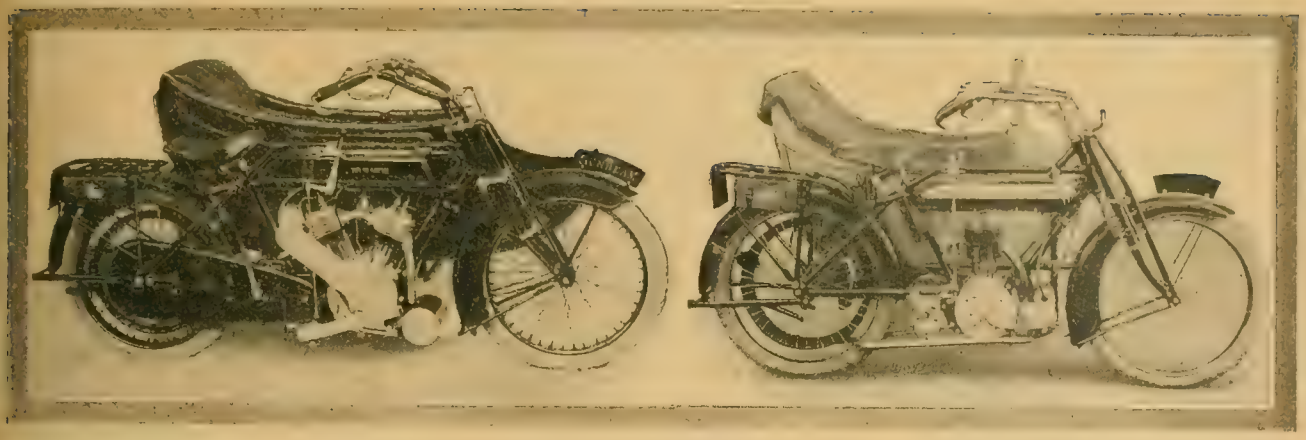
STAR, No. 81.

4½ h.p. MODEL (single-cylinder): 89×100 mm.; side by side valves; Amac or Senspray carburetter; chain; three-speed countershaft gear.

THE STAR CYCLE CO., LTD., Wolverhampton.—The 4½ h.p. Star in all probability has more distinctive features than any other exhibit. The cylinder of the big single has a detachable head, which is held down by four long bolts. The valve springs and stems are almost entirely enclosed by aluminium covers, which are extended over the valve ports to act as a trouser guard. Lubrication is ingenious, for the oil is led from a B. and L. lubricator to the timing gear, whence it feeds to the crankshaft bearing and into a groove formed in the flywheel. From this groove it is thrown to the crank pin by centrifugal force, and thence passes up through a hole in the connect-

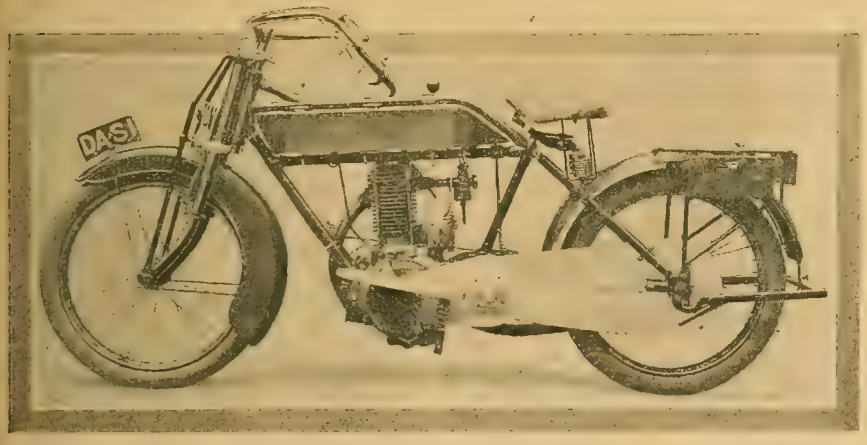


Combined trouser guard and valve cover on the single-cylinder Star



(1) Valve side of the 6 h.p. three-speed Sunbeam with chain drive and kick-starter. (2) The 3½ h.p. three-speed Raglan sidecar machine.

ing rod, through the hollow gudgeon pin and out to the cylinder walls. A large diameter leather-faced cone clutch is mounted on the crankshaft, and drives through an enclosed chain to a three-speed gear box. In the driving sprocket is mounted a cushioning device to take up the shock of explosions. The gear box has two sliding members, and is actuated by a stoutly constructed change-speed lever working in a quadrant on the right-hand side of the tank. The final chain



The 4½ h.p. chain-driven Star.

drive is entirely enclosed in an oil bath case. In the rear hub is mounted an internal expanding foot brake of ample dimensions. The magneto is mounted on an extension of the crank case directly behind the cylinder, and is chain-driven from the cam gear. Long footboards are fitted, and are sprung at the rear end. The specification includes Saxon forks, front and rear stands, powerful kick-starter, pannier tool bags, and well designed mudguards. A twin-cylinder 6 h.p. model is also staged, but is almost the same as the machine just described, except for the fact that it is fitted with a 76×85 mm. twin-cylinder J.A.P. engine. Considerable ingenuity has been shown throughout the design of this machine. A 6 h.p. model is shown attached to a well-designed sidecar, the body of which is slung at the rear ends on enclosed coil springs, which should provide extreme comfort. A parcels delivery van is also shown attached to a 4½ h.p. machine.

SUNBEAM, No. 80.

3½ h.p. Model (single-cylinder): 85×88 mm.; side by side valves; Amac carburetter; chain; three-speed counter-shaft gear.

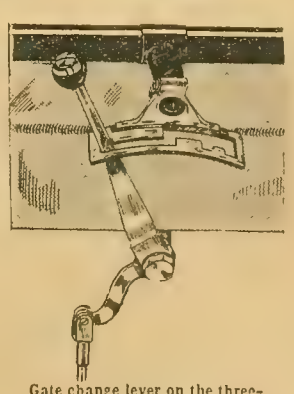
John Marston, Ltd., Wolverhampton.—The 3½ h.p. Sunbeam is a comparatively new model, but since it has made its appearance in competition it has made its name. The engine from outward appearances is built on standard lines, but it is fitted throughout with roller bearings, even the large intermediate gear wheel for the magneto drive being supported on this type. The chain drive from the engine to the gear box is enclosed in a cast aluminium oil-tight case. A multi-plate clutch is fitted, and the gear is of the sliding type. The final chain drive is also entirely enclosed, but to obtain a quickly detachable wheel, a loose spindle and a distance piece are employed, thus enabling the wheel to be withdrawn in a few seconds. A new feature has been introduced in the striking mechanism. The lever itself works as before in a gate quadrant, but the control rod is fitted with a buffer spring at its lower end, so as to prevent damage to the gears should the dogs not be opposite when the gears are changed. Enclosed spring tappets are fitted to the engine. A 3½ h.p. T.T. model is staged, but this differs in no way from the standard model, except that the handle-bars are neatly dropped and a picked engine is used. 26×2½in. Bates tyres are fitted as standard.

2¾ h.p. Model: 75×79 mm.; side by side valves; Amac carburetter; chain; two-speed counter-shaft gear.

In its general lines the 2¾ h.p. model is similar to the 3½ h.p., except, of course, that it is built somewhat lighter. The clutch, however, is of the single plate type, with cork inserts, and a two-speed gear only is fitted.

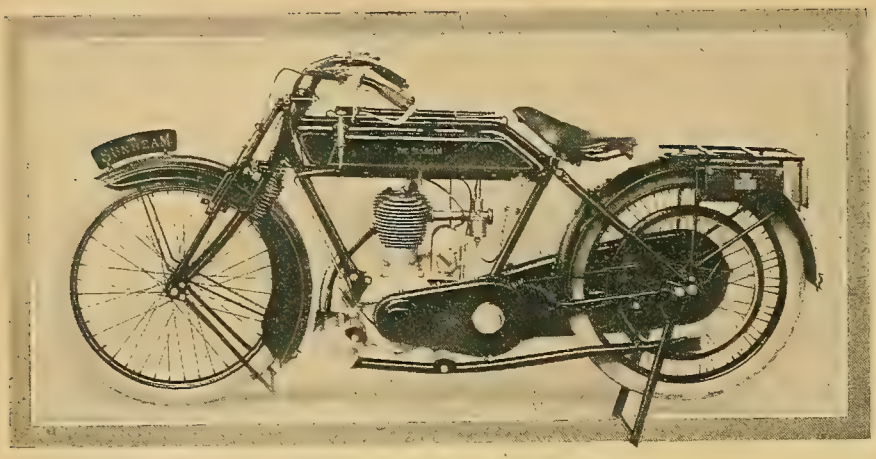
6 h.p. Model (two-cylinder): 76×85 mm.; side by side valves; Amac carburetter; chain; three-speed counter-shaft gear.

This machine follows the lines of the 3½ h.p. model, except for the fact that a 5-6 h.p. J.A.P. engine is fitted. All three



Gate change lever on the three-speed Sunbeams.

types retain this make's well-known features, such as the all-black finish, well-designed mudguards, and rear brake applied on the inside of a V-section rim. A Best and Lloyd semi-automatic drip feed lubricator is also a standard fitting. A particularly smart 6 h.p. sidecar combination is shown. In this case the sidecar is painted in black and lined with gold to match the machine. It is fitted



A new model 3½ h.p. T.T. Sunbeam with semi-dropped bars.

with a stout luggage carrier and excellent accommodation for tools and spares. 650×65 mm. tyres are fitted as standard. The kick starters on all Sunbeam models are carefully enclosed.

SUN, No. 114.

2 h.p. Model (Sun): 60 × 60 mm.; m.o.v.; B and B. carburetter; belt; Precision two-speed gear.

Sun Cycle Fittings Co., Ltd., Aston, Birmingham.—This machine is fitted with a Precision power unit made by F. E. Baker, Ltd., described on page 157 in the issue of Nov. 20th. It will be remembered that the valves are horizontal, and a neat foot-operated two-speed dog clutch gear is incorporated in this unit.

2¼ h.p. Model: (Sun-Villiers) 70×70 mm.; two-stroke; Amac carburetter; belt.

The most interesting part about this handy little machine is the two-stroke Villiers engine, which is of particularly neat design. The silencer is also worthy of mention, as it has two expansion chambers both of practically the same dimensions and joined by a single pipe. From the second expansion chamber there is a long exit pipe. The arrangement should effectively silence the exhaust. The crank case castings are particularly neat, and there is a heavy outside flywheel. Footrests and no pedals are fitted.

2¾ h.p. Model: (Sun Villiers) 77½×80 mm.; m.o.v.; B. and B. carburetter; belt; dog clutch Villiers gear.

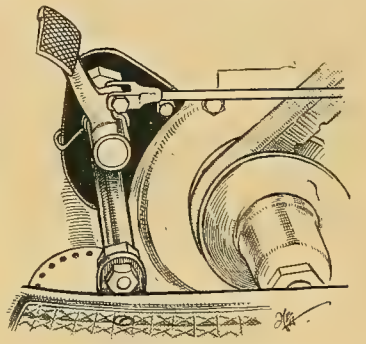
This is a useful model of medium horse-power fitted with the popular Villiers two-speed unit, the details of which are well known to our readers. The all-black finish is noticeable, otherwise the machine is constructed throughout on accepted principles.

3¾ h.p. Model (Sun-Precision): 85 × 88 mm.; m.o.v.; Amac carburetter; belt; Sturmey-Archer three-speed gear.

This is another model of sound design. We may mention that the lubrication is through a Best and Lloyd lubricator, and that particular attention has been paid to detail. The Sturmey-Archer three-speed gear is fitted, and a kick-starting device of the usual chain and free wheel pattern, but in which the spindle of the pedal is eccentrically mounted, so that the chain may be easily adjusted. Comfortable aluminium footboards are fitted.

2¾ h.p. Model (Sun-Precision): 70 × 90 mm.; m.o.v.; B. and B. carburetter; belt.

This is a model which is recommended to those who like simplicity, and is a



Showing method of mounting brake pedal, and position of footboards on the Sun-Precision.

soundly built machine which should serve as a handy runabout.

4 h.p. Model (Sun): 60 × 88 mm.; m.o.v.; Amac carburetter; belt; Sturmey-Archer three-speed hub gear.

The 4 h.p. machine is one which will appeal to the man who likes the smooth running of a twin and does not require excessive horse-power.

5 h.p. Model (Sun-Jap): 70 × 85 mm.; m.o.v.; Amac carburetter; belt; Sturmey-Archer three-speed.

As regards details, this machine resembles in the main the 3¾ h.p., being equipped with Amac carburetter, aluminium covered footboards, and Best and Lloyd lubricator. Since it is provided with a fairly high-powered engine, it is particularly suitable for sidecar work.

It will be noticed that a very wide range of machines is marketed by the Sun Cycle Fittings Co., who lay themselves out to cater for almost every branch of the buying public.

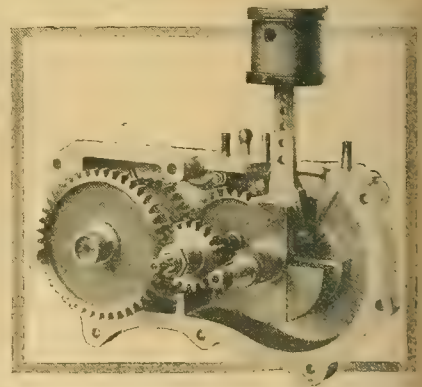
SWAN, No. 28.

Midland Motor and Cycle Co., Oxford.—This firm, who specialise in the Swan sidecar, are showing six examples of their models. One of the most attractive is that painted red to suit an Indian. A feature of the Swan sidecars is the coil suspension at the rear, from which the body is slung, the springs being fixed on a square section tubing running completely round the sidecar. The back of the sidecar is neatly curved. All the Swan sidecars have spring upholstery to the backs. Valances are fitted to the mudguards, and reflex red rear lights are a standard fitment. Another sidecar is shown painted to suit the Matchless machines. An extremely attractive model is shown painted pure white, fitted with a hood and wind screen, and luggage carrier fitted with a suit case, and is altogether a complete touring model. The Modèle de Luxe, which is painted olive green with white lines, has the back of the seat made to hinge at the lower end, and by swinging this forward a box capable of holding a considerable amount of baggage or a two gallon petrol can is disclosed. Another special model of this exhibit has a provision for a child's seat in the front of the sidecar.

SWIFT, No. 91.

3½ h.p. Model: 86×85 mm.; side by side m.o.v.; B. and B. carburetter, single, three-speed hub, or three-speed counter-shaft gear.

The Swift Cycle Co., Ltd., Cheylesmore, Coventry.—The 3½ h.p. Swift is made in three models—(1) single geared, (2) with three-speed Armstrong hub gear, or (3) with a counter-shaft three-speed gear. In all cases the power to the back wheel is conveyed by belt, but in the case of the counter-shaft gear chain transmission is introduced from engine to counter-shaft. The engine is of clean design, and a waterproof magneto placed in front of the engine is driven by a chain encased in an aluminium cover. The kick starter at the rear works on the back wheel through a chain and free wheel arrangement. The back brake has a separate V-rim on the right-hand side of the wheel. In the multi-geared models the gear-changing control arrangements are substantial and convenient. Needless to say, the cycle part of the work coming from a firm of such experience is of the highest order.



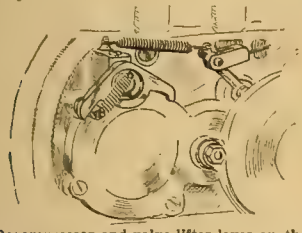
Internal mechanism of the 2 h.p. Precision Junior, showing piston, connecting rod, and two-speed gear.

The Olympia Show.—

TRIUMPH, No. 31.

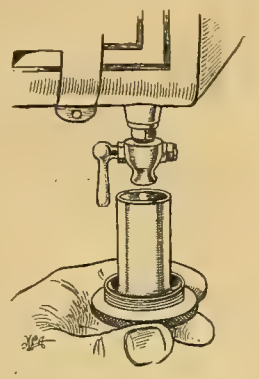
4 h.p. Model: 85×97 mm.; side by side m.o.v.; Triumph or B. and B. carburetter; belt; Sturmey-Archer three-speed gear.

The Triumph Cycle Co., Ltd., Priory Street, Coventry.—The exhibit of the Triumph Co. invariably commands a great amount of interest and attention, and this year even more so than usual, for this firm hitherto so extremely conservative and faithful to the 500 c.c. single-cylinder, have now struck two entirely new notes. Instead of the 500 single, the Triumph Co. are placing on the market a machine equipped with a single-cylinder engine of 550 c.c., the reason for this being that in the past the machines have been extensively used for sidecar work, and the makers have realised that such demands are made upon the 500 c.c. engine that it is almost invariably worked at high pressure. To obviate this, and at the same time to make a machine capable of giving a comfortable solo service, they have introduced the new model as a happy compromise, and there is little doubt that they have thoroughly succeeded. The general details of the machine, of course, follow the usual Triumph practice, and the same exquisite finish and attention to detail is observable on the new models as in the past. The designers have remained faithful to the belt drive, and the new 4 h.p. model is equipped with a specially constructed one-inch belt, which may be relied upon, running as it does on large pulleys, to give perfectly satisfactory service, even when loaded up with the extra weight of sidecar and passenger. The belt transmits the power to a Sturmey-Archer three-speed back hub; but the method of withdrawing the clutch and changing the gear is a speciality of the Triumph Co., changing gear being effected by an exceedingly neat lever mounted on the lower tube of the frame and situated on the right hand side of the tank. No cut-out is fitted, and a long exhaust pipe with flattened end projects from the silencer as far as the rear hub.



Decompressor and valve lifter lever on the 4 h.p. Triumph.

The most noticeable outward change in Triumph design is the frame, which is now dropped, giving a lower saddle position and increased comfort. This has, of course, necessitated the tank being redesigned to fit the rear end of the frame. The Best and Lloyd semi-automatic drip-feed lubrication is shown on this machine for the first time, and the tank has now no petrol gauge, a screw-down needle being used to cut off the petrol at the end of a run. To facilitate easy starting, a decompressor is fitted, working on the inlet cam, and by means of this the engine can be started when cold without the least trouble. Of course the fitment of a more powerful motor and the fact that the Triumph Co. are catering for sidecar use have necessitated the strengthening of the frame throughout, and this has been carried out without in any way sacrificing the elegant appearance of the machine. The machines on the stand are equipped with both Triumph and B. and B. variable jet carburetters. We understand that for the T.T. Race the Triumph Co. will prepare a set of 500 c.c. engines.



The petrol cap of the two-stroke Triumph has embodied with it a receptacle for the purpose of measuring oil from the forward compartment of the tank.

2 h.p. two-stroke Model: 64×70 mm.; B. and B. carburetter; belt and chain; two-speed counter-shaft gear.

The new model 2 h.p. two-stroke two-speed Triumph attracts enormous attention. It is not exaggerating to say that this is one of the prettiest lightweight models ever put upon the market, the design throughout being extremely neat. The engine, which is 64×70 mm., is situated almost exactly midway between the wheels, which gives such a perfect balance to the machine that anyone standing over the machine can lift it from the ground quite evenly by means of the handle grips. The drive is taken by a totally enclosed chain to a tiny two-speed gear box situated close up to the engine base chamber, the transmission thence being by rubber belt to the back wheel. Flexibility is a great feature of the engine, and the designers claim to have entirely overcome the difficulty which makes the two-stroke engine "four-stroke" at slow speeds. The carburetter is situated at the front of the engine, and the Bosch magneto is mounted high up in a sheltered position behind the cylinder on the top of the gear box. The flywheel is external. Petrol and lubricating oil are mixed, and a new feature just adopted is the provision of a petrol injector to the cylinder head. The actual machine exhibited will have eventually a slightly different mudguard to the front wheel, which will either have side valances or be curved backward at the lower end as on the 4 h.p. model. The tank is a round one. An exceedingly neat feature is the method by which the speeds are changed, this being effected by Bowden wire and lever situated on the left of the handle-bar, immediately underneath the lever controlling the magneto. Needless to say, the finish of this machine and the other Triumph models is, as usual, superb.

The Olympia Show.—

VAL No. 109.

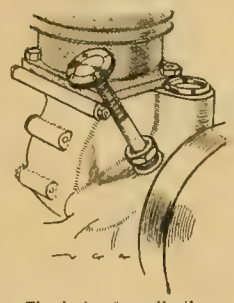
3½ h.p. MODEL: 85×85 mm.; side by side valves; B. and B. or Amac carburetter; belt transmission; single fixed speed gear.

THE VAL MOTOR CO., 314, Bradford Street, Birmingham.—The 3½ h.p. Val is the product of a new firm. It embodies standard practice, and is provided with a single-cylinder engine having the Bosch magneto placed in front and driven by a chain. To the silencer is fitted an expansion box of ample dimensions affording an easy passage for the exhaust. Though the engine exhibited is fitted with hand pump lubrication, we understand that future examples will possess a forced drip feed. On the same stand are some admirable examples of sidecars, one having a particularly interesting pattern springing system for the sidecar wheel. The wheel is mounted on a tube extending three-quarters of the way across the frame and secured at right angles to short tubes swinging around the main transverse member, which is clamped to the chain stays. The swinging movement is under the control of a coil spring, so that, on the wheel mounting any obstacle, it is swung upwards from the cross-member and is always under spring control. A very neat arrangement is seen on the body too. This is torpedo shaped, turned up at the front end, from which a storm apron is carried to the wind screen placed just in front of the seat. Before opening the door, the button attaching the apron to it is undone, and the whole mounting of the wind screen can then be swung clear around a pivot on the far side of the sidecar. This exceptionally neat design is particularly worth attention, and the firm also show an excellent example of sidecar work on more standard lines.

VELOCE, No. 103.

2 h.p. MODEL: 60.5×73 mm.; valveless; Amac carburetter; belt.

THE WILTON CYCLE AND MOTOR CO., Wilton Road, Victoria, S.W.—The two-stroke Veloce engine has already been described. It may be as well to point out that, instead of mixing the lubricant with the petrol, the oil is poured into the crank chamber and distributed by ring lubrication to a recess in the phosphor bronze bearing. Here the flow is regulated by a needle valve and is fed to the whole crankshaft through a hole in the shaft journal. It must be observed that the frame of this model is designed to take a gear box under the chain stay bracket if need be, and an example of this is afforded by the two-speed model chain - driven throughout. The weight is only 101 lbs.



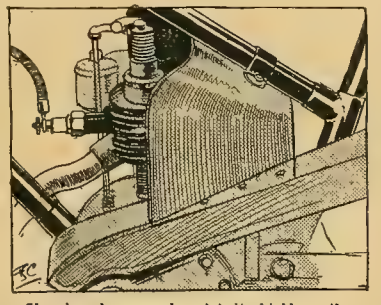
The device for adjusting oil feed on the Velocette.

2 h.p. MODEL: 60.5×73 mm.; valveless; Amac carburetter; chain; two-speed counter-shaft gear.

This is an extremely neat little machine, and even the change-speed gear is controlled from the handle-bars.

2½ h.p. MODEL: 70×76 mm.; valves in front, one above the other; Amac carburetter, belt; two-speed gear in crank case.

In the four-stroke Veloce engines but little alteration has been made, though a

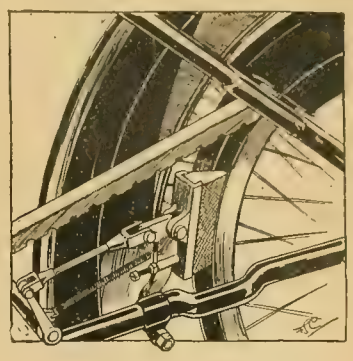


Showing dressguard and belt shield on the ladies' model Veloce

slightly larger model of 2¾ h.p. has been introduced. The gear counter-shaft is embodied with the camshaft, the geared down belt pulley being placed in front of the engine and affording a long belt drive. Lubrication is forced by pump through the counter-shaft to the gears and engine, finally into a sump at the bottom of the crank case, whence it is circulated back past the filter. A lady's dropped frame machine of this type is on view.

3½ h.p. MODEL: 85×85 mm.; side by side m.o.v.; Amac carburetter; belt; three-speed hub gear.

The 3½ h.p. is unlike the other Veloce models, in that it follows the more



Veloce internal operating belt rim brake; also showing mudguard and belt guard.

ordinary standard lines. It is a finely finished machine with magneto in front of the engine, and is a good example of up-to-date standard practice.

VICTORIA, No. 120.

4¼ h.p. MODEL: 89×96 mm.; m.o.v.; B. and B. carburetter; belt; Armstrong three-speed gear.

THE VICTORIA MOTOR AND CYCLE CO., LTD., Dennistoun, Glasgow.—This is a powerful single-cylinder machine, suitable for sidecar work, in which there are several interesting features. The engine is a Precision, and a spring pressure lubricator is fitted. Glass top filler caps are fitted, and special attention has been paid to the mudguarding. The front mudguard has a side shield, and the back mudguard an extension to prevent mud being thrown up by the belt rim. A comfortable Brooks B170 saddle is fitted. In the main, the machine follows standard lines throughout.

4 h.p. MODEL: 60×88 mm.; m.o.i.v.; B. and B. carburetter; belt; Sturmey-Archer three-speed gear.

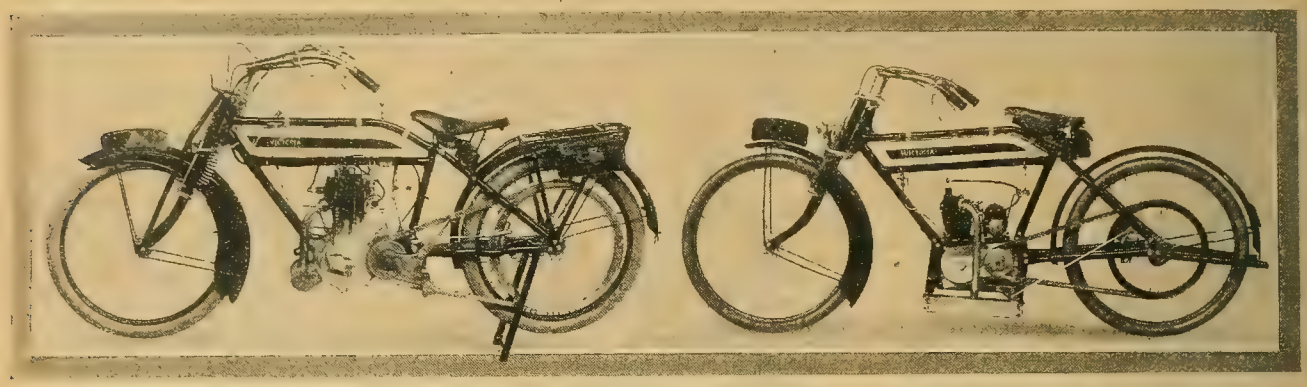
This is a handy little solo mount fitted with a small two-cylinder Precision engine, adjustable footrests similar to

TWO OPEN FRAME LIGHTWEIGHTS.
(1) The 2¾ h.p. Veloce, with belt drive and kick-starter. (2) The 2¾ h.p. two-speed Douglas.

The Olympia Show.—
those fitted to the large single-cylinder model, and in general arrangements resembling it. The lubrication is by splash, the oil being delivered by a spring plunger pump through an adjustable sight feed to the crank case.

chamber the exhaust gases make their exit through a short pipe with a flattened end, in which there are saw cuts. No less interesting is the 2¾ h.p. 74.5×80 four-stroke engine, incorporating a dog clutch, two-speed gear, and kick starter. A phosphor bronze cone clutch is also

It is shown attached to a 2½ two-speed Levis. These two models are not folding, but two examples of folding sidecars are shown, capable of going through a 2ft. 8in. door when fitted to a motor cycle. A tandem-seated cane sidecar with two doors completes the exhibit.



Two types of Victoria for 1914. (1) The 2¾ h.p. two-speed model, showing kick starter and belt drive. (2) The 2 h.p. two-stroke single-cylinder type.

3½ h.p. MODEL: 85×88 mm.; m.o.i.v.; B. and B. carburetter; belt; Sturmey-Archer three-speed gear.

Save that it is fitted with a different-sized engine, the details of this model are practically identical with the 4¼ h.p.

2¾ h.p. MODEL: 74.5×88 mm.; m.o.i.v.; B. and B. carburetter; belt; Villiers two-speed gear.

This machine is fitted with a neatly designed Villiers power unit. A kick starter is fitted, consisting of a ratchet quadrant engaging with a pinion on the counter-shaft, to which the pulley is fixed. It is a particularly well-designed model, and a point worthy of note is the bottom bracket lug, which looks extremely substantial. An Enots lubricator is fitted.

2 h.p. MODEL: 60×60 mm.; m.o.v.; B. and B. carburetter; belt; two-speed Precision gear.

This model is fitted with the new lightweight Precision power unit, and was described in detail in last week's issue. The belt drive is indirect from a counter-shaft, and consequently pulleys of more equal diameter can be fitted, thus ensuring longer life for the belt. A foot-operated two-speed dog clutch gear is incorporated in the engine unit. The rear brake acts on the interior of the belt rim. As a contrast to the other models, all of which are fitted with Druid forks, the smallest model has Saxon forks.

VILLIERS, No. 225.

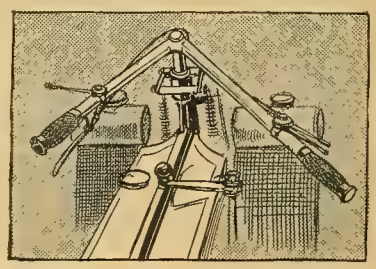
2½ h.p. two-stroke Villiers MODEL: 70×70 mm.; valveless; Amac carburetter; belt.

THE VILLIERS ENGINEERING CO., LTD., Blakenhall, Wolverhampton.—One of the novelties on this stand is a 2½ two-stroke Villiers which is shown as a separate unit and also fitted to Ixion motor bicycles. The big end is fitted with a roller bearing, and the silencing arrangement is well worthy of mention. Two expansion chambers are joined together by a pipe which forms the end cap of the two chambers. In the second expansion

included in the unit, which is operated either by the hand or foot. This enables one to use the hand when engaging the clutch, which is often convenient in heavy traffic, enabling one to start with both feet on the ground. A kick starter is also provided, consisting of a quadrant engaging with a free wheel on the engine-shaft. The air release pipe pointing downwards, so as not to blow the oil on the crank case, is also a very neat fitting. One of these engines is also shown in part section, and one of these units is fitted to a Sun-Villiers motor bicycle.

WATSONIAN SIDECAR, No. 27.

THE WATSONIAN FOLDING SIDECAR CO., LTD., Conybere Street, Birmingham.—A most striking sidecar on this stand has an all-metal body. The special feature is the carrying in the nose of the sidecar of a spare petrol tank holding three gallons. The springing is very luxurious, special shock absorbing spiral springs being fitted to check the rebound of the C springs at the rear. The seat is sprung, and a large luggage carrying boot is supplied at the back of the passenger. Another interesting sidecar shown is a featherweight one, scaling only 46 lbs., ready to attach to the machine. It has a cane body, and, despite its light weight, it has plenty of leg room. The chassis is primarily composed of a single tube, and the body is slung in exactly the same way as a Brooks saddle.

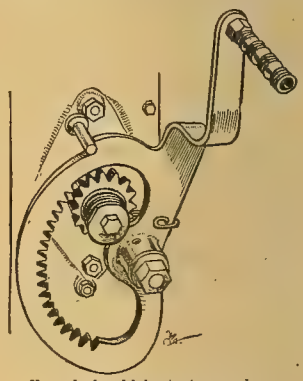


Unusually shaped handle-bar on the Williamson to prevent fouling the cabriolet sidecar body.

WILLIAMSON, No. 85.

8 h.p. TWIN: 85×85 mm.; side by side valves; Amac carburetter; chain; two-speed counter-shaft gear.

THE WILLIAMSON MOTOR CO., LTD., Coventry.—The Williamson exhibit consists of one model which may be obtained either air or water-cooled. As the water-cooled model is the most fre-



New design kick-starter on the 8 h.p. Williamson.

quently seen, this will be described first. The engine has two horizontally opposed cylinders, and remains practically unaltered for the coming year, except for the fact that the crankshaft is now balanced and valve covers are fitted. The water pipes are much neater, and cooling is effected by an improved type of radiator. The main frame tubes are duplicated. Both driving chains are enclosed, and the gear box is of the sliding dog type operated by a lever working horizontally on the top tube. The rear brake drum has been increased in diameter, and the ground clearance raised to 6½in. A new form of kick starter is now fitted, which consists of an internally cut quadrant meshing with a free-wheel which is so arranged that when once the engine is started it is thrown out of mesh. The carrier is strongly constructed, and mounted on either side are large pannier

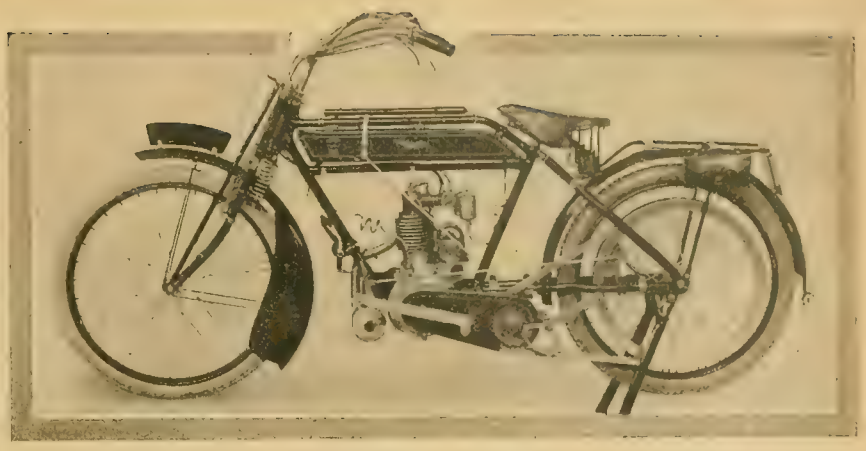
The Olympia Show.—

tool boxes. Mudguarding has received special attention, and the Williamson is probably one of the best protected machines on the road, especially as the long aluminium footboards, which are now sprung at the rear end, help to protect both rider and engine. Lubrication is by sight feed drip, but auxiliary pump supplies for emergency. The water-cooled model is essentially a sidecar machine, and, as well as some excellently designed passenger outfits, a miniature cab is shown with seating accommodation for three, and the body is entirely enclosed, and luggage accommodation is provided on the roof.

WIN-PRECISION, No. 24.

4¼ h.p. MODEL: m.o.v.; B. and B. carburetter; belt; Armstrong Mark VII. gear.

THE WINCYCLE TRADING CO., LTD., 106, Great Saffron Hill, London, E.C.—Two Win-Precisions, one fitted with a 3½ h.p. single-cylinder, and the other with a 4¼ h.p. single-cylinder engine, are shown. The drive is by belt, and an Armstrong Mark VII. gear is fitted to both models. The 3½ h.p. is shown with a folding sidecar chassis, and the 4¼ h.p. with a similar type chassis, on which is mounted a handsome coach-built sidecar, painted French grey with red lines and claret coloured upholstery. The feature of this sidecar is that it will pass through a 30in. doorway, a point of interest to those who have little space for storage. The sidecar body is noticeable for the deep scuttle dash, comfortable upholstery, and arm rests on each side. The motor cycles are extremely substantial in design, the engines being the well-known Precision. Control is completely from the handle-bar, and the gear is changed by the new long lever quadrant, which is an advance on the small levers fitted during the past year. The firm also exhibit a remarkably well-finished cane sidecar upholstered in brown, this chassis also being made to fold when it is necessary to fold the sidecar. The body, of course, has to be detached, but by means of the special self-locking clips this is literally a matter of a moment. The equipment of the machines follows standard practice, and embodies Druid forks, Hutchinson 2½in. tyres, B. and B. carburetter, Bosch magneto, and a kick-starter fitted to the back stays.



The 2½ h.p. single-cylinder counter-shaft geared Wolf, showing kick-starter, footboards, and method of mounting the clutch pedal.

WOLF, No. 22.

3½ h.p. MODEL: 84 × 89 mm.; side by side valves; B. and B. or Amac carburetter; chain and belt or chain; Toroga two-speed gear.

THE WULFRUNA ENGINEERING CO., LTD., Wolverhampton.—The above machine was referred to last week as a 3 h.p. in error. Two models are shown, one fitted with all chain and the other with chain and belt transmission, the Toroga two-speed gear being fitted behind the engine. The engine is a workmanlike-looking job, and is fired by a U.H. magneto placed in a sheltered position high up behind the cylinder. Either Xl-All or Pattison saddles are supplied at option, and the specification includes B. and B. carburetter and Druid forks. The price of the machines is exceedingly moderate, the cost of a two-speed machine with chain drive and complete with coachbuilt sidecar being only 55 guineas. Handle-bar control to the magneto is fitted, and a noticeable feature is that the oil and petrol pipes are copper finished.

2½ h.p. MODEL: 76 × 65 mm.; overhead inlet valves; Senspray or Amac carburetter; chain and belt; Albion two-speed counter-shaft gear; clutch and kick-starter.

An excellent little machine is this model, which retails at the moderate price of 32 guineas. The big bore engine gives plenty of power, and the combined drive enables a large diameter pulley to be used, thus avoiding belt slip. The Albion two-speed gear, clutch, and kick-starter is a well designed piece of work. Comfortable footboards and large mudguards and saddle render this machine a thoroughly serviceable touring mount.

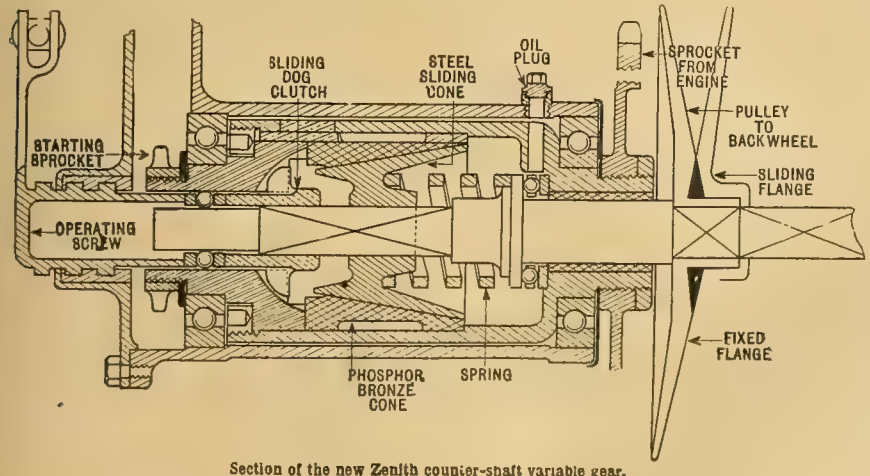
ZENITH, No. 51.

6½ h.p. MODEL: 76 × 85 mm.; side by side valves; Amac carburetter; chain and belt; Gradua gear.

ZENITH MOTORS, LTD., Weybridge, Surrey.—The principal novelty of this machine is the position of the variable pulley, which constitutes part of the Gradua gear. This is placed on a counter-shaft before the engine, thus affording a long and flexible belt drive and the possibility of lower gears than can be fitted when the pulley is on the engine-shaft, as the counter-shaft can then be geared down to any desired ratio. This counter-shaft also incorporates a metal-to-metal clutch, which revolves in an oil bath, and a kick-starter, which is enclosed in the same case. The mechanism for moving the back wheel backwards and forwards as required by the variation of gear is guarded by a small aluminium cover. The magneto is placed behind the engine slightly on the right hand side of the machine. The stand, instead of being fitted in the usual position, is placed amidships. The silencer is alongside the back wheel.

3½ h.p. MODEL: 70 × 64.5 mm.; side by side valves; Amac carburetter; belt; Gradua gear

This model appears to be a very desirable solo machine, but it is fitted with permanent lugs for the attachment of a sidecar if required. The magneto is placed before the engine. The 3½ h.p. Zenith is also made with a new counter-shaft gear as previously described. Other machines to be seen on this stand are racers of various sizes, one of which is fitted with a J.A.P. engine, having overhead valves. All Zenith machines have twin engines, with the exception of the 3½ Green water-cooled engine. The finish is, in most cases, black with green lines, but the racing machines are red.



Section of the new Zenith counter-shaft variable gear.

Cycle Cars at the Show.

A.C. No. 86.

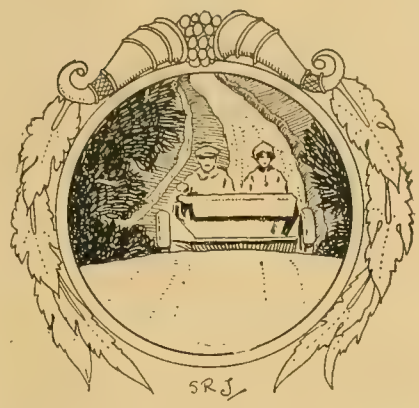
5-6 h.p. single-cylinder MODEL: 95×102 mm. (723 c.c.); air-cooled vertical, cooling by two fans; m.o. valves; B. and B. carburetter; Bosch magneto; two speeds, clutch drive; wheelbase, 5ft. 9in.; track, 4ft. 6in.; 650×65 mm. tyres on wire wheels.

AUTO-CARRIERS (1911), LTD., Thames Ditton, Surrey.—The models staged here have been described from time to time in our columns, and have all the characteristics which are special to this particular make of vehicle. A very large number are in use in London and the provinces for carrier and passenger work, and have been found to be very reliable. The most interesting of the models on the stand are the 10 h.p. vehicles fitted with a four-cylinder water-cooled engine, which was described and illustrated in a recent issue of *The Motor Cycle*. The engine is *en bloc*, thermo-syphon cooled, and the special feature of the design of the chassis is that the gear box and back axle form one unit, the centre torque rod and gear box being in one piece to ensure perfect alignment. An oil-tight partition separates the worm gear and the differential. This model is fitted with 700×80 mm. tyres on Sankey detachable wheels. The firm claim credit for having marketed a really strong and light four-cylinder car that at the same time is a cycle car under the A.C.U. definition, and that this is brought about by the scientific reduction of unnecessary weight in its construction

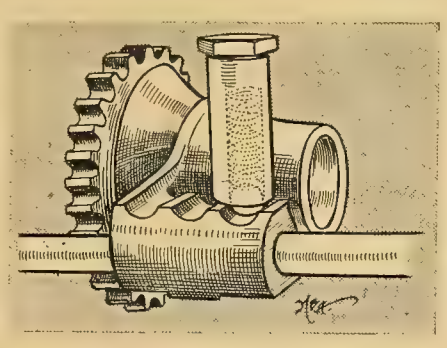
ADAMSON, No. 132a.

Two-cylinder 10 h.p. MODEL: 85 × 95 mm.; Solex carburetter; final drive by belt.

BARTON, ADAMSON, AND CO., Enfield Highway, N.—The 10 h.p. Adamson cycle car was fully described in our issue of October 30th. The engine is a two-



cylinder vertical Alpha bolted straight on to the frame. The gear box, however, is carried on a subframe, and the drive is transmitted from the leather cone clutch to the gear box, which contains three speeds and a reverse, by a shaft provided with a leather disc type universal joint at its rearward end. Two similar universal joints are to be found each side of the counter-shaft, to which the belt pulleys are attached, which runs on ball bearings. Motion is transmitted to the counter-shaft by means of bevel gearing. A V-shaped distance rod runs from the gear box to the rearmost transverse member of the frame, and terminates in a ball joint and adjusting screw by means of which any slack in the belts may be taken up. Points worthy of special study on this vehicle are the seat starting device, the construction of the gear box, the underslung springing, and the distance rod referred to above. The Adamson is low built and possesses particularly pleasing lines.

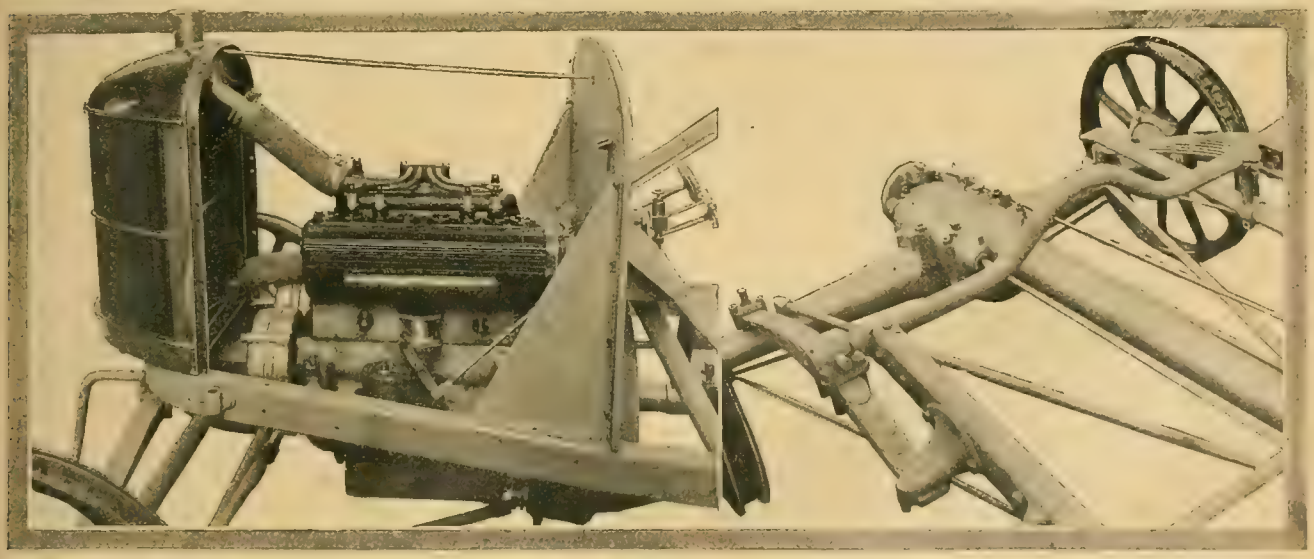


Eccentric locking device of gear striking rods on the A.C

BUCKINGHAM, No. 35.

12 h.p. MODEL: 89×88 mm., twin cylinders, V 90°; water-cooled; m.o. overhead valves; Buckingham carburetter; Bosch magneto; two speeds; chain and belt drive; wheelbase, 7ft. 2in.; track, 3ft. 8in.; chassis weight, 5¾ cwt.; tyres, 26×2½, on wire wheels.

G. N. HIGGS, 31, Vauxhall Bridge Road, Victoria, S.W.—The chassis staged indicates that the engine is a very powerful one and that the transmission should be equally efficient. From the engine crankshaft there are two chains which transmit the power to loose external portions of friction clutches, either of which can be brought into engagement with the internal clutch portions so as to impart the top or lower speed to the large belt pulleys secured to the end of the counter-shaft. Either of the speeds can be engaged by moving the pedal, which can normally be held out of engagement when required by a form of ratchet and sprag, the latter being attached to the pedal. The frame is mounted on a transverse spring at the front and at the back by quarter elliptical inverted springs.

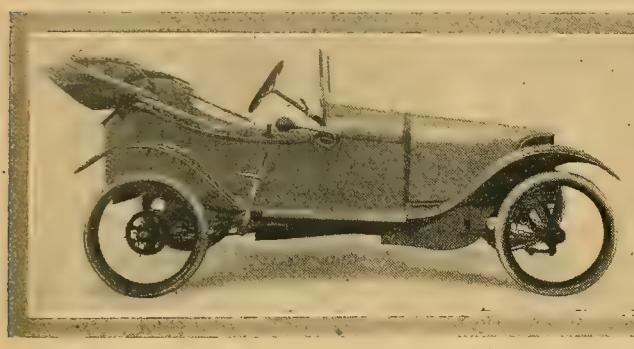


Monobloc four-cylinder engine and radiator of the A.C. 10 h.p. model. A Binks carburetter supplies the gas

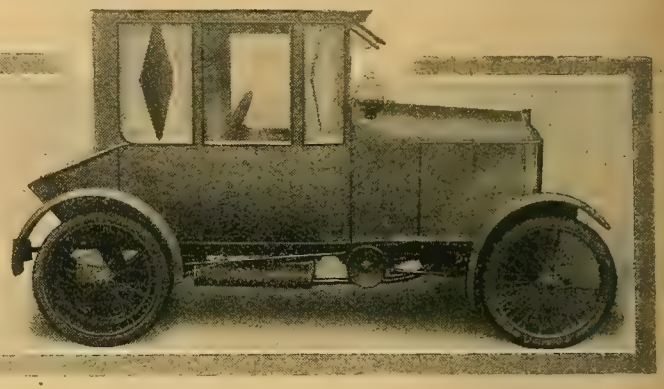
Rear portion of the chassis, showing rear spring anchorage and gear box and back axle unit

The Olympia Show.—

A torque rod is arranged to connect up the rear axle centre and the centre of the frame. Means are provided for adjusting the chains. Both sets of brakes take effect on the inner part of the rear wheel belt pulleys, the brakes being of the single shoe type forced into contact with the belt rim by means of wire cables. The steering is of the bobbin and cable type. The chassis is very well thought out, and the work is good. A twin-seated vehicle complete with body is also staged, together with the various parts, showing the material and workmanship employed in the construction of the engine. A very tastefully fitted coupé-bodied car is also staged.



Single-cylinder four-wheeled A.C., one of the few £100 cycle cars in the Show.



A Buckingham Coupe, with a twin-cylinder water-cooled engine and belt drive, shown by G. N. Higgs.

CARDEN, No. 33.

3½ h.p. single (85×85 mm.) or 4 h.p. twin (70×85 mm.) MODELS: side by side valves; chain drive; Carden two-speed gear.

CARDEN ENGINEERING CO., Farnham, Surrey.—Three models of these speedy-looking single-seated cycle cars are displayed, all fitted with J.A.P. motors. The original type of Carden was supplied with a single gear, and a single-cylinder power unit of 3½ h.p., but for 1914 the firm are marketing two-cylinder models with multi-speed gears, one on the stand being shown with a twin J.A.P. 70×85 mm., 585 c.c., and another with a twin J.A.P. 70×64½ mm., 499 c.c., and a choice of finish in either grey, blue, or red is given. The coachwork is the shape of a cigar sharply pointed at both ends, and the motors are mounted over the rear axle, to which the drive is transmitted by means of a chain, a feature being the new Carden two-speed gear. The Carden is probably the lightest cycle car in the Show, and is designed for use by one person only. The striking feature is the entire absence of a steering column visible to the eye, the dashboard being brought so close to the steering wheel that the latter fitment appears to be mounted directly on the dash. The steering is controlled by wires running through tubes. This velicle weighs far less than many sidecar outfits.

One of the most novel designs of a four-wheeled single-seater is the Carden shown above.

CHATER-LEA, No. 54.

CHATER-LEA, LTD., Golden Lane, E.C.

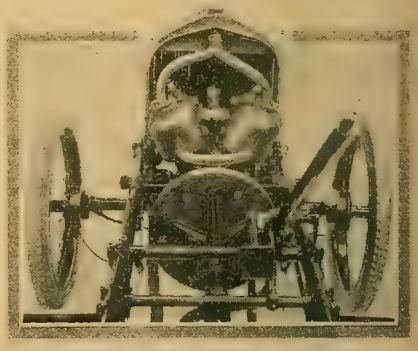
Four-cylinder engine, 59×100 mm., 1,098 c.c.; Sthenos carburetter; three-speed and reverse gear box; wheelbase, 7ft. 6in.; track, 3ft. 10in.; 700×80 mm. tyres; chassis weight, 5¼ cwt.

CHATER-LEA, LTD., 74-84, Banner Street, London.—The Chater-Lea cycle car has been on the market for some considerable time, in a simple form with a two-cylinder V engine, but this year the makers are supplying, in addition, a miniature car type fitted with a four-cylinder *monobloc* engine. The whole design of the vehicle follows car practice throughout, the three-speed gear box being situated in the is by propeller-shaft to a live axle. middle of the chassis, while the final drive Messrs. Chater-Lea evidently recognise that vehicles of this description are capable of considerable speeds, and they wisely provide larger sized tyres than are frequently met with on machines of this type, and their example in this respect is one which might be followed with advantage. The workmanship and design throughout are excellent, as may be expected from this firm. A twin-cylindered chassis, with the cylinders set mitted to the rear axle by means of a at 50°, the motor being water-cooled, is also shown, together with a complete car of this type fitted with a Zenith carburetter. Complete cars as well as chassis are staged at Olympia.

CRESCENT, No. 138.

7-9 h.p. MODEL: Blumfield 50° V-type; water-cooled; thermo-syphon; m.o.v.; Cox carburetter; Bosch magneto; five speeds; friction and chain drive; wheelbase, 7ft. 9in.; track, 3ft. 2in.; weight about 7 cwt.; 650×65 tyres on wire wheels.

CRESCENT MOTORS, LTD., Smethwick, Birmingham.—in this chassis a specially designed Blumfield engine for cycle car work is attached to the tubular side



Showing radiator and twin-cylinder engine of the water cooled Crescent.

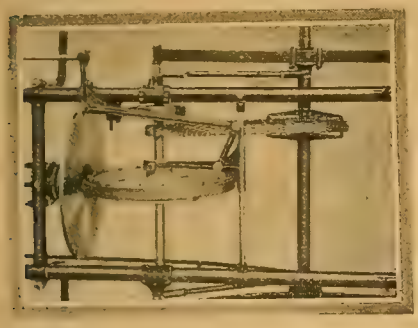
members of the frame by means of brackets, and the drive is taken from the flywheel through a six-armed lug connected to a flat leather ring bolted to the flywheel rim. The flywheel is fitted with vane arms, which act as a fan A long shaft extends from the six-armed lug, and carries at its rear end a friction disc which engages another disc carried on a transverse shaft. The transverse disc has its edge covered with Ferodo. The disc can be moved over the face of the driver disc by means of a hand lever which gives five forward speeds. The drive from the counter-shaft, on which the friction wheel is mounted, is transmitted to the rear axle by means of a

The Olympia Show.—

silent chain. There is no differential, but a type of band brake connects one wheel to the axle, so that slip takes place when turning corners. The steering box is substantial, and the steering is of the worm and nut type. So far as control possible to start the vehicle with the brake on. The chassis is very well finished, and the complete vehicle has very nice lines. It should be remarked that in the chassis model on view a Precision V type water-cooled engine is fitted longitudinally in the frame.

The smart looking water-cooled 8 h.p. Crescent.

and brakes are concerned, one pedal, on being compressed, takes the friction discs out of contact, and a further movement brings into operation expanding bands to the interior of the front wheel brake

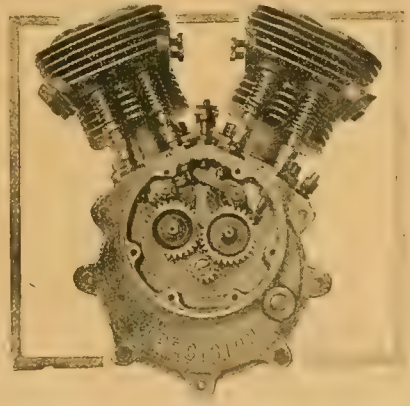


Friction gear and silent chain drive to back axle on the Crescent.

drum. The change-speed lever is also connected to the hand brake lever to apply a contracting band on the shaft on which the second friction wheel is mounted. The change speed lever moves through a gate quadrant to the inner part, when it is desired to apply the hand brake, and to the outer part when it is desired to bring any of the speed ratios into operation, so that it is im-

DAY-LEEDS ABSENT.

A stand had been booked for the Day-Leeds cycle car, which for 1914 has been re-designed with a four-cylinder water-cooled engine and three-speed gear box. It is, in fact, a car in miniature, and we were not surprised to learn on enquiry that it had shared the same fate as two of three other makes and been debarred from Olympia, as its chassis weight exceeded the stipulated limit of 6 cwt.

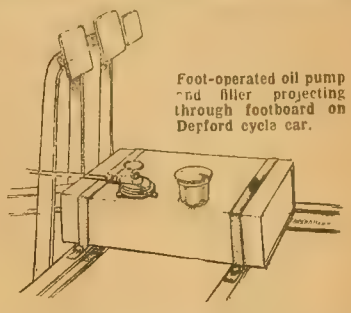


A type of 8 h.p. twin-cylinder Precision engine commonly used on cycle cars. The timing gear cover has been removed to show the mechanism

DEPFORD, No. 137.

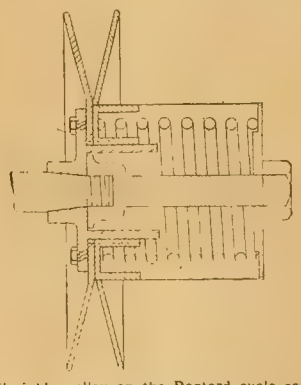
8-10 h.p. Model: The Blumfield, Precision, or J.A.P. 50° twin-cylinder, water cooled; m.o. valves; Solex carburetter; Bosch magneto; four speeds; shaft, counter-shaft, and final belt drive; wheelbase, 8ft. 2in.; track, 3ft. 6in.; weight, 5¾ cwts.; 650×65 mm. tyres on wire wheels.

The Depford Co., Evelyn Street, Deptford, S.E. The chassis staged has



Foot-operated oil pump and filler projecting through footboard on Depford cycle car.

a large J.A.P. racing engine with overhead valves. The drive is taken from the crankshaft by means of a multiple plate clutch and propeller-shaft through a leather flexible joint to the gate change gear box. The changes of speed are operated by the left hand, the speed lever being placed centrally in the chassis. At the end of the counter-shaft

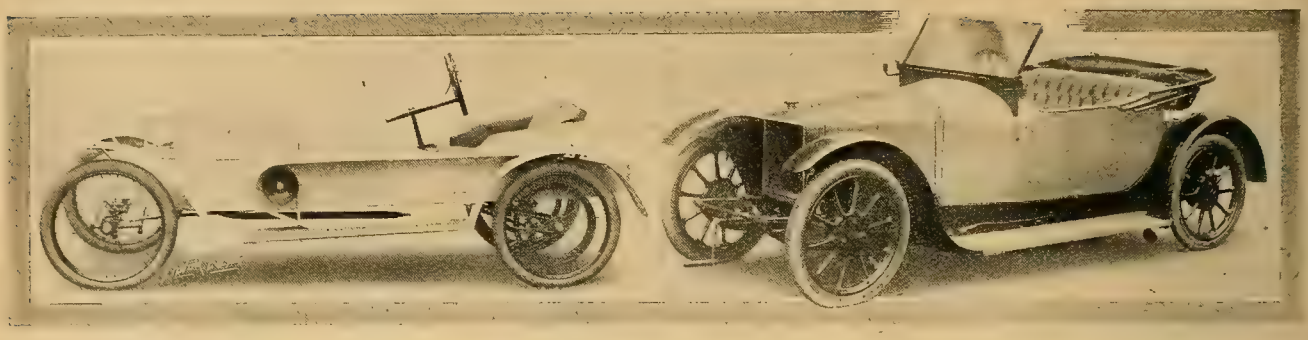


Variable pulley on the Deptord cycle car.

variable pulleys are fitted, from which the drive is transmitted to pulleys on the rear wheels. The tensioning of the belt can be effected by means of a hand lever, which is used for varying the position of the rear wheels. The frame is

The new Deptord cycle car shown for the first time

The Tweenie belt driven cycle car on Messrs. Alfred Dunhill's stand.



Left—The D.E.W. belt-driven air-cooled single-seater. Right—Threequarter front view of the Duo water-cooled two-seater, an entirely new model.

mounted on quarter elliptical springs. For lubrication purposes to the engine an oil tank is fitted beneath the footboard, the oil being passed from the tank by means of a plunger hand-operated pump to a couple of adjustable sight feed drips mounted on the dash; from these the oil is fed to the cylinders and the crank case. The finished vehicle staged presents a very good appearance, as the radiator is helmet-shaped in front, and the lines of the bonnet, scoop dash, and other parts of the body follow through continuously in one curve. The wings are fitted with side valances, and there are also side valances to the footboard, so that this vehicle should keep very clean in dirty weather.

DUO, No. 65.

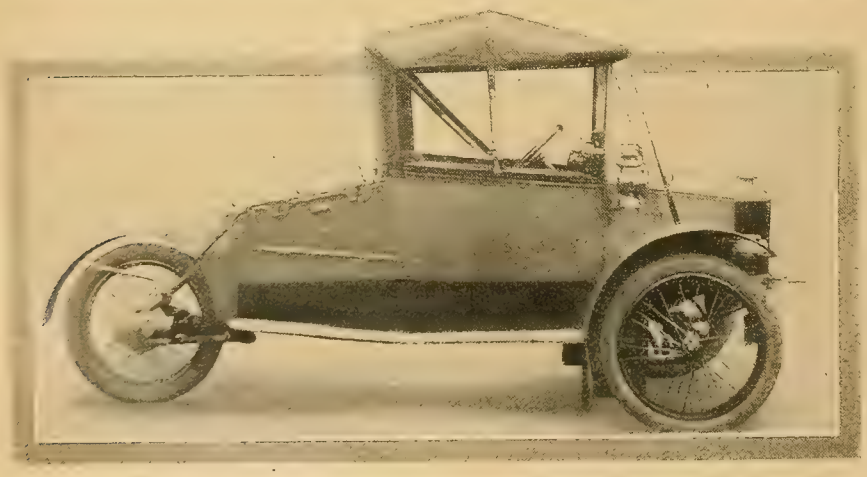
6-8 h.p. MODEL: Buckingham engine; overhead m.o.v.; Claudel-Hobson carburetter; shaft; two-speed epicyclic on back axle.

DUO CYCLE CARS, LTD., 30, Harrington Road, South Kensington, S.W.—The Duo has been entirely re-designed, and it must be confessed its appearance has been very considerably improved. A very taking car is exhibited with a water-cooled engine, the latter having overhead valves. The frame is underslung, giving the car a very low and racy appearance. Instead of belts, as in former Duos, the present model is driven by a long shaft from the engine to the back axle, embodied in the casing of which is a two-speed epicyclic gear, no differential being employed. A five-ply leather universal joint is provided at the forward end of the propeller-shaft. Operation of the gears is effected by a lever in the centre of the gear. A black hood and black leather work are adopted, such as favoured on many American cars. The chassis on the stand has a two-cylinder Dorman engine, but a separate engine (shown) may also be fitted to the same chassis when desired. This is the Mathis 58×100 mm. four-cylinder motor. The radiator is of square pattern, following very much the design of the Rolls-Royce. Cooling in each case is effected by thermo-syphon.

D.E.W., No. 139.

4¼ h.p. MODEL: 89 × 96 mm. single-cylinder air-cooled vertical, 597 c.c.; m.o.v.; Amac carburetter; Mea magneto; two speeds; chain and belt; wheelbase 7ft. 0in.; track 2ft. 10in.; chassis weight, 4¾ cwts.; 26in. × 2½in. Michelin tyres.

THE D.E.W. ENGINEERING CO., Eynsford, Kent.—In this model the single-seated body also forms the frame to which at the front is attached a bracket which carries the inverted laminated plate transverse springs connected by links to the axle end bosses. The front axle is also stayed by two radius rods to a part of the footboard immediately behind the dash. The quarter elliptical inverted spring connecting the body to the rear axle allows a considerable amount of play of the axle, the position of the latter being preserved by means of a V tubular radius rod. On the left-hand side of the engine crankshaft a double chain wheel is fixed, from which the power is taken by two chains to clutches mounted on a counter-shaft. The ends of these counter-shafts have the pulleys from which a long belt transmits the power each side to the rear wheel belt pulley. Engagement of one or other of the clutches causes the low or the high speed to be put into action. This model presents a very racy appearance, and it is fitted with a miniature bonnet which resembles that of the Deasy large cars. The steering wheel is rather novel, as it simply consists of a little more than half a wheel with a single cross spoke attached by its boss to the steering pillar, the steering being by direct lever.



The Eric 9 h.p. four-cylinder three-wheeler, with three-speed and reverse gear. Observe the bevel drive to the rear wheels.

ERIC, No. 30.

9 h.p. MODEL: 56 × 76 mm.; side by side m.o. enclosed valves; Sthenos carburetter; shaft; three speeds and reverse gear box.

THE P. AND C. SYNDICATE, LTD., Northampton (works Bedford).—The Eric Sociable makes a third appearance at the Show in a much improved form. There are two models exhibited, both having four-cylinder water-cooled engines. The engine is placed amidships, and drives first through a disc clutch to a three-speed and reverse gear box, and thence by shaft and bevel direct to the single rear wheel. A leather universal joint is arranged at the forward end, and a star pattern joint at the rear end. The radiator, which is carried well forward in front of the car, is of the gilled tube type, with an imitation honeycomb of semi-circular shape in front, and from the front appearance it resembles an ordinary car. The driving wheel is sprung in a patent way, the laminated spring employed being arranged vertically. A good point to render the rear tyre easily get-at-able is the arrangement for one side of the rear wheel support, *i.e.*, the usual chain stay and seat tube on a motor bicycle, to swing aside, leaving the whole of the side of the wheel exposed. The front of the car is suspended on semi-elliptical springs in the usual car fashion. The frame is tubular. Running boards are provided from front to rear, and provision is made for the carrying of luggage on the engine cover.

Another model has a 12 h.p. engine of 62 × 90 mm. bore and stroke.

The Olympia Show.—

G.N., No. 35.

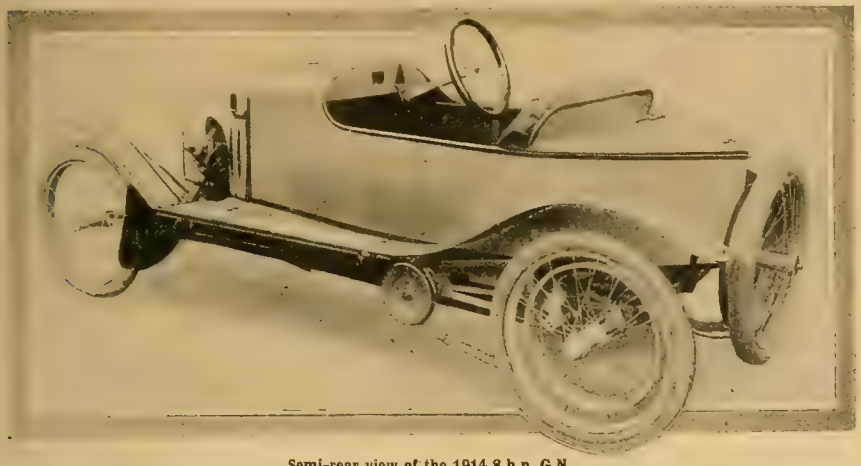
8-10 h.p. Model: 84×98 mm. twin; overhead inlet valves; B. and B. carburetter; bevel counter-shaft and belt transmission.

Godfrey and Nash, Ltd., Bell Lane, Hendon, N.W. For 1914 the G.N., shown on the stand of G. N. Higgs, has not undergone any serious alterations. There have been, however, several small but important improvements in detail. A neatly fitted pipe is provided to each end of the counter-shaft on which the belt pulleys are fixed, connected to the lubrication system, enabling the driver to lubricate this important part of the vehicle from his seat. Means are also provided for excluding all dust and dirt from the bearings. Quarter-elliptic springs are fitted to the front axle, and, whereas in the 1913 models these were double, the lower one has been replaced by a radius rod. The engine is set longitudinally in the frame, and the drive is through a friction clutch and a bevel gear to the first counter-shaft on which the two-speed gear is fitted, thence the drive is by chains to the second counter-shaft on which the belt pulleys are fixed.

G.W.K., No. 38.

8 h.p. Model: 85.8 × 92 mm., 1,065 c.c.; vertical, water-cooled; Solex automatic carburetter; shaft; four speeds and reverse; 4.3 to 11 to 1; friction drive and propeller-shaft by bevel; weight, chassis, 5¾ cwt.

G.W.K., Ltd., Datchet, Bucks.—Wisely, we think, the G.W.K. firm exhibits only one chassis and one car. The alterations made in the 1914 model are details only. The shape of the body has been altered slightly, and is now fitted with a scuttle dash, providing increased knee room inside the body. The depth of the seat from back to front has also been increased. With regard to the engine the cylinder design has been improved, giving increased cooling round the valve ports, and the timing gear has been strengthened. The rear portion of the body has been slightly altered in shape, being made flat above the toolbox, which allows for increased luggage carrying capacity. Heavier tyres are fitted, viz., Michelin Voiturette Légère, in place of the Michelin Trident. B.N.D. steel is used throughout the back axle, and a larger and stronger bevel pinion is fitted. The chassis price is £126, and £150 for the complete car with hood, screen, lamps, and horn. The G.W.K. is one of the cycle cars on the market which has won its spurs, and therefore can be purchased without fear of future reprisals.



Semi-rear view of the 1914 8 h.p. G.N.

HUMBERETTE, No. 135.

3 h.p. Model: V type twin-cylinder, 84×90 mm., 998 c.c.; thermo-syphon, with flat gilled tube honeycomb appearance radiator; m.o.v.; Smith's carburetter; Bosch magneto; three speeds; shaft and bevel drive; wheelbase, 7ft. 5in.; track, 3ft. 6in.; 650×65 tyres on wire wheels. Also staged: 8 h.p. air-cooled models, same size and specification as above.

Humber, Ltd., Coventry.—The general design of the new water-cooled model follows that of the well-known air-cooled. The lever control to the carburetter with a pedal accelerator is very neatly carried out and worthy of special attention. The compact nature of the built up and extended crank case to enclose the fly-wheel and carry the gears, and the neat manner in which the three-point suspension and the staying of the rear part of the crank to the front axle is arranged, are also worth special consideration. The polished water-cooled chassis and the two other finished cars on the stand are excellent examples of the best Humber workmanship. We were glad to observe that the bonnets of the new models are hinged. A refinement for 1914 is the fitting of decompressors in place of the compression tap to each cylinder, thus facilitating starting. The Humberettes fitted up complete look very attractive in their light fawn colour.

J.A.R. No. 215.

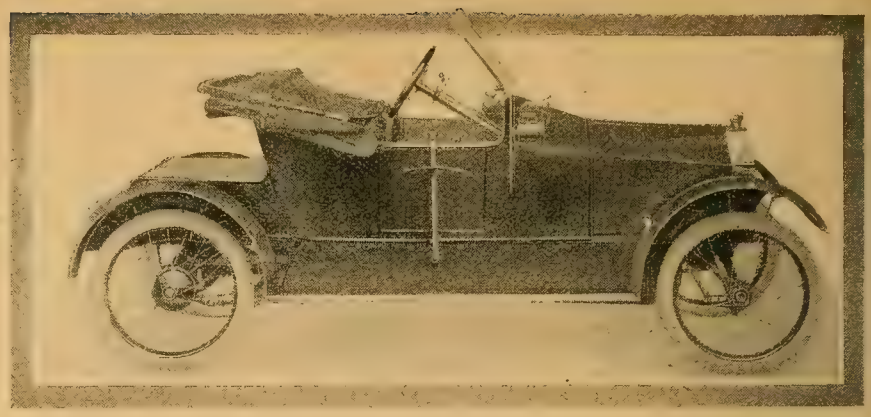
8 h.p. Model: 85×85 mm.; Precision V type air-cooled engine, 694 c.c.; m.o. valves; Sthenos carburetter; Kew magneto; two speeds; chain drive from engine to gear box, and from gear box to back axle; 6ft. 9in. wheelbase, 3ft. 9in. track; 26 × 2½in. tyres on wire wheels.

J. A. Ryley, Martineau Street, Birmingham.—This chassis is staged in the

Power unit and friction disc of the 8 h.p. G.W.K. The 8 h.p. water-cooled Humberette engine and radiator.

The Olympia Show.—

gallery on the above stand to show a complete vehicle built up of J.A.R. fittings, which are sold to manufacturers or amateurs desiring to build a chassis for their own use. The frame is of ash reinforced by steel plate, and is carried on quarter inverted elliptic springs fore and aft. The drive is taken from the engine by means of roller chains to the two-speed gear box, and thence by another roller chain to the rear axle. There is no differential fitted to the latter, but a slipping friction disc which can be locked to the left wheel to give any desired amount of slip when turning corners. The steering is of the rack and pinion type. The clutch is of the flat disc pattern lined with Ferodo and operated by a pedal which also actuates an internal brake on the rear wheels, when the clutch is further depressed. Another pedal-operated brake takes effect on the brake drums attached to the rear wheels, the pedal being held in any desired position by means of a small ratchet.



The latest pattern 8 h.p. water-cooled Humberette.

MARSHALL-ARTER, No. 141.

8-10 h.p. Model: 59×100 mm.: *en bloc* Chapuis-Dornier engine, 1,096 c.c., thermo cooling; m.o. valves; two speeds and reverse; Zenith carburetter, Bosch magneto shaft and final bevel and gear; wheelbase, 8ft. 9in.; track, 3ft. 7in.; chassis weight, 5¾ cwt.; 650×65 tyres on wire wheels.

Marshall-Arter, Ltd., Hammersmith.—This is a most interesting model which makes its first appearance, and is distinctive by reason of the clean design throughout. The power is transmitted from the engine to the rear axle by means of an enclosed flat steel strip which takes the place of the usual propeller-shaft. There is a link-supported universal joint action between the rear end of the propeller-shaft proper and the remaining enclosed portion, which is really part of the back axle. The latter is made in four parts, namely, the two side sleeves and the top and bottom. The top half can be removed. Examination can be made of the first set of driving wheels, which are of the bevel type, and also the two countershafts, which furnish the two-speed and reverse gears. The teeth of the pinions are of large pitch and are wide, and a model shown which has run upwards of 10,000 miles indicates that these teeth will stand up for many more thousands of miles before the wheels require renewal. Two expanding metal-to-metal brake shoes operate on the interior of the drum of the rear wheels. The frame is suspended on quarter elliptical laminated springs fore and aft. It is interesting to note that the American rights for the production of this vehicle have been secured, and that the chassis is to be exhibited at the American Show, which opens on January 5th.

McKENZIE, No. 18a.

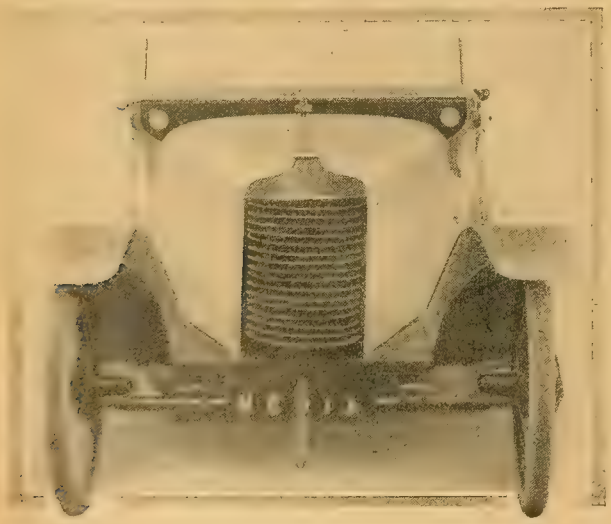
9 h.p. Model: 58 × 104 mm., four-cylinder *en bloc* vertical, 1,096 c.c.; thermo-syphon cooling; m.o.v.; Solex carburetter; U.H. magneto; three speeds, gate change; enclosed shaft and overhead worm drive; wheelbase, 7ft. 6in.; track, 4ft.; chassis weight, 5¾ cwts.; 700 × 80 mm. tyres on Sankey steel wheels.

Thomas McKenzie, Bath Passage, Birmingham.—This is a new model exhibited for the first time, and has practically all the advantages of a large pleasure car. Behind the gear box is a flexible leather joint which transmits to an enclosed shaft driving the overhead worm. With respect to the engine, it has all the valves on the left-hand side, and a large valve cap is fitted to each pair of valves so that both induction and exhaust can be removed. The frame is of pressed steel, and the suspension is on four semi-elliptical springs. The vehicle is well fitted up with acetylene lamps, wind screen, and Cape hood. In the body there is ample accommodation for two passengers, the boot behind being sufficiently large to hold enough luggage for an extended tour.

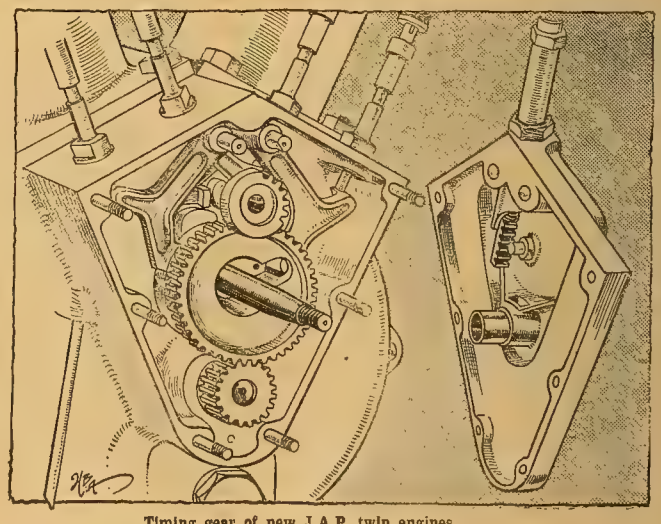
MEDIA, No. 42.

8-10 h.p. Model: 56 × 76 mm.: four cylinders *en bloc*, vertical; thermo-syphon cooling; Sthenos carburetter; Bosch magneto; 700 × 65 mm tyres on wire wheels.

Mead and Deakin, Tyseley, Birmingham.—A new production staged here is known as the Media. The chassis is fitted with a Salmon engine. The radiator is of original construction, being made



Front view of the Media four-cylinder water-cooled cycle car showing novel type radiator.



Timing gear of new J.A.P. twin engines.

TWO FURTHER TYPES OF 8 H.P. MORGAN RUNABOUT FOR 1914.
On the left is the "Standard" model and on the right the "De Luxe." Both models are fitted with hood and wind screen.

up of a vertical central three inch tube, this tube really being part of hollow gills of a foot diameter so that the water circulates through all the gills and down the centre. The clutch is of the disc type, and the power is transmitted from the gear box to the back axle by means of a propeller-shaft. The frame is supported on a modified Lanchester system of semi-elliptic plate springs. The steering is of the pinion and rack type. Rather a neat fitting on this car is the two electric lamps which are flush with the dash

MELEN, No. 102.

10 h.p. Model: 85×95 mm.; twin-cylinder, vertical, *en bloc;* c.c.; thermo-syphon; m.o. valves; Solex carburetter; Bosch magneto; three speeds; shaft and bevel drive.

F. and H. Melen, Ltd., Birmingham.—This chassis is practically identical with the orthodox type of heavier chassis, and is mounted with a very roomy and comfortable body for two, fitted with all equipments necessary for the road. The springing of the frame is all round semi-elliptical laminated plate, the rear spring shackles being further fitted with spiral spring shock absorbers. Steering is rack and pinion type. In addition to the Alpha twin-cylinder engine in the finished vehicle, there is a separate twin engine and also the Alpha new four-cylinder *en bloc* engine staged. This engine is of pleasing design, and has an oil circulating system as a part of the unit. A small force feed pump operated from the camshaft serves the troughs into which the connecting rod ends dip, and, further, the same serves to supply efficiently all the working parts, including the end and the middle crank shaft bearings.

MIDGET, No. 77.

8-10 h.p. Model: 86 × 92 mm.; twin-cylinder vertical; thermo-syphon, water-cooled; m.o.v.; Zenith carburetter; Mea magneto; three speeds; shaft drive by under worm.

Alldays and Onions, Ltd., Fallows Road, Sparkbrook, Birmingham.—One finished two-seater is staged, fitted with full equipment of lamps, horn, wind screen, Cape cart hood, and with valances to the wings and side running boards, making a substantial all-weather vehicle. The design is practically that to which one is accustomed in standard motor car work, with the exception of the springing, which is by inverted semi-elliptical springs at front and rear. This method of suspension gives very smooth riding, and from our experience the vehicle holds the road quite as well as most large cars and better than many. The general finish of the vehicle is excellent.

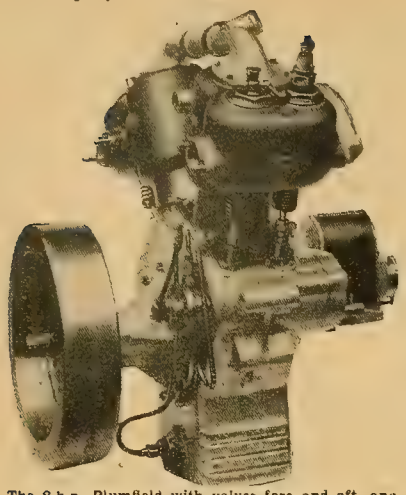
MORGAN, No. 66.

8 h.p. Model: 85×88 mm.; 50° V twin-cylinder, 964 c.c.; air-cooled; m.o.v.; Amac carburetter; two speeds; chain drive; wheelbase, 6ft.; track, 4ft.; 8 h.p. water-cooled Model: 85 × 85 mm.

The Morgan Motor Co., Ltd., Malvern.—The air-cooled three-wheeled chassis staged shows the general arrangement very fully, following out the orthodox lines of the Morgan design. In addition to this chassis, there are staged various Morgan vehicles with water-cooled engine and honeycomb radiator. The lightness of the chassis without undue cutting down of the weight of vital parts merits careful inspection. Several types of runabouts and a carrier for Messrs. James and Co., district agents, of Sheffield, are shown. The general finish of the whole of the ten vehicles staged is exceedingly neat. The chassis is one of the simplest and most mechanically designed that has been produced, and its longitudinal frame members are made up of three tubes, two of which act as final outlets for the exhaust gas, and the third is a large diameter tube enclosing the propeller-shaft. Several types of engines are fitted, and the overhead type as used in the Grand Prix model is water-cooled. This engine is larger than those which are fitted to the standard models, having a cubic capacity of 986 c.c. Binks three-jet carburetters are fitted in some cases. Besides being one of the most thoroughly proved exhibits, it has the advantage of being very moderate in price.

TWO ENTIRELY NEW CYCLE CARS.
1) Side view of the Melen
2) The neat looking New Imperial. Both these machines are fitted with water-cooled engines

The Olympia Show.—



The 8 h.p. Blumfield with valves fore and aft, and radiating ribs at the bottom of the oil sump.

MOTORETTE, No. 105.

7 h.p. MODEL: 95×102 m.m.; vertical single cylinder; water-cooled; J.A.P. automatic carburetter; single chain drive to two-speed epicyclic gear in back axle.

THE PREMIER MOTOR CO., Aston Road, Birmingham.—A comprehensive display of these well-known three-wheelers is made on this stand. Several of the models shown are in the shape of tradesmen's carriers, for which purpose they have achieved a considerable vogue; but a touring model is also shown, a feature being the large amount of luggage space provided behind the seats. The design of this cycle car is exceedingly simple, the gear is of the epicyclic two-speed variety contained within the rear hub. A very large section driving tyre is used. Steering is by means of a tiller. Excellent protection is afforded by the dashboard in front of the driver and passenger, on which may be mounted a screen. There is only one driving chain transmitting the power, and the general design is on the simplest possible lines.

NEW IMPERIAL, No. 78.

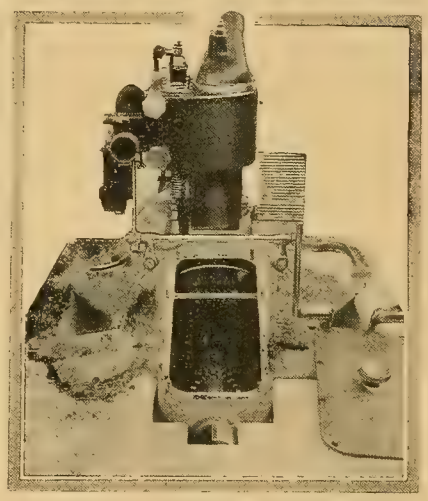
10 h.p. MODEL: 65×85 mm. four-cylinder; m.o.v., opposite sides; Cox streamline carburetter; shaft; three-speed and reverse gear.

NEW IMPERIAL CYCLES, LTD., Princip Street, Birmingham.—The New Imperial is one of the few four-cylinder cycle cars which it has been found possible to keep within the cycle car definition. It is a car in miniature in every respect, the engine, gear box, and shaft drive being exactly in accordance with the usual car practice. The frame is of channel steel, and suspended at the front on semi-elliptical springs, and at the rear on threequarter elliptics. The radiator is a very neat design and of pointed shape, cooling being effected on the thermo-syphon principle. All the brakes are arranged on the back axle, the hand brake being of the internal expanding type, and the foot brake of the external contracting type. The steering is of the worm and segment pattern. The New Imperial looks more of a car than any vehicle in the Show, and some merit is due to the designers for being able to keep it within the 6 cwt. chassis limit.

PERRY, No. 112.

8-10 h.p. MODEL: 72×108 mm., twin-cylinder, *en bloc*, vertical; thermo-syphon cooling; m.o.v.; Zenith carburetter; Bosch magneto; three speeds; propeller-shaft and bevel drive; wheelbase, 7ft.; track, 3ft. 8in.; chassis weight, $5\frac{3}{4}$ cwt.; 700×80 Dunlops on Sankey detachable wire wheels.

PERRY MOTOR CO., LTD., Tyseley, Birmingham.—The chassis exhibited on this stand is very similar in design to the chassis as exhibited last year, but there are several important modifications disclosed in the model on view. In the first place the carburetter is fed by pressure applied to the tank by means of a hand operated pump fixed to the steering post; a gauge on the dash indicates the amount of pressure put on the tank, the latter being carried between the longitudinal members of the frame at the rear. Again, instead of worm drive, bevel drive is now employed, also the detachable Sankey wheels are the same for both axles, and



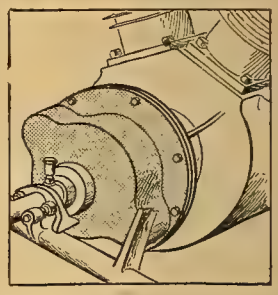
Power unit of the Perry cycle car showing control pedals.

the brake drum is not embodied as part of the wheel, so that, as far as the front wheels are concerned, these now appear very much lighter. The method of springing the frame is by means of semi-elliptic springs at the front and at the rear by similar springs which are underslung to the rear axle flap and also reinforced at the rear by means of a pair of shock absorber springs. The foot and hand brakes are internal, both taking effect on the rear wheel drums and actuated by means of wire cables. Two open type finished cars, complete with wind screen, hood, tool and luggage carrying locker behind the seat, are also staged, and a small coupé suitable for commercial travellers' or doctors' work, the whole exhibit being beautifully finished. A sample of the driving unit and section of the steering gear, showing the complete worm wheel, also illustrates the fine workmanship of the makers. The new four-cylinder model, with bore and stroke of 60×110 mm., was also to have been exhibited, but being outside the limit it is therefore being employed for demonstration purposes outside the Exhibition.

PYRAMID, No. 52.

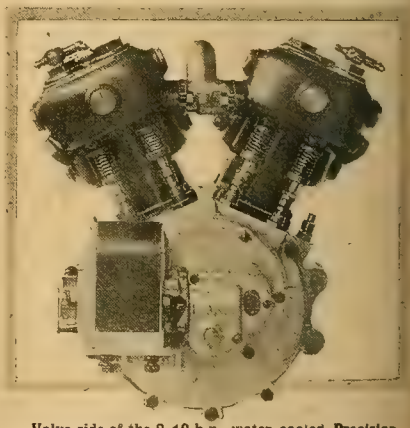
8 h.p. MODEL: 85×85 mm.; V type, 50° twin-cylinder, air-cooled, 964 c.c.; m.o.v.; J.A.P. carburetter; Bosch magneto; four speeds; friction and belt drive; wheelbase, 7ft.; track, 3ft. 6in.; weight of chassis, $4\frac{3}{4}$ cwt.; 650×65 mm. Avon tyres on wire wheels.

THE PAYNE'S ENGINEERING CO., Hogarth Lane, Chiswick, W.—The channel steel frame is supported on the axle by means of quarter inverted semi-elliptic springs. Behind the engine is a very large enclosed universal joint running in oil. To an extension of the shaft which carries the universal joint at its forward end is



The large sized casing for the Universal joint on the Pyramid.

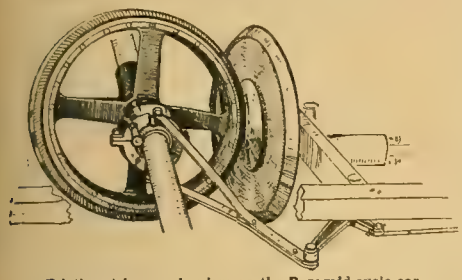
attached a friction disc which is allowed to come in contact with a red fibre friction wheel mounted on the counter-shaft across the frame. By the arrangement of the change-speed lever on a quadrant carrying equivalent holes it is made impossible for the driving disc to come in contact with the fibre unless the gear lever is in a definite position, so that there is no tendency to wear the red fibre unduly. A feature of the transmission is that the driving disc is stepped so that a strong pressure forcing the two surfaces into engagement is variable according to the speed on which the drive is taking place. On the direct drive the cone portion of the driving disc and of the red fibre are in contact, so that if flats are by any means formed on the fibre on the



Valve side of the 8-10 h.p. water-cooled Precision cycle car engine showing position of and gear drive to, the magneto.

The Olympia Show.—

lower gears they do not affect the top gear drive. The ends of the counter shafts have operating pulleys mounted on them through which the drive is taken to the rear road wheels. The foot brake takes effect on the drum attached to the right-



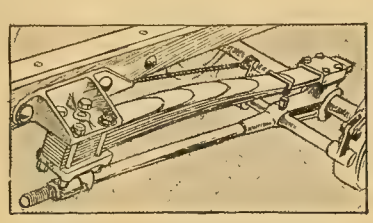
Friction drive mechanism on the Pyramid cycle car.

hand side of the counter-shaft, this brake being of the contracting band type, whilst the rear wheel hand-operated brakes act upon the belt rim. The chassis staged is very well made, the workmanship being exceedingly good, whilst the finished two-seater car presents a neat appearance.

RANGER, No. 117.

8 h.p. Precision Model: V type; water-cooled; twin-cylinder, 85×85 mm., 964 c.c.; thermo-syphon; m.o.v.; Polyrhoe carburetter; Bosch magneto; two speeds; chain drive; wheelbase, 7ft. 3in.; track, 3ft. 10½in.; weight of chassis, 5¼ cwt.; 26in.×2½in. Avon tyres on wire wheels.

Ranger Cycle Car Co., West Orchard, Coventry.—The chassis staged is supported on an inverted half-elliptical cross spring at the front and on quarter elliptical inverted springs at the rear, whilst the two finished cars have quarter inverted elliptical springs to both axles, the rear springs being additionally reinforced by auxiliary spiral compression springs. The side frame members are of ash reinforced by steel angle flitch plates. Steering is of the rack and pinion type. The engine and the gear box are supported on tubular members, those carrying the engine being longitudinally arranged in the frame, whilst the gear box is supported by transverse members. The clutch pedal-shaft is fitted with a small lever brake, which comes into operation when the clutch is depressed to slow up the male member, which is of the cone leather-faced type. A metal flexible joint is arranged immediately in front of the gear box. The external hand brake acts upon a brake drum on the right hand of the gear box, and is lined with Ferodo, whilst the foot brakes are of similar type and size, taking effect on the drums of the rear wheels. The final drive from the gear box is by roller chain to the rear axle, and no differential is fitted, but on the left wheel there is a friction disc which allows for slip in turning corners. One finished model is a open sporting type with nice lines to the body and ample seating accommodation.

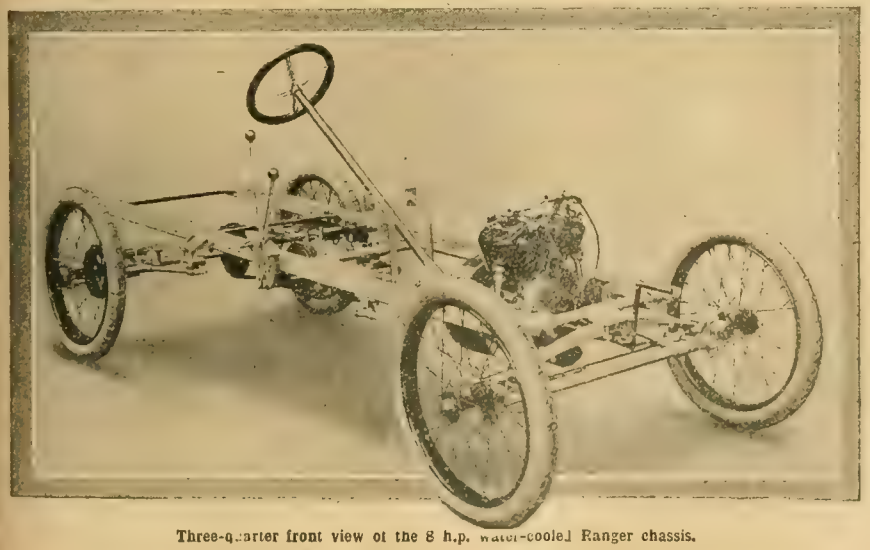


Method of springing the rear portion of the Ranger chassis.

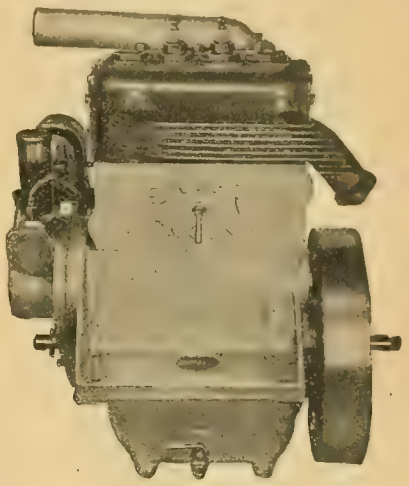
ROC No. 143.

8 h.p. Model: 85×85 mm. twin; side by side valves; Amac carburetter; bevel transmission; two-speed Roc gear.

A. W. Wall, Ltd., Hay Mills, Birmingham.—Roc tricarriage. This is a light form of three-wheeled motor vehicle driven by an 8 h.p. 85×85 mm. Precision engine set longitudinally in a substantial tubular frame which is A-shaped with the apex turned upwards and brazed to the steering head. It is suitably strengthened by tubular transverse members where necessary. An epicyclic two-speed gear is carried separately from the engine, and the final drive is through an enclosed propeller-shaft to the bevel-driven differential. The steering is by wheel acting directly on the front wheel of the machine to which spring forks are fitted. Change of gear is effected by means of a pedal, and the control levers are similar to those employed on motor bicycles and are fitted to a tube fastener to the off side door of the body. The new type of body is comfortable and is provided with a hood and screen.



Three-quarter front view of the 8 h.p. water-cooled Ranger chassis.

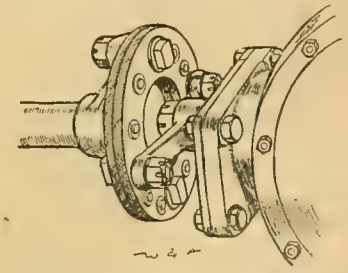


Twin-cylinder water-cooled engine of the 7 h.p. Swift

SWIFT, No. 91-91a.

7 h.p. Model: 75×100 mm., 972 c.c., twin-cylinder *monobloc*, vertical; thermo cooling; m.o.v.; Longuemare carburetter; Eisemann magneto; three speeds, gate change; shaft, bevel drive; wheelbase, 7ft. 3in.; track, 3ft. 7in.; 5½ cwts.; 700 × 80 mm. Dunlop tyres on wire wheels

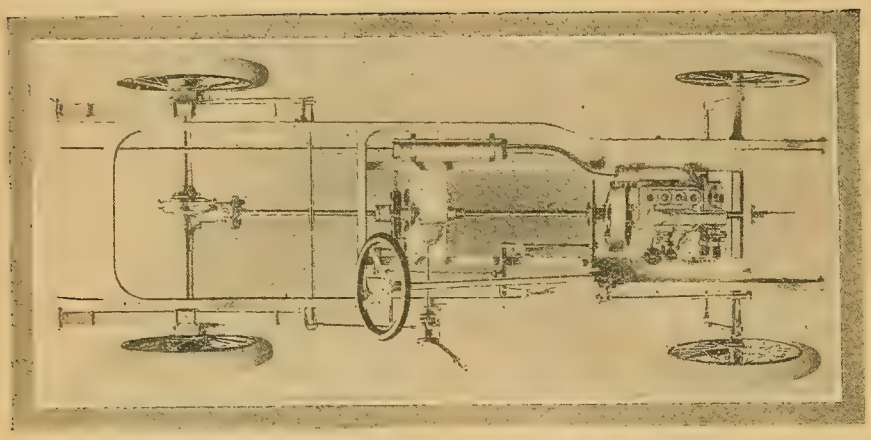
The Swift Cycle Co., Ltd., Cheylesmore, Coventry.—The polished chassis staged shows that an H section front axle stamping and a very nice pressed steel frame are now standard features. The neat arrangement of the cross drive to the magneto at the front of the engine should be noted, also the three spring pads acting beneath the leather of the



The leather universal joint at the rear end of the propeller-shaft on the Swift cycle car.

cone clutch, the clutch withdrawal lever being exceedingly neatly arranged. An outstanding feature is the very well made gear box with short shafts, and the passing of the propeller-shaft through a hole in one of the pressed steel cross members of the frame. The foot brake

The Olympia Show.—



Plan view of the 7 h.p. twin-cylinder Swift showing general arrangement.

adjustment is behind the gear box, and the wire which operates the internal expanding brake to the rear wheel hubs should also be noted. Immediately in front of the front axle there is a twin washer flexible leather joint. Exceedingly long semi-elliptical springs to the rear axle of this light model are an excellent feature. Two finished two-seaters of excellent appearance are also staged.

TINY CAR, No. 142.

8 h.p. Model: 85 × 85 mm., water-cooled; side by side valves; Lukin carburetter; bevel; three speeds.

Nanson, Barker and Co., Yorkshire.—On this stand is to be seen the 8 h.p. Tiny cycle car, which is fitted with a two-cylinder water-cooled engine, three-speed gear box, and propeller-shaft drive, the final drive being through silent bevel wheels. The frame is of channel steel and rack and pinion steering is fitted. The brakes are of the internal expanding type, and ball bearings are fitted throughout. The body is panelled in sheet aluminium and trimmed in leather, fitted with a scuttle dash and gracefully sloping bonnet, which has a very smart appearance. The back of the body is long, leaving room for a third seat and affords ample luggage accommodation.

TWEENIE, No. 21.

8-10 h.p. Model: 72×120 mm.; twin V 30°, 976 c.c., thermo-syphon, water cooling; m.o.v.; Solex carburetter; Ruthardt magneto; seven speeds; friction and chain drive; wheelbase, 7ft. 2in.; track, 3ft. 4in.; chassis weight, 5 cwts.; tyres 650×65 mm. on wire wheels.

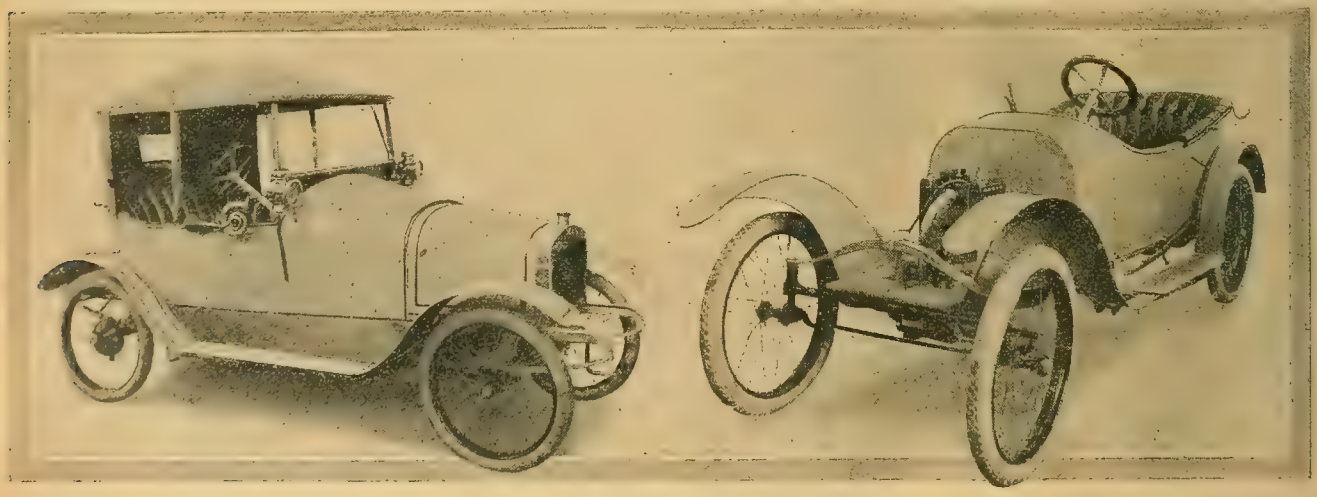
Alfred Dunhill, Ltd., 359-61, Euston Road, N.W.—This model is exhibited for the first time, and is a very welcome introduction. So far as the front portion of the chassis is concerned the springing is by cross springs pressing on the upper part of the swivel pin. At the rear are inverted semi-elliptic springs. This vehicle is friction driven by means of two large friction wheels, the rear one being carried on a cross-shaft, and the end of the cross-shaft is furnished with a sprocket by which the power is transmitted to one of the road wheels. No differential is employed. Accessibility has been very closely studied in this model, for the footboards can be removed and all the moving mechanism is then disclosed and the seat can be taken out bodily so that the rear tool locker is accessible. The model staged has a neat lighting dynamo fitted which supplies current at 8 volts to the two head lights and three other lamps, this fitting being provided at an extra cost of 14 guineas, the vehicle itself costing 110 guineas.

V.A.L. No. 109.

8 h.p. Model: 85×85 mm.; V twin-cylinder, 964 c.c.; water-cooled; thermo-syphon; vertical gill-less tube radiator; m.o. valves; Amac carburetter; Bosch magneto; four speeds; friction and roller chain transmission; wheelbase, 7ft. 6in.; wheel track, 3ft. 10in.; weight, 5¾ cwt.; 650×65 mm. Dunlop tyres on wire wheels. The steering is by means of a small pinion at the bottom of the steering stem engaging in a curved internal cut rack.

5¾ h.p. Model: 85×88 mm. Green-Precision, 499 c.c.; thermo-syphon cooling; m.o. overhead valves; Amac carburetter; Bosch magneto; twelve speeds; friction and twin side belt drive; 26×2½in. Hutchinson tyres on wire wheels; wheelbase, 6ft. 6in.; wheel track, 3ft. 2in.; weight of chassis, 4½ cwt.

The V.A.L. Motor Co., 314, Bradford Street, Birmingham.—The V type model has a withdrawable friction clutch in conjunction with a friction type variable gear. The clutch is of the cone type faced with Ferodo. The bearing carrying the clutch and shaft is carried in an extension of the crank case. The counter-shaft carries a large friction disc by which motion is communicated from the propeller-shaft disc, the ends of the counter-shaft being fitted with roller chain sprockets, whence the motion is transmitted by chain to the hub chain rings. The hand brake operates on the counter-shaft brake drum. The two-seated body is roomy and is fitted with hood and wind screen, the petrol tank being carried in the scuttle dash. The V.A.L. mono type has a single-seated body, and the drive is taken by means of Coventry silent chains from the crankshaft



TWO TYPES OF WATER-COOLED CYCLE CAR.

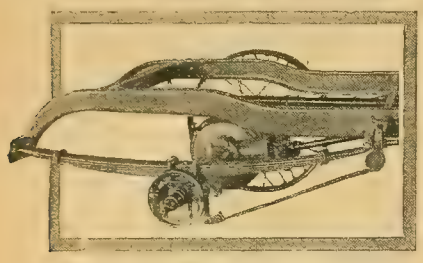
(1) The new 8 h.p. Warne with shaft drive. (2) The single-cylinder Val Monocar with Green water-cooled engine.

A problem that a good many visitors at Olympia will endeavour to solve during the week.

Mr Auto knows buys a catalogue and nearly buy's a lightweight.
and next thinks an Auto wheel will meet his requirements
He then almost decides on a big Twin.
But gets converted to a long wheel base
After which he turns his attention to side cars.
And all but selects a smart combination
He then forms the opinion that a runabout is the thing.
And finally gets struck on a sporting cycle car which he very nearly buys.
G.E. Shepherd

The Olympia Show.—

to the counter-shaft, at the end of which are attached expanding pulleys controlled by a side lever which gives twelve speeds forward. Pressing the speed lever forward expands the pulleys so that the belts stop driving, and at the same time the brake shoe is brought in contact with the outer peripheries of the rear wheel brake drums. The wire controlled pedal brake also takes effect on the smaller of the rear wheel brake drums. This model has direct steering. The tubular frame is mounted on a semi-elliptical spring at the front, and spiral compression springs are fitted on the steering pins; quarter-elliptic springs are used for the rear suspension.



Rear springing of the Swift cycle car, also showing band brake and differential gear.

WALL TRICARRIAGE, No. 143.

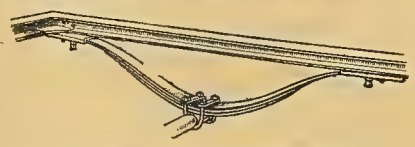
4¼ h.p. MODEL: 89×96 mm. single cylinder air-cooled Precision engine; m.o.v.; Amac carburetter; Bosch magneto, two speeds, shaft and bevel drive; chassis weight ¾ cwt.; 650×65 mm. tyres on wire wheels.

A. W. WALL, LTD., Hay Mills, Birmingham.—On this and the adjacent stand the well-known Wall and Roc tricars are staged in several forms, mainly for goods carrying. Another type is a two-seater which contains similar features as regards the chassis to the well-known carrier, and in this case an 8 h.p. Precision air-cooled engine is fitted.

WARRICK CARRIER, No. 104.

6 h.p. MODEL: 95×102 mm., 723 c.c.; single-cylinder, vertical; air-cooled, with fan; B. and B. carburetter; Bosch magneto; two-speed and reverse; chain drive; epicyclic gear; wheelbase, 8ft.; track, 4ft.; chassis weight, about 5½ cwt.

JOHN WARRICK AND CO., LTD., Reading.—On this stand are six models of carriers designed to suit various requirements for the carriage of light parcels. The chassis arrangement follows the lines of the A.C., but the rear axle moves vertically by means of a special arrangement of arms attached on each side of the axle below the inverted quarter elliptical springs. This does away with the tendency to break chains which is found to occur when the axle tilts. These models also have reverse gears. The actuation of the toggles of the direct drive clutch is brought about in a well-thought-out and mechanical manner, so that the least effort is required to move the sliding sleeve endwise. Another model is one of 8 h.p. with single-cylinder air-cooled engine, 100 bore × 120 mm. stroke, which is cooled by a single fan friction driven off the left hand flywheel. Both valves are on the off side of the engine. In the Post Office model a six-plate metal-to-metal clutch is employed, three plates being of copper and three of steel.



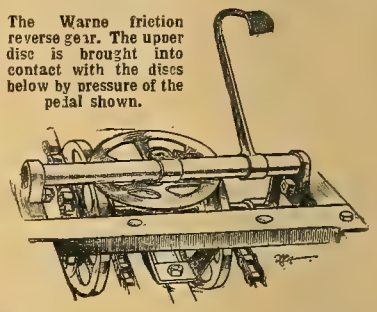
Rear springing of the Warne, showing the slipper guide.

WARNE, No. 106.

8 h.p. MODEL: 85×85 mm., V type twin, 964 c.c.; air-cooled by fan at right-hand side of cylinders; m.o.v.; Binks carburetter; ten speeds; chain, friction, and belt drive; track, 7ft. ×3ft. 6in.; weight, 4¾ cwt.; Michelin 26×2½ tyres on wire wheels.

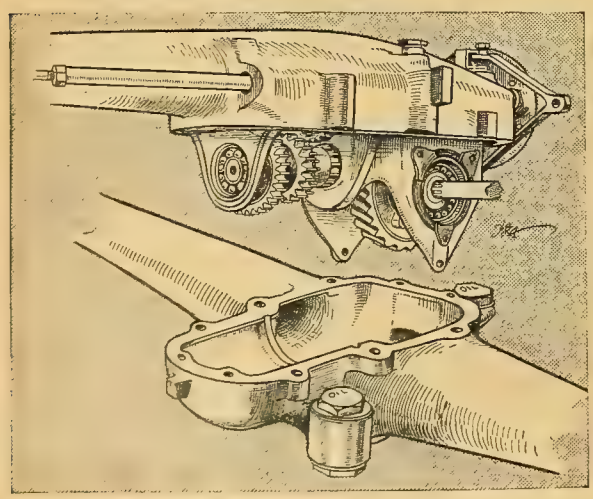
8-10 h.p. MODEL: 85×85 mm. Precision twin, 50°; water-cooled; 964 c.c.; water-cooled by thermo and fan; m.o.v.; Binks carburetter; three speeds, gate change; shaft and bevel drive; track, 7ft. ×3ft. 6in.; weight, 5 cwt.; Michelin 26×2½ on wire wheels.

PEARSALL-WARNE, LTD., Letchworth.—in the air-cooled model the crankshaft is set across the splayed channel steel frame, being carried on an angle steel underframe. The drive is taken from the engine by means of a roller chain to a counter-shaft which gives two speeds forward and reverse. A further counter-shaft is driven by a pair of roller chains on either low or high speed, and expanding pulleys are fitted at the end of this counter-shaft, from which a leather belts transmit the drive to rear wheel belt pulleys. In this way two speeds are obtained from the first counter-shaft, and five from the second, so that ten speeds in all can be obtained.

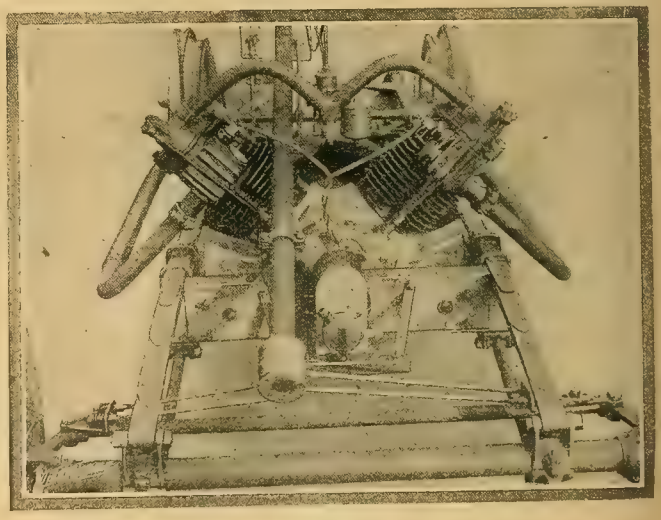


The Warne friction reverse gear. The upper disc is brought into contact with the discs below by pressure of the pedal shown.

The belt can be tightened by means of a hand lever. The foot brake is contracting on the rear wheels drums, the hand brake expanding. The frame is mounted on semi-elliptic springs at the front and at the back, both ends of springs sliding in guides. In the water-cooled model the engine is carried by a bracket vertical to the pressed steel side members, but inclined so that the shaft drive is practically in a straight line. In this model the steering is by worm and sector. A nicely arranged three-speed gate change box is attached by brackets to the side members of the frame. This model has an orthodox method of steering by semi-elliptic springs The foot brake is contracting on the drum behind the gear box; the hand brakes expanding within the drums of the rear wheels. A finished model in grey with hood and wind screen is also staged.



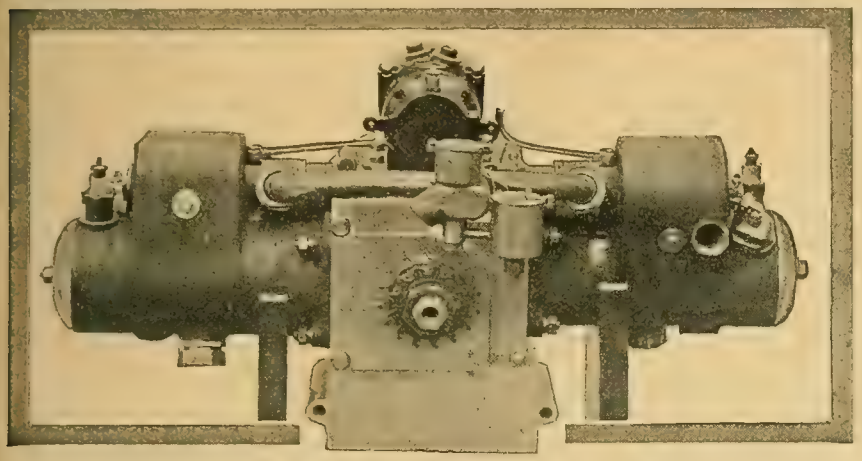
A.C. rear axle showing arrangement of gear box, also brake on end of worm shaft



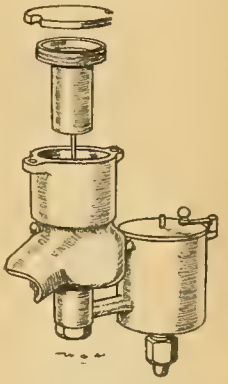
The 8 h.p. G.N. engine showing overhead inlet valves, also position of magneto and steering mechanism.

A New Horizontal Engine.

An exceedingly interesting and ingeniously designed horizontal two-stroke engine is shown on the stand of the Carden Cyclecar Co., and, under the name of the M.I.P., is made by G. Wailes and Co. to the design of Motor Improvements and Patents, Ltd. The particular model exhibited is of 496 c.c., and is intended for passenger motor cycle work. It consists of two horizontally opposed cylinders containing trunk pistons which are connected to a two-throw crankshaft. Each of the pistons has two diameters, which act respectively as working and pump pistons. Over the tops of the horizontally opposed cylinders are placed two rotary distributer valves driven by a worm gear off a disc crank. The cubic capacity of the pump cylinder is greater than that of the working cylinder, so that the inlet gas is already partially compressed when allowed to flow into the working cylinder *via* the transfer ports which are opened by the rotary valve. The latter works under but little pressure, and is kept cool by the flow of fresh gas. As it is not subject to explosion pressure, any looseness it may develop has but little effect upon the actual efficiency of the engine. The lubrication is effected in a very complete manner. A pinion pump draws oil from the crank chamber sump and passes it to a distributer, whence it is directed through separate pipes to each main bearing, and also to each rotary valve. From the latter a supply of lubricant is carried to the pistons and cylinder walls, and the supply is maintained always proportionate to the throttle opening. Thrower rings on the crank webs ensure that a supply is passed to the big end bearings. A Mea magneto is fitted. Mushroom release valves are fitted in each cylinder head and operated by a single Bowden wire. The cylinder heads and liners are efficiently water-cooled. The special feature of the M.I.P. engine is its robust construction and ample dimensions of all working parts. Needless to say, we shall look forward with interest to the road results which are obtained with this interesting engine. Tests, we understand, are shortly to be made on Brooklands track. The carburetter fitted is a specially made S.U., of which a detail sketch is given herewith.



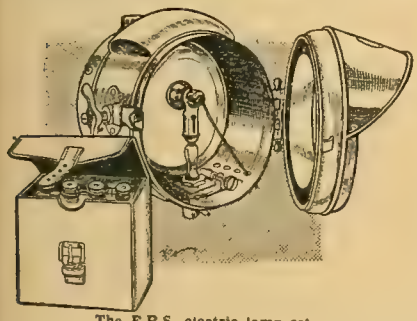
One of the real novelties of the Show is the M.I.P. two-stroke horizontally opposed twin, which is fitted with a rotary valve to each cylinder, latest Mea magneto and S.U. carburetter.



The new S.U. variable jet carburetter on the M.I.P. two-stroke engine.

F.R.S. Lamps.

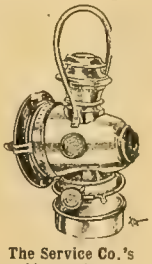
The F.R.S. electric lamp adapter, which we illustrate, is used in conjunction with an accumulator battery. This battery is filled with unspillable composition, and can be recharged as often as necessary. The method of connecting up is to attach one of the terminals to the cycle frame and the other to the adapter, and as soon as the adapter is fitted to the burner the lamp will light up. It is also possible to illuminate different parts of the machine by touching any such part with the adapter. The makers, the F.R.S. Lamps, 7 and 9, Pershore Street, Birmingham, are having a spring made to clip this adapter to any part of the cycle frame, when the lamp adapter can be readily used for making repairs after dark.



The F.R.S. electric lamp set.

Service Specialities.

The Service Co., although not exhibiting at Olympia, have a good exhibition at their High Holborn Depôt, consisting of a representative display of accessories and clothing, among them being the Canada cap, which we illustrate. This is fitted with a woollen extension which can be folded under the cap or drawn out over the ears, brow, and neck. It is a useful headgear for winter riding. Another item marketed this year is a sidecar lamp. This burns paraffin and is provided with a rear red light, and on the near side a white prism. It is extremely light. The paraffin reservoir is hinged to the base of the lamp, and the lamp is nickel plated and provided with a bail handle. This lamp will prove useful for inspection purposes.



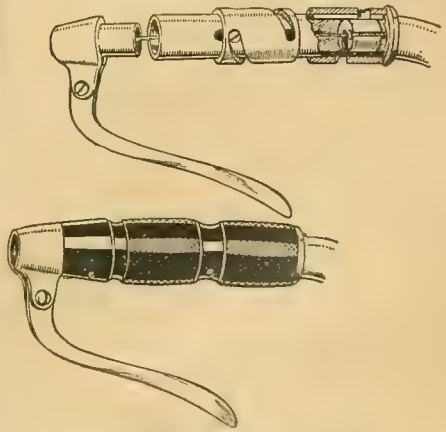
The Service Co.'s sidecar lamp which shows a red light to the rear and white to the side.

A novel type of cap sold by the Service Co. which has a knitted fall to protect the ears and neck.

Olympia.

THE AUTO CYCLE UNION, Pall Mall, S. W. (No. 10).—The A.C.U. is the oldest institution looking after the interests of motor cyclists. The stand is situated adjoining to the Princes Rooms, which may be used as club rooms by members.

AUTOMOBILE ASSOCIATION AND MOTOR UNION, Fanum House, Whitcomb Street, Coventry Street, W. (No. 144).—The A.A. show a telephone box with a scout and information is given with regard to the A.A. and M.U. membership.



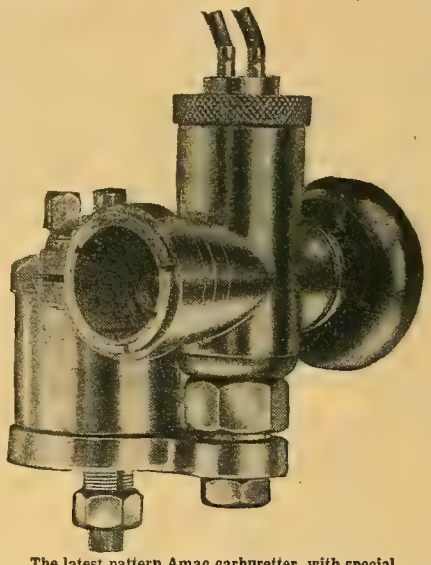
THE BOWDEN TWIST-GRIP CONTROL.
(Top) Part section showing method of operation. (Bottom) How the finished article appears.

ACCESSORIES OF THE SHOW

ABINGDON-ECCO CO., LTD., Tyseley, Birmingham (No. 216).—Three types of engine are shown by this firm: a 6-8 h.p. 73×95 mm. and a 5-6 h.p. 67×95 mm. Both these twin-cylinders have the cylinders set at 50°. Lastly, we may mention the 3½ h.p. 85×88 mm. In these models the clean casting of the crank case is worthy of note. The timing gear cover is provided with a spigot enabling it to fit closely, which prevents any leakage of oil. The question of lubrication has been carefully studied by the capable designer of this engine, Mr. Blumfield. The oil enters through a pipe into the main bearing, which is provided with a groove and a right-hand spiral which gradually works the oil on to a recess on the flywheel, whence it reaches the big ends by means of a special channel. Means are provided for spraying the oil mist on to the tappet rollers, and even the rollers themselves are provided with oil grooves. The system employed is therefore almost as good as if a force pump were used. Adjustable tappets are fitted, and the exhaust lifter employed consists of two arms provided with rollers which are hardened and turn on hardened steel bushes and bear up against flanges on the exhaust tappets. The fulcrum pins are also specially hardened and are provided with oil holes.

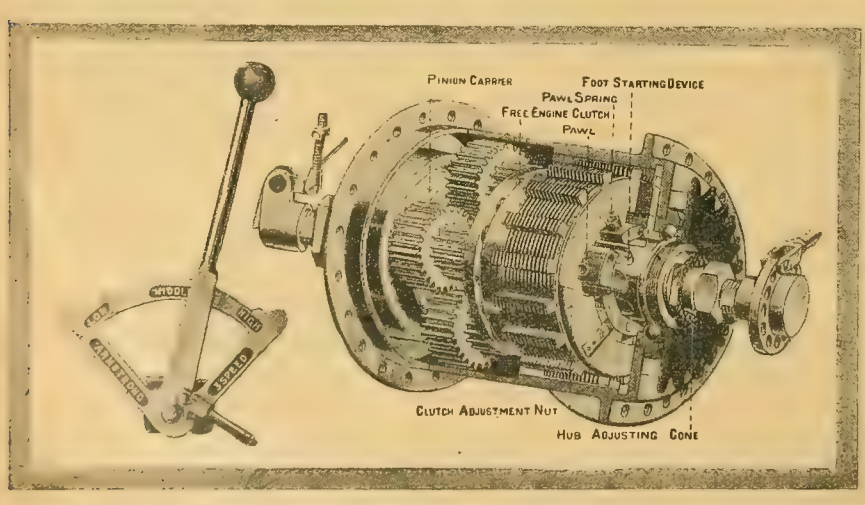
M. ADLER (ENG.), LTD., Sampson Road North, Birmingham (No. 197).—This firm are importers and exporters who do not deal in the retail market.

THE ARMSTRONG THREE-SPEED GEAR CO., LTD., Armstrong Works, Birmingham (No. 187).—The latest type of Armstrong gear, Mark VII., is shown here. This type is suitable for use on high-powered motor cycles and has been through very severe tests which it has passed satisfactorily. The principle of the gear is identical with that of previous types, the only difference being in dimensions and strength. The new system of gear control provides a long lever with plunger and spring in a convenient position beside the tank. This lever has a notch for free position



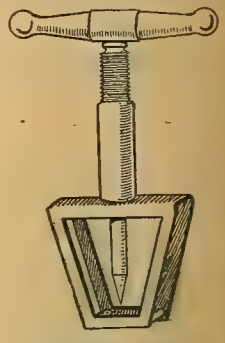
The latest pattern Amac carburetter, with special arrangement to prevent blow-back.

FRANK ASHBY AND CO., Princip Street, Birmingham (No. 223), have on view specimens of their Tanpillion auxiliary seat and various types of luggage carriers and lamp brackets.



Details of the 1914 Mark VII. Armstrong three-speed gear, showing control lever and internal mechanism of the hub.

THE ASTON MOTOR ACCESSORIES CO., Aston Cross, Birmingham (Stand 202).—A well-known vaporiser was described in *The Motor Cycle* a few weeks ago. The 1913 model has been considerably altered, and a new one has many advantages, which include an easily detachable jet, variable choke, and other improvements, all of which have been previously with. An introduction is the Amac cycle car carburetter. This is constructed to work as a single lever device operated by accelerator pedal. The exhibit includes other accessories for which this firm is well-known,

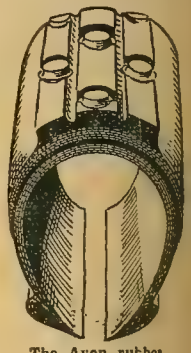


A useful accessory is the Amac belt drift.

namely, decompressors, switches, belt fasteners, spring terminal clips, etc., and a two-lever featherweight carburetter for low-powered machines, which has not been shown before, is exhibited.

A. R. ATKEY AND CO., LTD., Nottingham (No. 237).—A speciality here is the Rodess automatic inflator. A completely automatic device for keeping the tyres at a proper pressure at all times while the machine is in motion. The output of the inflator is such as to enable it to overcome as many as ten ordinary punctures at normal speeds. The device consists of a little pump driven through a simple cam mechanism not liable to break. When the required tyre pressure is reached the pump cuts itself out automatically and revolves without doing any work.

THE AVON INDIA RUBBER CO., Melksham, Wilts. (No. 98).—The Avons are sold in a variety of patterns, the rubber-studded, the Sunstone, which consists of transverse indentations with closed ends moulded at intervals round the tread and a new and practically designed combination cover. The Avon tyres are successfully used on well-known makes of motor bicycles and are rapidly coming to the front, if they are not already there.



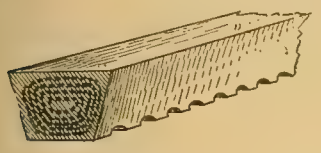
The Avon rubber studded tyre.

F. E. BAKER, LTD., King's Norton, near Birmingham (No. 201).—On this stand is to be found a most interesting exhibition of Precision engines of all sizes, including the new 2 h.p. unit described in last week's issue. A 2¾ h.p. single is shown in part section, and a

The Olympia Show.—

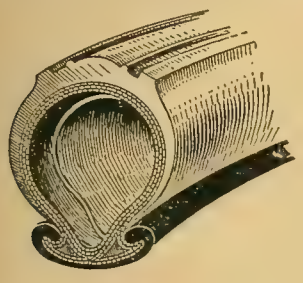
racing overhead twin with ball bearing connecting rods is also shown in part section. A 5-6 h.p. twin, 3¾ h.p. single, a racing 3½ h.p single with overhead valves, an 8 h.p. twin, a Green-Precision fitted with the interesting copper-jacketed Green patent cooling apparatus complete an interesting exhibit.

W. AND A. BATES, LTD., St. Mary's Mills, Leicester (No. 73).—The Bates tyres are shown in all sizes in ribbed and



Bates belt.

rubber-studded patterns. A speciality is also made of a heavy 28in.×3in. cover suitable for the heavier type of machines. Messrs. Bates, Ltd., also show rubber



Bates tyre.

belts in all sizes. Their rubber goods are excellent value for money, and they are one of the oldest firms in the tyre trade.

THE BAVARIAN RUBBER AND ASBESTOS WORKS, 63, Crutched Friars, London, E.C. (No. 46).—The exhibit contains primarily a complete range of Metzeler tyres which have recently been placed on the market. Tests have been completed and these tyres are now ready to be placed before the public. The covers are made of a white quality of rubber of the highest degree of purity. Tyres are shown which have completed 6,000 miles under trying conditions.

The firm also make special tyres for passenger work, designed on the lines of car tyres, but with beads to fit motor cycle rims. The exhibit also consists of a large range of covers, tubes, inflator tubing, and other indiarubber sundries.

PROTECTION FOR THE RIDER.

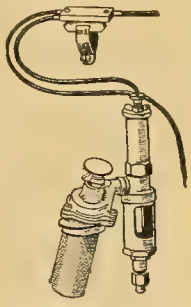
BEARD-BROWN AND CO., Dodridge St., Northampton (No. 238).—This is an exhibit by specialists in leather clothing, who, themselves, dress the leather from which they make their motor clothing. We have examined some examples of excellent material, thoroughly sound finish, and designed to give plenty of comfort and warmth at a very reasonable cost. Another feature of the exhibit is the College patent leather mud-shield, which extends from the crossbar downward, forward of the engine, and then rearward below the crank case. These shields have pockets, capable of taking a spare set of overalls and other impedimenta. The shield with its accompanying aprons goes a long way towards giving comfort to drivers in bad weather. Among other details, the leather pedal bars should be specially noted.

BENTON AND STONE, LTD., Bracebridge Street, Birmingham (No. 244).—The special feature here is a new lubricating system, providing a sight feed automatic drip of oil. In addition to this, by means of a by-pass and a plunger device, an extra supply of oil—the quantity of which is in every case visible—can be put through at will without any adjustment to the control of the automatic lubricating system. Other exhibits here mark the firm as specialists in matters of lubrication and its application. Also air pumps, foot pumps, and hand pumps for pressure feed are exhibited.

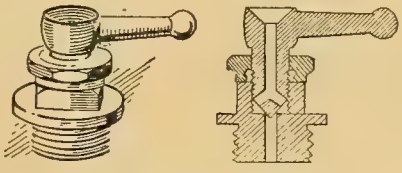
The Benton and Stone combined petrol can pourer and filter.

A NOVEL LUBRICATOR.

BEST AND LLOYD, LTD., Handsworth, Birmingham (No. 242).—Semi-automatic, forced, sight feed lubricators. Special types are shown designed for the Scott, Douglas, and New Hudson machines, also special types with Enots domed glass. A very interesting exhibit is the system of lubrication by throttle control, the idea being to provide a supply of oil in exact relation to the work that the engine is doing at any moment. The use of a special adaptor or junction box allows the ordinary handle-bar control to operate the lubrication as well as the control. A neat little fitting is a combined petrol tap



Interconnected throttle control lubricator by Best & Lloyd.



A neat cone-seated compression tap by Best and Lloyd.

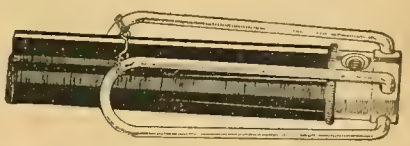
and filter, and interest also attaches to well-designed hinged tank fillers and fillers of the screwed hinged type. An apparatus which combines a number of purposes is a positive reserve supply petrol gauge valve, sump, and filter.

THE BIRMINGHAM SMALL ARMS CO., Small Heath, Birmingham (No. 183).—This firm's main exhibit of motor cycles and accessories is on Stand 58 on the ground floor, but a few parts and components are shown in the gallery. A complete engine is exhibited, together with the parts going to make it up, shown separately. There are also B.S.A. carburetters, an example of the B.S.A. three-speed gear, and samples of frame components and other parts.

BLUEMEL BROS., LTD., Wolston, near Coventry (No. 157).—The Bluemel accumulators are already well-known, and the exhibit also includes sparking plugs, steering wheels, pumps, mudguards, etc.

Bluemels celluloid handle-bar grip.

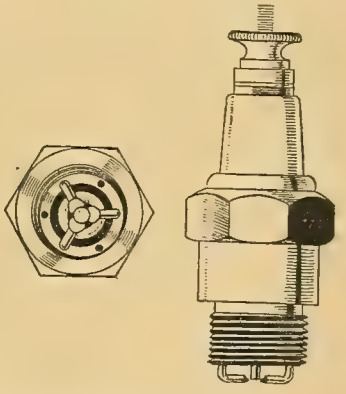
There is a neat and satisfactory adjustable wind screen for cycle car use. A new type of pump, specially adapted for cycle car owners, which is strong and well



Bluemels pump showing clip for holding foot extensions together.

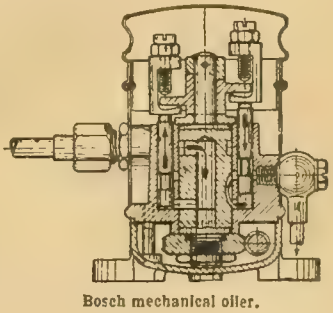
finished, but not too bulky or heavy, is also shown. The same remark applies to a rather similar pump, the Powerful, intended for motor cycles.

THE BOSCH MAGNETO CO., LTD., 40-42, Newman Street, W. (No. 196).—A description of the Gallery exhibits would be in-



Latest Bosch three-point plug.

complete without reference to the makers of the famous Bosch magneto, an electrical device which is almost universal on motor cycle engines. A detailed reference to this magneto would be superfluous, as it is so well known, but readers will be interested to examine the various types for different engines, also the Bosch system of automatic force feed lubrication, a small mechanical pump with various leads,



Bosch mechanical oiler.

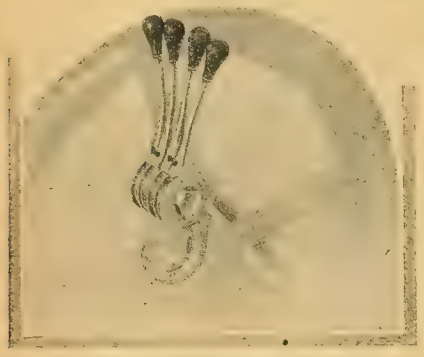
The Olympia Show.—

directing oil to different bearings and other parts which necessitate constant lubrication.

THE BOWDEN BRAKE CO., LTD., Tyseley, Birmingham (No. 235).—Motor cycle front brakes, controls for magneto, carburetter, and change speed gears. Motor cycle handle-bars completely fitted, also steering wheel showing control fitted for different operations.

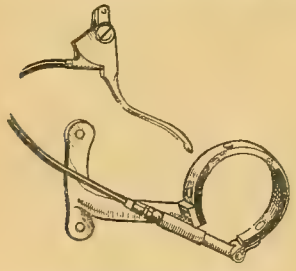
WIRE CONTROL.

BOWDEN WIRE, LTD., Pratt Street, Camden Town, N.W. (No. 211).—Almost any moving part on a motor cycle or cycle car from carburetter control to gear changing can now be effected by Bowden wire, and one of this firm's latest fitments is a quadruple cycle car control in which four levers are arranged on a little bracket neatly clipped to the centre of the steering column above the wheel, the levers being held in any position by the well-known "Bowdenloc" system. Thus it is easy to arrange the gas, air, magneto control, and half com-



The Bowden quadruple control levers for cycle cars.

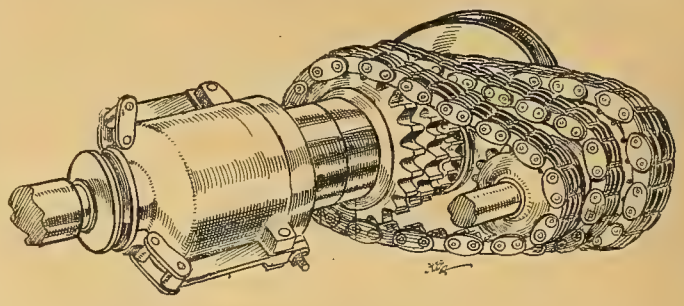
pression device all to be operated from the wheel. Another clever fitment marketed by Bowden Wire, Ltd., Pratt Street, Camden Town, N.W., is an extra air inlet device, designed to decrease petrol consumption and increase engine efficiency. This fitment may be obtained



Handle-bar control for the Philipson pulley marketed by Bowden Wire, Ltd.

in various sizes, and in lengths of cable suitable for cycle cars or motor cycles, and it has the further advantage of being easily fitted and neat in appearance.

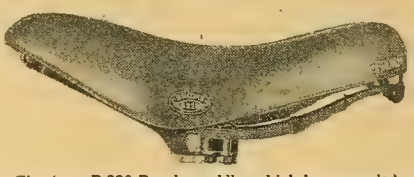
BRAMPTON BROS., LTD., Oliver Street, Birmingham (No. 186).—The chief item of interest is the Sava three-speed gear for motor cycles. This is a counter-shaft gear, the drive from the engine to the counter-shaft being by three pairs of chain sprockets and three chains, the sprockets being of varying diameters. The variation of the gear ratio is obtained by locking one or the other of the three counter-shaft sprockets to the wedged



Details of the Saver three-speed gear and silent chain drive.

clutches. Another gear is the Brampton variable pulley gear, which provides seven speeds and a free engine. The faces of the pulley flanges are grooved to provide a better grip for the belt. The exhibit includes chains, hubs, spring forks, handle-bars, brakes, etc. Readers should ask to see the patent dustproof front hub for motor cycles.

J. B. BROOKS AND CO., LTD., Great Charles Street, Birmingham (No. 227).—The usual extensive range of motor cycle saddles, tool bags, carrier bags, and the like. Also all kinds of leather fittings for cycle cars, as, for example, tool bags, tool cabinets, and luggage boxes for fitting either to the running board or to the back of the car. There are no very big novelties here, though several de-

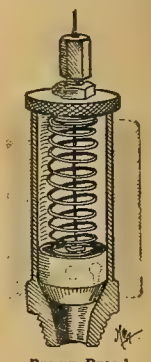


The type B 220 Brooks saddle, which is suspended on leaf springs.

tailed improvements have been embodied and deserve attention. A novelty is a patent spring legging that may be put on and taken off instantaneously, and fits either leg.

BROWN AND BARLOW, Westwood Road, Witton, Birmingham. (No. 241).—The B. and B. for 1914 was fully described in a recent issue, and at the same time we published our own experiences with the semi-automatic variable jet model. Readers may remember that this carburetter is fitted with a tapered needle interconnected with the throttle lever. This gives a very small jet for slow running, and when more gas is required for power purposes, such as hill-climbing, the tapered needle allows for a more copious flow. In addition to operating the jet, the throttle provides about sixty per cent. of the total air required, an extra air lever being only requisitioned to strengthen or weaken the mixture as desired. The same firm show a new type of automatic carburetter for cycle cars, various descriptions of metal float chambers, petrol strainers, and small taps, etc.

BROWN BROS., LTD., Great Eastern Street, E.C. (No. 160).—In addition to complete machines, this firm, as usual, exhibit a very full range of motor cycle



Brown Bros.' auxiliary air inlet.

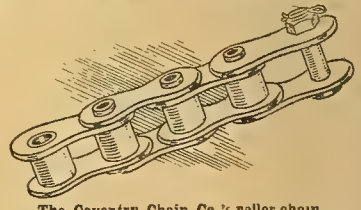
accessories of a great variety. One of the novelties is the "Vapo" patent atomiser, which is in the nature of a variable jet designed to effect economy in petrol consumption. There is also a new mode of Autoclipse acetylene lamp with spherical body. Another new exhibit, appealing more to cycle car users, is the Brown sprayer for washing down engines with paraffin spray. The necessary pressure behind the spray is obtained by a simple hand pump embodied in the can of the contrivance. A neat and quite cheap little set of tools for removing carbon deposit from cylinders and pistons without dismantling the engine also claims attention. These are but a few of numerous points of interest to be found on this stand.

ARTHUR CAKE AND CO., LTD., Cumberland Street, Birmingham (No. 165).—Trade only. Chain wheels and cranks.

CAPON, HEATON, AND CO., Birmingham (No. 99).—This firm make a speciality of repairs of all kinds of motor cycle tyres. They also supply the trade with a large assortment of repair bands, plasters, and inflator tubing.

THE CLIPPER TYRE CO., LTD., Steelhouse Lane, Birmingham (No. 12).—A large number of Clipper motor cycle tyres are to be seen on this stand, which are mostly of the three-rib and rubber-studded patterns.

THE COVENTRY CHAIN CO., LTD., Spon End Works, Coventry (No. 161).—The usual extensive variety of chains of roller and noiseless types will be found here. Special interest attaches to a motor



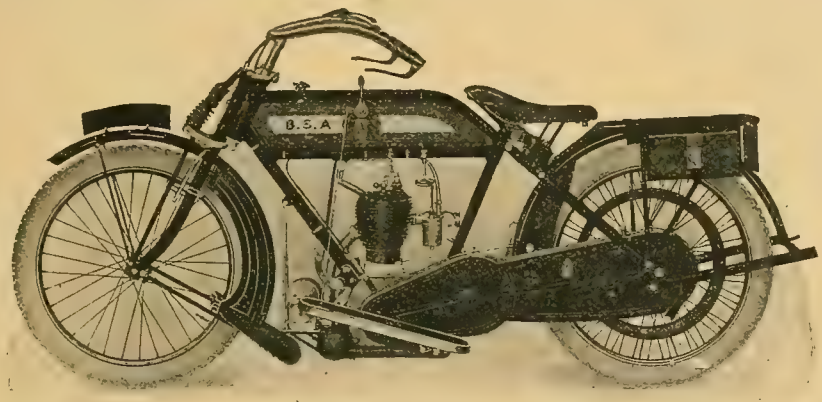
The Coventry Chain Co.'s roller chain.

cycle chain drive embodying a spring wheel. The drive is designed to transmit 5 h.p. at 1,200 r.p.m. The "Coventry" chain is fitted to the drive from the engine shaft to the shock absorption wheel, the final drive to the rear wheel being by roller chain.

B.S.A.

Motor Bicycles

FOR SOLO AND SIDE-CAR WORK.



THE B.S.A. 557c.c. MOTOR BICYCLE FITTED WITH B.S.A. COUNTERSHAFT THREE-SPEED GEAR AND CHAIN DRIVE

This machine should be inspected at Olympia, Stand 58, by everyone interested in motor cycling. Many improvements and refinements are embodied, which place it in the forefront of passenger machines. It is an ideal mount for side-car riders who object to the expense and strain of a heavy twin. Owing to its wonderful flexibility there are very few hills which cannot be ascended with power to spare. Other B.S.A. Models to be seen at the B.S.A. Stand are the Fixed Engine, Free Engine, Countershaft Three-speed Chain-cum-Belt Drive, and Tourist Trophy, and also the new B.S.A. Side-cars. It will pay you to obtain full particulars of the B.S.A. Motor Bicycles and Side-cars before selecting your new machine.

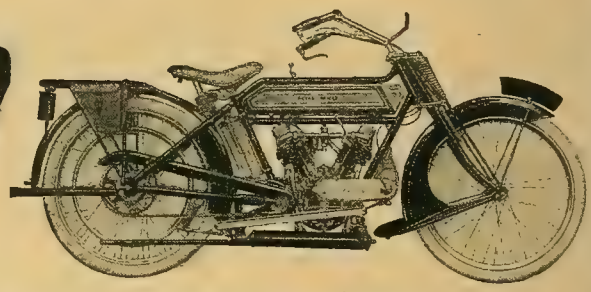
In answering this advertisement it is desirable to mention "The Motor Cycle." C43

ENF

The Motor Cycle of Brooklands Fame.



This 3 h.p. model is now offered with an equipment never before approached in a solo model. New "kick-starter," Enfield patent two-speed and free-engine gear, automatic lubrication, cush drive hub, chain drive, and Palmer cord tyres.

Net Cash - - - - - - 50 Guineas.

Positively the best solo motor cycle. At Brooklands, on September 13th, these models beat a representative entry of the best known $3\frac{1}{2}$ and 7 h.p. machines, a feat never equalled by any other make of motor cycle.

The 3 h.p. Royal Enfield has accomplished feats impossible to other machines—because it is the best and most reliable.

Note the specification—and the price.

$2\frac{3}{4}$ h.p. Two-speed model - - - £45 net cash.

You will find Royal Enfields at Stand 88, Olympia. - -

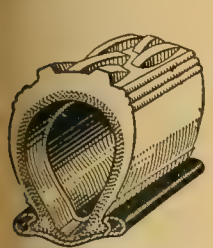
We should like you to read our latest booklet, "Something Done." The performances reprinted therein are proof you need before buying any motor cycle. And afterwards your choice will be a reliable Royal Enfield. Send postcard for booklet and 1914 Catalogue. :: :: :: :: :: :: ::

The Olympia Show.—

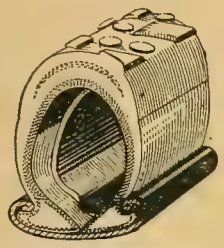
THE COVENTRY PLATING AND PRESSWORK CO., LTD., Coventry (No. 167).—This firm show the usual fine selection of well-finished examples of plating and presswork. Among the specialities of the firm are mudguards, belt rims, and tanks, and to this list has now been added radiators for cycle cars.

COMPONENTS, LTD., Birmingham and London (No. 228).—Trade only (see Ariel) in complete machines.

THE CONTINENTAL TYRE AND RUBBER CO., Thurloe Place, South Kensington (No. 96).—The principal patterns shown on this stand are the combinations in which squares are placed diagonally around the tread and interspersed with



Section of the Continental Basket pattern heavy tyre.



Continental combination rubber and steel-studded tyre.

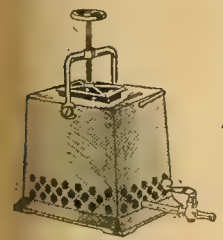
steel studs, the rubber-studded pattern, the basket pattern, and the corrugated type of tread. The quality put into these tyres has always been good, but it is

The latest pattern Continental butt-ended tube.

greatly improved for 1914, as the covers are built on similar lines to those on which the Tourist Trophy was won in 1911. Cycle car tyres and motor cycle belts are also shown.

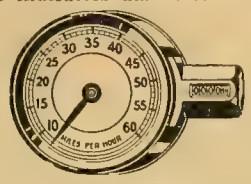
A PORTABLE VULCANISER.

THE COUNTY CHEMICAL CO., LTD., Birmingham (No. 246).—Here are found examples of the new Chemico tyres in the wired-on and beaded-edge varieties. An interesting little accessory is the Facet rear light, designed to radiate over a very broad field. Vasol is a well-known and efficient lubricant, and Chemico repair outfits are useful fittings for motor cycles and cycle cars. The firm exhibit a handy portable vulcaniser, suitable for dealing with covers and tubes of motor cycle tyres. The method of heating is either by coal or gas, or by acetylene.



The Chemico vulcanising outfit.

THE COWEY ENGINEERING CO., LTD., Kew Gardens, S.W. (No. 219).—The most important novelty on this stand is the Cowey speed indicator, built specially for cycle car work. The principle is, of course, the same as that of the other types of indicators manufactured by the

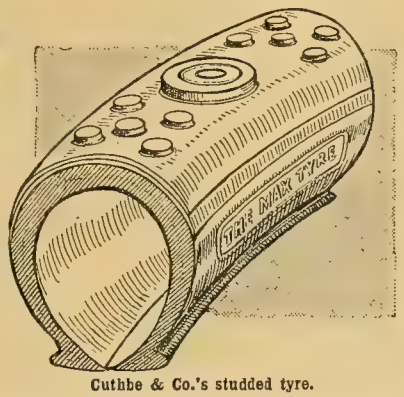


The Cowey speed indicator and mileage recorder.

same firm, which have been successfully used for a long time past on all classes of motor vehicles.

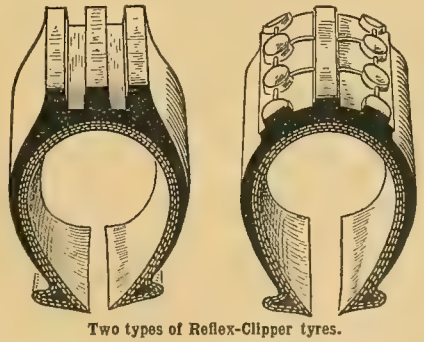
A NEW NON-SKID TYRE.

CHAS. L. CUTHBE AND CO., Great Eastern Street, E.C. (No. 75).—The most conspicuous tyres on this stand are the Cy-car pattern, the tread of which consists of a single groove, in which lozenges of rubber are moulded at intervals. The tread has the letter



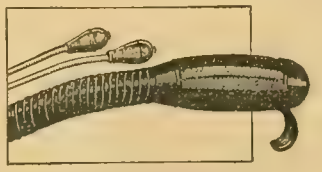
Cuthbe & Co.'s studded tyre.

"T" moulded upon it in steel studs. A new type of tyre is the Super, which has a leather tread with large hollow rubber studs projecting through at intervals, and between them at intervals a series of steel studs. Serviceable motor cycle suits are also exhibited on this stand.



Two types of Reflex-Clipper tyres.

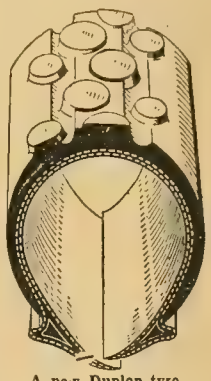
DOVER, LTD., Northampton (No. 218).—One novelty here is a new motor cycle



Hooked handle and spiral wound bar by the Dover Co.

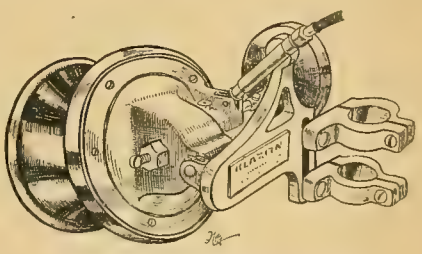
tyre inflator, which will be shown in operation on the stand. A very interesting exhibit is a motor cycle handle-bar covered with Exonite wound spirally to form practically a solid shield. To this same pair of handle-bars is fitted a new design of handle with hook grip. The firm also show wind screens for sidecars and cycle cars and steering wheels for the latter.

THE DUNLOP RUBBER CO., Aston, Birmingham (No. 4).—On this stand are to be found various patterns of the well-known Dunlop tyre, including the latest, in which the tread consists of large and small rubber studs and grooves; a transverse grooved light voiturette cover for sidecar machines and cycle cars; the rubber-studded pattern; the lozenge-shape pattern, etc. Also belts and tyre accessories.



A new Dunlop tyre.

THE EAST LONDON RUBBER CO., Great Eastern Street, E.C. (No. 224).—In addition to complete machines, a variety of sidecars, engines, and components, this exhibit includes a number of interesting accessories. Among these is the Volta lite, a little dynamo of almost pocket size, designed to drive off the front wheel of a motor cycle and to provide light when the machine is moving. Great efficiency is claimed for the new models of this device. The Yutu horn bulb is



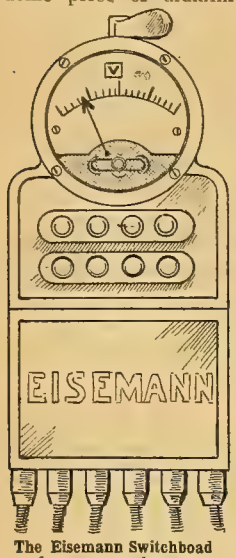
The latest pattern Klaxon motor cycle horn with new pattern fixings.

half rubber and half metal nickel-plated, the latter portion being an extension of the horn portion. In the Redhead spring fork the action depends upon the presence of two rubber balls on each side of the lower portion of the head. In taking up shock the two sets of balls rise over one another, falling into a separating space under the pressure of a central spring. Another useful accessory is the motor cycle Klaxon horn, which incorporates the same mechanism as is contained in the full-sized warning signal of this make, but the method of drive, instead of being electrical, is in this case mechanical. The horn is mounted on an aluminium bracket attached to the front forks, which allows the instrument so to be tilted that on the depressing of a Bowden lever on the handle-bar a friction disc is brought into contact with the rim of the front wheel. To the shaft of this

The Olympia Show.—

friction disc is attached a wheel, on which there are ten small cams, each of which in rotating gives a button a push, causing the vanadium steel diaphragm to buckle.

THE EISEMANN MAGNETO CO., Berners Street, W. (No. 180.)—The Eisemann magneto has several distinctive points. The magnets are lined with an inner dome piece of aluminium, and the end plates are fixed to the edges of this so that the magnets are intact. The edges of the dome piece are ground dead level, and, consequently, there is no trouble at all in making this magneto watertight. The system of lubricating the contact-breaker shows great ingenuity, for the excess of oil is caught by the shallow trough or trap in the rocker and conducted through a fine hair boring to the rocker on the spindle. A similar device providing for the insert eliminates the possibility of sticking, and so causing irregular firing. The Record sparking plug claims attention. The electrode is of pure nickel and non-incandescent. The aim in view was to make a sparking plug that was quite unaffected by oil. This firm is also showing a lightweight lighting set suitable for cycle cars. The total weight of the dynamo is only 34½ lbs., and the length, to end of shaft, is 10in., height 5½in., breadth 5¾in. The output is 12 volts and from 6 to 15 amps. There is an electro-magnetic cut-out which operates at 400 revs., and an automatic control of voltage which permits the lamps to be lighted directly from the dynamo in case of necessity, and at other times controls the pressure, so preventing trouble from grossly overloaded lamp filaments.

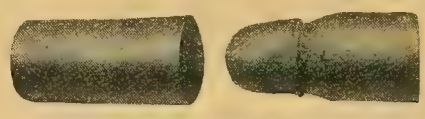


The Eisemann Switchboad for use on cycle cars.

THE MINIATURE MEA.

B. M. FAIR AND CO., Great Winchester Street, E.C. (No. 198).—Here are seen the Mea magnetos, in which the distinguishing feature is the bell-shaped magnets, the design of which is such as to secure that the rotating armature is at its maximum position at the moment of break, whether the sparking lever is advanced or retarded. The arrangement, of course, results in securing a good spark at low speeds as well as at high, thus tending towards easy starting and smooth running at slow speeds. A big model of the machine is shown, giving sparks across a gap of nearly ⅜in. The position of the sparking lever on this model can be varied over a big range, so that the quality of the spark under all conditions may be satisfactorily demonstrated.

GAULOIS TYRES, LTD., Bath Street, E.C. (No. 130).—The models shown on this stand consist of a corrugated tread, a two-ribbed pattern, and a tread consisting of lozenge shaped projections moulded diagonally on the cover and



The Gaulois butt-ended inner tube.

centrally ribbed. These three patterns have treads of special white rubber which is claimed to be self-sealing after it has been cut. Two ribbed and lozenge patterns are also shown with ordinary treads. Yet another model is a steel studded pattern, the studs being embedded in leather. Steel studded and white rubber treaded tyres are also shown for cycle cars.

GOODRICH TYRES.

B. F. GOODRICH, Golden Lane, E.C. (No. 14).—On this stand are shown various examples of Goodrich tyres, which are of the rubber-studded pattern. The very best quality and workmanship are put into these tyres, which have been used successfully on many different makes.

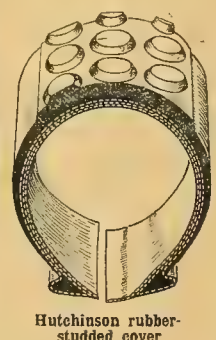
GOUGH AND CO., Hockley, Birmingham (No. 240).—A big variety of saddles is to be seen here. Special attention is to be directed to the pan seat motor cycle saddles, of which there are two varieties. There is also a good show of pannier bags, leather trunks designed to be attached to carriers for tourists, also cases for belts, tubes, sparking plugs, and tools.

H. AND W. GREER, Chiswell Street, E.C. (No. 97).—This firm, previously known as the Calmon Rubber and Asbestos Co., exhibit the Calmon extra special and ideal tubes, also cycle car tyres.

A. H. HADEN, Princip Street, Birmingham (No. 181).—Components, fittings, and parts of all kinds for motor cycles are here shown, from a single lug to a complete machine, also accessories and fittings of all kinds. The firm are manufacturers, selling to the trade only.

ERNEST H. HILL, LTD., Beater Works, Sheffield (No. 191).—Messrs. Hill always have an interesting exhibit. Special attention should be given to their petrol,

Hanover corrugated cover.



Hutchinson rubber-studded cover

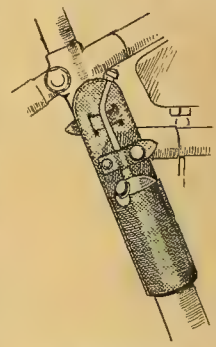
oil, and grease injectors. The E. H. Hill inflators are excellently made tyre pumps with brass cylinders. They can be had in brass finish or nickel plated. The observation mirrors for attaching to handle-bar or wind screen are another speciality of the same firm. These are made in polished brass, nickel plated, and black.

THE HANOVER RUBBER CO., LTD., Goswell Road, E.C. (No. 71).—Motor cycle tyres, including a combination pattern cover of excellent design, consisting of V-shape bars between which are steel studs. Also the Gloria belt which was used on winning machines in the T.T. races of 1908-9-10. Inner tubes and other rubber goods are shown.

HOBDAY BROS., Great Eastern Street, E.C. (No. 168).—Wholesale trade only.

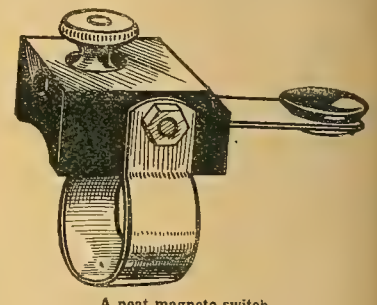
THE HOFFMANN MANUFACTURING CO., LTD., Chelmsford, Essex (No. 226).—This firm show their usual fine collection of ball bearings and roller bearings, suitable for every conceivable purpose for which such bearings can be applied in motor cycle or cycle car construction.

HUMPHRIES AND DAWES, LTD., Birmingham (No. 243).—Here is to be found a full range of Swan cycle and motor fitments and accessories. Special attention may be drawn to the Swan oilcan and carrier and the Swan valve remover.



The Swan oil can and carrier on the down tube.

A. H. HUNT, Cannon Street, E.C. (No. 175).—There is a fine variety of electric lighting sets for motor cycles and cycle cars, including a complete system with dynamo. A number of rear lights for motor cycles are shown. An interesting novelty is a new type of valve lifter, which has a cam action which lifts the very strongest loads, and automatically locks itself in position. The overall size



A neat magneto switch.

is about two inches. There is also, of course, a large variety of Hellesen dry cell batteries, in connection with which a special free offer is made to give users an opportunity of testing the merits of the system without expense to themselves in the first instance.

THE HUTCHINSON TYRE CO., Basinghall Street, E.C. (No. 129).—The Hutchinson

The Olympia Show.—

tyres have been successfully used in numerous competitions for years past. The principal pattern is the rubber-studded, of the excellence of which we can speak after personal experience. A speciality is made this season of the three-ribbed pattern, which is sold specially for heavy sidecar work, and another pattern manufactured on car lines specially constructed for use on cycle cars. This latter is made only in the 650 × 65 mm. size, and the finest quality canvas is used.

THE KEMPSHALL TYRE CO. (OF EUROPE), LTD., Long Acre, W.C. (No. 101).—The Kempshall tyre is conspicuous for its peculiar tread, consisting of circular depressions moulded at intervals around

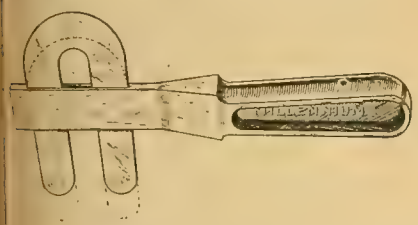
Kempshall heavy cycle car tyre.

Another form of Kempshall cover for cycle cars.

the cover. This enables the tyre to keep cool, and the pattern as a whole acts as an efficient non-skid, the Kempshall being the only tyre to have gained an R.A.C. certificate for non-skidding. The Kempshall tyre is fitted to P. and M., Rex-Jap, New Hudson, Brough, Blackburne, and other well-known machines. It is interesting to note that all covers are built up of the Kempshall interlocked fabric, which greatly improves the wearing quality of the tyre.

USEFUL TOOLS.

LAKE AND ELLIOT, LTD., Braintree, Essex (No. 194).—This firm, known all over the kingdom for the ingenuity of their motor tools, exhibit a small jack for cycle cars, a folding light jack for cycle cars, their well-known valve truer



The Millennium pedal pin spanner.

for scraping the faces of valve heads before grinding, a garage valve grinding tool which should be very useful where there is sufficient room between tank and combustion head to get the grinder into position without fouling the tank. A new item this year is a pedal pin remover. This is a spanner thin enough to go between the pedal and the crank and is prevented from spreading by a locking bar across the faces. Lake and Elliot still supply a two-speed and free engine hub, and also their two-speed Fit All gear for engine-shaft.

LEATHERIES, LTD., Sampson Road North, Birmingham (No. 228).—Empire de Luxe motor cycle saddles with leather and metal pan, padded felt and covered leather seats. Also the Pattison motor cycle saddles, which has metal pan seats padded and covered with leather. Empire de Luxe belt and tube cases, luggage carrier, sparking plug cases, etc.

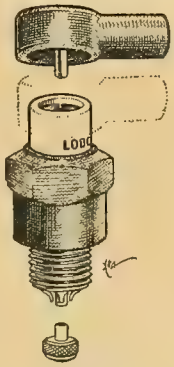
NON-SKID TREADS.

LEICESTER RUBBER CO., Granby Street, Leicester (No. 147).—Here are shown various examples of the well-known John Bull tyre. The pattern exhibited has a tread consisting of two ribs, between which are transverse grooves. Another in which the tread consists of lozenges moulded at intervals. These tyres are known for their excellent wearing qualities.

The tread of one of the Leicester Rubber Co.'s covers, composed of long rubber lozenges.

LODGE SPARKING PLUG CO., LTD., Wrentham Street, Birmingham (No. 230).—An introduction by the Lodge Company is a very neat lighting set. This is not shown this week, but it was on view at the Car Show. Particulars concerning it can be obtained at the stand. The Lodge plugs are made in various types, the standard model being put up in a red metal sealed box with gap gauge, washer, and guarantee slip. The weatherproof model has an insulated quickly detachable

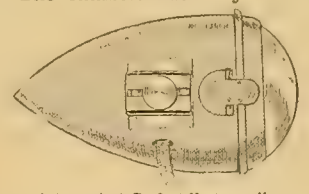
The Lodge self-cooling plug, which is provided with radiating ribs.



The Lodge plug and waterproof terminal. Observe the gauge for the points at foot

terminal, which, in addition to making the plug weatherproof, acts as a convenient method of testing the spark. The racing model has self-cooling fins in body and centre stem, and the miniature model is said to be the smallest plug made which will give perfectly reliable and lasting service.

C. LOHMANN, Great Eastern Street, E.C. (No. 245).—Acetylene head light outfit for motor cycles, brass and electro-plated electric lamps for motor cycles and for cycle cars, and similar lamps in black. A good range of motor cycle horns (plated and black), push bells, etc. The exhibits naturally include the



Lohman's "Perfect" streamline sidecar lamp.

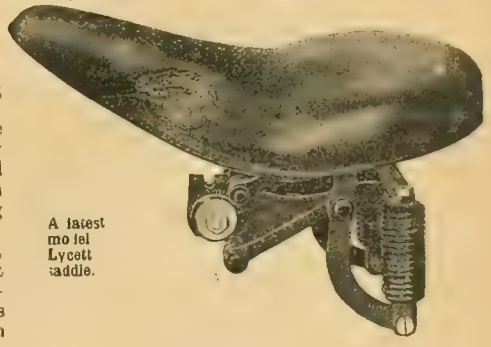
firm's well-known Superber saddles for motor cycles, and a variety of well selected tool kits for motor cycles and cycle cars, in leather and canvas cases.

LAMPS OF ALL KINDS.

JOSEPH LUCAS, LTD., Birmingham (No. 184).—A big range of lamps for motor vehicles of all types. Among new models is the King's Own, on a combination bracket for mounting upon the handlebars. This little device looks very well with special black finish. Another novelty is a very pretty sidecar lamp, showing a white light forward and a green or red light aft. The lamp is supplied complete with a small generator for supplying gas for a two-and-a-half miles run. The electric lamps include equipments suitable for cycle cars, embodying, if desired, the dynamo as well as an electric battery. A neat design of motor cycle rear light with separate generator is intended to be riveted to the identification plate, which it illuminates in addition to throwing a red light aft.

LUKIN, LTD., Newcomen Street, Borough, S.E. (No. 229).—This firm is exhibiting the Lukin automatic carburetter for motor cycles and cycle cars. This is a well designed gas making apparatus for motor cycle and similar engines. When properly tuned up it is quite automatic, and enables the engine to run both slow and fast without loss of power. It has been described and illustrated on more than one occasion in these pages. A clever device recently introduced by M. Lukin is an air leak detector; this consists of a simple wood plug screwed at one end to take a horn bulb, and at the other to fit the spigot pipe of a single-cylinder engine. When assembled, if the bulb be squeezed, any air leakage between the spigot and the cylinder is immediately detected.

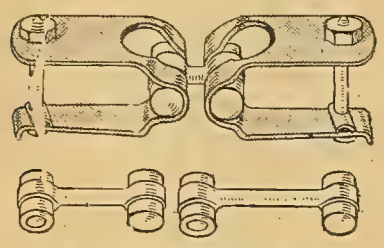
THE LYCETT SADDLE AND MOTOR ACCESSORIES CO., LTD., Bromley Street, Birmingham (No. 177).—All motor cyclists know the "La Grande" saddles, anatomical pan seats, and armour-plated motor



A latest model Lycett saddle.

The Olympia Show.—

cycle tool bags. A full range of these is exhibited; also the Lyso 1914 belt. It is a new belt for which great claims are made. The Reliable belt is a combination of rubber and leather, and has undergone severe tests with conspicuous success.

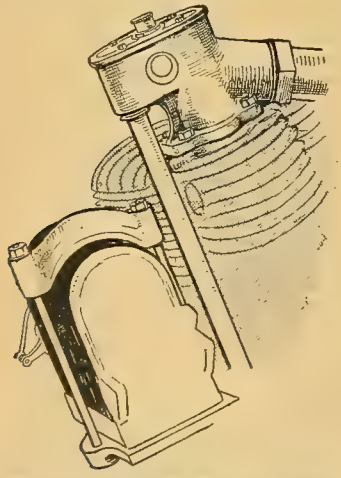


The Dall fastener with three links of various sizes.

Chas. Macintosh Co., Ltd., Manchester (No. 11).—Messrs. Macintosh were one of the earliest firms to enter into the rubber trade, and are manufacturers who have had long experience in tyre construction. Various designs of motor cycle tyres are to be seen on this stand, which are, of course, made in all standard sizes.

M.A.G. ENGINES.

The M.A.G. Engine Co., College Park, Willesden, N.W. (No. 169).—The exhibit of the M.A.G. Engine Co. is a particularly interesting one. The engines shown are the 1¼ h.p. 62×70 mm., which has a bronze combustion head screwed into the cylinder and contains the automatic inlet valve; the 1½ h.p., 62×75 mm.; the 2½ h.p., 64×90 mm., automatic inlet valve; the 2½ h.p., 64×90 mm., mechanically-operated valves; the 2¾ h.p., 54×75 mm.; the 3½ h.p. 64×77 mm.; and the

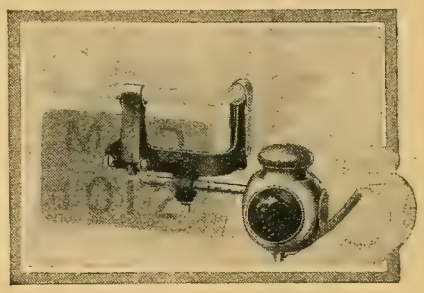


Overhead valve gear, and method of carrying the magneto on the Matchless sidecar machine.

6 h.p. 72 × 91 mm. The last two engines deserve special study, as they have been recently placed on the market, and except as regards engine size they are identical. The inlet valves are mechanically operated, the operating mechanism being entirely enclosed. The lubrication of the valve mechanism is effected by pressure in the crank case, allowing the oil to rise up the pipe in which the operating rod works and lubricate the rocker. The tappets are adjustable, and the engines are also noteworthy for the fine finish on the crank case and the fineness of the casting of the radiating fins. Engines of this type are fitted by Messrs. Collier and Sons and other well-known manufacturers.

Markt and Co., Ltd., Clerkenwell Road, E.C. (No. 171).—A novelty here is a new handle-bar Veeder, and there are also samples of the Goodlads speedometers. A very effective apparatus is a Long horn for motor cycles, which is a purely mechanical device. As for the rest, the exhibit is on the lines of previous years, a very important feature, of course, being the well-known Jones speedometer.

Mechanical Products Co., Armoury Close, Bordesley Green, Birmingham (No. 210).—The convertible acetylene electric head lights, suitable for motor cycles and cycle cars, which were described and illus-



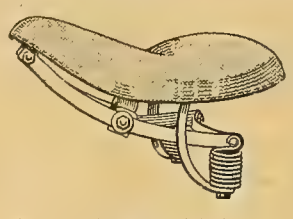
The M.P. rear lamp, showing method of attachment.

trated in our last issue (see page 1545), are exhibited on this stand. The idea is to use a small battery and electric bulb which is interchangeable with the gas burner, so that if the rider wishes to use the lamp only for a short time there is no necessity to decompose a container full of carbide. A range of cycle car mascots of suitable design for light cars and other fittings are also shown.

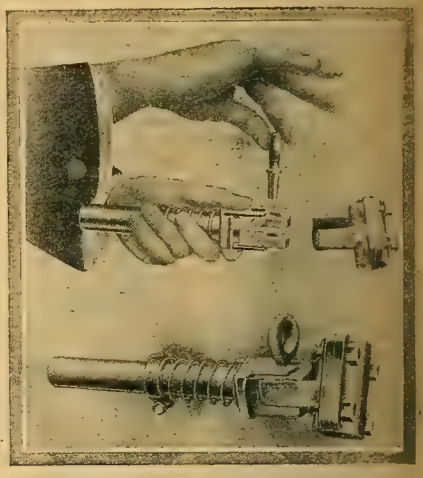
Michelin Tyre Co., Ltd., Fulham Road, S.W. (No. 48)—The chief types of tyres shown by the Michelin Co. are the Trident and the Semelle. These are made in all sizes, and, of course, their quality for excellence is known throughout the world. Particular attention is paid to cycle car tyres, and various sizes of these are made.

ANATOMICAL SADDLES.

Middlemore and Lamplugh, Ltd., Little Park Street, Coventry (No. 189).—One of the leading lines for 1914 is the new motor cycle saddle, which was recently described and illustrated in *The Motor Cycle*. This saddle is built up on a steel underframe on anatomical lines, and is not only provided with coil springs, but the cantle is attached to C springs of flat section steel. We have had personal experience of this saddle, and have found it to be comfortable as regards the seat and the actual springing thereof. Its price is moderate.



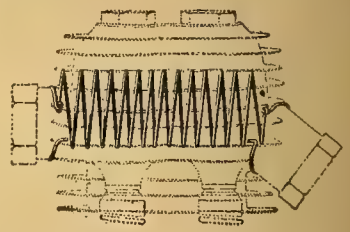
The latest pattern Middlemore saddle.



Neat and strong quickly detachable joints on the Supreme sidecar.

The Midland Gear Case Co., Bridge Street West, Birmingham (No. 232).—A selection of leather goods, including gear cases, tool bags and rolls, cases for tubes and belts, and kindred exhibits are here shown.

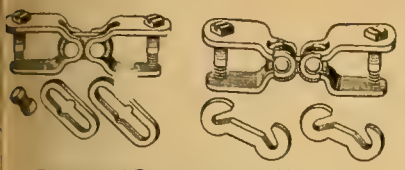
H. Miller and Co., Ltd., Miller Street, Birmingham (No. 188).—A big range of lamps generally is shown here, including sets for motor cycles and cycle cars, and some neat rear lamps for both classes of machine. All the lamps shown here burn acetylene. A special feature of the exhibit is Miller's "Rearlite," which is made in two patterns, being either supplied with gas from the generator of the head lamp, or self-contained. The "Rearlite" is a very neat little lamp carried from the after end of the carrier and showing a white light on the number and a red light aft. It is well-made and of very neat design. The girder brackets for motor cycle lamps have all been strengthened in the 1914 patterns.



The Dall trouser-guard.

Moebius and Son, 23, Howard Road, Stoke Newington, N. (No. 166).—Lubricating oils, burning oils, and tins of carbide of calcium. A comprehensive exhibit that does not lend itself to description.

The Olympia Show.—



Two types of Forward fastener which will be marketed for 1914.

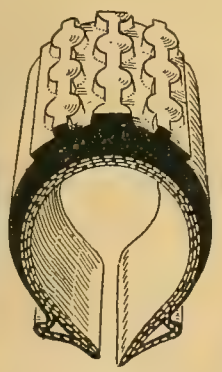
D. Moseley and Sons, Ltd., 51-52, Aldermanbury, E.C. (No. 45).—Here are exhibited the Moseley tyres, tubes, pedal rubbers, inflator tubing patches, repair bands, and repair canvas. The Moseley tyres, which are made by an old-established firm in Manchester, have a very good reputation, Moseleys being large manufacturers of other rubber goods their tyres can be relied upon as satisfactory.

WATFORD SPEEDOMETERS.

Nicole, Nielsen, and Co., Watford (No. 233).—A most interesting exhibit is on this stand, where there is to be seen a full range of Watford speedometers. There is a large size model with a dial upwards of a foot in diameter, having a glass front, so that the action of the centrifugal governor and other internal parts can clearly be seen when the machine is running. The detail improvements in these instruments were recorded in a recent issue.

The North British Rubber Co., Ltd., Great Portland Street, W. (No. 7).—As regards patterns of covers, this company specialise mostly in the rubber

Clincher extry heavy cover.



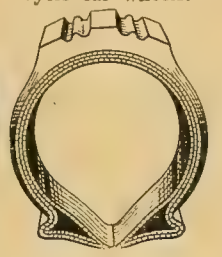
The Dreadnought tyre for motor cycles.

studded type. A new pattern Dreadnought, however, of the three-ribbed pattern, has been introduced. Two designs of tread, one studded and the other three-ribbed, are known as the Heavy de Luxe, and are designed to fit flat based rims.

A useful motor cycling Poncho produced by the Hutchinson Tyre Co.

Oylers, Ltd., Cavendish Street, W. (No. 127).—The Skew non-skid tyre consists of staggered indentations round the edge of the tread, and is a cover which is especially suitable for cycle car use. A number of tyres are shown fitted to wire cycle car wheels.

Section of the Skew non-skid tyre.

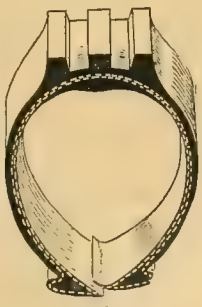


Section of the Palatine tyre.

The Palatine Tyre Co., Saul Street, Preston (No. 74).—The Palatine tyre first came into prominence in the early part of this year, when its manufacturers entered for a 3,000 miles A.C.U. trial, from which test the tyres emerged with the greatest possible success, only using four-elevenths of the tread of the driving wheel. The covers are made in 2⅜ for 2¼in. rims and 2⅝ for 2½in. rims, while there is a totally new type for cycle cars of substantial construction, the tread of which is no less than 13 mm. in thickness.

Palmer Tyre, Ltd., 119, Shaftesbury Avenue, W.C. (No. 150).—Palmer tyres are too well known to need a detailed description, but we may mention that a speciality is made for 1914 of cycle car tyres, 650×50 mm., to fit standard S.M.M.T. rims. A heavy motor cycle tyre, 26×2½in. fabric, and a heavy 26×3in. cycle car tyre, constructed on car lines, in which the cords are anchored to

Section of the Palmer Cord studded cover.



The Palmer Cord three-ribbed tyre.

the beads by steel pins. It will also be supplied with a steel-studded tread. The 700×80 mm. fabric cycle car tyre will fit a 2½in. rim. All the standard tyres made in standard sizes have been improved in construction and the quality of rubber used for the tread.

Messrs. J. Pedley and Son, Ltd., Oxford Works, Great Charles Street, Birmingham (Stand No. 145), show tyres, belts, and indiarubber goods of all descriptions. The Pedley tyres are made in four models—the heavy three-rib for 3½ h.p. and over, medium weight three-rib for 2¾in., and the Pedley lightweight three-rib for front and sidecar wheels. The new model is a combination cover, combining rubber bars with steel studs in a novel manner. We illustrate this cover. The same firm also make the Pedley cycle car cover in three-rib heavy and combination, 26in. × 2½in. and 3in., for motor cycle and cycle car rims.

The combination Pedley cover which has alternate rubber bars and steel studs.

Perry and Co., Ltd., Tyseley, Birmingham (No. 170).—Chains, hubs, freewheels, lubricators, etc. Wholesale only.

The Peter Union Tyre Co., Ltd., Great Portland Street, W. (No. 128).—Tyres of interest to motor cyclists shown by the Peter-Union Co. are a two-ribbed cover and a steel-studded cover, both of which have stood the test of time.

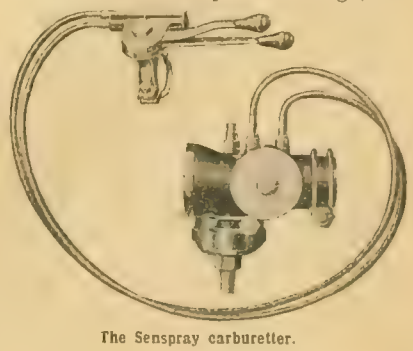
J. A. Phillips and Co., Ltd., Smethwick, Birmingham (No. 158).—Spring forks and pedals for motor cycles, wholesale only.

A VARIETY OF LAMPS.

Powell and Hanmer, Chester Street, Birmingham, and 167, Great Portland Street, W (No. 182).—Acetylene lamps are shown here in great variety. There is a new rear lamp for motor cycles and a complete system of electric lighting with dynamo, suitable for cycle cars. In the Powell and Hanmer dynamo the electric magnetic cut-out is mounted direct upon one of the poles of the field magnets, an arrangement which tends towards the simplification of the outfit.

Price's Co., Ltd., Belmont House, Battersea, S.W. (No. 162).—Here there is to be found the usual excellent selection of motor cycle lubricants, whether for engines or gears, together with oils for use in racing and touring engines. Price's Huile de Luxe is one of *the* finest oils on the market, and is often the means of securing a cool running engine when other expedients fail.

Chas. H. Pugh, Ltd., Birmingham (Nos. 204 and 205).—Here we find a selection of chains by the Alfred Appleby Chain Co., Ltd., also a quantity of components and specialities manufactured in flat sheet steel by C. H. Pugh, Ltd.



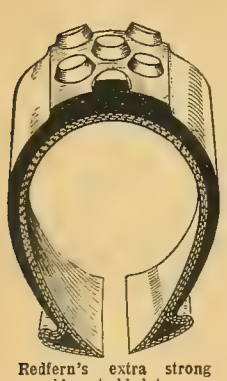
The Senspray carburetter.

The Olympia Show.—
The chief feature, however, is perhaps the Senspray carburetter, in which air is drawn by the piston through the small bore spraying nozzle at a very high rate. This air, passing over the top of the petrol jet, acts on the injector principle, drawing the petrol forcibly from the jet into the mixing chamber, in the form of a fine mist. In connection with this carburetter a carefully thought out system of handle-bar control is marketed.

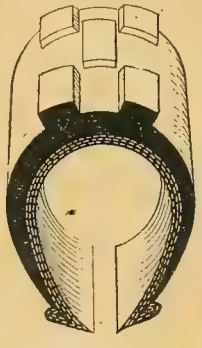
A FIRE EXTINGUISHER.

THE PYRENE CO., Charing Cross Road, London, W.C.—The Pyrene fire extinguisher is a pump filled with flame extinguishing liquid, which is forced under pressure against petrol flames or fire arising from any other cause in a garage, or on a motor cycle or car. The pump is made by the Pyrene Co. The pump is at present made in car sizes only, but the makers intend to place on the market a smaller one measuring 6in. × 2in. The larger size is one which motor cyclists might reasonably hang up in their sheds, and the smaller one, when ready, could be carried either on a motor bicycle or in a sidecar. Pyrene liquid is a chemical combination which as it touches a fire or the heated parts of a motor is converted into a dense white gas blanket, which surrounds the fire and smothers it instantly. It is non-damaging and non-corrosive, and extinguishes flaming petrol in one second.

THE REDFERN RUBBER WORKS, LTD., Hyde, Manchester, and 10, Gresham Street (No. 100).—The Redfern high-grade rubber-studded covers are sold in 26 × 2¼in. and 26 × 2½in. sizes. The



Redfern's extra strong rubber-studded tyre.

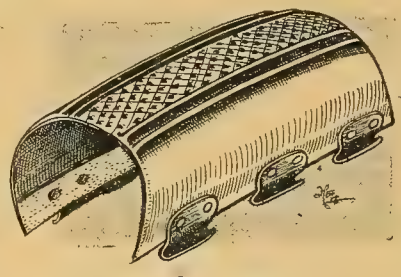


The latest R.O.M. tyre the tread of which is composed of squares of rubber.

covers are built up in three-ply casing with the finest Egyptian canvas. The sidecar cover is made in 26 × 2in., 2¼in., and 2½in. Other specialities of the same firm are the Redfern belting with the canvas core stretched by a special process in course of manufacture, horn bulbs, and wing plasters.

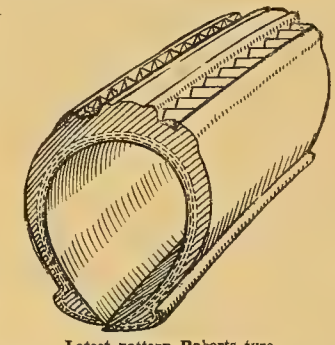
The Renold quickly detachable spare chain link.

HANS RENOLD, LTD., Progress Works, Manchester (No. 185).—The Hans Renold exhibit consists, as usual, of interesting show-boards showing the various processes through which the silent and roller chains pass before they are used for motor cycle transmission. Two motor cycle models are exhibited fitted with Renold roller chains running in oil bath cases. Also a new type of spring clip joint which is an improvement on the 1913 type, being more easily removed or adjusted.



The Roberts tyre band.

ALFRED ROBERTS AND SONS, LTD., St. Mary's Row, Birmingham (No. 7).—Various types of motor cycle covers, rubber studded and of the corrugated



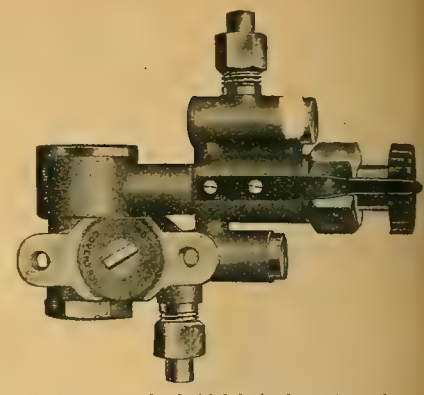
Latest pattern Roberts tyre.

pattern, detachable tubes, bands for re-treads, detachable non-skid bands, belts, gaiters, tyre repair outfits, and other rubber accessories are shown on this stand.

THE R.O.M. TYRE CO., LTD., Brook Street, Holborn, E.C. (No. 1).—The Rom Tyre Co. are showing the combination cover which has been so successful as a non-skid under all conditions, and a special range of tyres for cycle cars, inner tubes, and tyre accessories.

ROMAN RIMS, LTD., Upper Priory, Birmingham (No. 247).—2¼in. and 2½in. rustless rims for motor cycles without joint, seam, or rivet. Also the Roman motor cycle tyres.

ROTHERHAM AND SONS, LTD., Spon Street, Coventry (No. 178).—The principal novelty here is a lubricating system for motor cycles. Oil is contained in a tank, where it is under pressure by the action of a spring, which forces the oil through a drip-feed at a regulated speed to the engine. When the spring handle is turned, oil is drawn through into the 4 oz. tank from the main oil tank. A simple and useful device is a three-in-one petrol gauge, embodying gauge, strainer, and filler. A very neat form

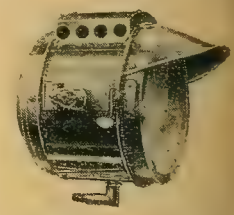


Rotherham mechanical lubricator for motor cycles.

of mechanical oil pump is intended to be driven from the two-speed gear. The driven shaft operates through a worm to the cam, which is thereby made to rotate slowly, operating the plunger of the pump. The stroke of the plunger is simply regulated by a spring device. A number of carburetters, as well as a great variety of other lubricating devices, are also shown.

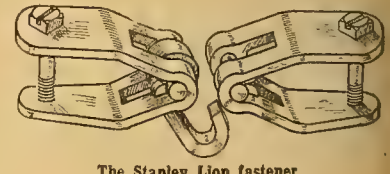
A POWERFUL LAMP.

RUSHMORE LAMPS, LTD., Brewer Street, Piccadilly Circus, W. (No. 213).—This firm's exhibit consists of the Rushmore cycle car acetylene lamps and generators. The Rushmore type of lamp has been extensively copied all over the world and was one of the first lamps of the circular type with adjustable focus and lens. The lamps are excellently constructed.



Rushmore motor cycle lamp.

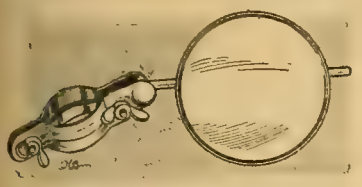
J. A RYLEY, Martineau Street, Birmingham (No. 215).—An extensive exhibit of lamps, components, fittings, and accessories of all kinds. A complete set of components for use in the construction of a cycle car is shown. These are exhibited on the complete chassis, which possesses many interesting features dealt with upon another page. An interesting little accessory is a rear red light for motor cycles. The electric light and small accumulator are fitted inside a little tool bag to be slung on the side of the carrier. A speciality of the firm is the Sthénos carburetter for cycle cars. This is a two-jet carburetter with no moving parts, designed to provide smooth running at slow speeds. Other interesting specialities are the K.E.W. magneto, in which the armature is enclosed in a solid casing, rendering the machine dust and waterproof, and the Vita sparking plug.



The Stanley Lion fastener

The Olympia Show.—

SEABROOK BROS., Great Eastern Street, E.C. (No. 190).—One of the principal novelties here is a neat form of tail



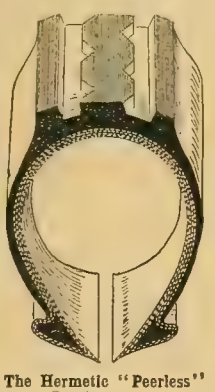
Seabrook Bros.' handle-bar mirror with ball joint. It is adjustable to any length on the armpiece.

acetylene lamp suited for fitting to the rear mudguard of a motor bicycle, and serving the double purpose of lighting the number-plate and showing a light aft. Similar types are also shown in electric lamps. The general range of motor cycle and cycle car lamps, horns, and bells includes a new type of electrically-operated horn.

SELF-SEALING TUBES.

THE SELF-SEALING RUBBER CO., Ryland Street, Birmingham (No. 149).—The pattern of tread employed on several of these covers is extremely interesting, one known as the Peerless consisting of two outer ribs between which a pronounced zig-zag pattern is moulded, which will be the leading line for 1914. Also another zig-zag pattern in which a steel stud is placed in each indentations of the zig-zag, a double zig-zag pattern in which there is a central rib, and a rubber-studded tyre. A speciality is also made

The Hermetic extra strong motor cycle tyre.



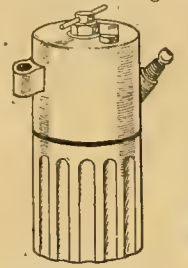
The Hermetic "Peerless" tyre.

of the Peerless cycle car tyre, made in the 650×65 mm. size as well as the 26×2½in. Self-sealing inner tubes and other tyre accessories are also shown.

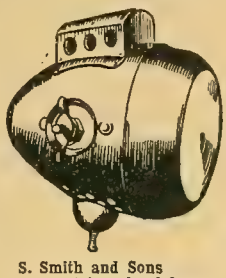
THE SEVERN RUBBER CO., LTD., Newhall Street, Birmingham (No. 71a).—Another large rubber firm hailing from the Midlands is the Severn Rubber Co. This concern has laid itself out specially to supply motor cycle and cycle car tyres of all descriptions, also brake blocks, footrest rubbers, repair outfits, and gas tubing. The last-named are sold in suitable lengths for connecting lamps and generators, and have the Severn moulded ends which prevents the tube from splitting. The cycle car tyres are made both grooved and studded.

ALFRED SMITH, George Street, Birmingham (No. 231).—"VVV" specialities for the motor cycle trade, which comprise among other articles luggage carriers, reflex rear lights, etc. Wholesale only.

S. SMITH AND SON, LTD., Great Portland Street, W. (No. 192).—The important feature here is, of course, the Smith speed indicator. A very interesting and novel exhibit is an aluminium generator, automatic in action, having drip feed and carrying no loose parts—thus facilitating cleaning. The generator is stated to be absolutely unbreakable under the roughest usage. The demand for electric lighting sets is met by a small dynamo giving 8 volts at 6 amps.



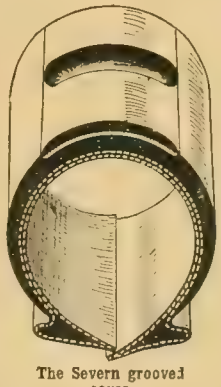
S. Smith & Sons' aluminium generator with corrugated lower portion to afford a better grip for dismantling.



S. Smith and Sons car acetylene head lamp.

This dynamo is built on the same lines as the car dynamos marketed by this firm, the system of regulation being identical, that is to say, there is nothing whatever experimental about the apparatus. The equipment includes egg-shaped lamps of clean design. The general exhibit of this firm is of a character already well known, and all the usual features are to be seen on the stand, including a working model of their well-known carburetter, which has lately shown up so well under R.A.C. tests.

THE SPENCER MOULTON TYRE CO., 75-77, Cannon Street, E.C. (No. 148).—These tyres are sold in three-ribbed pattern and in a combination pattern, which latter is well-designed and should be an efficient non-skid under all conditions. The company has lately paid special attention to the manufacture of motor cycle tyres, and these are becoming increasingly popular.

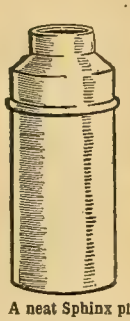


The Severn grooved cover.

The Spencer Moulton extra strong cover, the tread of which is a combination of steel studs and rubber lozenges.

Interior mechanism of Smith's speedometer

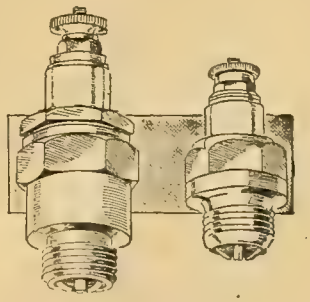
THE SPHINX MANUFACTURING CO., Bradford Street, Birmingham (No. 200).—In addition to a big exhibit of the Sphinx plugs, this firm shows spring handle-bars. A new fitting is a plug



A neat Sphinx plug cleaner.

Sphinx belt punch.

cover, which performs the functions of an umbrella, protecting the plug from inclement weather. There is also a new pattern belt punch of simple design fitted



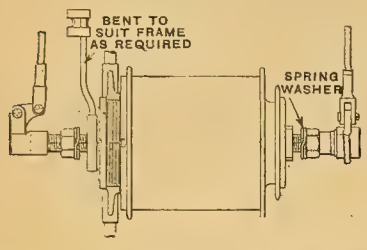
Two types of Sphinx plugs, showing comparative dimensions.

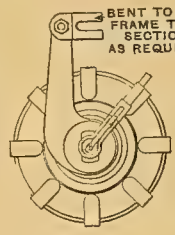
with an additional guide, ensuring that the punch will enter the belt centrally. A new model of plug specially made for racing work will be of interest to some.

THE SPLITDORF ELECTRICAL CO., City Road, Finsbury Square, E.C. (No. 174).—This American-made magneto is exhibited for the first time at a public exhibition. A detailed description of its construction was published in a recent issue of *The Motor Cycle*. The new type shows the latest American practice in magneto manufacture. The same firm exhibit Splitdorf induction coils for their dual ignition system, the Splitdorf plug

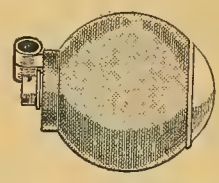
The Olympia Show.—

wire, and Common-sense sparking plugs and cables. Also the Excelsior carburetter, which is a ball-governed device with clock spring control, air valve, and index adjustments for air and gas. The A.P.L. Co. lighting system is an electric lighting equipment, which is said to be easy to install, and is very compact.





Details of the Sturmey-Archer hub.



C.A.V. spherical side-lamp

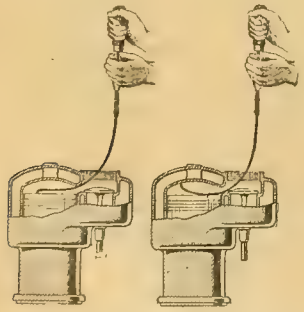
STANLEY FEAST AND CO., Waltham Road, S.E. (No. 217).—The principal novelty here consists of the "Musticon" tyre repair outfit, a feature of which is a rubber double repair stud designed to strengthen the tyre inside and out at the point needing repair. For the rest the exhibit includes a variety of articles to assist in the repair of pneumatic tyres.

A HARD WEARING TYRE.

STELASTIC TYRES, LTD., York Street, Westminster, S.W. (No. 131).—The Stelastic tyre is exhibited on this stand, which, as our readers are aware, possesses a practically indestructible tread which consists of a series of upstanding spirals of piano wire into which rubber is hydraulically pressed, the whole forming an armoured surface. These tyres were used by Mr. Little on the occasion of his ascent of Skiddaw.

STERLING METALS, LTD., Northey Road, Foleshill, Coventry (No. 164).—This exhibit comprises a good variety of air-cooled and water-cooled cylinder castings. Also a variety of aluminium, gun-metal, and brass castings connected with the production of motor cycles and cycle cars.

THE STERN-SONNEBORN OIL CO., Royal London House, Finsbury Square, E.C. (No. 239).—Sternol lubricants are much favoured among motor cyclists. This firm have a special method of testing all their lubricants, and will be pleased to demonstrate to motor cyclists at the above address the quality of their oils. Ambroleum is a gear box lubricant, which is demonstrated in a gear box with the gear wheels running. The box is open and the speed of the shaft is 600 r.p.m. This demonstration is to show the clinging tendency of the lubricant, and the cleanliness under working conditions.



The "Success" carbon removing tools marketed by Brown Bros. Ltd.

THE STONEHOUSE WORKS CO., Houghton Street, West Bromwich (No. 195).—Motor cycle pedals, belt rim brakes, and footrests, footboards, tyre inflators, and a 3½ h.p. motor cycle engine.

STURMEY-ARCHER GEARS, LTD., Lenton, Nottingham (No. 159).—No material change has been found necessary in the design of the well-known specialities of this firm. The enlarged hub of the 1914 model, which is to be seen on the stand, has already been in direct road service for some time past. A detail improvement is to be found in the foot control of the clutch for the 1914 model. The firm is supplying frame backs complete to form a part of almost any motor cycle.

HERBERT TERRY AND SONS, LTD., Redditch (No. 179).—In addition to the usual range of springs, clips, and small brass tools and the like, one of the most interesting exhibits here is a new shock-absorbing link in conjunction with the Druid spring forks to take horizontal road shocks. The result is to relieve the handle-bars practically complete from vibration. Another very important novelty is Terry's new belt fastener. This is made in hardened and tempered steel. The method of attachment to the two ends of the belt is simple, and the arrangement provides a double bearing surface, giving great strength, and quite free from any risk of spreading open.

BRAKE MATERIALS.

THE THAMES RUBBER AND METAL CO., Upper Thames Street, London, E.C. (No. 9).—The Thames motor cycle tyres. These are made in several different types, the principal being the heavy extra strong cover, the heavy-studded cover, and the Thames sidecar tyre. A speciality is also made of the Petrie Fibrax and Fibre brake blocks and the Doncaster's tyre stretcher, the last-named being an instrument used for stretching a cover before fitting it to the rim.

TIMSON BROS., Snow Hill, Birmingham (No. 172).—Wholesale only. Lamps, horns, and other accessories for motor cycles and cycle cars. This firm are export agents for the Levis, examples of which are on the stand.

THE TORMO MFG. CO., LTD., Bunhill Row, E.C. (No. 163).—2½ h.p. and 3½ h.p. single-cylinder engines are to be found on this stand, as well as 5 h.p. and 6 h.p. twins. Of these the 5 h.p. has a bore and stroke of 74 × 85 mm. and the 6 h.p. a bore and stroke of 85 × 85 mm. The valves are situated side by side, and are mechanically operated, while the cylinders are set at an angle of 60°. The finish of these engines and the beautiful casting of the radiator fins are worthy of special attention.

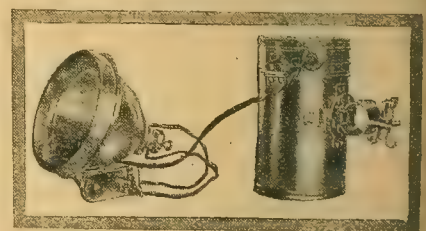
THE VACUUM OIL CO., LTD., Caxton House, Westminster, S.W. (No. 173)—This exhibit is, of course, a full range of lubricating oils, the high quality of which is already well-known to all our readers.

C. A. VANDERVELL AND CO., Acton, W. (No. 234)—A very striking illustration of the waterproof nature of the C.A.V. Ruthardt magneto can be seen here, the machines in operation being situated below water in a glass tank. A new spring advance mechanism for the magneto contact breaker is shown. There are a number of electric side and head lamps of very striking and neat design. There is also a new lighting outfit, consisting of a complete set of lamps and the necessary electrical battery for use on sidecar combinations. The C.A.V. system of electric lighting is, of course, perfectly applicable to cycle cars, and an outfit is shown, the price of which is extraordinarily moderate. The set embodies free-wheel mechanism, which does, in a simple form, the work of a cut-out.

C. C. WAKEFIELD AND CO., Wakefield House, Cheapside, E.C. (No. 154).—A complete range of oils and greases suitable for the gears and engines of motor cycles and cycle cars of various grades is shown. The many successes of Castrol in the past year on both road and track cannot fail to have attracted the reader's attention.

A COMPACT LIGHTING SET.

MESSRS. WESTON'S, LTD., 104, Wool Exchange, E.C. (No. 43), are exhibiting a particularly sound lighting set for motor cycles fitted to a Pope machine. It will be noted that the device is very similar in form to an acetylene lamp and generator, but we should imagine that, weight for weight, the electric outfit would easily prove the lighter. The working is as follows: A battery that can be recharged on the road by the user, by the simple removal of two



A neat electric head light and battery on the Pope stand.

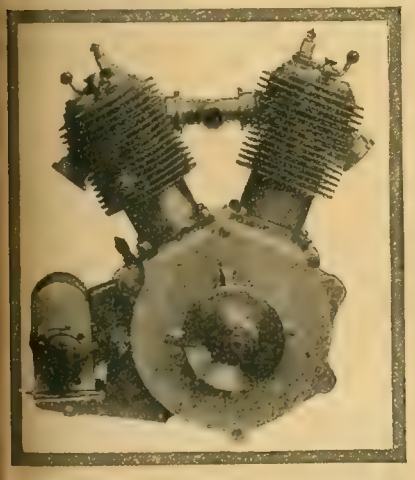
stoppers made airtight by thumb screws, is contained in a cylindrical metal case. When these stoppers are removed, the old or used charge can be emptied and a new charge substituted. A powder contained in a metal case, of size suitable for the pocket, can be carried and then mixed with water and, when stoppers are replaced, light will be given for approximately ten hours; thus the process is extraordinarily simple and compares very favourably with other methods of

The Olympia Show.—

lighting in regard to recharging; also, it is a particularly cheap form of lighting, since the tin of powder costs only about twopence and light is supplied for approximately ten hours. Moreover, vibration does not affect the generator in the least degree; in fact, we understand that the more vibration it is subjected to, the better are the results given, since the solution is well shaken up in the generator. A reversible clip is fitted to the generator, so that the rider can switch on the light by simply reversing the position of the powder. For example, to switch on the light, the generator is turned upside down and is fixed in that position. The light is now on, and to switch off, it is merely necessary to turn it upside down again and the light is swtiched off. This simple operation applies to both the motor cycle and cycle car outfits. The name of the battery is the "Aladdin."

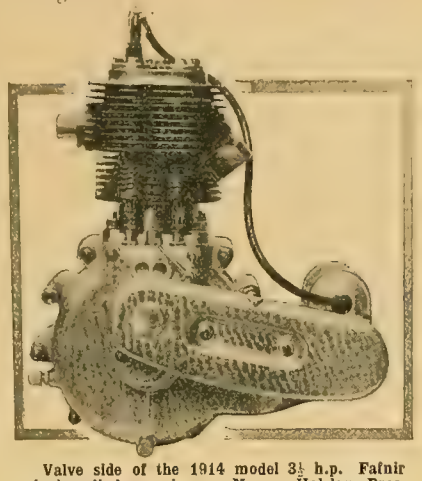
The standard Druid spring fork as fitted to a number of machines at Olympia.

S. WOLF AND CO., Southwark Bridge Road, S.E. (No. 214).—The principal feature of this exhibit is the display of magnetos. The new types of the U.H. introduce certain modifications in the adjustment of the contact breaker, and in the details of the general design. The new type of pole-piece has its extensions drilled out, leaving the tip of the pole-



Pulley side of the 6 h.p. Sarolea engine.

piece honeycombed. the effect being to equalise the strength of the spark for various positions of the sparking lever. New types of the Solex carburetter have been introduced to motor and cycle car requirements, fittings being provided for attachment to an induction pipe, or to a *monobloc* casting. The exhibit also includes steel pressings for cycle cars, sparking plugs, ball bearings, and other fittings and accessories.



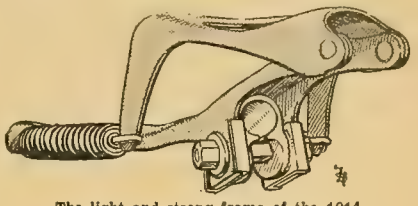
Valve side of the 1914 model 3½ h.p. Fafnir single-cylinder engine on Messrs. Hobday Bros. stand No. 188.

WOOD-MILNE, LTD., Ribblebank Mills, Preston (No. 13).—This year, instead of employing steel-rubber, Messrs. Wood-Milne, Ltd., are using ordinary rubber of the best possible quality in their tyres. The various patterns manufactured are long longitudinal indentations placed at staggered intervals round the tread, a rubber-studded pattern, a type in which there are semi-circular indentations on the tread, and a similar pattern in which the indentations are interspersed with steel studs. The tyres are, of course, manufactured in all the standard sizes.

WOODGATES BROS., Tiverton, Devonshire (No. 176).—Patchquick patent patches for use in conjunction with Patchquick fix, which dissolves the surface of the patch and ensures complete amalgamation between the patch and the air tube. The same firm also exhibit oils, grease, soft soap, cycle black, and calcium carbide packed in neat tins.

THE WULFRUNA ENGINEERING CO., LTD., Great Brickkiln Street, Wolverhampton (No. 221).—This exhibit of the Wulfruna Co. in the gallery is of more interest to manufacturers of motor cycles than to readers. It consists of Pickard's patent lining apparatus for lining the frames and tanks of motor cycles, and consists of a small stylographic pen provided with guides. The point is forced through the point of the stylo by a hand-operated piston, and the guide fixes the distance apart of the lines, also their breadth.

XL'ALL, LTD., Hall Green Works, Birmingham (No. 212).—An extensive selection of saddles with parallel motion adapted to fitting to all makes of motor cycles, the design in each case aiming at the low position without sacrifice of a



The light and strong frame of the 1914 pattern Xl'All saddle.

great range of springing. An interesting novelty is a combined saddle and spring carrier, the spring carrier of which can be used also as a pillion seat, the same spring mechanism also pro-

An addition to the Xl'All range of saddles enabling a low position.

viding spring footrests for both riders. A special new saddle for drop frame motor cycles is made with a stamped steel underwork, of which the top and bottom links are stamped out of one piece, the seat-pillar being combined with it and formed of another stamping. This allows room for springs without sacrificing the low position, these springs being readily adjustable at accessible points.

The latest pattern Beldam tyre.

The two-seater Craven sidecar (cane pattern) attached to a 3½ h.p. Triumph

ZENITH AUTOMATIC CARBURETTER.

The Zenith Carburetter Co, 171, Great Portland Street., W., have introduced a small model of their instrument for cycle cars with water-cooled engines.

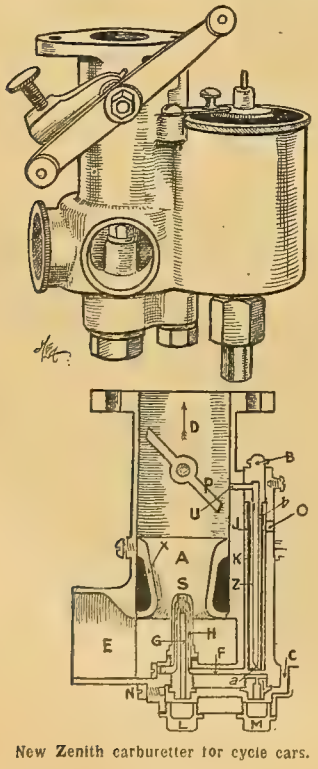
The vertical section shows that the two jets, main and compensating, are disposed concentrically, the compensating jet allowing for a constant flow for a given period of time, this being independent of the suction or depression. To a jet G, drawing petrol direct from the float chamber, is added a compensator H, which is connected to the base of pipe J, the top of J being open to the air. The petrol falls into this pipe J through a gauged orifice projecting from the base of the float chamber. The cross section of J being larger than H, pressure changes within the carburetting chamber can take place without affecting the flow through the gauged orifice beforementioned.

This is the broad principle of the device, and the two jets both have their opening at S, the main jet being in the centre, the space H being connected through F to the top of the gauged orifice or compensator.

Slow Running and Acceleration.

Tubes K and Z give perfect carburation when the engine is just turning over, and enable the engine to pick up without hesitating when the throttle is opened slowly under load. Z is connected to a by-pass U and is situate inside the tube K. This tube has two holes a and b, and, by varying the size of these holes, the quantity of petrol can be regulated. When the engine is pulling, the action in K and Z is *nil*, but for starting, slow running, and picking up they play important roles. For starting they obviate any need for flooding the jets; when running slowly the depression is weak and petrol will rise in K until it reaches Z, when it will be strongly sucked up and sprayed at U.

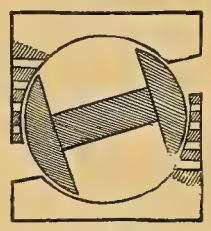
For picking up the sudden rush of air past the jets when throttle is opened is compensated by the petrol remaining in J. This petrol descends and is induced through F and up through S, which, having a large orifice, allows for a rapid flow of spirit. X is the choke tube, and L and M plugs allowing the jets to be readily removed. An inspection window in the side of the float chamber permits the spirit level to be accurately gauged.



New Zenith carburetter for cycle cars.

1914 U.H. MAGNETO.

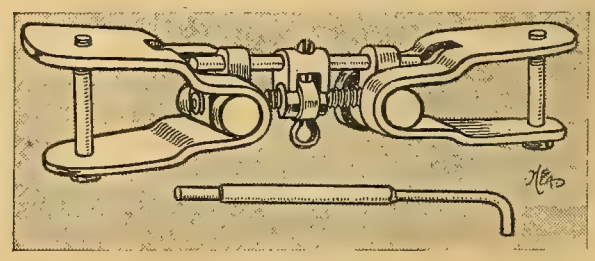
The alteration to the U.H. magneto for 1914 is an extension of the pole pieces over the armature. These are drilled longitudinally with rows of holes, and the range of maximum spark is thereby extended further along. The holes in the pole pieces enable the lines of force to be cut over a bigger range of the contact maker, with the result that the spark at slow speed is as "fat" as at high speed. The engine can be started with the spark fully retarded with great ease.



U.H. magneto for 1914 showing extra portion on pole pieces (shaded) with holes drilled from top to bottom.

AN ADJUSTABLE BELT FASTENER.

We have received a sample of the Hibrul belt fastener, made by the Hibrul Engineering Co., 19, Cannon Street, Manchester. This is an ingenious device, and works as follows: If the split pin be withdrawn and the lever is inserted in the hole through which it passes, by turning the central nut the ends of the belt fastener may be brought nearer together or farther away, according to the direction of rotation. It will be noticed that a guide bar is used to keep the ends of the belt fastened parallel, which is kept in position by a split pin.



The Hibrul belt fastener.

THE PEDERSEN-ALPASS THREE-SPEED HUB.

Mr. Pedersen, the inventor and manufacturer of the well-known Dursley-Pedersen cycle, has turned his attention to the production of a three-speed motor cycle hub gear, the point specially aimed at being to reduce friction on the lower gears as far as possible. We gave the first illustrations and descriptions of this gear in *The Motor Cycle* of 28th August, and now we learn that special machinery is being installed at the Dursley works with a view to turning out the gear in quantities.

The special feature of the hub is that there is only one gearing down for both the middle and low gear, the top speed being the direct or solid drive. All driven parts run on ball bearings, and a friction clutch is interposed between the gear and the belt rim to absorb any shock which might be transmitted to the gear when changing, which is effected by a lever on the tank, movement of which automatically locks the dog clutches and then the friction clutches in one movement. The clutches are easily adjusted externally. It is possible by the adoption of these clutches to employ a single direct chain drive from the engine to the back wheel. Of course, if preferred, a belt, or belt and chain may be used, but the inventor has a decided preference for a single chain as a power transmitter. A comparatively few number of parts are utilised in building up the gear, and a feature worth mentioning is that it is possible to dismantle and re-assemble the gear with no other tool than a screw driver.

The Pedersen-Alpass three-speed hub gear.

We are asked to state that a 3in. cover to fit a 2¼in. motor cycle rim has been manufactured by the Hutchinson Tyre Co for the past two years. This offers readers an opportunity of guarding against tyre troubles without recourse to changing the rim as is usual when fitting a tyre of larger section.

Since our description of the 1914 pattern Rex-Jap appeared last week, we understand from the Premier Motor Co. that it has been decided to fit Kempshall 650×65 mm. tyres as standard.

RECORDS AT BROOKLANDS.

Remarkable Long-distance Runs by Rudge and N.S.U. Riders.

THERE is always great activity at Brooklands about Show time, and strenuous efforts have lately been made to annex various records. On Thursday last the Rudge had quite a field day, for between them C. G. Pullin and T. E. Greene broke no less than nineteen records. The weather was fine, but very windy. Pullin had a long struggle before he got among the records, and it was not until he had covered 250 miles that he beat the previous best, his time being 4h. 11m. 2⅖s., which is a record for Classes C and D. Going on for six hours, the following were his records :

C. G. Pullin, surrounded by a group of admirers who saw him break records at Brooklands last Friday.

5 hours	... 298 miles 1,020 yards	= 59.71 m.p.h.
6 hours	... 358 miles 1,106 yards	= 59.77 ,,
250 miles	... ... 4h. 11m. 2⅖s.	= 59.75 m.p.h.
300 miles	... ... 5h. 1m. 22⅖s.	= 59.72 ,,
350 miles	... ... 5h. 51m. 36⅖s.	= 59.72 ,,

Pullin thus averaged close on sixty miles an hour for six hours—a feat all the more remarkable on account of the high wind prevailing.

When Pullin had finished his 6 hours attempt, T. E. Greene continued the ride on to 7 hours. Greene had made an attempt on the 9 hours record earlier in the morning, starting at 7.30 a.m., but was dogged with valve trouble right up to six hours, when he gave up, as the repeated stops to change valves put him outside the record average. The following records stood to the credit of T. E. Greene and C. G. Pullin at the end of seven hours :

7 hours	... 419 miles 823 yards	= 59.92 m.p.h.
400 miles	... ... 6h. 41m. 21⅘s.	= 59.79 ,,

It is interesting to note that the 7 hours record beats the previous best in Class E for 7, 8, 9, and 10 hours, and establishes a new record for Classes C and D for 7 hours; while the 400 miles record beats the previous best in Class E of 9h. 6m. 25⅘s., made by H. Collier in his twenty four hour ride at Canning Town track (May 5th and 6th, 1909), and also establishes new records in Classes C and D.

On the same day, Lieut. R. N. Stewart, riding a two-cylinder N.S.U. (54½×75 mm.=349 c.c.), established new records in Class B for the following distances and times :

350 miles	... ... 8h. 32m. 4⅘s.	= 41.01 m.p.h.
8 hours	... 328 miles 184 yards	= 41.00 ,,
9 hours	... 369 miles 1,454 yards	= 41.09 ,,

This ride was noteworthy, as it was a genuine amateur attempt, to verify Stewart's ability to ride nine hours at Brooklands to settle a sporting bet made by Stewart with his fellow officers in his regiment. He had no trade assistance whatever, and had his own orderly and servant to assist him. He ran most consistently from start to finish, and would doubtless have done much better but for the very high wind which prevailed all through the ride.

CLUB NEWS.

Ripon and District M.C.C.

The annual dinner took place on the 14th inst.

Islington and District M.C.C.

The annual dinner, followed by a concert and prize distribution, will take place on December 11th at headquarters, Camden Head Hotel, Islington Green.

Dewsbury M.C.

The result of the 100 miles reliability trial, held on the 6th inst., was as follows : 1, C. Sydney (3½ Bradbury) ; 2, F. Rispin (3½ Triumph) ; 3, C. Hart (5-6 Rudge Multi sc.)

Cambridge University M.C.

The results of the hill-climb held at Gazeley Hill on the 8th inst. are as follow :

CLASS V. (any machine up to 1,000 c.c.)—E. I. Gibbons (8 Martin-Jap).

CLASS VI. (unlimited).—E. I. Gibbons (8 Martin-Jap).

CLASS VIII. (cycle car class).—1, C. O. Hayward (10 Singer) ; 2, L. Hansard (8 G.N.)

Burton-on-Trent and District M.C.C.

On Monday, December 1st, a lantern lecture will be given at headquarters (Station Hotel) at 7-30 p.m., by Mr. F. Hunt of Nottingham. The subject will be "Motor Cycle Variable Gears." All local motor cyclists are cordially invited to attend and contribute to the discussion.

The first dinner will take place on Monday, December 8th, and the chair will be occupied by Mr. E. E. Baguley ; vice-chairman, Mr. T. H. Baldock.

A lecture on "Magneto Ignition" will be given by Mr. Bennett (of the Bosch Magneto Co.) on January 6th. Non-members will be welcomed to this lecture also.

Streatham and District M.C.C.

The annual dinner will take place at the Holborn Restaurant on 20th December. Mr. Stenson Cooke will occupy the chair. Medals and prizes to the value of over £150 will be awarded.

Public Schools M.C.

Members who are visiting Olympia are requested to meet at Stand No. 133 at 1.30 p.m. on Saturday, the 29th inst. The address of the hon. sec. is now 21, St. Nicholas Street, Coventry.

Tyldesley and District M.C.C.

The whist drive and dance held at Tyldesley on the 12th inst. proved very enjoyable, there being 103 members and friends present. The first annual dinner, prize distribution, and smoker takes place at Leigh headquarters on December 3rd.

Liverpool A.C.C.

The annual dinner, followed by the presentation of prizes, will take place on the 17th of next month at the Hotel St. George, Liverpool, at 6.45 p.m. On Jan. 3rd the open winter reliability trial will be held from Liverpool to Carlisle and back.

Kidderminster M.C.C.

The results of the speed-judging competition, held on Oct. 18th, are as follow : 1, C. A. Nicholls (2¾ Douglas) ; 2, T. Jenks (6 A.J.S.) ; 3, H. Walker (6 A.J.S.). No watches or speedometers were allowed, but one competitor, on being searched, was found to have an alarum clock and six watches concealed on various parts of his person and machine. The members were afterwards entertained to tea by Mr. and Mrs. H. E. Pritchard at the George Hotel, Bewdley.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Do Sidecars Skid?

Sir,—I notice your contributor "Ixion" states that he has never known a sidecar skid. I have. I ride a 7-9 h.p. Rex and sidecar, and recently drove from Llanfair Talhaiarn to Manchester (after heavy rain), *viâ* Abergele, Flint, and Chester. The machine skidded from side to side quite frequently, the tail evincing a desire to get broadside to the road. My friends on Matchless and Triumph outfits experienced the same thing. All three outfits are properly aligned and steer "hands off" on crown of a dry road.

REGD. LOCKE.

Excessive Garage Charges.

Sir,—"Lightweight" complains of ill-treatment at a garage near Victoria Station.

I also recently left my machine, a Douglas, at a car garage near Victoria Station. I was obliged to do this, as the oil tank having become empty I was in danger of damaging the engine.

When I called for the machine some hours after, I was allowed the use of appliances, supplied with a tank full of oil, and given some slight assistance.

For this a charge of 6d. was proposed by the garage people; indeed I had some difficulty in compromising at 1s.

I hope you will find space for this communication in justice to garage proprietors who are not all mercenary to the degree one might be led to suppose.

J. SYDNEY CABLE.

Engine-shaft Gears.

Sir,—Noticing much controversy lately in *The Motor Cycle* as to the relative merits of hub and counter-shaft gears, I have been rather surprised to see no mention made of engine-shaft gears. One sees very few of these about considering what serviceable gears they are. I have now had one of the Millennium Fit-All two-speed gears running for three years on a 5 h.p. sidecar combination, and a few days ago I dismantled it for examination. All the gear wheels and working parts were absolutely without any sign of wear, and although I have not oiled or greased its internals for two years, it was still in quite a greasy state. The only thing necessary to be done was to true up the groove in the belt pulley in the lathe.

As regards its control, it is absolutely foolproof, one lever does the lot, high, low, and F.E. from the side of the tank; the changes can be made as quickly as one likes without lifting the exhaust valves as the gears are epicyclic and always in mesh. Should the clutch ever show signs of slipping it can be easily adjusted in a minute on the roadside. The clutch requires no oiling of any kind and cannot possibly seize up.

No doubt some of your readers will say, "What about the extra wear on the engine-shaft bearing, due to overhang and weight of gear?" I can only reply from experience—the phosphor bronze bush I fitted two years ago is practically without a shake to-day; in fact, it is as good as the day it was put in and will, no doubt, run another two or three years. I think that the gear also makes the engine run more smoothly, acting as an outside flywheel.

The chief disadvantage is the inability to start without jacking up the back wheel on the stand. I am surprised the makers have not overcome this difficulty long ago (perhaps they have ere now), as, with a little thought, suitable mechanism for a kick-starter could easily be fitted. Personally, nine times out of ten I make a push start in top gear and try to arrange my stoppages as much as possible on the level or downhill, but in any case it is an easy matter to start the other way on the stand and glide off even on a steep hill.

Its chief advantages are cheapness as compared with other types of gears, reliability (it has never let me down yet), wearing qualities, foolproofness, and simple manipulation. If it should happen that the gear should become deranged from any cause, it can be taken off in a very few minutes and an ordinary pulley slipped on and used temporarily—the machine is at least not totally disabled as it otherwise would be, perhaps for weeks, should the back wheel have to be sent away.

One advantage of having hand control (as against foot levers), and one that I have not seen mentioned before, is: Sometimes one meets with a lot of newly laid metal, say, in a country by-road, or one gets "lost" and finds an almost impossible tortuous hill facing one, fit only for a goat; the passengers can dismount and the driver work the clutch by hand whilst walking alongside the machine as slowly as he likes. The tyres and machine are thus saved a great deal of unnecessary wear and tear and more than once I have been glad of having hand control to my clutch.

It would be rather interesting to hear other of your readers' experiences with engine-shaft gears.

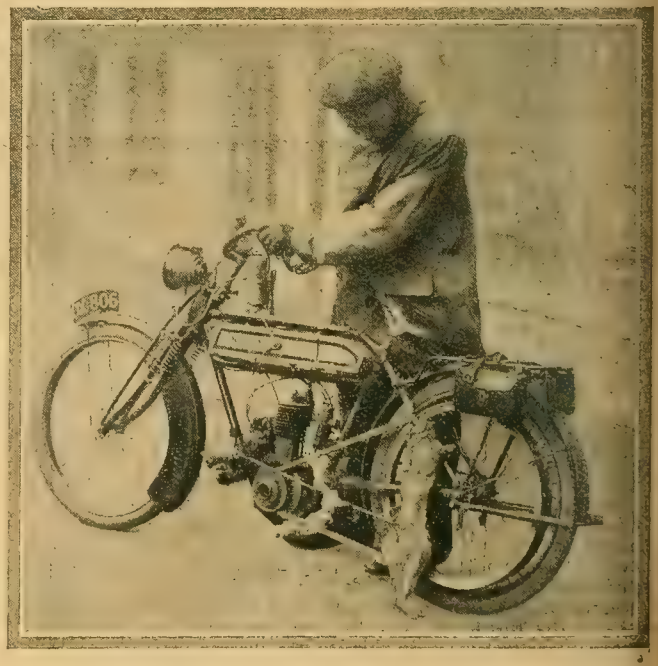
AF 274.

Rabbit Catching.

Sir,—Isn't this rather a novel way of catching a rabbit?

I was travelling between Colchester and Ipswich on Sunday evening, the 16th inst., and this rabbit was struck by the front wheel of my machine and apparently flung backwards on to the belt. Dismounting, I looked for bunny, but could not find him, but on looking for traces on the machine I was surprised to see him hanging up as you see in the photograph. His crushed appearance is worthy of notice. I wonder if any of *The Motor Cycle* readers have seen one caught by a machine like this before. It would be interesting to know.

E. FELGATE.



A rabbit caught by a motor cycle (see letter from E. Felgate).

Shippers' Delays.

Sir,—Abroad one is constantly hearing of cases of neglect and indifference on the part of manufacturers and shippers, but I think my particular case is worth mentioning. On July 15th I cabled to a friend to purchase spare forks from the makers of my machine. He called on them within three days explaining what I required and paid their bill. The makers proceeded to hand the package over to a shipping firm for despatch, and they advised me on the 24th July of what they had done.

I waited nearly a month, but failed to hear from the firm of shippers, so I wrote again to the makers and have just received their reply, merely repeating their first advice and adding that they are communicating with the shipper. To-day, although exactly three months since my cable, I have not got the forks. Wanting them badly I cabled again to my friend on the 3rd September, and learned the name of the ship they were despatched by, which ship did not leave England till September 8th. The ship is now in Karachi, but as I have had no advice from the shippers as to who are their clearing agents here I am helpless.

It so happens that I was able to effect a temporary repair whereby I could still use the machine, but had I not been able to do so you can imagine what a great deal of trouble I should have been put to. EXILED.

Karachi, India, October 14th.

A Gradient of 1 in 1.

Sir,—"Ixion" appears to have been catching it hot lately from some of his ultra-critical readers, but he is not the only sinner.

I note with interest in your issue of the 13th inst., p. 1459, a photograph of a Clyno-ite on a gradient of 1 in 1, and on the advertisement, p. 81 of same issue, a photograph of the Excelsior climbing 1 in 2.44.

Should any Midland club want a new hill-climb I can recommend Woollas, up the Worcestershire side of Predon Hill. C. W. HELLIER.

Sir,—*Re* the photograph of the driver of the Clyno on a gradient of 1 in 1 which you published in the issue of November 13th. Surely this is a mistake, for a gradient of 1 in 1 gives a base angle of 45°, and in the photograph it appears to me to be nearer 90°. Assuming the mountain side is perpendicular, then the gradient is ∞ in 0 and $\frac{\infty}{0} = \infty = \tan 90°$. VULCAN.

[Our correspondent is in error, the inscription is quite correct. In *The Autocar* of June 22nd, 1912, page 1117, we read: "A gradient of 1 in 10 means that if a vehicle starts from a certain point and is driven over ten units of distance (whether the distance be in feet, yards, or kilometres), in traversing this distance the vehicle rises up one foot, one yard, or one kilometre, as the case may be." Also in *The Engineer* of November 15th, 1912, page 509, in an article by Mr. H. E. Wimperis, M.A., it is stated that to climb a gradient of 1 in 10 a tractive effort of 224 lbs. per ton is required. Following this line of argument, we find that to climb a 1 in 1 gradient 2,240 lbs. per ton will be necessary; in other words, the whole weight is lifted vertically. We believe that in mining engineering the tangent is taken to represent the gradient, but in road work it is customary to take the sine. The difference, however, is very slight even on the steepest hills met with on the roads, *e.g.*, an angle of 14° measured by the sine method is 1 in 4.13, by the tangent 1 in 4.01. On the Continent gradients are expressed in percentages, and they can also be expressed in the angle made with the horizontal. It is simply a matter of custom, but it is interesting to note that the sender of the photograph in question called the gradient 1 in 0.—ED.]

Reflex Mirrors.

Sir,—Your contributor "Ixion" evidently does not understand what he describes as "the fierce hatred of many cyclists towards the red reflex mirror," although he partly explains the attitude by his own declaration that "there would be much more to say in favour of compelling all pedestrians to wear phosphorescent hats after sunset." The real reason for the so-called "fierce hatred of many cyclists" is not an objection to reflex devices *per se*, for they are as harmless and as useless as a gollywog mascot, but many cyclists can fortunately see beyond the end of their noses, and motorists have themselves given the show away, so that it is clearly understood that the reflex device agitation is only intended as the thin end of the wedge for the ultimate object of bringing about a compulsory second lamp, and it is this ultimate object which explains the "fierce hatred" "Ixion" cannot understand. If motor cyclists had displayed the same "fierce hatred," they would have received the sympathy of all cyclists in their present state of consternation over the recent divisional court judgment, for the difficulties, danger, and general unnecessary nuisance of a second lamp on a motor bicycle are even more so in the case of an ordinary bicycle. Further, an ordinary cycle cannot be left standing by itself as an obstruction in the road, and the cyclist on the road is not nearly such a danger as a pedestrian, a flock of sheep, cattle, etc., so that before the rapidly moving cyclist requires to be illuminated, the pedestrian and all other road users would have to be compelled to carry tail lights, which statement has only to be made to show the absurdity of the present demands taken to their logical conclusion. Under the conditions of atmosphere mentioned by "Ixion," it is well to bear in mind that if the cyclist is "practically invisible till the motorist or motor cyclist is within a "yard or two of him," it is equally certain that the motorist's or motor cyclist's lamps are not powerful enough to illuminate any reflex device, and if the cyclist is in danger, the pedestrian must be in danger four times as much. W. F. COOK.

[We cannot agree with our correspondent. Motor cyclists have no wish to saddle cyclists with rear lights, for motor cycles would naturally be included in any order of the kind. It is not true that a good reflex light is useless; the red buttons and cheap imitations certainly are, but a good reflex light properly attached in a horizontal position is visible at least twice as far off as the cycle is without one. It is, as a rule, harder to see a cyclist than a pedestrian.—ED.]

Luminous Paint on Speedometers.

Sir,—I have just purchased a watch with so-called radium painted figures. They show clearly in the dark. Could not our speedometer figures be painted in the same way? or even if only the ten-mile figure and pointer were painted, it would be a great boon to motor cyclists.

A. CUNNINGHAM (REV.).

AT OLYMPIA. Three-quarter front view of the 2¼ h.p. two-stroke Triumph, showing outside flywheel, large silencer, and belt drive

Two-stroke Lubrication.

Sir,—With reference to the principle of mixing the oil with the petrol, neither the Bordesley Engineering Co., nor the Americans mentioned in your footnote are entitled to the credit of originating this, unless the period you describe as "some" goes back ten or twelve years.

So far back as this Mr. Charles Garrard originated this system, and I have some of the special oil he used now by me. "*Palmam, qui meruit, ferat.*"

For the guidance of some of the future "inventors" who will make and claim a great discovery, I may recall the fact that he used it on a *four-stroke engine*. A. C. DAVISON.

Carbon on Sparking Plugs.

Sir,—Having recently experienced some trouble with regard to sooting up of sparking plugs, I was much interested in Mr. J. F. B. Carslake's letter on the subject, and found that an external gap certainly cleared the plug points.

I was intending to try the effect of a small capacity as suggested, but have been rather deterred (having no rubber trousers) by the experiences of Mr. Jabez Hyde-Thomson. I am not quite clear what part of the circuit Mr. Thomson obtained resonance with, and it would be interesting if he would state whether his engine developed more power, as from the first mentioned letter it appears that it should do so, owing to the intensified heat of the spark.

A SEEKER AFTER KNOWLEDGE.

A Long Climb.

Sir,—A short time ago I climbed to Tosari on my 2¾ h.p. Sunbeam. That is a rise of 5,825 feet in fourteen miles, *i.e.*, 1,419 feet higher than Ben Nevis. I should think this is a record climb for a 2¾ h.p. motor cycle at least.

I did the climb in just under one and a half hours and entirely on the saddle. I was only off the machine three times, once to read a notice board, once to admire the view, and once I skidded in deep sand on a hairpin corner.

There was a difference of 30° in the temperature between the foot and the top, *i.e.*, 92 to 62, both in the shade. At the foot, sugar cane, bananas, and other tropical vegetation were growing; at the top, fir trees, roses, etc. The machine is absolutely standard, with gears 5.3 and 10.4, and has done over 5,000 miles. By the by, it still has both its original chains, and neither has broken in spite of what Mr. Bowden said. There was no sign whatever of overheating, though the climb was quite close to the equator and done at midday. LEWIS PECK.

Soerabaya, Java.

Why More Air with Benzole?

Sir,—After my protest against the loose statements made by "experts" concerning carburation, I rather expected some brickbats, and was considerably heartened, Mr. Editor, by your cautious approval; I did not expect, however, such ill-aimed boomerangs as have been discharged by "Chemist" and Mr. Preston.

The sentence in "Chemist's" letter to which I took exception was, "the higher proportion of carbon to hydrogen in benzole shows us why we must give more air than with petrol." I pointed out that, weight for weight, carbon requires about one-third as much air for combustion as hydrogen does. Now "Chemist" (and Mr. Preston with him) corrects me, saying that I should have considered gaseous volumes, that one volume of "*gaseous carbon*" requires four times as much air for burning as an equal volume of hydrogen; the correction that is called for is, in my opinion, of "Chemist's" intelligence—I had not dreamed that he would be guilty of thinking of such an absurdity as "gaseous carbon" existing within miles of a motor cycle. I should *not* have considered gaseous volumes, but suppose we do, and do it correctly, take equal volumes of petrol gas and benzole gas, then a chemical formula representative of them must be assumed: let us say C_6H_6 (benzene) for benzole, and C_7H_{16} (heptane) for petrol, though I am quite prepared to accept anything better. Then $2C_6H_6 + 15O_2 = 12CO_2 + 6H_2O$, or 2 vols. benzole gas and 15 vols. oxygen will combust completely, and $C_7H_{16} + 11O_2 = 7CO_2 + 8H_2O$, or 1 vol. petrol gas and 11 vols. oxygen will combust completely. The method of Mr. Preston and "Chemist" has brought us to the interesting conclusion that, taking equal volumes of petrol gas and benzole gas, the *former* requires almost 1½ times as much air as the latter for combustion; surely, then, it stands to reason that, if, as is the case, on substituting benzole for petrol in our carburetters, combustion is incomplete unless we give more air or narrow the jet, there must be much more benzole drawn from the original jet than there had been petrol under like conditions, and in my last letter I ventured to suggest the explanation of this. CAMERON GIBSON.

Power for Sidecar Work.

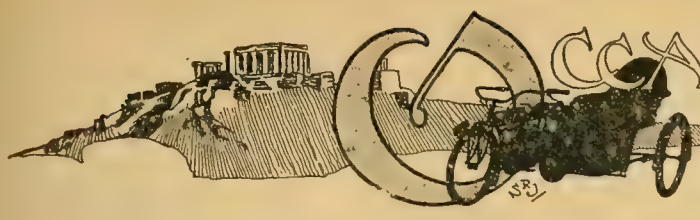
Sir,—Being a constant reader of your valuable journal, and having read the correspondence recently appearing in your columns relative to sidecar work, perhaps the following brief account of my experience may prove of interest to your many readers. I bought a 3½ h.p. Bradbury, two-speed gear and sidecar early last May, and up to the present I have covered well over 5,000 miles. I use my machine daily in all kinds of weather for business purposes, and have had absolutely no trouble with the exception of tyre trouble and defective belts.

The latter fault, I may say, has been remedied since I used a Whittle belt, which I think has no equal. My Bradbury has brought me over most of Ireland, including the worst roads and hills with which we are "blessed." I have done several day trips of over 100 miles, and on one occasion I covered 227 miles in the day with a 12 st. 9 lb. passenger and numerous spares through Wicklow and Wexford counties, which boast of unlimited stiff gradients and mountain roads, and my only trouble was punctures. I have been for four days over the worst part of the West of Ireland, some of the roads being mere sheep tracks full of ruts and stones, and, as my passenger can testify, we completed about 350 miles with no trouble except one puncture, which we got in the town of Ballinasloe. Furthermore, while in Galway city we met motor cyclists from various parts, who congregate for the Galway Races, and they, one and all, had tales of woe to tell, including sidecarists with 6-8 h.p. outfits. During the strikes in Dublin (which are as yet unsettled) I have on dozens of occasions carried four and five passengers to and from the city, and on one occasion I brought three passengers to Drogheda, a distance of 35 miles from my home, without the slightest difficulty.

So far in my travels, I have not come across any hill which has proved too much for my Bradbury and sidecar, and for economy and freedom from trouble I think the 3½ h.p. single cylinder machine will be very hard to beat.

I can assure you that the owner of a sidecar combination has been much sought after in Dublin of late, and especially when we had no tram service after dusk. I only joined the motoring "fraternity" in May, and I have no interest of any kind in any firm. H. A. MULLETT.

H. A. Mullett with his 3½ h.p. Bradbury sidecar and complement of four passengers



OCCASIONAL COMMENTS

BY 'IXION'

The Cost of the Sidecar Outfit de Luxe.

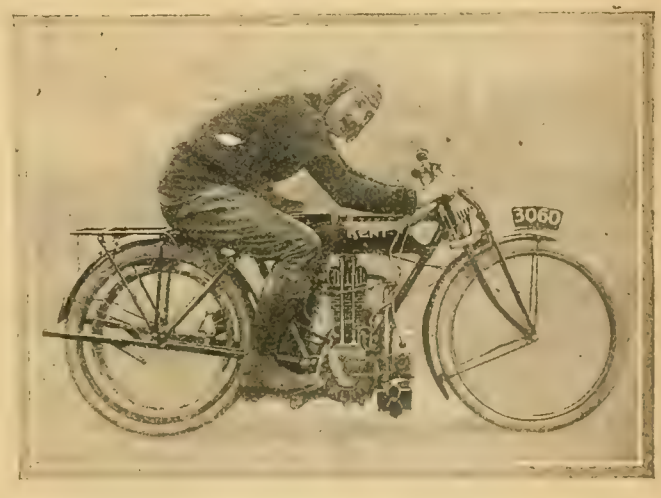
Last week I was inspecting an up-to-date sidecar outfit, newly purchased by a fellow-enthusiast, and, in reply to my query, he confessed that the bill left him no change out of £100. My year's riding has afforded ample evidence that such outfits are as common as blackberries in the more popular touring districts. *Ergo*, there is an enormous potential demand for the high-class £100 cycle car. It is ridiculous to assert that the first-class £100 cycle car is either a mechanical or a commercial impossibility. The fact is that the firms with most experience and capital have treated the cycle car with marked lukewarmness. But we need good cycle cars. Factories can be run up in a few months nowadays The firms of real standing could get ample capital subscribed in a week for a cycle car offshoot if they gave the least evidence that they had a first-class design. It is ridiculous to imagine that the entire inventive talent of a big concern is employed from January 1st till December 31st in planning the adoption of a new lubricator and the transfer of a gear from the hub to the counter-shaft.

Two-stroke Lightweights.

The new miniature two-strokes give more promise of a final solution of the ancient town runabout problem than any of their predecessors. Judging by the latest examples, the worry of "four-stroking" at low speeds is being rigidly eliminated, and they lend themselves admirably to no-trouble transmissions—a point that has spelt shipwreck to many a clever effort in the past, whilst they also surmount the difficulty of constructing wee valve parts that can stand up under heavy spanner-tightening, for the valve caps, etc., of a 1 h.p. engine should be, if anything, tighter than those of an 8 h.p., and they have often crumpled up when a big wrench was forcibly applied. Many tiny engines of the last decade have leaked air in and oil out at every pore, but the two-stroke design dodges all this. I am a little disappointed in the weights which seem likely to rule in this class. Equipped with a two-speed gear, they often outweigh the original single-geared Douglas, which has turned the scale at 110 lbs., or even less, and not a few weakly, elderly, or timid gentry of my acquaintance found that too much. I admit that the specification is an improvement on any single-geared four-stroker, but we want reductions in both weight and cost ere we can genuinely tap the lower financial strata of the movement in *posse*. Lower prices should come along with bigger outputs, but weight is a matter for designers. It will be a mistake if these feather-weights are developed up towards the luxurious specification of a £50 roadster. They should be developed down to a weight and down to a price if they are to afford entry into the sport for the waiting millions. As rivals to the medium and heavy-weights, they cannot hope for more than a restricted future.

What is an Emergency Gear?

The sales of one or two ingenious variable gears, limited by their design to a bottom gear ratio of 7½ to 1, or thereabouts, have probably suffered a little during the last two seasons by the excessively low ratios employed by the cracks in big competitions and by the atmosphere thus created, which suggests that nothing under double figures is of real use to the go-anywhere man. It should be clearly understood that in the Six Days Trials the astute expert knows he may have to tackle an almost perpendicular precipice, when its surface is sloughed up by rain, when the previous ascents have ploughed deep ruts in all directions, and with singles and sidecars either baulked or crawling immediately ahead of him. Consequently he is wise to fit as low a ratio as the design of his machine will permit; and if the design of the machine limits him to a 7½ gear, he will naturally feel more comfortable with a 750 c.c. or 1,000 c.c. engine than with one of 500 c.c. But the ordinary tourist is in rather a different position; he seldom tackles a freak hill; when he does, he has the road practically to himself; he need not—and probably will not—attempt such climbs in frightful weather, and under urgent pressure to avoid a first-time failure. For him a much higher emergency ratio may suffice. I personally have climbed practically every notorious freak hill in England, Wales, and Scotland on a 7½ gear with a 500 c.c. engine; and there are men who have been up most of them on a 6½ gear. No private rider need therefore disdain a solo machine because its emergency gear ratio is no lower than 7 or 8 to 1, though it is true that a 9 or 12 ratio will give him more confidence and a greater mastery.



C. W. A. Korner on his 3½ h.p. Rova-Kent motor cycle, which was built and designed by Messrs. Eglington and Clarke, of Adelaide. He made fastest time of the day in a hill-climb organised by the South Australian M.C.C. Note the engine, which has two inlet valves and two exhaust valves of the overhead type, and a ported cylinder. The crank case is of gunmetal; a Bosch magneto and B. and B. carburetter are also fitted

An Overall Legging Tip.

Many riders dislike a pair of full-seated waterproof overalls because of their lack of ventilation, and the type which terminates at the thigh is easily the most popular. The supporting straps usually button on to the trouser brace buttons, and are a shade tiresome to adjust or remove. Last week I saw an improved pattern with long, thin, flat steel hooks designed to slip over the waistband of the trousers. I commend the idea to the notice of motoring outfitters.

The 600 c.c. Class.

Of course, the growing popularity of the 600 c.c. class is solely ascribable to the sidecar boom. The 500 c.c. has power enough and to spare for all rational solo work, but it is a trifle too small to afford complete satisfaction with a sidecar. Such an outfit clamours for second gear too soon and too often, besides occasionally giving best to a bad hill. The manufacturer does not wish to be bothered by the production of two models of 500 c.c. and 600 c.c. respectively, identical in everything except engine measurements, and so the 500 c.c. enthusiast is to be saddled with an extra 100 c.c. which he never asked for, in order to suit the convenience of the makers and their sidecar customers. However, I don't suppose anybody will complain, for there will be no perceptible increase of price or of running expenses, and the situation is that we are being given a little extra power for nothing—not at all an objectionable position to be in. At the same time I wish that an alternative solution had been adopted, and there is still time for recourse to be made to it before the markets crystallise into a fresh set of stereotypes. Surely the 600 c.c. twin-cylinder is a better proposition from the sidecarist's point of view. These high efficiency 500 c.c. engines are already very near the limit size for a sweet-running single-cylinder, and indeed they have only survived in solo use because they are throttled right down during 75% of their annual mileage, and are only given their heads for an occasional scrap or a bad hill. In sidecar use such engines are opened well out for quite 50% of the mileage, and the merits of a twin-cylinder design are then borne right home to the fastidious owner. Moreover, the sidecar machines of the near future will all have two-step drives, and as transmissions increase in rigidity, the difficulty of getting the sweetest running from a big single-cylinder will become more acute, and the development of 600 c.c. twins should be imminent. The A.C.U. may exert a great influence on this dilemma. If they foster the over-size single by catering for it in the 1914 competitions, the 500 c.c. single may get squeezed off the road. If the A.C.U. ignore the over-size single for no more than twelve months, I would wager that the 600 c.c. twin takes its place in the sidecar world, and the 500 c.c. single is left untouched for its present devotees. I am not at all sure that this solution is not eminently desirable. What I feel is that I should never dream of asking for the power of my present 3½ h.p. single to be increased—it can do all I want and more; but if the trade and the A.C.U. act in haphazard fashion, a bigger engine may be forced on me, *nolens volens;* and I cannot think that the bigger single will run quite so sweetly as my present 500 c.c. I have tried several over-size singles, and granting that they were all a little young and raw, I greatly preferred my refined 3½ h.p.

THE F.B. TWO-STROKE ENGINE.

THE F.B. engine, which is the result of much study and experience on the part of the makers, will shortly be placed on the market by Messrs. Fowler and Bingham, 32, Coventry Road, Hay Mills, Birmingham. The engine is built on car lines, with anti-friction metal-lined bearings throughout and a 1in. mainshaft. Great care has been taken in the spacing of the ports, a great factor in efficiency. The bore and stroke are 78 × 86 mm., giving a cubic capacity of 411 c.c., and an outside flywheel is fitted. The lubrication system is forced automatic, but we cannot give details until the patents are completed An Amac carburetter and Bosch magneto complete the power unit. The engine is said to be capable of a speed of 50 m.p.h. for half an hour at a time, and accelerates well. A consumption of 80 m.p.g. has been attained, but it is hoped to improve on this after the engine has been well run in. The compression release valve is in the head of the cylinder.

Last week we had an opportunity of observing the behaviour of the machine on the road, and it certainly has a very crisp exhaust. As regards its efficiency we can only say that we observed it taking a sidecar and a third passenger on the carrier with ease, though it had but one gear of a ratio of 5⅛ to 1. Last week it was being run on a mixture of petrol and oil with satisfactory results.

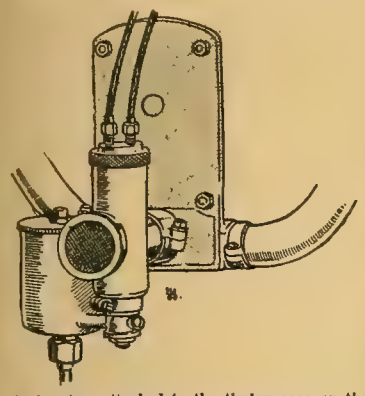
THE THREE-CYLINDER HUMBER.

A Clever Machine which is not being Exhibited at Olympia.

ONE of the most interesting machines which was to have been exhibited at the Olympia Show is, we regret to state, not on view. The motor cycle we refer to is the three-cylinder horizontal Humber, which was described in a recent issue of *The Motor Cycle*.



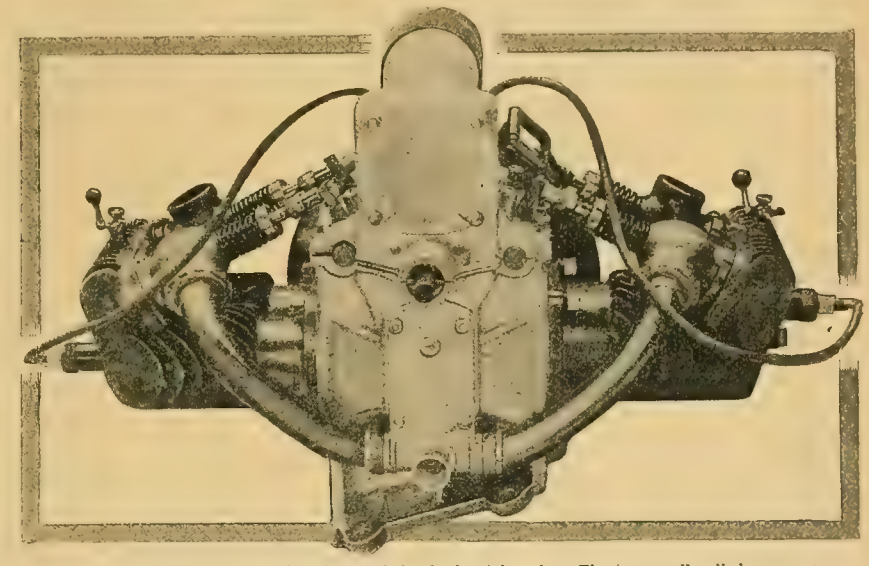
Carburetter attached to the timing case on the three-cylinder Humber.

Messrs. Humber, Ltd., had every intention of showing this model, but as a result of the car show their works are running at such high pressure that they do not feel justified in standardising a new type. It is to be hoped that this most interesting design is not going to be permanently dropped, but merely kept till the firm have a more favourable opportunity for introducing it to the public. Our readers will remember that the engine has a large cylinder forward of the crank case and two smaller cylinders of equivalent capacity opposed to it. The rear cylinders have a common combustion chamber, the inlet valve being placed over one and the exhaust over the other cylinder. The arrangement of radiating fins is unusual, and they are set to catch the maximum amount of air. The curious setting of the cylinders is due to an attempt to get perfect balance, as besides the fact that reciprocating parts balance each other in this design, the arrangement of the two small pistons acting on cranks on either side of the main crank removes the couple which is set up in twin horizontal engines having only two cranks.

Unconventional Design.

A curious feature of the engine is the use of detachable valve seatings, which in this instance are screwed into the cylinders and locked by a special ring. The valves are slightly inclined, and good provision is made for adjustments. A single camshaft operates all valves through the medium of rockers.

The Humber engine is rated at 6 h.p., and has a three-speed counter-shaft gear box placed behind the crank case and below the rear cylinder, the drive being by chain throughout.



A new view of the 6 h.p. Humber three-cylinder horizontal engine. The two small cylinders are seen on the left, the larger one on the right.

THE TOURIST TROPHY RACES.

Regulations for Next Year's Event.

The outlines of the 1914 T.T. races have been decided, and at a recent committee meeting of the A.C.U. the following resolutions were passed:

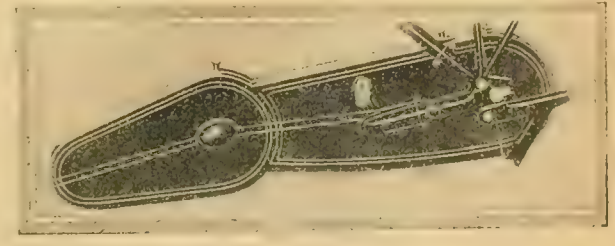
"That the Junior Race be held under the International Rules on May 19th, 1914, for a distance of five laps of the same course as was used this year, and be restricted to motor bicycles not exceeding 350 c.c."

"That the Senior Race be held under the International Rules on May 21st, 1914, for a distance of six laps of the same course as was used this year, and be restricted to motor bicycles not exceeding 500 c.c."

"That, for both races, competitors must practise for a minimum number of laps at a minimum speed, and must wear helmets of an approved type, both when practising and racing."

"That at least three security bolts—one of which may be a bolt valve—be fitted to each tyre of the competing motor bicycles."

It is gratifying to note that many of the ideas suggested by various prominent officials of the Union in our interview with them at the conclusion of the 1913 races, and by *The Motor Cycle*, have been adopted.



The chain cases of the new 3½ h.p. B.S.A.

A TRIP IN THE NILGHERIS.

Mountaineering on a 3½ h.p. Single-geared Sidecar Combination.

BEING stationed near the foot of the Nilgheri Hills in Southern India, amongst which rises Ootacamund (7,300 feet), the best known hill station in South India, and learning that there was a road up the hills, my enthusiasm, as an old motor cyclist, was aroused, and it became a point of honour that at the first opportunity this climb should be carried through.

Now a mem-sahib and sidecar had lately been added to the total load to be carried, so the 1910 single-speed Triumph was tuned up early one morning in the hot season, and we got on board, accompanied by a tiffin basket, a Kodak, and a spare outer cover, and started out at six o'clock in the pleasant cool of an Indian morning.

(1) On the way up to Ootacamund.

(2) A Triumph and sidecar and a Humberette 3,000 feet above sea level.

(3) One of the twelve hairpins.

(4) Another acute hairpin bend taken at 5,000 feet above sea level.

(5) A view of the fine road at the foot of the Ghauts.

Motorists in Great Britain have very little idea as to the sort of going that has to be faced across the plains of India. There are no steep hills, but the road surface, as soon as the European settlements are left behind, is atrocious. Many river courses have to be crossed, and bridges are not at all numerous. A sharp plunge down the bank, a heavy pull through the deep sand, and a sliding, skidding scramble up the opposite bank is a frequent occurrence during a ride. I have ridden round the Scottish Trials route, but there were no roads so bad as many that have to be traversed here. Leaving the good roads of the settlement, we plunge into the twenty miles of obstacles that lie between us and Mettapuliyam, a small town lying at the foot of the hills, whence starts the Ghaut Road which leads up to Ootacamund. We make a short stop at Mettapuliyam to examine the Rack Railway which runs through the hills, and to lower the gear of the Triumph to 5 to 1. A free engine pulley on the engine-shaft, controlled from the handlebar, proved a useful fitment at the corners. As we neared the foot of the hills, and ran into the forests which clothe practically the whole of this country, we found to our delight that the road was in splendid condition. This blessed state of affairs is to be accounted for by its being in the charge of the Government Public Works Department.

For three miles we kept along the bottom of a lovely valley, steadily working our way into the hills, when at last the front wheel tilted upwards and never came down again for sixteen miles. For the first five miles

A Trip in the Nilgheris.—

the road climbs up in snaky curves through the trees, and glimpses begin to be seen of the plains below, sweltering in the blazing sun of an Indian hot season. Corners, corners, nothing but corners: splendid waist-bending exercise to help the sidecar round them.

All the time the road rises with a steady gradient of about 1 in 15. Splendidly engineered, there are no abrupt changes in the gradient. A toll gate stops us and while I cash out, a Humberette which we had seen in Mettapuliyam comes up and stops in a cloud of smoke, and as it starts off with a rush and disappears up the hill I mentally note that we shall meet again. Off again, and the road seems imperceptibly to get steeper. It suddenly disappears in the near distance. It is only one of the twelve hairpins that lie before us, and with an outward sweep and a scrape past the corner stones we just get round and pick up speed slowly on the gradually increasing gradient. We pass the altitude board which says 3,500 feet, and then almost every turn and twist in the road brings fresh panoramas before us.

The view is magnificent, and my camera fails entirely to do justice to it. In the distance, through the entrance to the valley we have climbed, the plains show up in the glaring sunlight like a draughtboard produced to infinity. Here we pass the Humberette cooling after the climb. Down the valley can be seen the road peeping out of the trees in terraces.

Monkeys, Bulls and Motor Cycles.

We are now in the coffee growing district, and many plantations are to be seen on the steep hill sides, showing the hand of man in the regularity of planting. Here and there a rough bungalow shows up in the trees, and we pass a family of monkeys sitting in the trees by the roadside and intently watching us, which brings us to a halt, while the mem-sahib addresses them in coaxing language, but they seem quite satisfied to examine us from a height of thirty feet, and just pass a few remarks amongst themselves as to our appearance. A bullock cart with its two yoked bulls is a little experience on this road, as there are places where meeting anything on the road would be rather awkward. And as a bullock cart was never known to be anywhere but in the centre or the wrong side of the road, and as it takes the man a certain time after he has seen you (he never hears you) to get his wits to work and to grab the bulls' tails in the correct manner for working them over into the ditch, it can be understood that such an encounter can be quite exciting on a mountain road.

In several places as we ascend we have caught glimpses of the Rack Railway high above us, but we now catch it up, and finally triumphantly roll over the top of it on a little bridge in our corkscrew career upwards. The 5,000 feet mark being passed, and a few more hairpins negotiated, we climb a long last stretch of road, which by a rise in steepness seems to take us over the tops of a ridge of hills into another valley, and after a few more miles of steady hard pulling amidst magnificent views along this new valley, we come into Cornoor, a large and flourishing town, nestling amongst the hills at a height of 6,000 feet above mean sea level.

Coasting for Sixteen Miles.

Here, after a short rest, we turn, and putting in the free engine, run the sixteen miles to the foot of the Ghauts without a single turn of the engine being required, and a fast run home over the plains in the cool of the evening finishes a glorious day's ride.

The whole of the road is an object lesson in road grading. The surface is in splendid condition. To give an idea as to the number of bends in the sixteen miles, it takes about an hour and a half to come down, if reasonable care is taken. The turns include either twelve or thirteen of the most acute hairpin bends, and these require a good deal of jockeying to take either going up or coming down.

Being chased by bulls is quite common on Indian roads, and it is not till you have had several frights, and many "rides for life," that you discover that if you stop they will stop too, and always wait till you have passed them before joining in the game, and seem to consider that you have played them a mean trick if you do not at once speed up and flee.

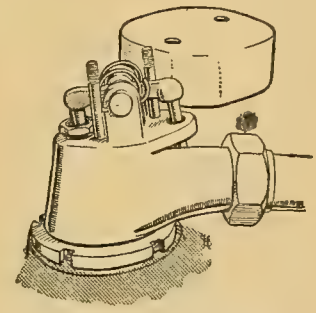
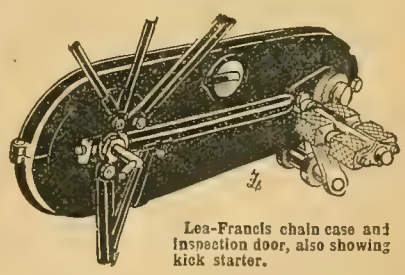
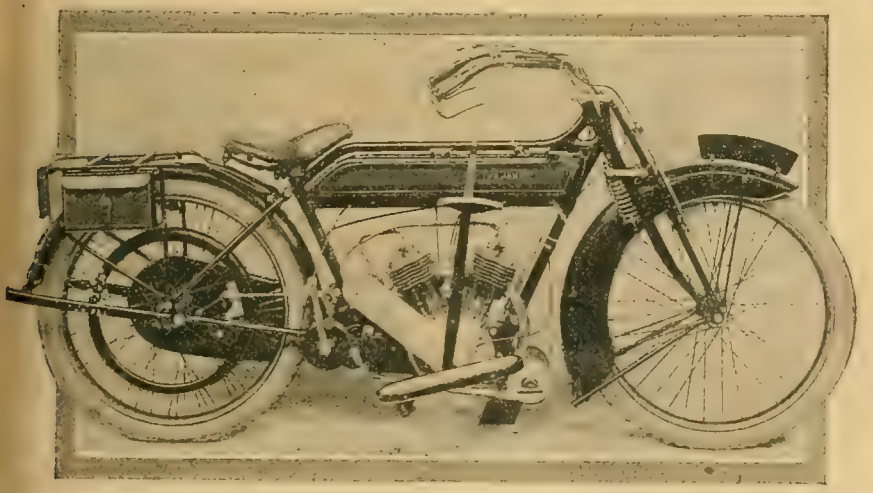
The 1914 improvements to the 3 h.p. twin Enfield include chain drive to the magneto, instead of by gears, larger silencer, etc.



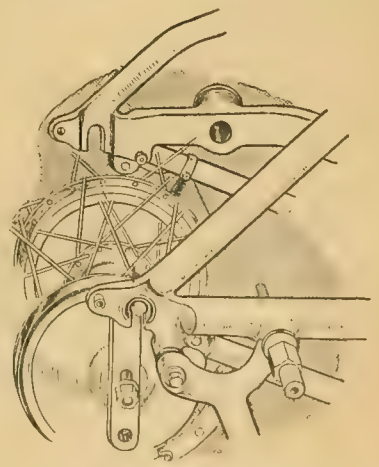
Enclosed overhead inlet valve gear on the 3 h.p. Enfield.



Lea-Francis chain case and inspection door, also showing kick starter.



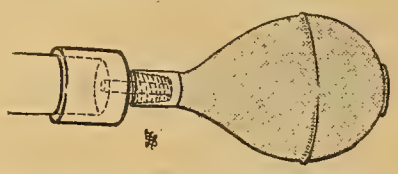
Valve side of the 3½ h.p. three-speed twin James showing kick-starter, gear operating lever, footboards and staggered radiating fins.



Rear forks on the 1914 Bat, showing how the rear wheel drops out of slot on both sides.

AIR LEAKS IN INDUCTION PIPES.

MR. LEONARD DOWSON, of Lukin, Ltd., The Ryde, Newcomen Street, Borough S.E., called at our office recently and showed us a very clever little fitment for ascertaining whether there are any air leaks in the induction pipe of a motor cycle engine. Practically, everyone knows the absolute necessity of perfectly air-tight joints, particularly when using an automatic carburetter like the Lukin. Most car carburetters are attached to the cylinder by double flanges, which can be drawn together by means of bolts in such a way that a washer which is placed between them is firmly and evenly compressed. This is seldom the case with motor cycles, and the result is that there are many air leaks which the manufacturers and riders seldom detect. Many think that the pipe is airtight because it has been fixed up and some sort of washer put between it and the engine spigot. They forget, however, that when the engine is much throttled down the pressure in the induction pipe may fall as much as 10 lbs. per square inch, and it is very difficult to exclude air from entering under such a suction. It is next door to impossible to fix the induction pipe so that air can be excluded by a metal to metal joint; also washers are practically useless unless some method is found of using them so that they are compressed. Our illustration depicts a small wooden apparatus, which is pushed over the spigot end of the induction pipe and screwed so that an ordinary horn bulb or a motor horn can be attached to it. If the bulb be squeezed it is immediately apparent whether there is a leak in the pipe or not. In the case of any air leak whatsoever the bulb can be squeezed; if there be no leak it will refuse to be compressed, in the same manner as it refuses to compress if the finger be held over the end which attaches to the reed. This little apparatus will be demonstrated on Messrs. Lukin's stand (No. 29) at the Show, and we commend it to our readers as being a very smart method of detecting air leaks.

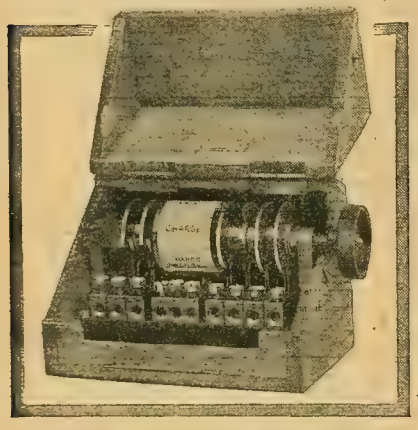


A simple device for testing air leaks in an inlet pipe devised by Lukin Ltd. The central portion is a wooden block which is pushed over the inlet pipe, when a horn bulb can be affixed to the other end.

With regard to the ordinary 191 Lukin carburetter, it has proved so successful this year that practically no alterations will be made for 1914. It is capable of giving the same flexibility in slow running that one is accustomed to find on the modern car.

THE BROLT LIGHTING DYNAMO.

The Brolt electric lighting set, made by Messrs. Brolt, Ltd., Princip Street, Birmingham, is already well known to motor car users as a most efficient and well-made article. Recognising the possibilities of a cycle car set, this firm has introduced a similar type to its motor car equipment, including one head light, two side lights and a tail light, generator, battery, and switchboard, the price being £19 2s. Messrs. Brown Bros., Ltd., Great Eastern Street, E.C., are the sole London agents for the complete lighting sets, and we illustrate the new switchboard, which is practically the smallest model made, both open and closed. It will be noticed that the posts for the cables are provided with holes through which the wires are threaded, screws passing through the posts to hold the cables in position. The rotary switch is fitted with cams or wheels at intervals along its shaft. These engage with spring tongues on the terminal posts, and are cut away at various points in their circumference, so that as the switch shaft is rotated connection is made or broken. In the centre of the shaft is a circular lettered indicator, the inscriptions on which pass a glass window in the lower portion of the switch, and are legible without moving the lid. The upper half of the switchboard case has let into it an ampèremeter showing the pressure in the battery. The neatness of this switchboard makes it peculiarly adaptable to cycle cars.

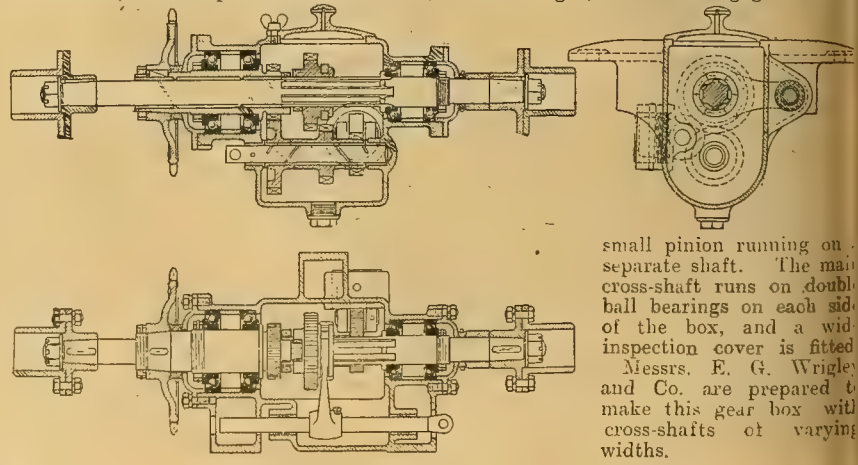


Interior of the Brolt switchboard.

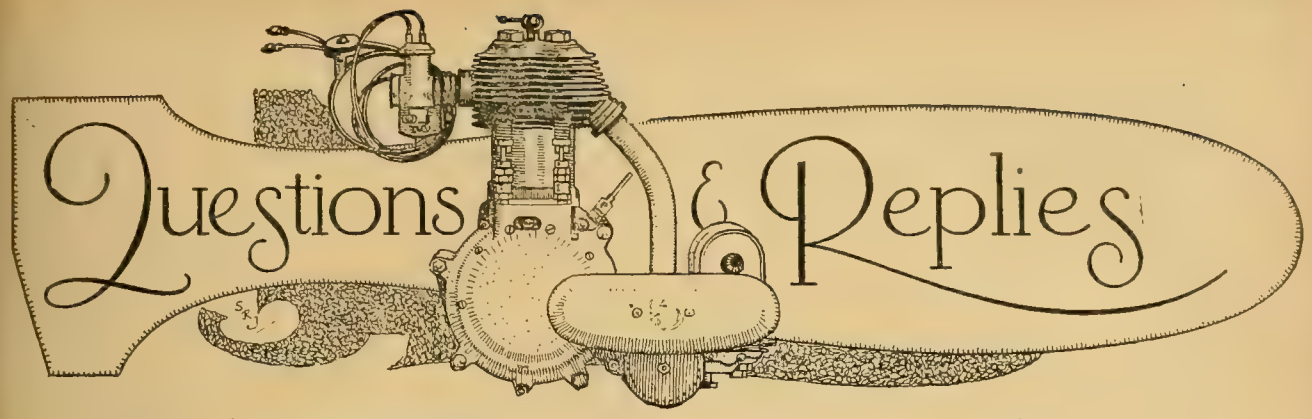
Brolt switchboard for cycle cars.

WRIGLEY'S CYCLE CAR GEAR BOX.

The firm of E. G. Wrigley and Co., Foundry Lane, Smethwick, near Birmingham, is marketing for 1914 a cycle car gear box with two forward speeds and reverse. This box is made with brackets for attaching to an angle iron or wood sub-frame, and does not incorporate a differential, as the shafts on each side are intended for the attachment of either chain sprockets, or belt pulleys, the latter being usual. The attachment of the pulley shafts can be made by means of screw-driver joints, or the shaft can be direct-coupled. As will be seen on reference to the illustrations, the gear box is a substantially constructed piece of mechanism with the gearshafts one above the other. The top shaft is castellated, and carries on the near side a sprocket which is connected to the engine-shaft by chain. The illustrations show the gear in free engine position. The low speed is obtained by moving the sliding pinion to the right, when it engages with a fixed pinion on the lay shaft. The top speed is in gear when the sliding pinion is moved to the left, this locks the chain sprocket direct to the cross-shaft by means of dog teeth. The reverse is obtained by sliding the wheel to the right, when it engages with a small pinion running on a separate shaft. The main cross-shaft runs on double ball bearings on each side of the box, and a wide inspection cover is fitted.



Messrs. E. G. Wrigley and Co. are prepared to make this gear box with cross-shafts of varying widths.



Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Sidecar Machine for Solo Work.

Will you kindly answer me the following question? I have a 1913 6 h.p. Royal Enfield which I want to ride solo; the present gear (about 4½ to 1) is too low. Can I obtain another sprocket from the Enfield Co.; also which is the best place to change the sprocket?—C.O.H.

If you wish to ride your machine solo, we think you would have no trouble in obtaining a sprocket for it from the makers. The sprocket which you change is the small one that carries the main driving chain on the opposite side of the counter-shaft to the two-speed gear chains. This will result in both the high and low gears being raised. If you only wish to raise the high gear, you must fit a new high speed sprocket to the gear.

A Curious Complaint.

I have a 5-6 h.p. twin Rex (1911) two-speed which is very erratic. As a sidecar machine it runs very well for perhaps a mile, then it seems to slow down quickly and finally stops. After waiting about half a minute, it runs very well again for perhaps another mile, when the same trouble occurs again. When reaching a stiff hill, it stops almost as soon as it begins the climb, and after a wait of a minute, it will climb up at perhaps 30 m.p.h. on top gear, which is 5½ to 1. I have had the engine down and cleaned it well, cleaned out all carbon, had magneto overhauled, cleaned carburetter and pipes, etc., but still the same trouble occurs.—E.M.

The only solution of your problem that we can suggest is that an air lock occurs in the petrol tank, and this prevents the petrol from passing through the petrol pipe to the carburetter. It is always necessary to have a small air-vent in the petrol tank. It is possible that there is an accumulation of grit in the channel between your float chamber and jet chamber. This would be sucked up towards the jet when the engine was running, but when the engine stopped the obstruction would fall back into the channel.

Removing Old Enamel.

Would you kindly tell me the best way of removing the old enamel from my machine? I am thinking of re-enamelling machine myself. Do you think an amateur could make a satisfactory job of this sort of thing?—M.E.P.

One of the best ways of removing the old enamel is by scraping it off with an implement such as the back of an old hack-saw blade. No doubt an amateur can remove the old enamel, but care must be taken in thoroughly smoothing and cleaning the tubing if you wish to put on fresh enamel. It is not an expensive job to have done by a professional, and we advise this course to be adopted.

By-pass or Decompressor.

I should like to know how the decompressor and the by-pass compare as regards economy?—T.D.

The decompressor proper only allows half the gas admitted into the cylinder to be used, the other half passing out unburnt, whereas the by-pass allows the engine to run on an infinitesimal amount of gas. The difference in economy can therefore be easily distinguished. Between a by-pass and a variable compression device, however, there is very little to choose. Even then probably the by-pass would be the more economical, though we should imagine the difference was negligible.

Removing Valve Caps.

Will you let me know the best way to remove the valve caps on my machine? It is a 1911 Singer 3½ h.p., and, as you are perhaps aware, the compression tap is let in the exhaust valve cap. I can remove the compression tap easily, but I want to grind in the valves and fit a decompressor. I have made a spanner that just fits the nut with a handle about ten inches long.—F.A.

Your best plan is to soak the caps in paraffin the evening before. The next morning apply spanner, giving it smart blows with a hammer. The spanner should fit tightly, otherwise the corners of the valve caps will disappear; also hammer the caps all round, giving them sharp light taps with a heavy hammer. If the corners of the valve caps become badly knocked about, the only chance of removing the caps is with a hammer and chisel.

A NEW USE FOR MOTOR CYCLES—RIDING ON PEOPLE'S TOES.

The above illustration shows the method adopted by the authorities for keeping back the crowd on the occasion of the arrival of the new Governor-General of the Philippine Islands at Manila, the police force being inadequate for the purpose. It will be noticed that the rider is using an Indian.

Storing a Motor Cycle

Please tell me the best way to store a motor cycle for two or three years, as I expect to be leaving the country shortly. Do you think if it is well smeared with grease and kept in a dry place it would be all right when I returned?—W.T.

If all bright parts of the machine were smeared with vaseline, the tyres taken off, and the whole machine thoroughly cleaned, it would probably be all right. The machine should be stored in a dry place and the tyres in a dry, warm, and dark place. Your best plan, however, is to sell the machine and buy another when you return; for, if you wish to sell the machine when you return after two or three years, you will find that it has depreciated to a great extent, and will perhaps be worth only a quarter or a little more of what you originally paid for it. Depreciation is a point worthy of consideration at all times.

Starting by means of Clutch.

I have a lightweight fitted with three-speed and free engine hub. My trouble is I cannot start properly with the clutch. It starts on the stand, but when ready to start, no matter how gently I let in the clutch, I stop my engine at once. I have tried it on all three gears with the same result. My only way of starting this way is by pedalling for a few yards and then let in the clutch, when the drive is taken up with no difficulty. As far as I can see all the adjustments are correct. Can you let me know the cause of this and a remedy?—T.G.

The best method is to let in a clutch very gradually on bottom gear. Possibly the clutch is rather fierce in action, or it may need lubricating. A special thin oil may be obtained from the makers of your hub gear suitable for the clutch. A little oil at a time at frequent intervals is the proper way to lubricate the clutch.

Routes and Ferries in Kent.

(1.) I should be obliged if you would let me know the best route from Goudhurst, Kent, to Colchester, avoiding Maidstone (2.) Does the ferry at Gravesend cross at certain times? If so, can you tell me the times on Sundays and the price for carrying over a motor cycle and two passengers? (3.) I have broken up a little car and sold the various pieces. Can I have the number transferred to a new cycle car?—J.B.

(1.) Your best route would be as follows: Goudhurst, Brenchley, East Peckham, Trottersciffe, Gravesend, by ferry to Tilbury, then through Billericay, Chelmsford, and Witham to Colchester. (2.) Full particulars regarding the Tilbury ferry are to be found in the Auto Cycle Union Handbook. The ferry runs from 6 a.m. to 6 p.m., Sundays included. Motor cycles cost 4d.; passengers 2d. (3.) You have to ask the authorities to cancel the registration, and if you wish to transfer the number to the new cycle car, you will have to pay full registration fees. You must also acquaint the authorities that you have broken up the car.

Loss of Power on Hills.

My machine is a 1911 model 3½ h.p. Bradbury which I use for sidecar work only. It is fitted with N.S.U. two-speed gear and runs very well; in fact, on the level and up slight inclines it seems almost impossible to overload it. Yet when driving up a steep hill which is of any length, say, over half a mile, the machine suddenly loses power and comes to a standstill. The compression is good, the engine does not knock, or very slightly, even when stopping, and certainly is not overheating, though, of course, it certainly gets warmer when hill-climbing. The piston and cylinder are clear of carbon, and I use a good oil. Can you suggest any cause for this trouble? Further, can you give me any information regarding the respective merits of the flat or ordinary valve caps and the raised hollow or dome-shaped valve cap? I have one of the latter shaped caps on my cylinder over the exhaust valve, and though it perhaps increases the capacity of the cylinder somewhat, my theory is that it weakens the mixture, for the reason that there is a larger volume of burnt gas left in the cylinder.—F.S.C.

Your gear is probably rather too high to enable the machine to climb the hill with a sidecar. The purpose of domed valve caps is to make the compression of an engine lower; conversely concave valve caps help to raise the compression of an engine. We should also recommend you to see that the platinum points of your magneto are clean. Possibly the float chamber is situated behind the jet, if so, in going uphill the level of petrol in the jet would be materially altered. It is advisable to place the float chamber in front of the jet, or, at any rate, to have them level for hill-climbing.

READER'S REPLY.

I venture to suggest for your correspondent "W.O.S.," who asks for the best route between Taunton and Ludlow, one which is shorter, quicker, and much quieter than that recommended in your issue of Nov. 13th. It is Taunton, Bridgwater, Axbridge, turn off main road left to Congresbury, then along Bristol Road as far as Flax Bourton; here turn sharp left and cross railway near station, straight on up winding hill, over Clifton suspension bridge, turn sharp left and on *via* promenade, Belgrave Road, Westbury Road, and turn right to join main Gloucester Road at Filton; through Gloucester to Newent, Dymock, and straight on by Little Marcle to Leominster (look out for right turn at cross roads about seven and a half miles from Leominster); on to Ludlow by either of the two roads. This route is good practically the whole way, and avoids Bristol altogether, the only large town passed through being Gloucester.—R. DE F. STAWELL.

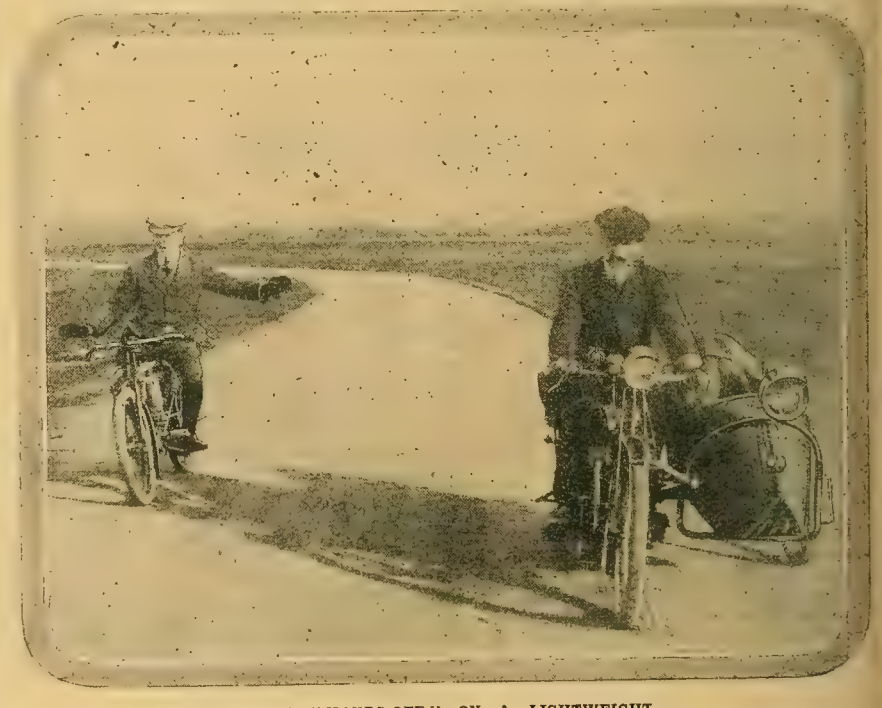
[Axbridge is not on the main road from Bridgwater. We have frequently published the Bristol avoiding route, but prefer to go through Long Ashton and over the new bridge and Clifton Downs.—ED.]

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.A.M." (London).—Brampton gear; wear of belts, etc., on 3½ h.p. Rudge. Paragon or other folding sidecar.

"A.H.B." (Plymouth).—New Hudson 3½ h.p. three-speed model VIIA. 1913, with sidecar. Power, hill-climbing, and general durability.

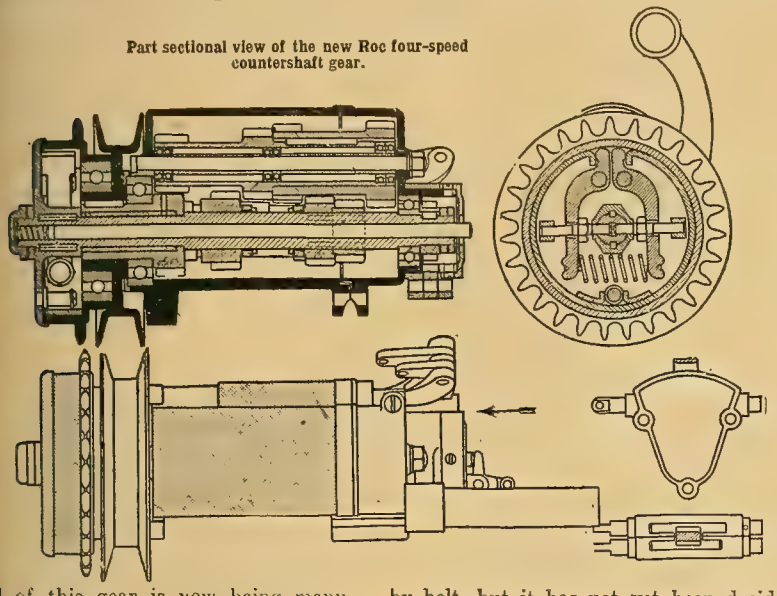


RIDING "HANDS-OFF" ON A LIGHTWEIGHT.
The modern machine is so splendidly balanced that it is possible to ride long distances without touching the handle-bars, although we do not recommend such a practice. The above photograph was taken during a five miles run on a 2½ h.p. Premier, when the rider covered the whole distance without touching the handle-bars.

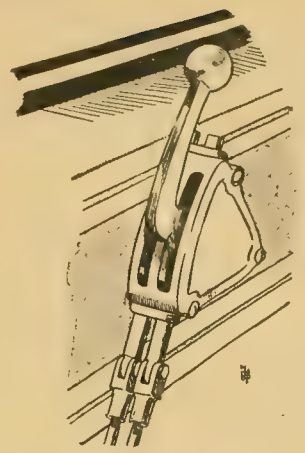
New Roc Four-speed Gear.

A RECENT visit to the works of A. W. Wall, Ltd., Birmingham, proved of great interest, for several new features, which will appear at Olympia, were shown to us. The Roc two-speed gear has been improved and is fitted with larger brake and clutch surface, double fulcrum high gear adjustment, and combined hand or kick starter. The rear fork ends have been considerably improved and now carry dustproof Hoffmann bearings. A smaller model of this gear is now being manufactured which is a miniature replica of the big model. Both these gears will be on view at Olympia, the one fitted to a 4½ single and the other to a 2¾ single-cylinder machine built by the firm. A third exhibit will be a 4¼ h.p. model fitted with a four-speed countershaft gear. This is quite a new departure for A. W. Wall, Ltd.; but we are informed that it is not to replace the hub type, which is doing better than ever, but will be marketed as an alternative model. As will be seen from the line drawing, the gear is of the sliding type, there being two sliding members controlled by a gate change speed, the selecting gear being enclosed in the gate. An enclosed kick starter is combined with the gear box, and an expanding clutch is fitted on the main shaft. The gear we examined was fitted with a final drive by belt, but it has not yet been decided whether belt or chain drive is to be adopted as standard.

Part sectional view of the new Roc four-speed countershaft gear.

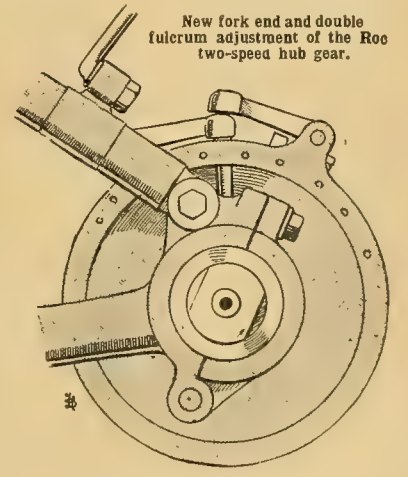


An interesting feature of the Roc hub gear is the employment of mild steel castings for the hub shells. These shells are hardened where necessary, and under a test which we supervised the metal proved very tough, and where hardened glass hard; also the castings were singularly free from blow holes. A simple form of ratchet hand or kick starter is being marketed by the firm, the body of which is also a mild steel casting.



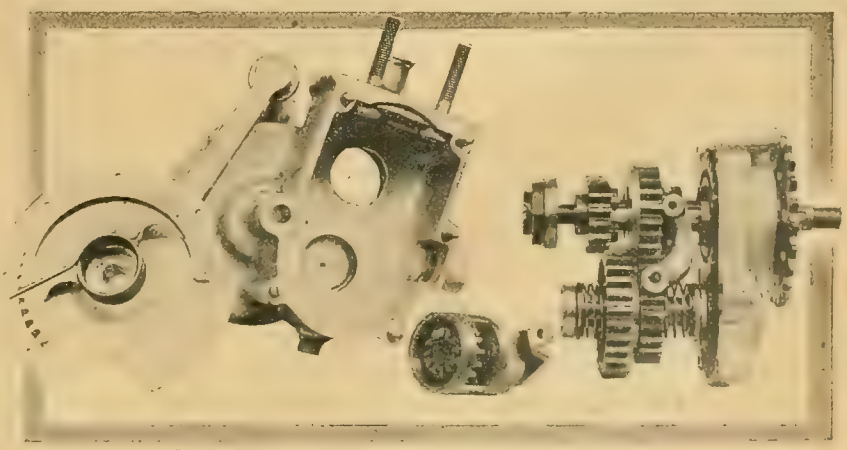
Gate change speed adopted for the four-speed bottom bracket Roc gear.

New fork end and double fulcrum adjustment of the Roc two-speed hub gear.



The Three-speed Jardine Gear.

THE latest type of Jardine G.H. gear takes the form of a solidly constructed box which possesses the unusual feature of constantly meshed wheels in every position. A slipping clutch device is fitted to the engine-shaft as is the usual Jardine practice, and this part has undergone no change except that four key-ways are fitted to the clutch plates, instead of two as before. On the primary shaft of the gear box is mounted a double plate cork insert clutch. The standard gear ratios will be 4½, 7¼, 13-1, though, of course, a higher or lower combination can be obtained by changing sprockets. The changes of ratio are obtained in a somewhat unusual manner, for, as has already been mentioned, the gear wheels are always in mesh. The changes are made by dogs in the usual way, but the middle gear wheels are both capable of being slid laterally on their shafts, and thus their teeth are kept engaged throughout all the movements of the striking lever. Buffer springs are mounted on either side of the middle gear wheel, and ball bearings are used wherever possible, though the spigot bearing is, of course, of the plain type. The kick-starter is entirely enclosed and revolves the engine 4¼ times to the half turn. The gear is very sound



The latest G.H. three-speed counter-shaft gear shown dissected.

Sidecarriers for New Zealand Mails.

The Clyno Engineering Co., Wolverhampton, have just despatched twelve Clyno express delivery outfits to New Zealand. These have been made to the order of the New Zealand Government Postal Department.

Dunlop Rubber Co., Ltd., Issue.

The Dunlop Rubber Co., Ltd., intimate that the first batch of letters of acceptance and letters of regret were posted on Friday to applicants for the recent issue of £295,000 cumulative 6% Preference Shares.

£5 for a Catch-phrase.

The British Monogram Oil Co., Ltd., of Acton Vale, W., are offering a prize of £5 to any motorist who sends in the most suitable catch-phrase bearing on Monogram oil. For full particulars, apply to the British Monogram Oil Co., Ltd.

Service Show Week Display.

The Service Co., Ltd., 292-3, High Holborn, W.C., do not feel that an adequate display of their goods can be made in the crush of the Olympia Show, and have therefore decided to make a special display during Show week at their showrooms in High Holborn, where a large range of goods of interest to all classes of motorists will be on view.

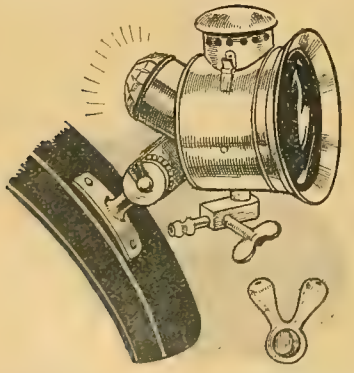
Racing Equipment.

The record-breaking Rudge, ridden by Greene and Pullin at Brooklands last Thursday, was equipped with Continental tyres, John Bull belt, Pratt's spirit, and Wakefield oil.

Lieutenant Stewart, who on the same day annexed records on an N.S.U. in Class B, also used Continental tyres, Gloria belt, Pratt's spirit, and Vacuum oil.

A Change of Address.

A motor cycle which is gaining rapid popularity on account of the extremely smooth running of the motor, particularly at low speeds and in traffic, is the Blackburne, which is chiefly noticeable for the large outside flywheel fitted and the employment of a solid crankshaft running in car type bearings. We are now informed that it has been necessary for the makers, Messrs. Burney and Blackburne, to remove into larger works, and their address is now Blackburne Works, Tongham, Surrey.



The Seabrook red rear light and number plate illuminator which fits on the back mudguard and is sold complete with two way connection as shown.

Big Orders before the Show.

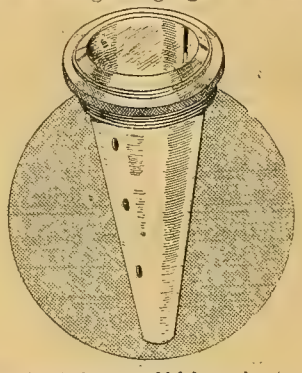
The Auto Carriers (1911), Ltd., Thames Ditton, inform us that they received, before the Show opened, orders for A.C. cars exceeding in value the entire output of last year. This is a very healthy sign for next year's business in cycle cars.

An Efficient Transmission.

There is one point in connection with R. O. Clark's six hour record on a lightweight F.N. which is worth special notice, *i.e.*, the fact that he used a two-speed model, which proves that the frictional losses in the F.N. type of transmission are infinitesimal, and that it has been brought to a state of perfection undreamt of, even by those who favour this system.

Combined Filler Cap and Gauge.

A clever little fitment is sold by Messrs. W. Brandon and Co., Ltd., Oliver Street, Birmingham, to take the place of side glass gauges and at the same time act as a cap to the tank. It is in the shape of a cone, and is attached to the underside of a filler cap, thus projecting down into the tank. Holes one inch apart are bored in the cone to let through the petrol when poured into the tank, and by means of which holes the rider can tell with a little practice the exact amount of petrol in his tank by looking down through the glass top of the filler cap. It can be fitted to any machine with a threaded filler cap.



Brandon's petrol gauge, which has a glass top and cone-shaped lower portion.

A Fine Display of Bodywork.

Messrs. Hollick and Pratt, the well-known Coventry coachbuilders, have long ago earned an enviable reputation for their car bodywork, and they have now laid themselves out to cater for sidecar and cycle car manufacturers. A visit to their works showed a great number of sidecar bodies in the course of construction, many of which we recognised as being built for well-known firms, and we were also shown a pile of bodies in various stages, built to the order of some of the biggest light car and cycle car manufacturers.

South African Trial.

Mr. Percy Flook, who rode in th Senior T.T. Race this year as representa tive of South Africa, won first prize, o Continental tyres, in the recent Johannes burg to Rustenburg Trial (about 18 miles).

A Show Absentee.

We regret to announce the illness Mr. James Hazlewood, senior, whic has prevented his attendance at th Hazlewood exhibit at Olympia this yea This is the first Show connected wit the cycle trade which Mr. Hazlewo has missed since the far off days whe the first Show was held in Hyde Par before the era of the Stanley Show Friends of Mr. Hazlewood will be glad t hear, however, that he is progressin well towards recovery.

Sydney to Melbourne Trial.

The Continental Motor Cycle Reliabilit Contest from Sydney to Melbourne (56 miles) has been arranged for Decembe 29th, 30th, 31st, and January 1st. motor cycle, value £65, will be presente by the Continental Tyre and Rubber C to the competitor who loses the lea number of marks, and gold medals wi be awarded the next ten competitors i order of merit.

New Appointments.

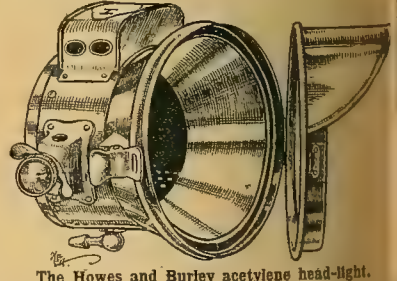
G. W. A. Brown, who designed th Clement Talbot car, which, driven by th late Percy Lambert, was the first car t cover over 100 miles in one hour, ha joined the Premier Cycle Co., Ltd., a works manager of the motor departmen

We understand that Mr. H. C. Picke ing, who for a number of years ha been associated with the sale of A.J.S motor cycles and P.D.A. cycle cars i the Midlands, has joined the staff o Messrs. P. J. Evans, John Bright Stree Birmingham.

Clifford Wilson is now sales manage of the Quadrant Co., Birmingham, an W. Pratt, late of the firm of Phelon an Moore, has joined the sales departmen of Messrs. F.N. (England), Ltd.

New Make Lamp and Generator.

The firm of Howes and Burley, lam manufacturers, Holloway Head, Birmin ham, re-established in 1850, for some tim past have supplied lamps for motor car and have now decided to enter the moto cycle lamp trade Their Projector moto cycle lamp is a splendidly made articl at a moderate price, and with hood an generator costs 37s. 6d. The Shakeon generator, which is supplied with th lamp, is well constructed and, as its nam implies, is provided with a shaking gri which sifts the waste calcium carbid to the base of the holder.



The Howes and Burley acetylene head-light.

The Show in Retrospect.

WITH the fourth Olympia Exhibition of motor cycles a thing of the past, it is pleasing to be able to record its complete success. The large number of visitors continued throughout the week, and the enthusiasm displayed shows unmistakably the sustained and rapidly growing interest in the motor cycle, sidecar, and cycle car. Naturally business was exceedingly brisk, many firms having disposed of the whole of their next year's output, and only in very rare instances did we hear of any dearth of orders. Considering the diversity of the types of machines exhibited all this goes to prove one thing, and that is no one type of machine possesses outstanding superiority. Oftentimes inexperienced writers, in their enthusiasm for a new type of machine, have been led away to "boom" that particular type in the assumption that it is the one of the future, and would ultimately squeeze all others out of existence. There never was a greater fallacy, and we who have watched the many ups and downs of the motor cycle during the last decade have always appreciated that fact. A single type of motor cycle would eventually spell stagnation, and no one wishes to arrive at that undesirable era. It has often been stated that one man's meat is another man's poison, and it is due to individual tastes that makers of so many different types find their order books full. Practically all standard types of motor cycles nowadays are a proved success, and it is no longer necessary to narrow one's choice to half a dozen different makes in the fear that outside that pale the owner is courting disaster. Such, then, is the general advance in design and workmanship of the 1914 pattern motor cycle.

A Problem of the Future.

ONE may ask has not finality been reached, and, if not, in what direction may improvements be expected at future Shows? Anyone who could correctly foreshadow the designs of even two years ahead would, indeed, be a genius, but from our conversations and general observations during last week's Show, we are confident that it is the lack of weatherproofness that deters many from taking up the pastime. True, a number of the 1914 machines can claim to be protected from the elements at every vital point, but it is the need for better protection for the rider that is outstanding. At present makers prefer to leave the important matter of weatherproofing the rider to the accessory maker. Years ago motor cycling was looked upon as a fair weather pastime, but that taunt cannot be truly urged nowadays (thanks to low-built machines and successful non-skid tyres), for hundreds of business men use their machines throughout the year, hail, rain, snow, and sunshine, and still more would do so were better protection afforded them. The cycle car boasts its hood and screen—very attractive points. The sidecarist can now provide equal accommodation for his passenger, besides possessing a skid-proof vehicle, but, so far, little has been done to protect the motor bicyclist. Surely some form of folding dash for the knees and lower part of the body, and maybe a transparent non-flammable insertion at the top to protect the rider's face, need not prove unsightly or a hindrance. Leg protection is provided in many instances by footboards with upturned extensions in front, and now we would like to see manufacturers go a step further and produce the true "all-weather" mount. When that object has been achieved, the possibilities of the motor cycle will appeal to many thousands of potential users, who, at present, fear the discomforts attendant upon a long ride on a winter's day, and look with disfavour upon the garb it is necessary to don. The motor bicycle wind screen favours somewhat of a faddist's idea for every day work, but in the autumn and winter months the case is different, and there are times when a screen of this kind would be a perfect boon.

We sincerely hope that our remarks will provide food for thought among designers in particular, and opinions of readers on the subject would be interesting.

SOLO MACHINES AT OLYMPIA.

By B. H. DAVIES.

LIGHTNESS, cheapness, and smooth running are three fine ideals, and they inspired most of what was new at Olympia. The two-speeded two-strokes are probably the first decent machines ever made at their weight; true, a Douglas model was once catalogued at 110 lbs., but it had direct belt drive and a single gear, whereas the new bantams mostly possess two-step transmission and an emergency ratio. Moreover, there is a lot of weight to come off them yet. I overhauled the details of several, including the Triumph and the Clyno, and I came to the conclusion that a good 20 lbs. could easily be pared off either. Here, as in the oversize big singles, we see the disturbing trail of the sidecar. Frank Smith said to me, "Too heavy? Yes, it is, but the first thing nine buyers out of ten do will be to sling a sidecar on it; in fact, we're the original offenders; the experimental model has pulled a sidecar and four men before now!" I do not see how manufacturers can protect themselves against the kind of idiot who will tie a sidecar to a 1¼ h.p. Motosacoche; but it is a thousand pities. Corpulent retired majors and other prospective buyers of the two-stroke bantams could be saved from 20 lbs. to 40 lbs. of dead weight if it were not for the sidecar fiend—why the tiny Clyno engine is actually mounted in a double-rail frame, and not without reason.

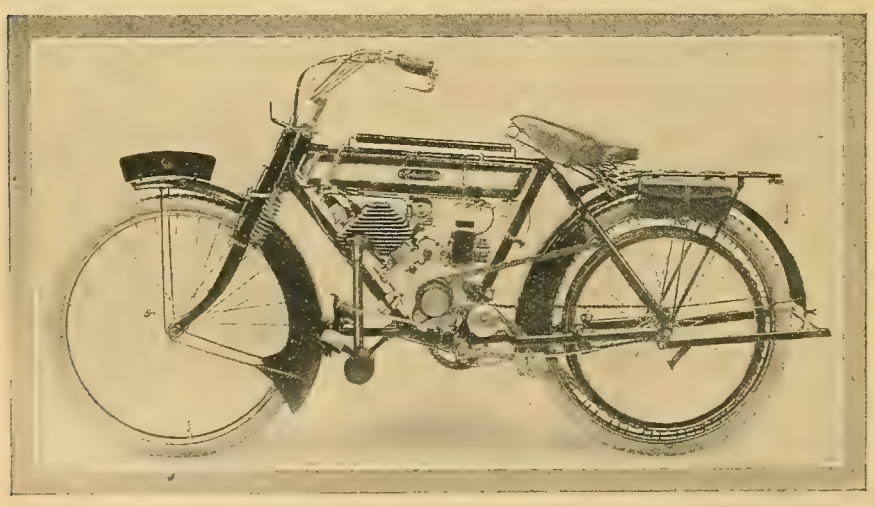
Some of the ultra-cheap featherweights will not prove too satisfactory; a toy four-stroke engine has to be jolly well made if it is to maintain its power, or even 50% of its power, for 1,500 miles; and we all know what a dollar-diameter pulley and the direct belt drive are like in sloppy weather.

The Price Question.

Cheapness, unfortunately, is limited to the bijou machines. I suppose the prices of the standard 500 c.c. machines will not come down till a motor cycling Ford flashes across from the western horizon. But it is something to know that a decent machine can be had for less than £50, even if it does not boast a gigantic engine. Smooth running is being catered for by a deliberate attack on the 500 c.c. single, for many firms list 500 c.c. twins, and some have dropped 3½ h.p. singles altogether. This move will almost eliminate "knocking" from our experience, and should spell better maintenance of tune. A 3½ h.p. twin, so far as my riding is any index, will keep on "revving" madly when its valves are pitted, its rings worn down flush with the piston, and its ignition adjustment all anyhow; but the average 3½ h.p. single seems very sensitive to its internal condition—there are exceptions, of course; did I not once get 52 m.p.h. out of a Rudge engine which had neither big end bearings, valve faces, nor timing teeth remaining, as near as no matter; but give me the twin for continued power without tinkering, and pleasant pick-up round a bad bend or on a grade, and there is the undoubted advantage in a twin that it is lighter on belts and tyres, as well as more comfy to ride.

New Transmission Details.

In gears there is little that is new to chronicle. I was very pleased to see in some quarters that the "gate" has replaced the "quadrant," for I find I often overshoot the desired notch with a straight-through change, and my 1913 three-speeder was rather fond of checking its lever at neutral when I wanted top, and the finish of such changes was unco' bad for the teeth. The Blackburne has an idea which deserves to be copied, viz., interchangeable T.T. and three-speeder back wheels. In the counter-shaft gears there are several first-rate three-ratio boxes on show; some of them had bigger gear wheels than the worst kind of cycle car. The most interesting detail in this connection had reference to the ingenuity with which the chain drive had been carried out, on which I shall have more to say another time. For the present it may suffice to say that some machines of the type indicated had rattleless quick-detachable gear cases, and perfectly accessible, and substantial adjustments for



Belt side of the 2½ h.p. Motosacoche showing jockey pulley for the variable gear.

Solo Machines at Olympia.—

all their chains. Others, on the contrary, had sardine-tin pattern casings, secured by a couple of grub screws and obstructed by almost immovable foot-plates and similar cumbrous attachments; in some cases a set of three special tools appeared to be necessary for adjusting the primary chain, while the drawbolts for tightening the rear chain were of the type familiar on a featherweight push bicycle. Buyers should scrutinise these details carefully. To mention one example of the good kind, the James 3½ h.p. twin appeared to me as a very refined application of the latest ideals. The chain cases were really substantial without being unduly weighty, and the tail segment of the back case is hinged at the lower end of the chord, permitting the wheel to come out, leaving the chain case *in situ*. The floating sprocket on the back hub was sprung both against the drive and away from it, so as to act within limited range as a road insulator as well. I wonder if an internally sprung hub could be made to solve the rear-springing problem, for it is obvious that rear frame springing with huge laminated quarter elliptics won't bite on for the 3½ h.p. just yet.

Weight still going up.

What a pity that no makers show a sample machine slung on a spring balance. I fancy weight will have a lot to do with the settlement of the hub v. counter-shaft gear problem. So far as I could ascertain, the two-chain machines with counter-shaft gears weighed from 20 to 60 lbs. more than a first class sample of the belt-driven three-speed hubber, and were distinctly heavier than those types which utilised combined drive in conjunction with a three-speed hub. Weight seldom bothers us, but when we advance towards the sere and yellow, we loathe lifting a 250 lbs. machine on to its stand. Just at present weight is being piled on to the standard 500 c.c. roadsters with magnificent abandon. My own 1913 three-speeder was a good deal heavier than I like, but it was thistle-down to some of the *recherché* specifications thoughtless spectators enthused over at Olympia. The 3½ h.p. Motosacoche is a most honourable exception; it can give 40 lbs. to some of the belt-driven three-speeders, and still underweigh them.

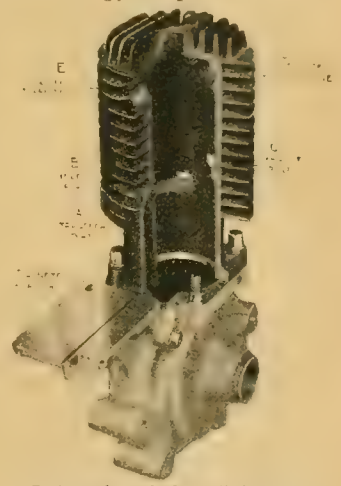
The Lea-Francis staged an interesting but unostentatious innovation. Its front hub bearings (immense in size) were non-adjustable, dirt and water being kept out by a gigantic felt washer. If this construction is sound what a boon it would be on all front hubs and steering heads, not to mention some of the complex little gear boxes, which are so like a watch when you spread their entrails sadly out on your handkerchief by the roadside.

Weatherproof finishes, one may trust, were designed with one eye on Olympia. I saw many machines with black forks, black hubs, black rims, black spokes, black handle-bars, and plated lubricators on the fork links, plated rings and packers for the Bowden control, etc., etc. In other words, all the big clean surfaces that can be mopped in a twinkling were black; and all the little niggly twiddly bits were plated. The absurdity of it! By the way, what is the use of blacking a rim destined to be scarred by a front brake? If a rim is blacked, the Lea-Francis type of front brake, or some similar arrangement, is alone applicable to it.

Some Cute Ideas.

Forks remain as they were, except on the Rover and the Blackburne which improve on Mr. Terry's idea. As most cute riders know, Mr. Terry increased the efficiency of the Druid type fork by substituting coiled springs for the original pair of rigid top links, thus combining the Triumph notion with Mr. Drew's. The one weakness of the idea is that these small coiled springs may snap unless the tempering is perfectly done. So the Rover and Blackburne forks have telescopic rigid links beneath the coiled springs—excellent; I know, because I have tried them.

The Zenith has rescued the infinitely variable gear from its threatened demise by re-designing it with a bottom ratio adequate for the freakiest A.C.U. Six Days; the Rudge people have taken the alternative exit from the dilemma by supplying a bigger engine, if required, and by listing three-speed hubs as optional alternatives to the multi. The 3½ h.p. twin Zenith with counter-shaft Gradua is as charming a belt driver as I ever saw in my life.

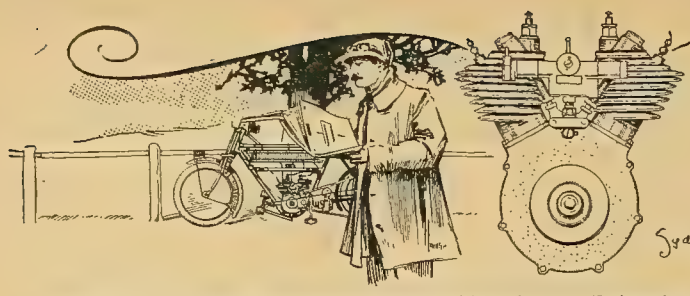


Part section of the cylinder of the two-stroke Triumph showing position of magneto platform and transfer ports.

The Indian? I suppose we shall all come to the electric lighting in time, and it will eternally possess the credit of being the pioneer. I should have liked the machine better if the magneto ignition had been retained. I am an imaginative sort of idiot, and I could not help picturing myself on the top of Dartmoor at midnight late in January with some subtle fault in my dynamoter—no light, no spark, no hooter! I shouldn't mind a bit being minus any one of these three, but if the entire trinity deserted me simultaneously, strong man as I am, I should most certainly weep. Still, the many occasions on which I had started up by twitching a lever, and flooded roads with artificial sunshine what time others delved in carbide sludge, would doubtless compensate for the most heartrending *contretemps*.

Horizontal versus V Twins.

Horizontal engines? The most obvious feature was that some men who *can* design engines *can't* design frames. I can see some of those horizontal twins' frames crumpling like tinfoil under quite minor collisions. When I take my trials of one or two of them, I must conquer a bad habit of clearing cows off the road by tickling their rumps with the front mudguard—not every frame would stand so much. Of course, it is a thorny problem. If you fork your down tubes, you get an ugly machine; if you bend them, you must use very heavy stuff and pile the weight on; but eventually the diamond-framed 3½ h.p. single will bow its head to these novel outfits, or I am a false prophet. They are nicer than the V twins, believe me: but at present some of them are extremely young.



List of Important Fixtures in 1914.

A meeting of club secretaries was held at Olympia on Wednesday last week, when the following events were arranged for next year. All the events are open except M.C.C. competitions and the B.M.C.R.C. meetings.

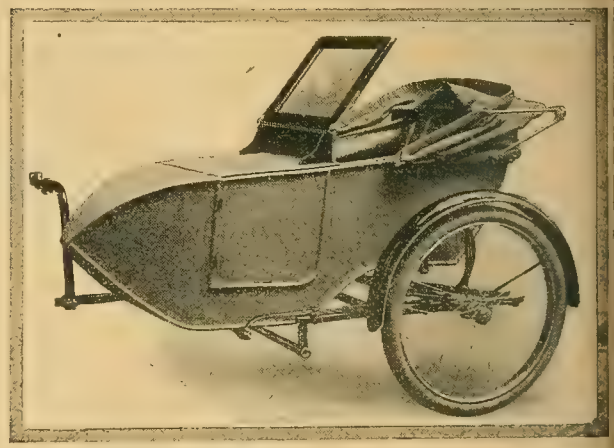
Jan. 3.—Liverpool A.C.C. One Day Trial.
,, 7.—Bournemouth M.C.C. One Day Trial.
,, 17.—Essex M.C.C. One Day Trial.
,, 31.—Birmingham M.C.C. One Day Trial.
Feb. 14.—Sutton Coldfield A.C. Colmore Cup Trial.
,, 20-21.—Oxford M.C.C. 24-Hour Trial.
Mar. 14.—Essex M.C. Hill-climb.
,, 21.—Birmingham M.C.C. Passenger Machine Trial.
,, 18-25.—Paris-Nice Trial.
,, 28.—B.M.C.R.C. First Brooklands Meeting.
Apr. 4.—A.C.U. East Midland Centre One Day Trial.
,, 11.—M.C.C. Jarrott Cup Contest.
,, 11.—Stockport and District M.C.C. Hill-climb.
,, 13.—Westmorland M.C.C. Hill-climb
,, 18.—B.M.C.R.C. Meeting.
,, 18.—Bristol M.C.C. Open Trial.
,, 25.—Essex M.C. Open Trial.
,, 25.—Bristol B. and M.C. Trial.
,, 25.—Streatham and District M.C.C. "Old Crock" Trial.
May 2.—Coventry and Warwickshire Reliability Trial.
,, 2.—B.M.C.R.C. Meeting.
,, 9.—Sutton Coldfield Amateur Hill-climb.
,, 9.—Essex M.C. Brooklands Meeting.
,, 16.—West Hants M.C.C. Trial.
,, 16.—Liverpool A.C.C. Trial.
,, 19.—JUNIOR T.T. RACE in Isle of Man.
,, 21.—SENIOR T.T. RACE in Isle of Man.
,, 29.—Mersey M.C. Trial.
,, 30-31.—London-Edinburgh Trial.
June 6.—Doncaster and District M.C.C. Speed Trials.
,, 6.—A.C.U. (East Midland Centre) Speed Trials.
,, 13.—M.C.C. INTER-TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
,, 20.—Birmingham M.C.C. Speed Trials.
,, 20.—B.M.C.R.C. Speed Trials.
,, 25.—South Wales and Cardiff M.C. Hill-climb.
,, 27.—South Wales and Cardiff M.C. Speed Trials.
June 26-27.—Dublin and District M.C.C. Twenty-four Hours Trial.
,, 27.—Mersey M.C. Speed Trial.
July 5-11.—A.C.U. SIX DAYS' TRIAL.
,, 13-14.—M.C.U.I. Irish End-to-end Trial.
,, 17-18.—R.A.C. Automobile Rally at Nottingham.
,, 18.—Streatham and District M.C.C. Hill-climb.
,, 25.—Coventry and Warwickshire M.C. Light Car Trial.
,, 25.—B.M.C.R.C. Race Meeting.
Aug. 1-3.—Dublin and District M.C.C. Two Days' Trial.
,, 5-9.—F.I.C.M. INTERNATIONAL CUP TRIAL IN FRANCE.
,, 15.—Liverpool A.C.C. Open Trial.
,, 15.—Streatham and District M.C.C. Hill-climb.
,, 22.—A.C.U. (East Midland Centre) Trial.
,, 22.—B.M.C.R.C. Meeting.
,, 29.—Coventry and Warwickshire Hill-climb.
,, 28-29.—Essex M.C. London-York Ride.
Sept. 3.—Bournemouth and District M.C.C. Speed Trials.
,, 5.—Birmingham M.C.C. Trial.
,, 12.—B.M.C.R.C. Meeting.
,, 19.—Mersey (Liverpool) M.C. Hill-climb.
,, 19.—Streatham and D.M.C.C. Speed Trials.
,, 24.—A.C.U. CYCLE CAR T.T. RACE.
Oct. 3.—Sutton Coldfield A.C. Levis Cup Trial.
,, 10.—A.C.U. and B.M.C.R.C. Race Meeting.
,, 17.—Mersey M.C. Hill-climb.
,, 24.—Streatham and D.M.C.C. Speed Trial.
,, 28.—A.C.U. One Day Trial.
,, 31.—Liverpool A.C.C. Open Trial.
Dec. 28.—Birmingham M.C. York Run.
,, 28-29.—M.C.C. Winter Run.

In addition to the above events there must be added the Scottish Six Days' Trial, the date of which has not been definitely fixed, and the Anglo-Dutch Trial in Holland, which it is expected, will be held on the same date as the two previous contests, viz., August 3rd (Bank Holiday in England).

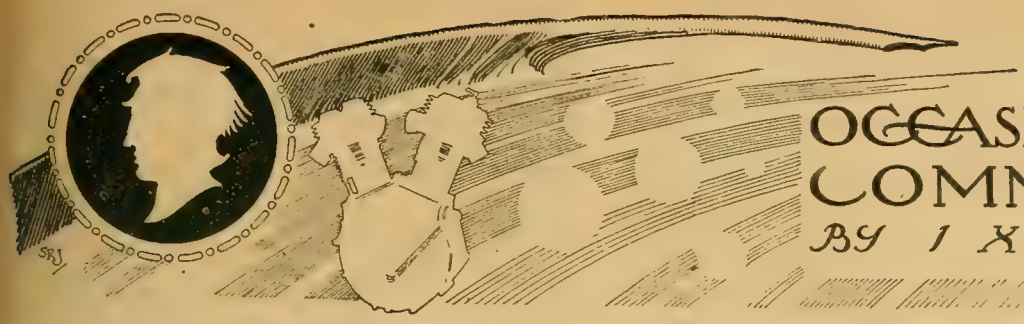
REAR LIGHTING OF MOTOR CYCLES.

We understand that the Local Government Board have issued to the R.A.C., A.C.U., and A.A. and M.U., draft regulations in connection with the rear lighting of motor cycles and sidecars. This draft regulation is provisional and is merely intended to deal with the present situation. A future order will be issued in due course, which will deal with the matter more fully. At present we understand that the draft regulation provides that all motor cycles with attachments, such as sidecars, must carry a rear red lamp and not a reflex lamp, but there is no reason for this to be placed on the "off side" of the machine, this provision having been made so that motor cyclists who wish to attach a sidecar in the unusual position of the "off side" need not be restricted in any way as to the position of the light. Naturally, anyone who wishes to be absolutely safe with regard to being run into from the rear will so fix the light that will be in the most "off side" position possible; overtaking traffic will then face the light with its "near" side nearest to the warning signal.

At present no regulations have been issued regarding the use of any form of rear light by motor bicyclists, *i.e.*, riders of solo machines. Riders of these machines need not even carry a reflex red rear light unless they wish to do so, but our advice to all motor cyclists is to show a good example and carry a really good reflex light as already embodied in the specification of some standard machines.



A neat sidecar manufactured by Stokes and Holt, Ltd., Belgrave Road Leicester. The suspension, screen-fitting and hood will be noted.



OCCASIONAL COMMENTS

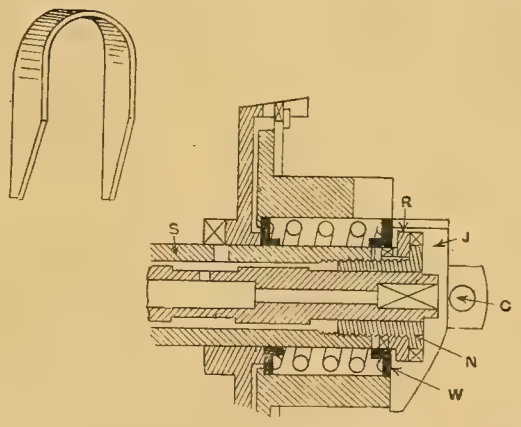
BY IXION

A Satisfied Cycle Car Owner.

I spent an interesting hour last week with a doctor who ran a genuine cycle car for twelve months terminating this autumn and has now transferred his patronage to a light car, *i.e.*, a miniature four-cylinder vehicle, which exceeds the cycle car weight and engine capacity limits by a few cwt. and a few hundred c.c. respectively. The medico in question was a complete novice when he purchased his cycle car, and, being a middle aged man, he is naturally more sensitive to vibration than the average youthful motor cyclist, whilst his profession requires clean and steady hands and a smart appearance; so that altogether his requirements constitute an exacting test of the merits of a cycle car. He expressed himself completely satisfied with the economy and the running of his cheap twin-cylinder cycle car. Detail troubles had been conspicuous by their complete absence, despite a hard season's work on inferior roads. Economy was excellent so far as fuel and oil were concerned, the consumption working out at better than forty miles per gallon on a mixture composed of two parts of petrol to one of benzole; but the machine was undertyred, and the expense of new covers was unduly heavy. The original back axle was replaced gratis by the makers. His sole reason for preferring the more expensive light car lay in the fact that the 7 cwt. vehicle was too light for rough roads, and bounced about too much. I was taken to inspect the discarded cycle car, which I found to be in magnificent condition. Its grey paint and brass work looked like new, and the chassis was devoid of rattles; the bearings all seemed perfectly tight, alike in the steering, engine, and transmission, while the engine ticked over dead slow with perfect smoothness, and accelerated furiously on demand. If this particular type of cycle car were equipped with larger tyres and its springing were rendered a little more efficient, I think it might be termed a perfect cycle car. It certainly shows that great achievements are practicable under the existing cycle car definition.

Dismantling N.S.U. Gears.

The sole defect latent in the N.S.U. gear consists in the difficulty of reassembling its internals if through curiosity or necessity one is rash enough to take it apart. *Experto crede*, for did I not once seize its planet pinions through using it unoiled on an engine which eschewed modern practice and blew no lubricant out through its pulley centre, thereby missing an opportunity of posing as a huge benefactor to the boot trade? A correspondent in Darmstadt sends details of a simple little fake which eliminates all this trouble, and his tip may be of service to some English manufacturers who use the gear, for I know several of them use very complex special tools for the same purpose. The sketch shows a little hairpin made of bent iron, ⅛in. thick with bevelled tips. This must be pushed (by standing on it) between the crossbar C and the washer W, thus compressing the spring, when the nut N can be unscrewed quite easily. It is better to unscrew N a turn or two before inserting the bit of bent iron, as the unscrewing can then be completed by hand. Clearly the bent iron must fit easily over



washer R, but must not be bigger than W. In reassembling the gear, do not pull the bent iron J out before washer R has engaged S. Readers, private and professional, will be very grateful for this simple little device.

The Future of the "Oversize" Single.

At the moment I am not too enthusiastic about the introduction of "oversize" single-cylinder engines with a capacity ranging from 500 c.c. to 750 c.c. I suppose there is no vestige of doubt that they are a compromise introduced to meet the needs of the man who does a lot of solo riding, but likes to attach a sidecar on occasions.

I fear the immediate results of the innovation will not be purely beneficial. They will involve motor cycle politics in some confusion, for we can neither set 500 c.c., 600 c.c., 650 c.c., and 750 c.c. engines to compete together in competitions, nor introduce a complete range of intermediate classes, nor view with equanimity the policy of a 550 c.c. or 600 c.c. specialist annually turning out a dozen 500 c.c. engines to compete in the principal speed trials of the year. Moreover, I have tried all the oversize singles on the 1913 market, and—writing before I have had time to try out all the 1914 oversizes—I confess to real doubts whether the oversize singles can be made to run quite so sweetly as the 500 c.c. type. My fear is that the solo enthusiast may be compelled to put

Occasional Comments.—

up with an extra 50 c.c. or 100 c.c. which he does not want for the sake of the double-purpose buyer, who, occasionally, wants the extra capacity to tug his sidecar up a bad hill, or to enable him to use a higher gear series. We should not complain of the extra power, other things being equal; but if it is a fact that the oversize engine is less sweet at low speeds and has several vibratory periods, well, we solo enthusiasts are being unnecessarily penalised in the interests of others. However, there is no need to worry; if the 1914 oversize engines do not come closer to the best 500 c.c. standard, the makers will soon feel the pinch and retrace their steps.

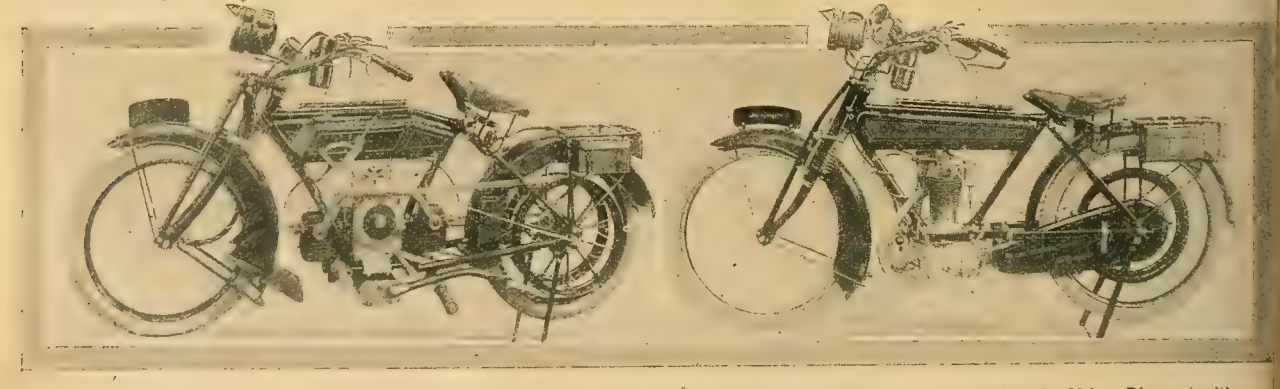
Looking further ahead, I should be inclined to speak more confidently. The oversize single-cylinder engine may conceivably be brought up to existing 500 c.c. standards; but whether it is or not, it cannot represent finality as a sidecar hauler, for a well-designed twin-cylinder can knock its head off, and I have no doubt whatever that the twin is going very largely to squeeze the single out of the field, and especially so in passenger work. Take any engine capacity you like to name, from 350 c.c. to 750 c.c.; other things being equal, the twin will oust the single from public favour; it will show better flexibility, it will be less inclined to knock, its running will be sweeter, and, to my mind, it will maintain its power better. So the oversize single appeals to me as no better than a transient compromise at the very best.

The Bantamweight Class.

The bantamweight class of motor bicycles present an innovation which one can survey without the faintest tinge of misgiving. They at any rate have come to stay, and very jolly little mounts most of them will make. My one surprise in surveying them is that the designers are not more unanimous about the merits of the two-stroke engine, and it would be very interesting if two able technicians would publicly state the reasons for their diverging enthusiasms. We may term these bantlings as being by "Levis out of Douglas," for the combined drive has given these bantlings genuine road efficiency by eliminating the belt troubles which wrecked so many premature introductions, and the two-stroke engine has given them a high power maintenance value. No man in England has sampled the light-weights of the last twelve years with more interest or diligence than myself, and many years have elapsed since I saw the impracticability of a direct belt drive disfigured by small engine dimensions with an inevitably microscopical engine pulley. I thought too that the miniature four-stroke engine of 1½ h.p. to 2½ h.p. was equally impracticable, for my experiences uniformly suggested that, though the original power output might be satisfactory, it could not be maintained over a satisfactory mileage. There was no reserve of power in these minute cylinders, and as soon as a little piston ring wear, valve pitting, lost spring temper, and carbonisation made their presence felt, the engine lost all its vivacity and stamina, and became a useless caricature of a power unit. In other words, I am sure the tiny two-strokes will survive, but I feel bound to reserve my judgment on the 2½ h.p. four-stroke single-cylinders.

Cycle Car Transmissions and Cheap Repairs.

The encomiums lavished on the miniature light cars which just overflowed the cycle car definition, and provided the car Olympia with its one real novelty, must have blinded many people to one outstanding advantage of the genuine cycle car. After twelve months of hard work the transmission of the best motor vehicle must require a certain amount of attention. In ninety-nine cases out of a hundred the light car will demand the services of a skilled mechanic, supposing its owner is thrifty enough to supply a stitch in time instead of boldly chancing his luck. A full automobile transmission may imply a worn clutch spigot bearing, worn universal joint bushes, worn ball races or brasses in the gear box, and a bevel or worm gear that needs adjustment, not to mention the possibilities of some attention to a differential rear axle. The ideal cycle car transmission is capable of being put in perfect order by an amateur; there may at the moment be few cycle car transmissions which absolutely attain this ideal, but we are well on the way to it. An amateur can fit a new leather disc to the simplest type of universal joint; he can replace belts or chains, or friction discs for himself; he can renew the balls and cones on which a counter-shaft revolves; and if his transmission includes one such complex item as a variable pulley or an epicyclic two-speed box, he can detach that tiny unit and return it to the factory for attention at a trifling cost. Consequently there is still a real opening for the genuine cycle car, and this opening should gape permanently, however splendid the future of the light car proper may prove to be. The simpler vehicle will not only remain cheaper to buy but as its design becomes stereotyped and the quality of its workmanship is improved, it will show an increasing superiority in maintenance costs.



Two striking designs for 1914. Left—the new 5-6 h.p. Montgomery with driving pulley mounted on the camshaft. Right—the 2¾ h.p. Diamond with unit construction of clutch and gears and enclosed chain drive.

IMPRESSIONS OF THE SHOW

AND A BRIEF ACCOUNT OF SOME OF THE LADIES' MODELS.

By MARGARET COOKE.

THIS year, for the first time, I had the opportunity of seeing the Cycle and Motor Cycle Show in the making, and a most interesting sight it was. Peeping in at Olympia on the afternoon of Saturday, Nov. 22nd, I was confronted with piles of huge packing cases, crates, motor cycles, and pedal cycles, all seemingly in the greatest confusion.

A small army of men, each an expert at his own particular calling, was busy creating order from disorder, and in a short time some of the stands were transformed into the most artistic structures, as though further to enhance the beauties of the array of bicycles to be exhibited to an admiring and critical public.

Many of the leading lights of the sport had thus early put in an appearance, and were busy superintending the arrangements of the stands or critically examining arrangements already made.

Truly the motor cycle movement is an extraordinary one, and continues to grow at a remarkable rate! What it will be when machines are marketed at a lower figure it is impossible to conceive.

The Show.

On entering Olympia for the Show proper what a wealth of gorgeous display met the eye! Never before have the colourings of the tanks, etc., been so delicate and pretty, and these, allied with the glittering silver plating, presented a most striking and artistic picture. What a pity that even these magnificent machines should eventually become "crocks"!

Taken on the whole, the Exhibition might well be described as one for the "Paterfamilias," or, more strictly speaking perhaps, for the ladies of the family. This seemed to be fully realised, for on every hand were to be seen ladies taking careful note of sidecars—their comfort and capacity as well as their appearance. With such a variety of designs, it must have been difficult to make a choice. There were models to suit all purses. Sidecars of every conceivable shape and form have been evolved, some with the most luxurious upholstery and fittings imaginable; in fact, they are miniature cars, and look almost as comfortable. Others, again, are large enough for a man to take his wife and family with him to participate in his pleasure—a distinct and gratifying innovation.

Makers have, indeed, excelled themselves in respect of sidecars, and deserve to reap large orders. There were certainly a few weird-looking specimens, but no doubt these also would have their admirers. In the olden days sidecars were made so that the passenger might be quickly shed when occasion demanded (sometimes this happened very frequently). Now one is inclined to wonder how the passenger gets in or out—in some models.

ELSIE AND HER AUTO WHEEL.
A charming photograph of a device which will be much in evidence next year.

Weight and Price.

Sidecaring has undoubtedly been the most popular side of the sport during 1913. Makers have realised this fully, and have catered accordingly by making the motor bicycles more powerful, and in consequence heavier, thus unfitting them for solo riding. The ordinary 3½ h.p. single as we knew it seems less popular. In my opinion this is going to prove a real blessing in disguise to the lady riders' side of the movement. A new type of machine has been brought into being more suitable for solo riding. I mean the two-stroke lightweight which is being marketed at from twenty-five to thirty guineas, and yet is reliable and sufficiently powerful for all ordinary requirements. This will pave the way for a new open frame model, light, powerful, simple in design, and at a price within the reach of thousands who could not afford to pay £50. Two manufacturers assured me of their intentions to build such a model to order at the above price. Surely, we may hope to make still larger additions to our ranks this year.

Ladies' Models at Olympia.

The open frame models at the Exhibition this year were not so numerous as last year, but the few shown were very select and the most suitable yet exhibited.

The Douglas.

Our old friend the Douglas, which has survived the lean years when others have gone under, is still to the fore looking as bright and up-to-date as ever. It has proved its worth so many times in the past summer

Impressions of the Show.—

that no great change has been made in the design, although there are some minor improvements, and it sells at £53. We all believe in the survival of the fittest, hence we must give all honour to Messrs. Douglas Bros., but could it not be made a little lighter.

The Veloce.

This machine made its *début* in 1912. It is a very feasible looking mount, and has some excellent points. I have not had the pleasure of riding it, but have had very good reports of it. The price is forty-eight guineas. A lady's open frame model fitted with the 2¼ h.p. two-stroke engine, as in the diamond frame Velocette shown on the same stand, would be an ideal machine and could be listed under £30.

The Levis.

This machine with its complete frame nickel-plated is a very striking-looking exhibit. It is rather long in the wheelbase, but beautifully low. It is simplicity itself, and should be one of the most popular mounts next year. I ought to say that these machines are not turned out in silver plating; were it so, the thought of the cleaning process would make one shudder. The price is £40.

The Connaught.

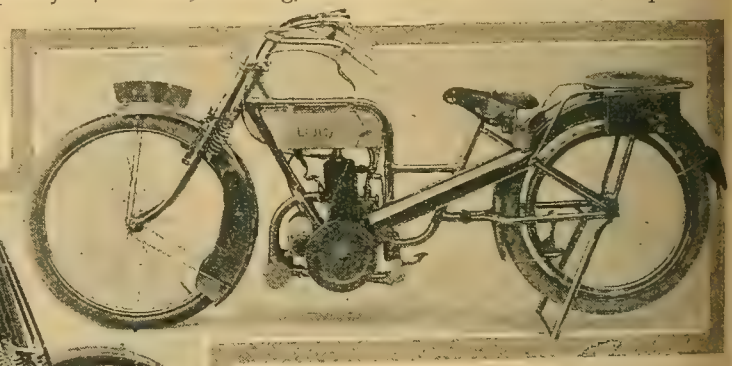
Here we have a machine at a very reasonable figure, namely, £36 for a single-geared model. This is a two-stroke motor cycle of which we have heard much during 1913. It has a 2½ h.p. two-stroke engine which makes for simplicity, has a low saddle position, is rather lacking in mudguarding, and weighs 125 lbs., but looks much lighter.

The Auto-wheel.

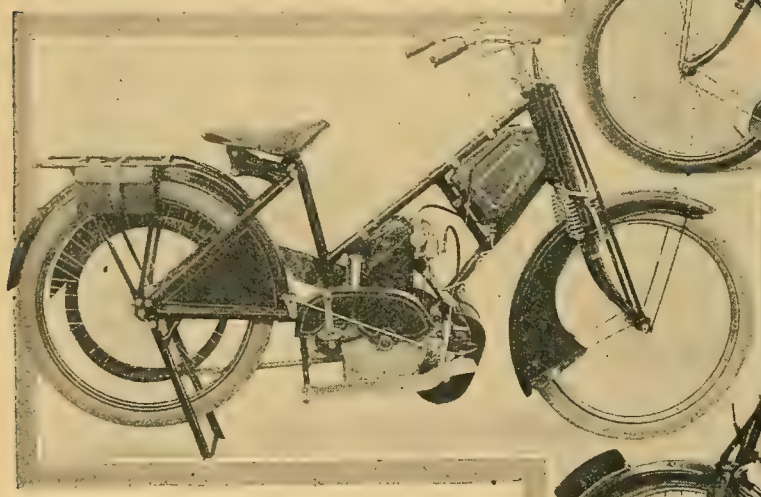
This was a most popular exhibit. It might be called the baby of the Show. Crowds of people were round the stand taking note of its working arrangements. Here we have the missionary of motor cycling, and especially in the case of ladies, who, after a few months' experience with an Auto-wheel, have the desire for a real motor bicycle, and have gained confidence from their experience with the former.

Cycle Cars.

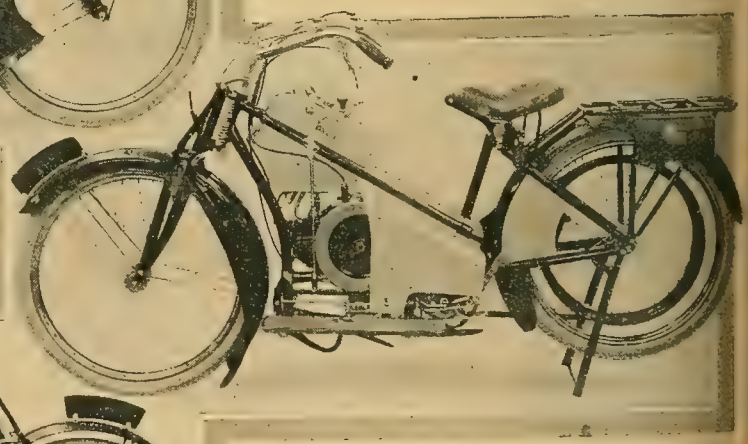
That these are receiving consideration was very evident during the Show. It was almost impossible to get near many of these vehicles because of the number of people inspecting them.



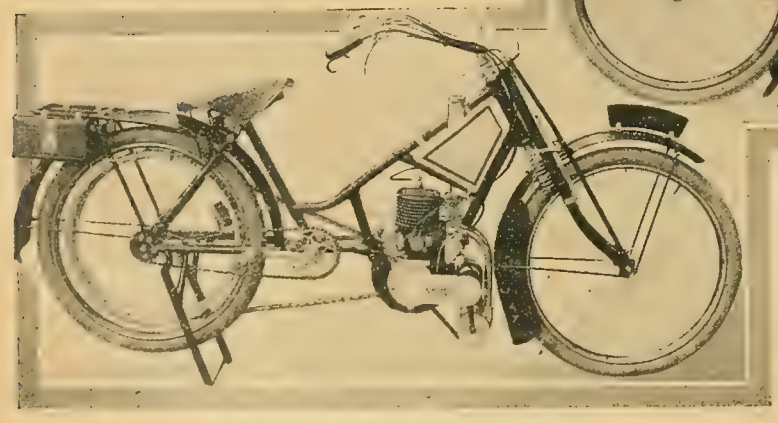
The two-stroke single-cylinder Levis, which is nickel plated throughout.



The 2¾ h.p. two-speed belt driven Veloce.



Flywheel side of the two-speed 2¾ h.p. Douglas, which has belt and chain drive.



The Connaught open frame two-stroke lightweight.

"The Ladies' Club."

Miss Mary Ellis, of 35, Portland Place, W., as mentioned in *The Motor Cycle* of November 20th, is anxious to form a ladies' Club. By supporting this I feel sure ladies will give good impetus to the cause

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Two-stroke Lubrication.

Sir,—With reference to a letter from Mr. Davison in last week's issue, I wish to disabuse the mind of this correspondent and also, I believe, of your good selves, with reference to the question of the lubrication of the Connaught motor cycle.

We have never claimed that we were the *inventors* of this system, as a reference to our 1913 catalogue will show, that we clearly state that it was used in America, and we had adopted it from American manufacturers. What we did claim, however, was that we were the first people to apply this system commercially to motor cycles in England, and that other manufacturers who are using this system have waited until we overcame the prejudice that was naturally engendered before adopting it.

We should be glad if you would kindly publish this letter, as it will remove what we believe is a misconception on this point.

THE BORDESLEY ENGINEERING CO., LTD.
JOHN ROWLAND, Managing Director.

Sir,—I can confirm the statements in Mr. A. C. Davison's letter on p. 1610 of November 20th issue. I had one of the first small Clement-Garrard 1½ h.p. motors imported into this country and received the same tip from Mr. C. R. Garrard, *i.e.*, to combine the lubricating oil with the fuel.

There was, in practice, however, one slight objection to its use, viz., the heavier oil, when thinned down, used to "creep" outside the carburetter and gradually spread over the outside of the induction pipes and the engine generally (behaving very much as ordinary paraffin does in a lamp which is not constantly cleaned), and was a great collector and retainer of road dust.

The mixture of petrol and oil was, however, quite effective as a lubricant. T. W. BLUMFIELD.

Weights—Nominal or Actual.

Sir,—Your "Buyers' Guide" affords very interesting reading. Being a lightweight myself I am always keenly interested in the weights of machines. I am at present riding a very heavy 3½ single-cylinder. I have always had an idea that I would like to try a 6 h.p. twin, but have been afraid to tackle one, because I thought it would be too big and heavy. As a matter of fact, my present machine (which must be in the region of 260 lbs.) is really too heavy for me on very long rides. Judge of my surprise in looking down the weights given in your "Buyers' Guide" to find the 2¾ A.J.S., weighing 180 lbs., is actually heavier than the 6 h.p. Brough (170 lbs.), and, further, it is only an inch shorter in the wheelbase. The 3½ single-cylinder Indian (210 lbs.) is 20 lbs. heavier than the 7 h.p. machine of the same make, and the 4 h.p. single-cylinder Triumph (which I had always looked upon as a fairly light machine) is 10 lbs. heavier than the 7-9 N.S.U.—both of these two latter machines include a three-speed gear.

I think this question of weight interests a large number of readers like myself, who would like a fast and powerful machine but do not feel equal to hauling 2½ cwt. on and off the stand fifteen or sixteen times a day, or steering it about on greasy tramlines. VERY SCEPTICAL.

[The weights, like all other information published in the Buyers' Guide, are supplied by the makers. It is obviously impossible for us to obtain them otherwise.—ED.]

The Tourist Trophy Course.

Sir,—I was very pleased to read your editorial comments upon the 1914 T.T. Races in *The Motor Cycle* of November 20th, and sincerely trust you will use your influence in obtaining better conditions for the next contest. I quite agree with all your remarks regarding clothing, but what is more important, to my mind, is your first suggestion *re* a safer course. You will no doubt recollect that when the mountain course was first suggested, my brother and myself, and also many other experienced riders, decided that the A.C.U. were making a very bad move, and, moreover, for no apparent reason, the general excuse being that the mountain course provides a much severer test for a motor cycle. This, to my mind, however, is a fallacy which has well been proved by the manner in which the Junior machines make light of the mountain climb. My chief objection to the Four Inch course is the number of treacherous corners, any one of which might be the cause of a fatal accident, either in practice or in the actual race itself, to a rider who is not absolutely at home on the course. It is universally acknowledged amongst experienced road racers that the most dangerous corner is not the most acute, but one which can be taken at speed, and with this type of corner the mountain course simply abounds. Proof of this lies in the fact that in every case of a serious accident, it has occurred on a corner of this description. Although, of course, no average road could be considered safe, to my mind the original T.T. course was the nearest to ideal that it would be possible to find without going to the Continent, the number of dangerous corners being very few, and the course being shorter it is more easily learnt.

Trusting that your excellent suggestion will bear fruit,
C. R. COLLIER.

Rear Lights.

Sir,—The correspondence *re* rear lights, in your interesting but *not sensational* periodical, prompts me to put a word in on this matter.

To think that the authorities should want motor cyclists to use rear lights is, to my mind, the most foolish and absurd thing imaginable.

Where the need is greatest it seems to be overlooked, viz.: carters and "push" cyclists. For the last two years I have been in the habit of going to and from London—a distance of twenty miles—and I have only my lucky stars, or my brakes to thank, that I have not been killed through cyclists and carters not showing rear lights.

The cyclists with acetylene lamps are not so much to blame as those with apologies for lamps of oil. Many times I have purposely slowed up to ascertain whether they really had a light at all. Surely these offenders should be forced to carry a reflex light, as it is always the motorist that gets the blame if there is an accident.

Carters give a good example of how the law of England may be evaded. Many times I have suddenly come upon a carter with apparently no red light showing from behind, but when alongside I have discovered the elusive light. This state of things should not be. The rear light is nearly without exception obscured by the freight carried, or fixed in a wrong position. Cannot the authorities turn their attention to matters of grave danger to motor cyclists, instead of trying to enforce a silly regulation on us which is of no good?

I consider these two the only real dangers of the road at night; the car with the blinding head lights is an angel in disguise compared with these. GILERT M. DESPREY.

Missing Bristol Trams and Traffic.

Sir,—The following may be of use to readers going North *via* Bristol.

Coming from Bridgwater take L. turn about four miles before Bristol. This turning can easily be identified by the reservoir filters at the corner. Follow this lane to the next main road which it joins at a motor 'bus terminus, where turn R. and continue until tram terminus, which is on a railway bridge. Cross this bridge and immediately turn L., crossing river and docks by two swing bridges. After second bridge (narrow), sharp L. and alongside docks and river, under Suspension Bridge, and R. fork up hill, at top of which straight on past Zoo until trams again. Follow trams L. for a quarter of a mile, when signpost directs R. to Filton, where L. for Gloucester. Sharp R. at Ship Inn about six miles after Filton.

This misses all trams and traffic except the quarter of a mile mentioned, which is quite suburban. J. W. KAY.

Agents' High Commission.

Sir,—With reference to the Rev. B. H. Davies's "Open Letter to the Trade" appearing in your Nov. 20th issue, and quoting the following lines addressed to the manufacturers: "We venture to think that some of you pay ridiculously high commissions to your agents." Apparently the writer is not very familiar with agents' terms, at least in the London district, or else he would not write of "ridiculously high commissions" being paid to agents. So far from being high, I take it that most agents consider them much too low, and without Mr. Davies's suggestions, they are being decreased for 1914, in many cases. On the other hand, supposing Mr. Davies was to put himself in the position of an agent. He would find his expenses increasing year by year. I might mention advertising as a very good example. A paper with an increasing circulation, increases its rates for advertisements. Other journals spring into existence, and have, in most cases, to be supported by the agents and so in numerous other instances. Let Mr. Davies remember that the manufacturers have in the past, and undoubtedly will in the future, rely upon the bulk of their trade through the agent. This being the case, ought not the manufacturer to look well to the interests of the agents? I consider this particular part of Mr. Davies's article very misleading to the general public, as they will, without doubt, take advantage of such a fact, and ask the unfortunate agent to share some of that *huge commission* with them.

R. G. NYE.

Engine Classification for Records.

Sir,—About four years ago the British Motor Cycle Racing Club instituted a series of classes A, B, C, D, and E, for the purpose of classifying motor cycles for racing at Brooklands. These classes were found to be so convenient that they have been adopted by other bodies, including the Auto Cycle Union and the International Federation. They range from Class A, which is for motor cycles having a cylinder capacity not exceeding 275 c.c. (the origin of which class was the old 70×70 racing engine) up to 1,000 c.c., the largest practicable motor cycle engine commonly used. The increment in capacity of each class above the smaller one is not constant, as the classes were arranged to suit the majority of various motor cycle engines then on the market. For instance, there is only a difference of 75 c.c. between Classes A and B, 150 c.c. between B and C, and 250 c.c. between C and D and D and E.

The classification has been of undoubted value particularly in standardising the 350 c.c. and 500 c.c. machines, and by providing a method of sub-dividing records by which the best machines of nearly all recognised sizes can be at once picked out.

Unfortunately, Class A appears to have been neglected by the manufacturers, and there are comparatively few makes to-day which come within this class, although there are a large number which are only just excluded from it.

The remedy would appear to lie either in the creation of an intermediate class, or in altering the present limit to Class A. The chief objection to increasing the number of classes is that the record list is already somewhat unwieldy, and that any new class instituted between 275 c.c. and 350 c.c. would necessarily be very restricted. The latter objection also applies to an alteration of the Class A limit. As pointed out above, there is only 75 c.c. difference between machines of Classes A and B, whereas if we turn to the record list, we find that all Class D records are held by machines of Class C, *i.e.*, of no less than 250 c.c. smaller capacity. An alteration to the Class A limit would also be an injustice to the present record holders in that class.

You will gather that it is not easy to find a satisfactory solution of the difficulty, and I would suggest, therefore, that you should invite correspondence on this question, particularly from those half a dozen or so makers who at present feel themselves rather hardly hit by the existing classification. G. STANLEY CARTER.

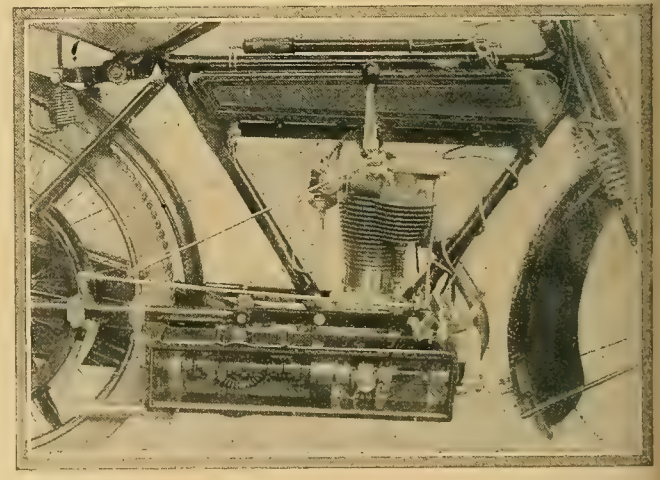
P.S.—Since writing the above, the F.I.C.M. has decreed that Class A is restricted to 250 c.c. This, however, does not help us out of the difficulty.

Cycle Car and Light Car.

Sir,—Like Messrs. Auto-carriers, we were turning out a considerable number of our cars before the term "cycle car" was invented. Nevertheless we do attach very considerable importance to the definition of the A.C.U. It was framed to include a new type of car—one which by its small engine-power and light construction should be at the same time speedy and economical. It was agreed that cars of this type should compete together in order that their merits and defects might be determined by public competition—the results of private trials are naturally taken with the proverbial grain of salt. But for purposes of competition a strict definition is absolutely necessary. It may be arbitrary, but it is essential. As the two distinguishing features of the new motoring were small engine power and light construction, the A.C.U. drew the line in regard to both these points, and their definition is accepted by the R.A.C., the F.I.C.M., and the Manufacturers' and Traders' Unions. No one imagines that there is anything sacrosanct in a limit of 1,100 c.c. and 6 cwt., but the line had to be drawn somewhere if competitions were to be of any value. We quite agree that for some purposes a "commonsense division" (the suggestion of *The Motor Cycle*) may be more satisfactory, but certainly not for competitions. This will, we believe, be acknowledged when the advocates of the light cars come to arrange competitions of their own. Some day, perhaps, competitions will become superfluous; then the necessity for a hard and fast definition will disappear. But the time is not yet. The Tourist Trophy, the Grand Prix, and the Six Days will be as instructive as they will be popular in 1914. MORGAN MOTOR CO., LTD.

Kick-starting.

Sir,—Surely the document entitled "An A.C.U. Certificate," etc., has missed its place amongst the jollities of your Christmas Number; The further I waded into this, the more hopelessly I groped for the "Q.E.D." May I, in simple fairness to a kick starter, the manipulation of which has been my fortunate lot daily since January, set forth an unvarnished statement of its performance. This kick



The power unit and gear of the 2¾ h.p Diamond. This was shown at Olympia under a glass case to facilitate inspection of the working.

starter is housed in a very damp cold country stable. A few nights ago we experienced a big frost. At ten o'clock the following morning the machine, a single-cylinder, was started in the open at the fifth operation of the kick starter, the carburetter being flooded with Shell II., throttle one-third open ignition half advanced—no petrol nor paraffin was injected. Without exception, this engine starts on first to third kick at all other times, far too numerous to reckon, my professional use of the machine requiring hundreds of starts a week. QUICK STARTER.

A Pleasant Run.

Sir,—I might suggest an interesting little run—one of many around Petersfield—which though in parts rather narrow, might appeal to cycle car enthusiasts out testing; that is to turn off on the Leas to Petersfield road at Bowyers, and thence up Rockpit and Old Stonor *viâ* Steep Mill and Ashford. The route is about three miles, and the view to be obtained at the top of the last hill is magnificent, extending over three counties. Many who come through Petersfield on their way to South Harting might be glad to try their machines round some of these local lanes, the surface of which, as a rule, is good. I do not think Old Stonor has as yet been tackled by a cycle car. It is about half a mile long, with a hard though rough surface, about 1 in 4 in parts. A. C. HOLDER.

Retreads.

Sir,—For the benefit of any reader who has but a shallow pocket, I give my experience of retreaded covers.

On the back wheel of my 6 h.p. Rex-de-Luxe and sidecar I fitted a well-known 650×65 grooved cover, which was worn out in 1,200 miles. A second cover lasted even less.

I was advised to have the cover retreaded, and decided upon Messrs. J. Pedley and Sons, Birmingham. I confess I did not expect much wear from a retread; however, this cover ran 2,100 miles without a puncture. Afterwards, I decided to try one of these retreads on the front wheel; this one ran 3,800 miles with only one puncture. I think the mileage remarkably good, considering the weight of the machine. ADAM KELLY.

Reckless Driving.

Sir,—In your number of the 20th ult., a "Car Owner-driver" complains of the reckless driving of some motor cyclists. I am sorry I cannot deny what he says, but I should like to know what consideration is shown to motor cyclists by the majority of motor car drivers—none.

Take, for instance, a car and cycle going in opposite directions: the cycle is forced into the gutter, and now on these greasy roads, when the mud is so thick on the sides that it is positively dangerous—the car driver will not deviate one inch from the centre of the road, and indeed in some cases he even turns his wheel upon you. Again, when a car overtakes a cyclist the driver flies past without giving any warning of his approach. On dark nights, with those blinding head-lights, knowing that one will only be allowed just room to get in between the side of the road and the car, a cyclist rides with fear and trembling. T. D. THOMAS.

Sir,—In your issue of November 20th a letter appeared under the heading signed "Car Owner-driver."

I think my first feeling after reading it was that of utter astonishment that "Car Owner-driver" could possibly have ever been a motor cyclist.

Of course, I admit that the type he writes about does exist, but I put it to anyone who cares to read this letter that the said type *never* "abounds in considerable numbers," even on the Portsmouth Road.

Might I suggest that "Car Owner-driver" should look to his own clan, that of the car owner, before carping at the behaviour of motor cyclists?

To prove that this is not bluff I quote two of my own actual experiences when being driven along the London-Coventry Road in a sidecar. We were going along at a fair pace (well on our right side of the road) when a Rolls-Royce car passed us and cut right in across our front wheel to avoid a car proceeding in the opposite direction, and to get a good space for the immediate swerve to the right up a side turning which the driver made. The result was that we came within inches of a collision through no fault of ours whatever. If that driver had been a gentleman, would he have attempted to pass, knowing that he was going to turn off within fifty yards? Anyhow, to raise "Car Owner-driver's" own point, passing should have been out of the question, owing to the position of the other car.

The second experience took place a month or two after on the same road, but in a place where the road is narrow. Coming towards us was a horse and trap, and some way behind was an Arrol-Johnston car travelling very fast. As we were passing the trap, the car driver attempted to do what "Car Owner-driver" deprecates so much, *i.e.*, cut in between the two vehicles, causing our sidecar wheel to mount the grass at the side of the road in avoiding him, and blowing off the motor cycle driver's cap with the draught caused. I am sure there was not more than six inches between his front wings and our handle-bars. Our remarks were vigorous and to the point when we turned round for the cap.

In both the above instances the drivers were men, so had not even the "recklessness of youth" as an excuse.

By all means, sir, let us have "a sound public opinion on the matter," but in trying to get it formed let us have FAIR PLAY.

The Motor Cycle in the Army.

Sir,—As Territorial motor cyclists who took part in the late Army Manœuvres, we should like to draw the attention of the authorities through your columns to the following facts:

1. We consider that the Government rate of pay is insufficient, and should be increased to 10s. per day.
2. Some adequate means of covering the machine should be provided. It is not good enough to expect machines, in many cases practically new motor cycles valued at anything up to £70, to stand all night in pouring rain, as our own machines did on several occasions this year.
3. The Government should insure both machine and rider. Much of the work is very risky; but it is extremely problematic whether in case of death one's dependents would get anything at all, and it is perfectly certain that a smashed machine would not be paid for by the Government.

To University men these details are not of much account, but to men like ourselves, who are, we trust, quite as useful as men possessed with a considerably larger portion of this world's goods, a smashed up machine and an injury which might prove permanent, if it is not fatal, are very important items.

We have not joined the Territorial Force with the idea of making money out of it; but we think the Government, which is considerably more wealthy than any of us happen to be, should find money to cover out-of-pocket expenses on manœuvres, to save the machine from greater damage by the elements than is absolutely necessary, and should also adequately recompense any man who happens to be injured on Government service, and repair damage to his machine incurred on the work free of all charge to him.

We give our names for your information, and sign ourselves,

SEVEN MOTOR CYCLISTS, TERRITORIAL FORCE.

Petrol Gauges.

Sir,—In your issue of November 13th your contributor "Ixion" grants me my contention that the sunk in type of gauge registers correctly, but he still finds other faults which I do not think fairly belong to it, and, like Oliver Twist, I crave for "more." He says that he has never managed to read his from the saddle, but I am sure I have read of him performing feats of adjustment while running, which must have necessitated him stooping to a position which would make reading a gauge child's play, so that I can only suppose he never tried very hard.

By a coincidence, since writing the article, I have heard a gentleman, quite a stranger to me, say that he could read his easily. The other two defects he mentions are the risk of losing the needle valve and the risk of being deceived if the rod is screwed quite down. Now, surely, the first of these could only arise from defective workmanship, and is not an inherent fault of the gauge. If the screw is a proper fit, and the rod put in with a slight camber as it should be, it will stay in any position and be quite free from rattle, and, in any case, the probability of it jumping up five inches and so getting lost seems rather a theoretical objection.

As regards being deceived by the needle valve being

closed, there is no need at all to close it, it is only a safeguard against the very remote chance of the glass getting broken, and some hard riders discard it altogether and take the very small risk.

In any case the trouble of unscrewing it half a turn if in doubt should not worry even the most happy-go-lucky individual. A. C. DAVISON.

Disqualifications in the Streatham Trial.

Sir,—I shall be obliged if you can spare me space to say that Mr. Cocks's disqualification in the above trial, as having claimed a non-stop which he had not accomplished, proves to have been due to his card having been hastily and carelessly signed and handed in at the conclusion of the event. It appears quite certain that he had no intention of making such a claim, and there is, therefore, no imputation against his honesty. SYDNEY J. TAYLER,

Judge of the Trial.

A Motor Cycle Show in Manchester.

Sir,—A few weeks ago I saw it stated that there was a possibility of a motor cycle show being held in Manchester early next year. I hope the idea will not be allowed to drop. Such a show is bound to be a success, for there are thousands of Northern and Midland motorists and prospective motorists who cannot get to Olympia.

Let us have a show at Rusholme, either to precede or to follow the car show.

Re excessive garage charges. Recently in Birmingham I was charged 1s. 6d. for seventeen hours for my bicycle with sidecar. It was explained that the charge was 6d. for six hours or fraction of six hours. E 1806

Date of Six Days Trial.

Sir,—I note with regret that the A.C.U. have fixed an early date in July for their 1914 Six Days Trial instead of a date in August.

If there is any chance of this arrangement being reconsidered I am sure you would earn the gratitude of most private owners, including myself, if you could, by means of any representations in your columns, or otherwise, induce the A.C.U. Committee to fix a later date.

So many private entrants are free in August, who would be quite unable to get off in July to compete; and the same applies to hundreds of others interested as spectators, and observers, etc.

It seems certain that the change to July would cause a falling off in entries, and in public interest generally; besides causing great disappointment to many, who, like myself, have looked forward to this trial as the chief feature of their summer holiday.

Hoping that you will kindly use your influence in this matter in the interests of the private owner.

C. PERCIVAL.

Exceeding the Limit.

Sir,—At about 8.30 p.m. on the 27th ult. I was riding a motor cycle along the Shooters Hill Road, when I was signalled to by a police constable and subsequently informed that I had been timed over a measured furlong and found to have exceeded the legal limit. I have no doubt such was the case.

It is only when oneself is so caught that one realises with what good grounds the bitter complaints I so frequently receive from the members of this Union are made. It is almost fatuous to remark that no responsible member of the motoring community objects to police regulation of traffic, or to the most vigorous action being taken against those who abuse the facilities of the road. It is equally true that every motorist habitually breaks the law.

I had hoped that the circular issued by the Home Secretary some little time ago would have abolished at least this class of trap—a trap deliberately designed to catch the unsuspecting motorist with no reference to the safety of the public, *i.e.*, the choice of an exceptionally wide, straight, level piece of road with no dangerous curvings, comparatively little traffic at any time, and practically none at night.

It would appear, however, that appeals to the discretionary powers of the Metropolitan Police, usually so wisely exercised, are in this matter made in vain, and the reason that at once suggests itself is hardly a creditable one.

T. W. LOUGHBOROUGH,
Secretary Auto Cycle Union, 89, Pall Mall, S.W.

The Price of a Differential.

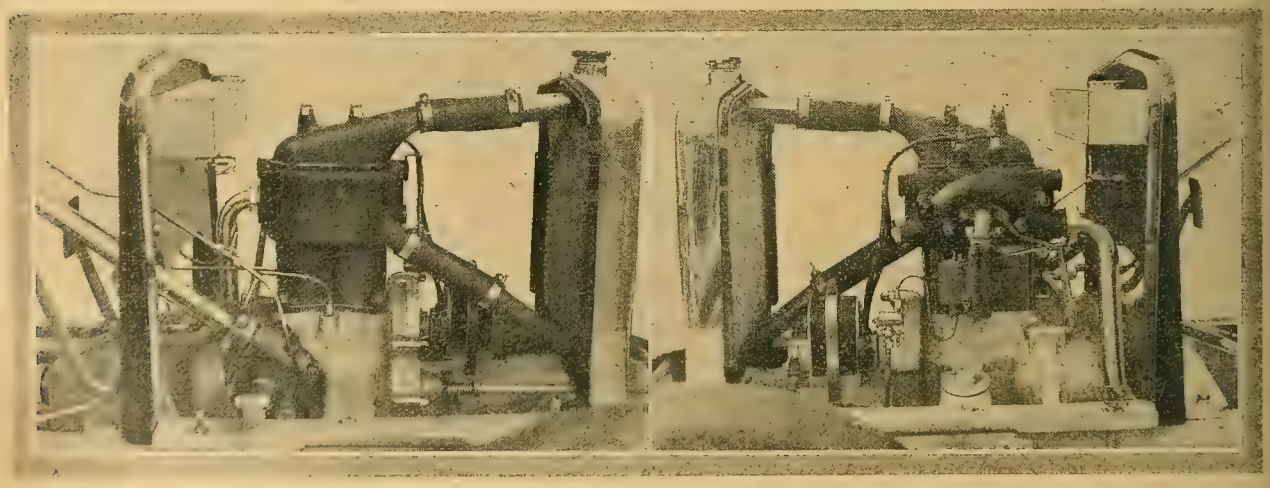
Sir,—The question of dispensing with a differential has been largely discussed in your interesting journal, but as this item is universally adopted in motor car practice, I do not see the reason why it can not be produced by British manufacturers at a low price.

Six years ago I owned an Orient buckboard 4 h.p. single-cylinder air-cooled engine located on the rear, and have actually in use a Metz runabout 8 h.p. opposed twin air-cooled engine carried in front under bonnet. The friction drive on both vehicles, including a small differential on the counter-shaft—so small, in fact, that it can be entirely covered with both hands—has given me no trouble at all, the final drive being by two chains to rear wheels. In my opinion a friction drive on these lines is most suitable for cycle cars and light vehicles and can be turned out at a very low figure.

Water-cooled engine, up-to-date carburetter, and better springing are the improvements that I should like to have in my next vehicle, which, I expect, will be a British made cycle car.

I read always with great interest your journal, which I receive regularly every week, and wish it continued success in the future.

E. DE PERMENTIER.



Two aspects of the twin-cylinder water-cooled Perry cycle car engine showing position of magneto, carburetter, and radiator.

SHOW GLEANINGS.

FURTHER NOVELTIES ON EXHIBITION AT OLYMPIA LAST WEEK.

A Neat Double-seated Sidecar.

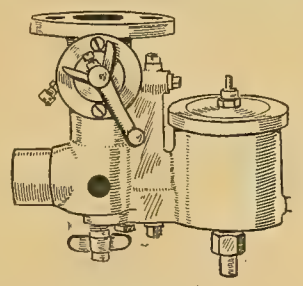
On the stand of the N.S.U. Motor Company, Purcell's double seated sidecar was shown. This is an interesting type sidecar of which the body is intended to carry two people seated tandem fashion, the back seat being a type of dickey. The body is mounted at the rear on double C springs. The chassis is of the double tube variety, and suspended at four points, while it is interesting to note that the joints are not brazed but acetylene welded. The frame is also dropped five inches; ten gauge spokes are employed, and a 2½ inch Hutchinson tyre is fitted. Illustrations appear on page 1650.

A Novel Sidecar Body.

Mr. James Parker, of Kendal, who was assisting the staff of the Scott Engineering Co., has brought out a novel sidecar body constructed on striking lines, which, made by a pattern maker, has no less than 800 pieces of wood, on the same lines as a wood pattern is made for a foundry. The body is like an elongated egg. The back semi-spherical piece is removable, and can be made to act as a receptacle for spares, etc., or even for carrying a small quantity of luggage. The interior of the body is beautifully upholstered, and the two fitments on the dash are a clock and speedometer, the latter being driven from the sidecar wheel. The dotted black line on the second illustration shows the position occupied by the seat. The base of this seat is only three inches from the floor and is tilted back. It will be noticed that the boy seated in the sidecar appears quite happy and comfortable. This illustration was taken to show that the seat, although a low one, is not intended to provide an abnormal position.

Sthenos Carburetter.

The Sthenos carburetter was shown at Olympia by Mr. J. A. Ryley, of Martineau Street, Birmingham, and is sold in a form suitable for the engines of cycle cars. It possesses two jets, one for starting and slow running and the other, which is a larger jet, for higher engine speeds. This model is practically the same as the larger types, except for the

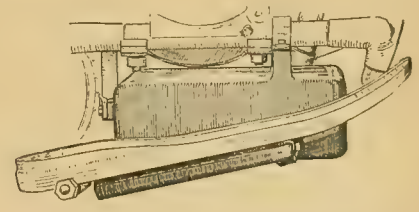


The latest pattern Sthenos carburetter.

fact that the regulating screw is done away with. On the throttle being opened the level of the petrol in the duct leading into the pilot jet falls so low that no petrol reaches it, and the main jet alone comes into operation. The points of accessibility have been well studied, and it is easy to get at the jets or to remove the cover of the float chamber.

A Tiny U.H. Magneto.

A new type of lightweight magneto was shown on the stand of S. Wolf and Company, specially designed for the smaller types of motor bicycles. It is completely waterproof, including the high tension terminal, which is neatly constructed and attached by means of a well designed snap fastener. The ignition point is fixed, and, instead of having two magnets, the little machine is provided with a large single one. The pole pieces are of standard pattern, the new U.H. type of pole pieces being only employed on magnetos in which the firing point is variable. A new type of contact breaker, which can be easily dismounted, is also fitted. It is interesting to note that the weight is 3¾ lbs. against the larger size, of which the weight is 5 lbs.



The large sized silencer and extension pipe under footboard on the horizontal twin-cylinder Bradbury

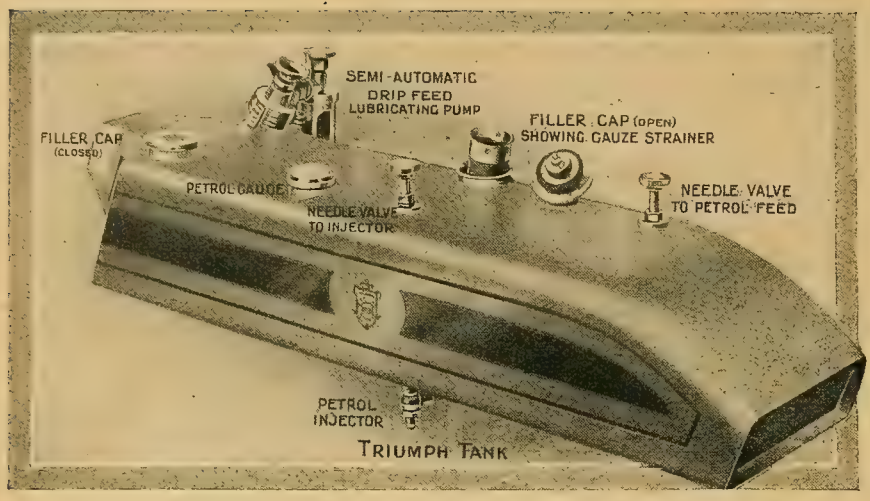
To Put Out Fires.

The Kyl-Fyre extinguisher was shown at Olympia last week. It was made by Kyl-Fyre, Ltd., of 12, Elms Buildings, Eastbourne. In case readers should think that in giving information regarding this fire extinguisher motor cycles are very prone to catch fire, we wish to correct any erroneous idea but would like to point out that it is as important to be in a position to deal with petrol flames on the road or in the garage as it is to insure against fire itself.

A New Belt.

The Stelastic Tyres, Ltd., 76, York Street, Westminster, whose tyres are well known to motor cyclists and cycle car owners, had on show last week at Olympia a new belt. Instead of a canvas core, this belt has a core made of wire springs interwoven on the same principle as the springs used in the composition of the Stelastic covers. The coil springs are arranged longitudinally so that when the belt is running over the small diameter of the engine pulley the coil spring will bend and take the same

A novel streamline sidecar made by J. Parker and Son, fitted in the front with a watch and a speedometer the latter driven from the sidecar wheel



Tank of the 1914 pattern 4 h.p. Triumph showing the whole of the fittings mounted thereon.

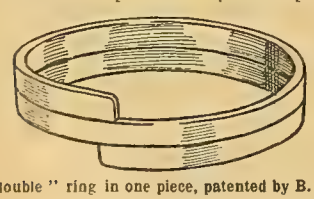
radius as the circumference of the pulley, and return to its original position without putting any strain on the wire. If a long flexible coil spring be taken in the hands and bent or folded to the circumference of the engine pulley, the action of the springs will readily be seen. Of course the rubber is pressed in between the coils in the moulding process in such a manner that each coil is supported by indiarubber, and the wires cannot work against each other and cause wear.

A New Fafnir Engine.

A new engine is being marketed for 1914 by Messrs. G. Strauss and Co., 211, Upper Thames Street, E.C. The engine is a low compression big single-cylinder of 689 c.c. The bore is 89 mm. and the stroke 96 mm. Like the other models, this engine is beautifully finished. The flywheels are extra heavy. The radiating fins are cast very thin. The valve caps are castellated. The usual method of operating both rockers by one cam is retained. The magneto is chain-driven. The weight of the engine is approximately 90 lbs., and it was illustrated on page 1604a of our last issue.

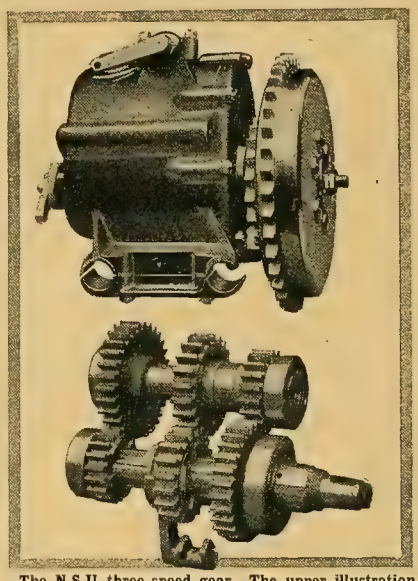
A Novel Piston Ring.

Mr. B. Yates last week showed us an interesting piston ring which has been patented in his name, and will in future be fitted to Humber motor cycles. The ring consists of a spiral coil of special piston ring cast iron, which is so arranged that in every part there are two complete coils round the piston body. A specially



A "double" ring in one piece, patented by B. Yates.

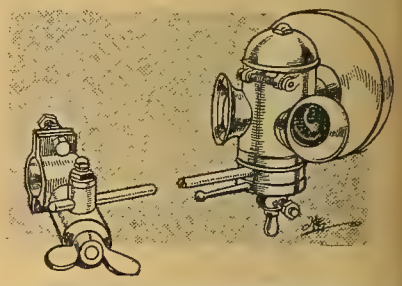
cut groove is, of course, necessary, and the ends of the ring are arranged to overlap. Besides giving excellent results in use the ring is particularly easy to detach, for this may be done by merely lifting the top or bottom ends out of the groove and unscrewing it either way.



The N.S.U. three-speed gear. The upper illustration shows the complete box, large clutch, and smooth exterior. The lower view the two gearshafts

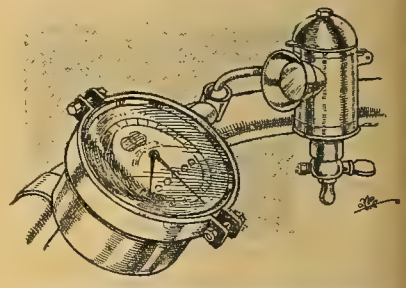
Novelties in Lamps

Several very neat accessories for motor cycles have been introduced by J. and R. Oldfield, Ltd., whose works are at Warwick Street, Birmingham. One is a



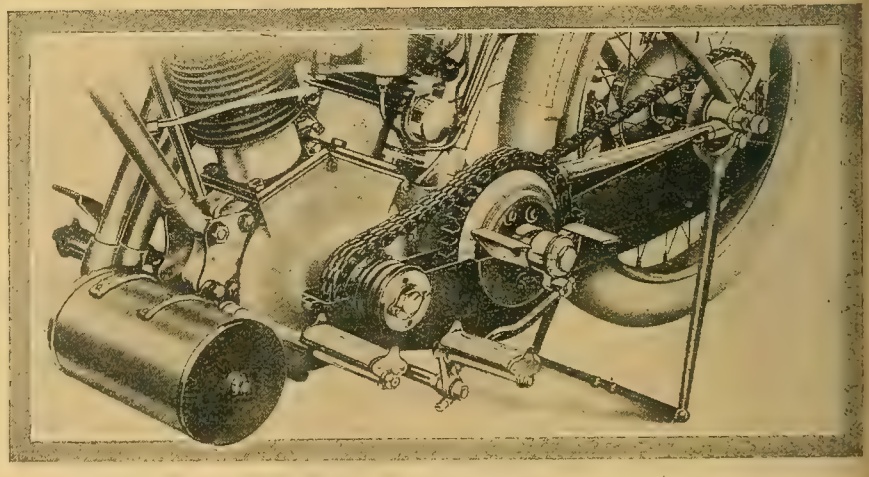
A combination rear light, speedometer lamp and mirror made by J. & R. Oldfields.

neat acetylene lamp, very tiny in its proportions, and fed from the ordinary generator to illuminate the speedometer. It is secured by a special clip designed to be clamped around the speedometer dial. We illustrate another novelty, viz., a combination rear light speedometer lamp and mirror. The mirror is used in

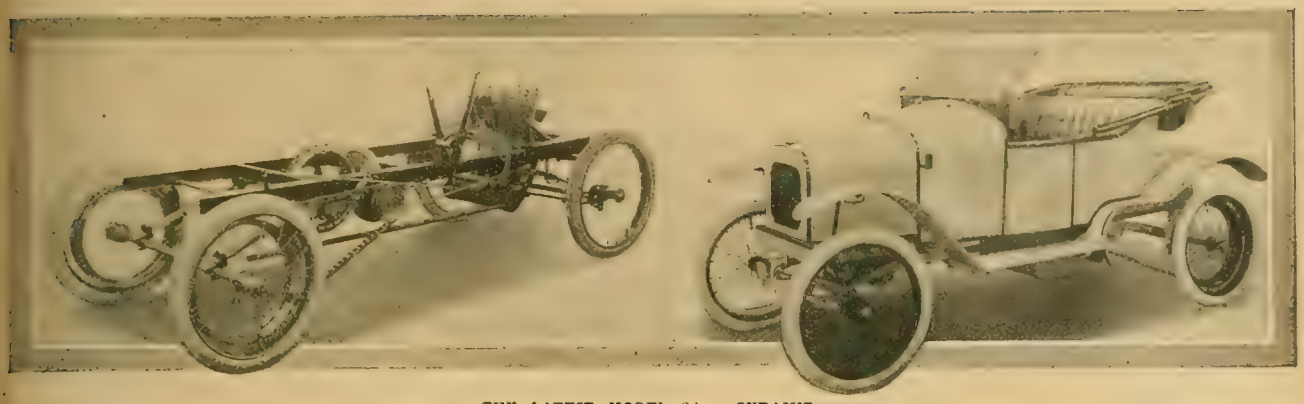


Oldfield's lamp for illuminating the speedometer dial.

daylight, while at night the lamp is brought into use, the white light illuminating the speedometer, and exhibiting a red light to the rear. Other motor cycle accessories include an electric handle-bar lamp and a swing over mirror with lever joint. Messrs. E. S. Thomas and Co. are the London agents.



Silent chain drive on the 7 h.p. Matchless, also showing clutch, shock absorber, and large silencer.



THE LATEST MODEL 8 h.p. PYRAMID.
Semi-rear view of the chassis, showing friction disc, belt drive and position of engine. The complete machine. Observe the clean lines and smart finish.

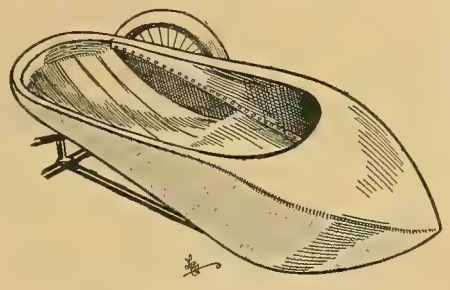
The Pyramid Cycle Car.

The Pyramid cycle car, made by Payne's Engineering Co., Hogarth Lane, Chiswick, W., is a two-seater, friction and belt-driven. The engine is a J.A.P., of 8 h.p., fan-cooled. A short propeller-shaft conveys the power to the friction gear, by which is given four speeds forward and a reverse, the ratios being 4.5, 6.7, 11, and 21 to 1.

The friction gear varies the spring pressure proportionately with the gear ratio, and gives higher efficiency on top gear by reason of the true rolling contact of the bevel friction wheels at top speed. The driven disc slides on a two-inch counter-shaft carrying adjustable pulleys, whence the final drive is by one-inch V belts to the back wheels. The frame is of channel steel supported on straight tubular axles and four quarter elliptic springs are used. Steering is by rack and pinion, controlled by a 14in. wheel, and we are assured that the car holds the road well at high speeds. The throttle, spark, and air controls are mounted on the dash, which carries a Best and Lloyd semi-automatic feed. Also the switch, the clutch, and the throttle are operated by pedals. The gear and another brake are controlled by levers set inside the body, which has a seat 38in wide, with a door on the side, and a locker at the rear.

A useful addition to the front of a sidecar is a wind screen as marketed by C. W. Bluemel Bros shown above

The ground clearance is eight inches, and wire wheels are fitted with 650 mm. × 65 mm. Avon tyres. The wheelbase is 7ft. and track 3ft. 6in. The chassis weighs 4¾ cwt., whilst the complete weight is 6¾ cwt.



The racing Canoelet sidecar, with hammock seat The bottom is composed of a strong twill

C.A.V. Lighting Sets.

The accompanying illustration is that of the cycle car lighting set made by C. A. Vandervell and Co., Warple Way, Acton Vale, W., and consists of a 6 volt dynamo battery in case, switchboard and head lamp, pair of side lamps and a tail lamp. In the illustration, a pair of head lights is shown, but Messrs.

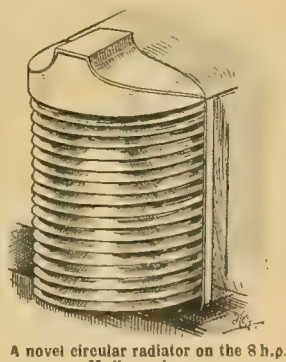
The complete C.A.V. cycle car dynamo lighting set.

Vandervell suggest that in the case of small cycle cars one head light is sufficient. The name of Vandervell is a sufficient guarantee to prove the suitability of this set for the purpose for which it is designed. The switchboard is known as the Hero type and has four tumblers, for the head lamp, the side lamps, the tail lamp, and one for the dynamo respectively. The set illustrated is the light car set, which comprises a somewhat more expensive switchboard than the Hero, a pair of medium sized head lights, etc., but the cycle car set is, to all intents and purposes, the same. The same firm make a speciality of head lights for motor cycles. All the C.A.V. motor cycle head lamps are now fitted with an improved focussing adapter. This allows for focussing the bulb, and the end piece which supports the cable is curved so as to relieve the armoured insulation of all friction.

The C.A.V. new pattern magneto and handle-bar control.

The Wolf Two-speed Gear.

In the description of the 2½ h.p. Wolf model in the last issue, we referred to the two-speed counter-shaft gear, clutch, and kick-starter on this machine, priced 32 guineas as an Albion—as a matter of fact, the machine is supplied with either Albion two-speed counter-shaft gear, chain, and belt drive, at 30 guineas, or Toroga two-speed counter-shaft gear, free engine, clutch, and kick starter at 32 guineas. The Wolf is one of the most moderate priced machines on the market, and is excellent value.



A novel circular radiator on the 8 h.p. Media cycle car.

OBSERVATIONS.

T. O. M. Sopwith, one of the earliest motor cycle and tricar drivers, now a prominent airman, has chosen a 10 h.p. A.C.

On Thursday last, W. H. Carson on his big single Excelsior carried a load of six people, weighing altogether 65 st. 9 lbs. up Netherhall Gardens, Hampstead, with plenty of power in hand. He informed us that if he could have discovered a method of carrying another passenger, he would have done so. The total weight of the passengers and outfit amounted to $12\frac{1}{4}$ cwt.

The new twin Brough with horizontally-opposed cylinders created a great amount of attention. We were interested to notice that the old Mercédès car system of running the valve springs through the stem of the valve instead of using cotters and caps was adopted. It adds to simplicity and lightens the valve.

The F.N. sections, showing clearly the working of the engine, gear, and transmission, were always a magnet.

Extraordinary care has been bestowed on the fitting of chain cases in many instances. So far from the cases looking ugly, they often actually improve the appearance of the machine. Lea-Francis, P. and M., Sunbeam, and A.J.S., came in for many flattering remarks on this point.

Trial runs during Show week were very popular, especially as the weather throughout was fine and mild.

The glass case which covered the gears and working parts of the engine on the $2\frac{3}{4}$ h.p. Diamond was an excellent idea and enabled anyone to grasp easily the principles of this interesting and cleverly designed machine.

We were very glad to see so many makers showing sections of engines, gears, carburetters, etc. Nothing explains more clearly to the interested novice how a mechanical contrivance actually works, and even experts seemed to take a pleasure in seeing "how the wheels went round."

The luxurious polished wood Bedford cord upholstered sidecar on Dunhill's stand came in for a lot of praise from the ladies, but mere masculinity did not take so kindly to its splendours. A wag suggested it ought to be sent through the London-Exeter-London Christmas Run under A.C.U. observation, and all damage to varnish and upholstery carefully noted.

Harry Bashall's choice for 1914 is a Morris-Oxford light car, which he hopes to drive in competitions next year. His brother, Aubrey, has arranged to take delivery of the special Show model Grand Prix Morgan, which he also will drive in the leading competitions of 1914.

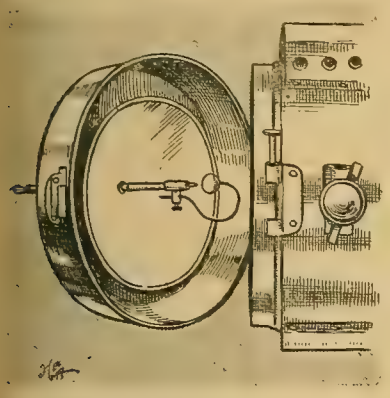
Everyone seemed to be talking "two-stroke." There is no doubt that something in the nature of a boom in this type of engine is being experienced.

The Depford stand had a prominent notice displayed "300 ordered for America." Another bore a notice, "Sold to S. F. Edge, Esq."

General view of the exhibits in the Main Hall at Olympia looking towards the Annexe

INCANDESCENT LIGHTING

Outside Olympia last week we noticed a very brilliant searchlight being projected on the walls of the houses in Hammersmith Road. On investigation, we discovered that it was a demonstration of a portable searchlight belonging to the Fallot Incandescent Light Co., Ltd., of 27, Noel Street, London, W. This light is an application of a patent pastille to motor lamps, searchlights, etc.



Fallox incandescent light showing the solid pastille.

Briefly described, it has the same advantages which the gas mantle gave to ordinary gas burners of the fish tail type,

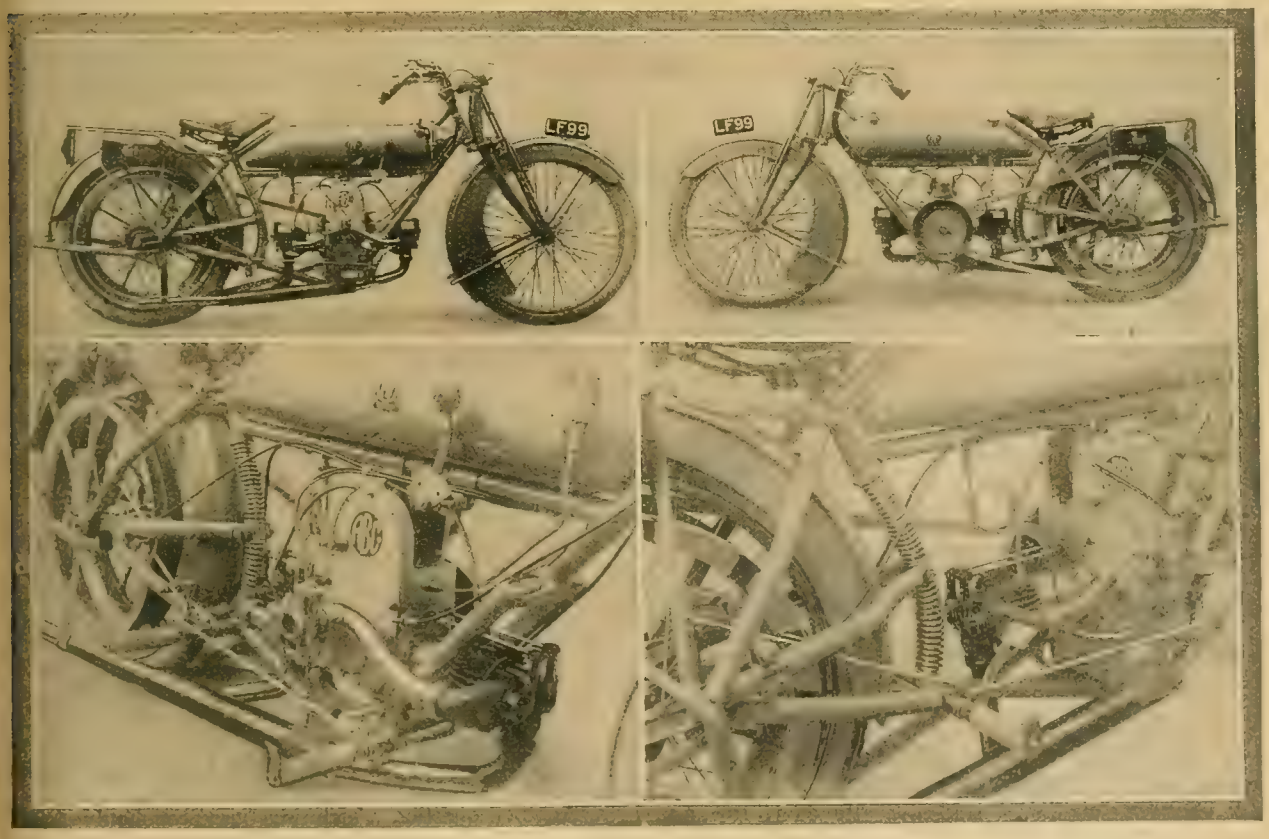
An oval type of Dover sidecar wind screen fitted with "non-flam."

but in place of a fragile mantle, a solid pastille is employed, which is heated to a high degree of incandescence, thus giving a point of intense light. It is claimed that the light which can be obtained with a given consumption of gas has never been attained before.

In addition, the consumption of gas is reduced to a minimum, the special generator designed for producing this gas being unusually small. Another advantage is that all light is reflected. This is because the incandescent pastille is directing the whole of its rays against the lens from which they are afterwards projected forwards by suitable focussing provided by sliding the burner through the centre of the mirror lens. Either a penetrating parallel beam or a spreading light over a wide field can be obtained. This is one of the most attractive features of the patent.

THE SPRING FRAME P.V.

Messrs. Elliston and Fell, Perry Vale, Forest Hill, S.E., are marketing for 1914 a new spring frame P.V. model, fitted with an A.B.C. horizontal opposed engine. This machine has been redesigned and is much neater in appearance than formerly. The frame forms a triangle underneath the engine. Below we illustrate the T.T. model, the roadster differing only in having a square tank instead of a round one, footboards and upturned handle-bars instead of dropped. All the other P.V. spring frame models are fitted with the 70 × 85 mm. and 76 × 85 mm. J.A.P. engines, Sturmey-Archer gears, Best and Lloyd lubricators, Bosch magnetos, and the usual first quality fittings.



The 3 h.p. P.V. in its latest form is fitted with an horizontally opposed twin-cylinder A.B.C. engine and spring frame

The two top illustrations show both sides of the complete machine while the lower ones give an idea of the general design of engine and method of springing

Some Humours of the Show.

By A STAND ATTENDANT.

IT has been said, and truly, that if one wishes to meet a Londoner all that is necessary is to take up one's stand at Charing Cross. Sooner or later the vigil will be rewarded. But standing at Charing Cross for an indefinite time, besides being decidedly monotonous and uncomfortable, is also impossible for a man who has to earn his living; and, anyway, I was by no means sure that my man was living in London.

It was an old schoolfellow whose whereabouts I wished to discover, so, knowing that he was a keen motor cyclist, the idea occurred to me that the Show afforded an excellent and much more congenial Charing Cross, provided I could be there the whole week. A stand attendantship seemed to fill the bill if it could be obtained, for there I would have the advantage of the fixed point in the stream past which, sooner or later, every floating straw must drift.

The first opportunity, therefore, which afforded itself was grasped at once, and Monday morning found me, in the company of fourteen other more experienced and genuine showmen, taking up my position on the Auto-wheel stand. From then on till Saturday evening, I dealt, to the best of my ability, with the thousands of questions hurled at me by interested, ignorant, cynical, or humorous persons. Some of these questions were quaintly funny.

Queries.

For instance, early in the week a visitor quite endeared himself to me by confessing that his hobbies were motor cycling and engineering, and we swopped lies about what we had done, and what we were going to do, and so on. This, however, was merely an introduction to the main point—could my interlocutor use an Auto-wheel both as it was intended to be used, and, when desired, as a power plant in his workshop? We discussed the momentous question at some length, discussing fans, beds, shafting, and so on, and decided that it could. The result of our deliberations emboldened an earnest enquirer to the remark that gardening was *his* hobby, and would an Auto-wheel and a garden roller——?

When the laughter had eased off a little, the earnest enquirer was not to be seen.

It must be borne in mind that nineteen out of twenty visitors to the stand had absolutely no mechanical knowledge whatever, but, even then, some of the questions asked seem almost incredible. What, for example, could one say to the lady who had been carefully watching the piston rising and falling, and the plug sparking, in a dissected model, what time the man in charge explained in words almost of one syllable just what it was that made "the wheels go round." It went something like this:

"You see, madam," said the attendant, turning the engine over by hand, as he spoke, "when the piston goes down a partial vacuum is created above it. This allows the inlet valve to open, and the piston sucks in a charge of gas, which is then ——"

"But it isn't doing it!"

Attendant heaves a muffled ——, takes a deep breath, and patiently points out that the vacuum is scarcely having fair play with only half a cylinder to help it. Notwithstanding an audible snigger from the back row, the lady, only half convinced that the whole thing is not a swindle, graciously permits the dazed attendant to proceed with his little lecture.

"At this point, then, a spark, as you can see, crosses the plug points and explodes the charge. The force of this explosion instantly sends the piston ——"

"Does it do it immediately, did you say?"

"Oh, yes, quite inst——"

"Then, surely there must be a great danger of it blowing out the spark!"

And firmly convinced that only her own astuteness had saved her from being swindled, the fair questioner shot a righteously indignant glance at the speechless dacoit behind the model, and moved haughtily away.

Horse-power.

The meaning of horse-power, not unnaturally, perhaps, caused a good deal of misunderstanding. One man who had been listening while I explained that the gradient which the Auto-wheel would climb unaided must, necessarily, be governed by certain factors, such as the presence or otherwise of wind, the nature and state of the surface, the weight of the rider, and so on, interrupted me to say that surely I must be mistaken His horse "didn't take no notice of anyone's weight"; in fact, he "didn't see 'ow an 'orse could tell to a stone or two, much less a little bit of a box o' tricks on a wheel."

A careful explanation of the intimate relationship existing between engine revolutions and horse-power failed to move him, and he shouldered his way through the crowd muttering that he'd "got an old yaller dog at 'ome wot 'ad more 'orse power nor that, and more 'orse sense too."

Two ladies, on different days, one a Londoner and the other from Dublin, strangely enough propounded almost identical questions, founded on the same misapprehension of the meaning of horse-power. The London lady explained that she shortly intended making an extended tour through Europe on a caravan, and wished to know whether it would be possible to dispense with horses, and install in their place four Auto-wheels coupled together between the shafts. The lady from Dublin differed only from the caravan enthusiast in assuming that an Auto-wheel *would* be a perfect substitute for a horse "and ever so much cheaper." Fancy an Auto-wheel between the shafts of a brougham!

Another question which was very commonly asked was, "Why don't you fit a neat cover all over the engine?"

Some Humours of the Show.—

I was asked on several occasions how often it was necessary to re-charge the magneto, and on one of these, whether in earnest or as a joke I could not decide, for there was not a shadow of a smile on his face, another member of the crowd struck in with an answer, or, at any rate, a surmise. He supposed the ordinary magnesia, obtainable at any chemists, would do. A passing wag, overhearing this brilliant suggestion, stated that he had found citrate of magnesia to be the best form, adding that in case of compression failure at any time it would be always advisable to carry a small box of compression tablets in the toolbag. Another time someone had complained about the lack of footrests. A fellow in the crowd looked ostentatiously downwards at the other's feet, then, looking up, enquired: "'Ow much extra would it be for a pair of railway platforms?"

Experts and Knuts.

One youth took me into his confidence so far as to explain (after a knowing beck and behind his hand) that he had for some considerable time past been saving up for a bicycle, and had at last accumulated funds sufficient for the purpose, but that his financial affairs did not admit of his indulging in an Auto-wheel as well. However, he would prefer the Auto-wheel. Did I think it would take him long to learn to ride it without a bicycle?

Then there was the knowing man, backed up by a few admiring members of the same cycle club. Laying his hand on the float chamber, he would enquire briskly and brusquely, "How often do you have to fill this up with oil?" or, toying with the magnets, "I see you've got a different type of silencer this year?"

I had rather a joke with one such knowing gentleman. I had stuck on to the backbone of my Auto-wheel one of those miniature petrol cans which Pratt's were distributing as souvenirs, and had found it useful, on occasion, to raise a laugh. Some low born thief eventually stole it, but that is by the way. Well, four would-be knuts pulled up, ripe for a little nether limb extension. One of them constituted himself Arch Filbert, and, after a little banter, asked, "What's that for?" pointing to the little can. (It was about two inches in height.)

I told him that it was for carrying a spare supply of petrol. Strangely enough he took this seriously, and was greatly disconcerted by the derisive howls of his brother barcelonas. I fancy I had got the better of the preceding badinage, and this thought appeared also to strike another of the nuts, for he assumed a conciliatory air, and, in an as-one-man-to another kind of way, began discussing seriously just what happened exactly when the bicycle turned either to the right or the left.

The Principles of Steering.

He disagreed with my explanation of what did happen, and I tried to convince him by a second explanation, which included references to such ordinary terms as horizontal and vertical planes, angles of inclination, points of road contact, and so on. It was quickly apparent that he had not the haziest notion of what I was talking about, and, as he insisted on pretending that he quite understood—"but that didn't affect the question," which was, would the Auto-wheel lift off the ground? I succumbed to the temptation of pulling his leg.

For one glorious minute, or so, I plied him with a torrent of such chemical, electrical, botanical, hydrostatic, and ballistic technical words, phrases, and expressions as I could recall to mind, turned out as quickly as I could utter them (and it has been stated that my ordinary manner of speaking is too rapid), and I was beating my brain for something really brilliant as a peroration, when the horrible thought entered my head that there might be some sane person within hearing, and, leaning forward, I lowered my voice impressively and wound up (with both brakes on hard), "and so, sir, as the old Greek poet says, although in quite a different connection, for, of course, here we are not dealing with the centre of gravity fashionable in those far-away days, *mens sana in corpore sano*. But you see my point, for, of course, the principle remains the same?" And I beamed benignly on him and stood up.

He had been trying for about threequarters of a minute to make his face look as though he understood, and judging from the net result, I don't think that some of the muscles he brought into play had ever been used before. After his jaw had moved up and down noiselessly once or twice, his face relaxed here and there sufficiently for him to get at his mouth, so to speak. But he was game. There was a certain amount of judicious and deliberate consideration in his tones as he replied:

"Well, perhaps you're right after all. I don't pretend to ——. Yes, I think the wheel *wouldn't* rise on corners. Come on, boys."

I expressed my pleasure at having convinced him at last, and hoped that after our serious conversation his friend on the left would pardon me for having tried to pull his leg in the matter of the spare petrol can.

That was the most interesting personal encounter I had with an "expert," but one of my fellow attendants was congratulated (on behalf of the firm) on the 1914 improvements. This particular "expert" thought that the universal joint on the high tension wire was great.

Price Cutting.

One old gentleman pointing to a model which was fixed on a wooden stand alongside the front wheel of a bicycle, remarked casually that "The d—— thing comes out pretty expensive after all. I didn't think you had to fit 'em to the front wheel as well."

Talking of expense reminds me of another incident. After a very exhaustive explanation of the little machine, its capabilities and its limitations, my hearer said to me:

"There's only one thing as I can see as'll prevent a lotta people frum buyin' it, an' that's the price."

I agreed that this was possible, and suggested tentatively that if the price were five pounds, and the potential buyers thereby greatly increased, that even then all would not be joy, for a still greater public would then be waiting to rush to the bank when the price was still further reduced to ninepence.

He enthusiastically agreed with me, got a ticket for a trial run, and is, I fancy, waiting for the year to arrive that will bring with it the ninepenny motor cycle.

I found my friend. TOUCHSTONE.

Pan Saddle Patents.

The Law Officer at the High Court of Justice last week decided in the case of Brooks *v.* XlAll that the applicants' (XlAll, Ltd.) patents be sealed and the defendants were ordered to pay the costs of the applicants attending the hearing.

Records at Brooklands.

On Thursday last Max Heinzel, on a 190 c.c. 2 h.p. N.S.U., beat the three-hour record in Class A for machines up to 275 c.c. In that time he rode a distance of 135 miles 1,101 yards, which gives an average speed of 45.21 m.p.h. The previous record, made on the 6th ult., was 134 miles 366 yards, and stood to the credit of R. O. Clark (F.N.).

1914 Scottish Trials.

We were glad to meet Campbell Macgregor, the secretary of the Edinburgh and District M.C.C., at Olympia, looking quite fit after his mishap last summer. We gathered that there was little doubt that the Scottish Trials would again be held next year, but the question of the date was rather a stumbling-block, owing to the dates for the big A.C.U. events being brought forward next year. Scotland is still under snow in May in many parts, so probably the Scottish Trials will have to be later than usual, say August.

America's National Road Race.

An event which promises to equal, if not surpass in point of interest and true competition, any previous motor cycle contest held in the States, is the 300 mile road race to be held on the Grand Prize Course, Savannah, Georgia, on Christmas Day. It will be national in its scope, and many of the country's best riders will compete. Prizes will total $850, and will be distributed as follows: First, $500; second, $250; third, $100.

The entry list is limited to 100, and the fee charged is $10. Many leading American manufacturers are planning to enter teams of three. Entries have already been received from about twenty-five individual riders, and others have signified their intention of participating in the event.

The famous Grand Prize Course, used in the Vanderbilt Cup Races, will be the scene of the race. The course is 11.25 miles to the lap, and the contestants will be called upon to make twenty-seven laps, or a total of 303¾ miles. We fear the announcement is too short for any English riders to take part.

"The Motor Cycle" Show Report.

We desire to acknowledge with many thanks the receipt of many congratulations on our record Show Report Number of last week.

There was a total of 244 pages, and the postage on each copy posted abroad was 5d.

If the 91,000 copies of this issue were placed one on another, they would make a pile higher than Skiddaw.

The Date of the Six Days Trials.

The early date fixed for the A.C.U. Six Days Trials next year (July 5th-11th) is unfortunate in that it is almost bound to cause a rather poor entry of private owners. A very large number of amateurs cannot arrange their summer holidays till August, but owing to the big racing programme to be carried out in the Isle of Man during next summer, the A.C.U. have practically no choice in the matter.

Presentation.

A very successful function was held at the Florence Restaurant, Rupert Street, on Wednesday of last week, when the "F.N." (England) Co. invited Mr. R. O. Clark to meet some of their clients, and took the opportunity of presenting him with a silver cup as a souvenir of his recent accomplishment on a 2½ h.p. F.N. (275 class) at Brooklands.

A Capital Suggestion.

There is a strong probability that the 1914 trials in Scotland may be so arranged that a start be made on a Thursday and the finish timed to occur on the following Wednesday evening. This would allow competitors to rest on the intervening Sunday and give them time to change their tyres in comfort at the half-way stage. Altogether, this plan seems to us to be an admirable one, for these trials are so strenuous under present rules as to constitute more of a tax on the rider than on the machines, and this has never been the idea of promoters of such trials. We have little doubt that competitors would heartily welcome such an innovation.

Initials of Machines.

At one time cars threatened almost a monopoly of nomenclature by initials, the fashion being started by the Italians with the F.I.A.T. Nowadays motor cycles and cycle cars have equalled, if not passed, cars in this respect, and the Italians are still to the fore with the S.I.A.M.T. Among others identified by the first letters of their full names are the B.S.A., N.S.U., A.J.S., F.N., L.M.C., M.R., P.V., N.U.T., O.K., P. and M., A.C., G.W.K., and G.N., while among engines we have, of course, the J.A.P., A.B.C., and M.A.G. Again, there are

SPECIAL FEATURES:

SOLO MACHINES AT OLYMPIA.
EXPERIENCES WITH BENZOLE.

the B. and B., S.U., U.H., U. and I., and F.R.S. among well-known accessories. We wonder how many motor cyclists can give the full name correctly of all these makes?

Miniature Motor Cycles.

Those who talk of the miniature motor cycle as an entirely "new" type conveniently ignore the existence of machines such as the Motosacoche, 2 h.p. Humber, and 1½ h.p. N.S.U., to mention but three which have been on the market for some years.

M.C.C. London-Exeter Run.

Additional entries for the M.C.C. winter run are given hereunder.

H. Johnson (3½ T.T. Triumph)
F. J. Watson (3½ Ariel sc.)
G. T. Gray (5 Rudge sc.)
S. Tharp (3½ Triumph)
E. Frasetti (7 Indian sc.)
J. H. Kerr (3½ N.S.U.)
R. R. Rothwell (10 Singer)
G. P. Howe (3½ Rudge sc.)
H. Playfair-Robertson (3½ Premier)
M. G. Abraham (5¾ Zenith)
D. S. Ainger (3½ Sunbeam)
F. G. Barton (10 Morris-Oxford)
E. F. Baxter (6 Rex sc.)
R. T. Blattman (6 Grandex)
W. Bretherton (8 G.W.K.)
J. F. Buckingham (8 Buckingham c.c.)
R. K. Butler (8 Sparkbrook sc.)
K. E. Don (3½ Rover)
H. E. Fairchild (6 A.J.S. sc.)
T. S. Fordham (7-9 Premier sc.)
S. G. Gliksten (8 Humberette)
W. M. Greenwood (8 Little Midland c.c.)
L. Inscoe (6 A.J.S. sc.)
H. Haynes (3½ Premier sc.)
J. H. Jeffery (9 Matchless c.c.)
J. Lake (3½ Bradbury)
A. C. Maitland (10 Beacon c.c.)
R. F. Mann (8 Duo c.c.)
F. H. May (8 Morgan c.c.)
S. D. Marr (8 H.S.M. double sc.)
F. E. Mocatta (8-10 G.N. c.c.)
L. Mogridge (3½ Rudge)
A. Noble (10 A.C. c.c.)
W. J. Brownsort (6 A.C. Sociable)
J. Munday (6 A.C. Sociable)
J. Oliphant (7-9 Premier sc.)
P. C. Oxborrow (8 H.S.M. double sc.)
P. Pike (2½ Levis)
C. Pressland (8 Crouch carette)
C. Taylor (2½ Connaught)
F. E. Thomas (3½ Triumph)
H. A. Thompson (9 Buckingham c.c.)
F. C. Townshend (8 Humberette)
R. E. Townshend (3½ N.U.T. sc.)
P. W. White (8 Matchless sc.)
C. R. Woolley (8-6 Clyno sc.)
G. Bax (3¾ Scott sc.)
V. Garland (8 Williamson sc.)
O. P. C. Collier (5¾ Grandex)
R. E. Guest (8 Collier sc.)
A. Mariani (8 Morgan)
T. S. V. Phillips, R.N. (5 A.J.S. sc.)
S. W. Carver (6 Rubr sc.)
T. Rigley (6 Brough)
K. A. MacDonald (3½ Singer)

Entries finally close on Monday next, the 8th inst. No more non-members can be elected in time for participating in this run. From present indications a total of 200 entries will be reached. Already there are over 100 in hand.

Copies of the instructions to competitors will be issued in a few days

Venue of Next Year's Six Days Trial.

It is proposed to hold the annual A.C.U. Six Days Trials, fixed for July 5th to 11th, 1914, in North Wales, with Chester as a centre.

Hideous Hoardings.

The Scapa Society has addressed a letter to the Chairman of the A.A. and M.U. (Mr. W. Joynson-Hicks, M.P.), asking him to use his efforts and those of his Association to prevent the disfigurement by hideous hoardings of beauty spots visited by motorists.

F.I.M.C. International Trials.

Mr. T. W. Loughborough informed us last week that Grenoble, near Lyons, would be the venue of the Six Days International Trial to be promoted by the F.I.M.C., and that he hoped a representative team, or teams, would go over from this country to compete. It was also the intention of the A.C.U. to do all in its power to promote interest in this event and to make it as international in character as possible.

A.A. and M.U. Notes.

WINTER ROAD INFORMATION FOR MEMBERS.—Now that the winter season has arrived, members of the Automobile Association and Motor Union are advised to keep themselves well acquainted with the road information issued every week by the Road Department. The Road Patrol organisation enables the Association to obtain prompt reports of impassable or bad roads; when motoring in districts where roads are liable to be flooded by heavy rains, members are especially recommended to consult the road patrols.

Exhibits at the Show.

Many people will be rather surprised to learn that there were actually fewer motor cycles in Olympia this year than last. There were more stands, however, and this led to a reduction in the space available on each. The actual figures were 608 motor cycles this year, against 638 last year. In 1911 the total exhibited was 529. Cycle cars show a shrinkage also, but probably this can be accounted for by the vigorous adhesion to the A.C.U. cycle car definition insisted upon this year before admission to the Show. There were 90 cycle cars, including chassis, on exhibition, against 99 in 1912, and 33 in 1911. The attendance was much greater.

A Sporting Suggestion.

Mr. R. H. Head, chairman of the Motor Cycling Club Committee, told us last week that the M.C.C. have had in view for some time past a scheme for organising a run from London to Edinburgh to be undertaken by a rider of a motor bicycle, and that they would beat any aeroplane constructed in a speed trial between the capitals of England and Scotland. The distance, as our readers know, is about 400 miles, and if only permission could be obtained for an open course for a single rider the M.C.C. have a man in view who they say, could beat the existing aeroplane time for 400 miles. Although we publish the paragraph concerning the sporting suggestion, we think that the possibility of obtaining permission for a road event of this nature is extremely remote.

FUTURE EVENTS.

Dec. 13.—Birmingham M.C.C. Open Cycle Car One Day Trial.
" 13.—M.C.C. Annual Dinner.
" 26-27.—MOTOR CYCLING CLUB Winter Run from London to Exeter and Back.
" 26-27.—Bristol M.C.C. Open 24 hour Trial to Land's End and Back.
" 27.—Birmingham M.C.C. Reliability Trial to York.

1914.
Jan. 14.—A.C.U. Annual Dinner.
" 23.—Liverpool A.C.C. Trial.
Mar. 7.—A.C.U. Spring One Day Trial.

Large Orders.

A telegram ordering 1,000 of the Levisette motor cycles was received by the makers during Show week. The Levisette was, by the way, probably the lightest motor cycle in Olympia last week, scaling 80 lbs. Contracts with different makers for 300 machines were common.

The 1914 Paris-Nice Trial.

Many of our readers will remember the Paris-Nice competition run by *l'Aero*, and for which *The Motor Cycle* organised an English team. Next year this event will take place between the 18th and 20th March, and will, we understand, be a great improvement over last year's trial. The rules and route cards will be printed in English for the benefit of British competitors. The more southern part of the course will include the famous road from Bourg to Nantua, in which there are numerous hairpin bends, and gradients in places of 1 in 6. The Riviera will be reached *via* Grenoble and the Alps, and on the last day there will be a hill-climb on the road which rises straight away from the Bay of Monaco to the fort situated far above in the hills. Already several well-known English riders who took part in the Paris-Nice last year have expressed their desire to enter again, and over one hundred entries are expected in France alone.

A Race Across a Desert.

A most severe test of motor cycle endurance was the race across 441 miles of desert, from San Diego, California, to Phœnix, Arizona, on November 2nd. It was won by Paul Derkum of Los Angeles, and the most astonishing feature of his record is that he beat the best time made by cars over the famous "desert course." His time was sixteen hours and four minutes, while the best time made by a car between the two cities was sixteen hours and forty-nine minutes. Derkum's lead over the other contestants in the race was three hours and twenty-nine minutes ahead of his nearest competitor. That the desert race is no joke is indicated by the fact that one of the entrants in the contest is missing, and grave fears are entertained for his safety.

A New Fishguard Road.

Fishguard, the town with the reputation of having the worst main road hill in Wales, last week celebrated the opening of a new road, made at a cost of about £4,000, to avoid the old hill with a gradient of 1 in 3 and with two hairpin bends. A large number of motorists assembled in the square of the old town. Col. Ivor Phillips, addressing the crowd at the ceremony, said he thought this improvement would be appreciated not only by the people of the district but by motorists from all parts of the country. The old road out of Fishguard to Cardigan, Aberystwyth, etc., was always looked upon with dread by motorists, and he thought the time was not far off when local authorities would receive grants from the Commons, and would have to see that roads were kept in good repair or would lose that grant. The cost of the new road was raised by subscription. In the days when the pilgrims journeyed to St. David's it was known as "Ye Bad Way," and until that afternoon it certainly was. Colonel Phillips's car, followed by a long string of other motorists, then moved forward breaking tapes across the road.

The first motor cycle up the new road at Fishguard. The machine is a 6 h.p. Enfield sidecar. (See accompanying paragraph.)

Running a Triumph on Benzole.

I HAVE just completed 1,400 miles running on benzole with my 3½ h.p. Triumph and coach-built sidecar attached on an average consumption of 100 miles per gallon, and I think, perhaps, a few notes on the subject may be of interest.

Acting on the maxim that a smaller jet and the same air is preferable to the same jet and more air, a reduction in the spirit orifice can be made at once, and in view of the fact that benzole does not evaporate as readily as petrol, a jet with a number of small openings is better than one large one, as the liquid has a greater chance of becoming atomised by the inrushing air.

A Smaller Jet.

Experiments were, therefore, made with a six-spray N.L.G. jet, and by stopping up one or more of the sprays various results could be obtained. The air cone was first removed with good results as regards power, but finally replaced, as it was found to give quieter running. Three of the jet openings were stopped up, and with the remaining three open the machine attained a good speed on the level with fair power on hills, the air lever being always in advance of the throttle, but as a little more power appeared advisable one of the closed jets was re-opened.

The writer of the accompanying article mounted on his 3½ h.p. Triumph and Canoelet sidecar outfit.

With this four-jet arrangement the machine has frequently carried three up at well over twenty-five miles per hour with a 4¾ to 1 gear, and will run at seven miles per hour on top gear without misfiring. The spirit used is the standard 90% benzole.

No great amount of trouble has been experienced in starting up when cold, a few drops of the liquid injected into the cylinder curing any stubbornness on a cold day on first taking the machine out.

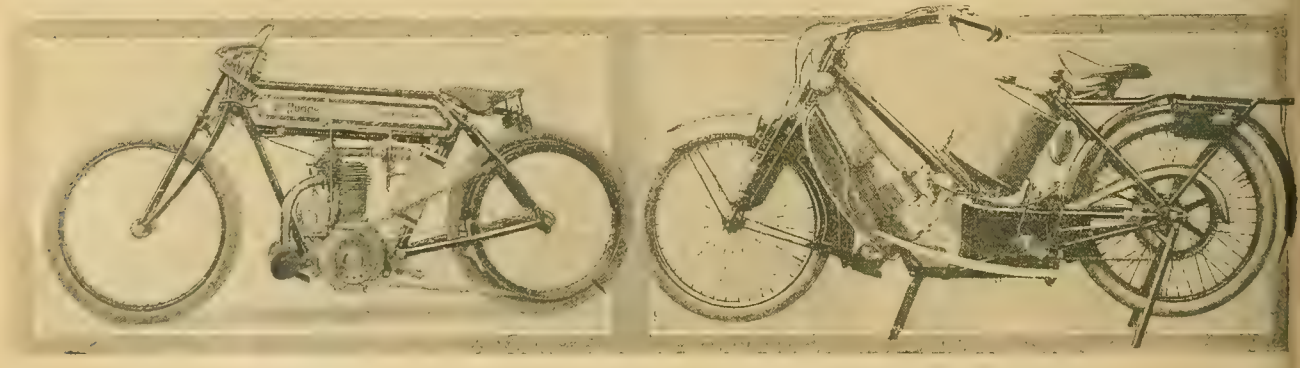
The Lodge plug has never sooted up, and in order to produce black smoke from the exhaust outlet it is necessary to close completely the air lever, showing that with ordinary driving the combustion is practically perfect. After running 1,000 miles the cylinder was dismantled for cleaning, and the slight deposit of burnt oil due to over-lubrication removed. This deposit was of a soft nature, and easily scraped off with a knife.

The Effect on Enamel.

The only drawback to the use of benzole is the effect on the outside of the tank, as great care must be exercised to prevent spilling the liquid when filling; but if by accident any should run over the side, do not attempt to wipe it off or the green and red enamel will be completely removed. Benzole apparently softens the enamel, but if allowed to dry naturally it hardens again, a slightly roughened surface being left. I have not noticed any effect on the aluminium finish nor on the black stoving on the frame. The engine tends to run slightly hotter than with petrol, but this is not surprising in view of the extra power obtained. Finally, no alteration has been made to the float for the simple reason that benzole is not obtainable everywhere at present, and there is almost certain to be some occasion when the supply in the tank is exhausted, when any previous alteration of the float would mean excessive flooding with petrol.

From these experiments the writer is convinced that when once motor cyclists realise the entire absence of knocking, and the marvellous way an engine will keep on plugging up a stiff incline, they will consider benzole to be quite the best fuel obtainable.

F.E.S



AT OLYMPIA 1) 1914 model 3½ h.p. T.T. Rudge. 2) Transmission side of the 3½ h.p. 1914 Scott.

The Inauguration of the Electrified Indian.

ON Wednesday of last week the Hendee Manufacturing Co., whose new address is 366-368, Euston Road, N.W., invited a few friends and press representatives to an informal luncheon, held (in the words of the menu) "to inaugurate the opening of the new English wigwam of the Hendee Company, and to meet the president of the firm, Mr. George M. Hendee."

Mr. W. H. Wells (English manager) occupied the chair, and amongst those present were Messrs. G. M. Hendee, R. H. Head, T. W. Loughborough (A.C.U.), Alfred Bednell (secretary Manufacturers' Union), T. K. Hastings (Hendee Company's Australian manager), D. S. Baddeley, and others. *The Motor Cycle* was represented by Mr. W. Grew.

The speeches were brief and to the point.

Mr. Head proposed the health of Messrs. G. M. Hendee and W. H. Wells. Mr. Wells, who was the first to reply, explained in a few words his gratitude to Mr. Hendee for the help and free hand he had been given to organise the business on British lines. Mr. Hendee, in replying, invited any of those present to Springfield (Mass.), to inspect their works, and explained that the luncheon was held to inaugurate the opening of their London premises.

Mr. O'Reilly, in a dry vein, expressed his views on the early types of motor cycles.

Mr. T. W. Loughborough, in welcoming the Indian machine to British shores, said that he was sure British sportsmen would be glad they had such a good machine to try and beat. He hoped that, in next year's International Six Days Trials, to be held near Grenoble, France, Mr. Hendee would use his influence to secure an American team for the competition.

The company spent a pleasant hour inspecting the premises, the lay-out of which has been the work of Mr. W. H. Wells, who found the building (an old coach works), though after his efforts we do not think the original tenants would recognise it now it has been transformed into a most up-to-date motor cycle depot.

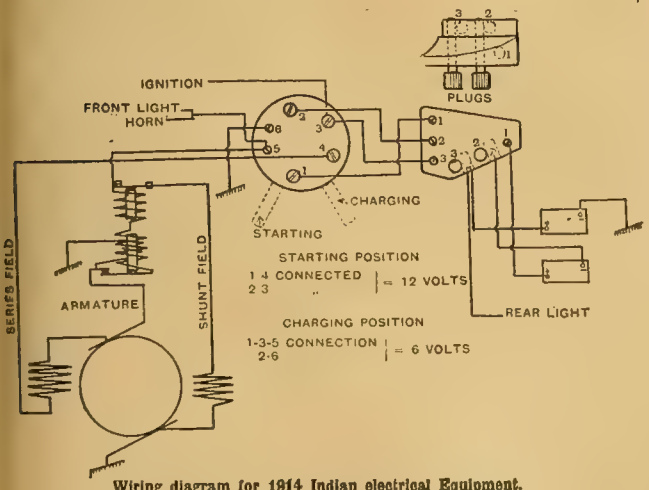
Mr. George M. Hendee's Views.

We had an interesting chat with Mr. Hendee, who extended us a cordial invitation to visit the Indian factory. He informed us that he was very much surprised at the large amount of business which they had done in this country and the Continent, as he was previously under the impression that the British public was somewhat antagonistic to American motor products. It was explained that British motor cyclists recognised the Indian as a first-class production and were interested in it as purchasers. In competitions it was given a fair field, and every credit was given to it for its leading position in some of the more important races, and other competitions which have taken place during the last two or three years. In comparing British and American depots and garages for the sale of motor cycles Mr. Hendee said that his company had in America several large depots of their own and were rapidly extending branches in this direction, not only in America but also in British colonies and the chief Continental cities.

The Designer of the Electrical Starter.

We also had a very interesting conversation with the designer of the new Indian electric starting and lighting device (Mr. G. B. Jacobson), who is the member of the technical staff who is responsible for this ingenious addition to the Indian Special, particulars of which we have already published. It will interest readers, however, to know that the batteries will light two lamps, with the machine at rest, for twenty-five hours, and, if desired, the starter can be used as an auxiliary to the power given off by the engine if it should be labouring when ascending hills. The power provided in this way is equal to one horse-power if the starter be switched on when the engine is running.

Mr. Frasetti, a well-known competition rider, demonstrated to the visitors the ease with which the engine could be started by means of the electrical motor, and also showed, in a darkened portion of the basement, the illuminating powers of the electrical head lights; the electrical "buzzer" horn was also demonstrated. One or two enthusiastic motorists among those present sat across the machine and started up the engine with the greatest ease by merely switching on the starting dynamo. In Mr. Jacobson's opinion, the spark produced by means of the batteries (which, by the way, are known in the States as "starting batteries"—being somewhat specially designed for this purpose) is quite equal to any spark produced by a magneto. We pointed out to Mr. Jacobson that, possibly, batteries using ordinary liquid electrolyte would prove unsatisfactory on the majority of unsprung motor bicycles, but in the case of the Indian with its rear and front springing they would be no doubt satisfactory. Mr. Jacobson assured us that the Hendee Co. had not placed their starting ignition and lighting device on the market without experimenting with it in a very thorough manner; in fact, for upwards of two years he has been perfecting the arrangement. He quite agreed that in the case of an unsprung machine the batteries might easily give trouble through vibration, and that the rear springing of the Indian saved the situation. Of course, semi-solid electrolyte would be equally good from the vibration view point, but batteries so filled do not give the same ampèrage for a given plate area or the same ampère hours as those of the liquid variety owing to the enormously increased resistance of the semi-solid electrolyte.



Wiring diagram for 1914 Indian electrical Equipment.

RECORD ATTENDANCE FIGURES AT OLYMPIA.

The attendance at Olympia last week was, as can be verified by the figures given below, very much greater than last year, Wednesday being a record day, when no fewer than 33,126 persons passed the turnstiles The total attendance for the week showed an increase of 16,873. This is extremely gratifying to us when comparing the figures with the circulation of over 90,000 for our Show Report Number.

Mr. C. D. Clayton, the Press Manager at the Show, who provided us with the above figures, also informs us that it was generally recognised by all the foreign journalists who attended the Show, and particularly the American pressmen, that the Olympia Motor Cycle Show was the Show of the world for motor cycles and cycle cars, although there were splendid examples of motor cycle construction from both America and the Continent, these journalists were struck by the general quality of the exhibits and were quite enthusiastic about the high standard and merit and progress shown, particularly in cycle car and sidecar construction.

Our congratulations are extended to the Show Management Committee of the Cycle Manufacturers' Union and its secretary, Mr. Alfred Bednell.

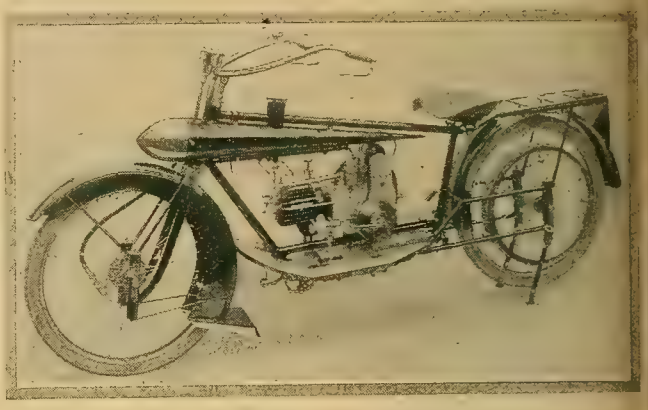
The Interesting Wooler Two-stroke.

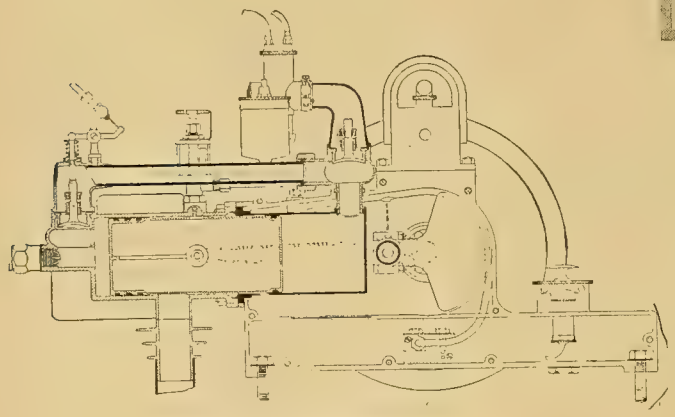
An original design having a two-stroke single-cylinder horizontal engine.

THIS machine arrived rather late at the Show last week, and was consequently omitted from our report. It has not undergone any startling alterations since last described in these pages, but a fresh company has been formed, under the title of the Wooler Engineering Co., 453, Strand, London, W.C., with works at Harrow.

The Wooler engine is an unconventional type of two-stroke, in which there is no crank case compression. The piston is double-ended, and on its up stroke draws in mixture through an automatic inlet valve. An explosion at the other end of the piston causes the mixture to be compressed in the chamber, and forces it through the transfer pipe and a check valve at the end of it into the combustion chamber, where it is then fired. As the pressure falls at the return of the piston a fresh charge comes into the displacer chamber, and the exhaust is driven out by the in-coming charge through a port in the cylinder. The gudgeon pin passes right through the piston, and to each end the two connecting rods, which are outside the cylinder, are attached, the gudgeon pin passing through slots in the cylinder walls.



The two-stroke Wooler in its latest form



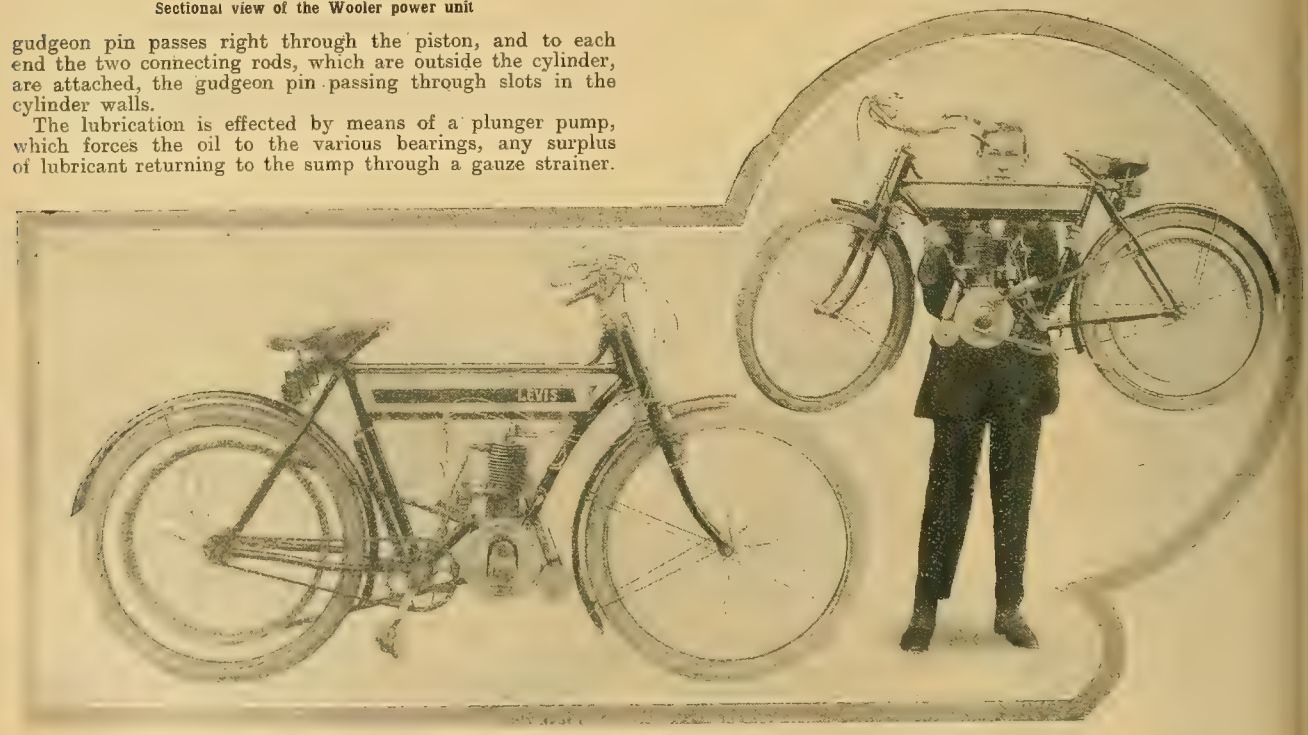
Sectional view of the Wooler power unit

The lubrication is effected by means of a plunger pump, which forces the oil to the various bearings, any surplus of lubricant returning to the sump through a gauze strainer.

An expanding type of under-geared pulley is fitted, and worked by means of a rocking pedal, which can be locked in several different positions. The pulley is also provided with a belt tensioning and shock absorbing device, allowing the slack of the belt to be quickly taken up, and absorbing the engine shocks.

The machine is well equipped as regards mud-guarding, and is provided with comfortable footboards, while the wheel spindles are supported between coil springs working in tubes.

The attractive looking torpedo shaped tank is provided with two compartments, and, if desired, one portion can be filled with paraffin and one with petrol, as this engine works admirably on the heavier type of fuel



THE NEW 1½ h.p. LEVISETTE TWO-STROKE.

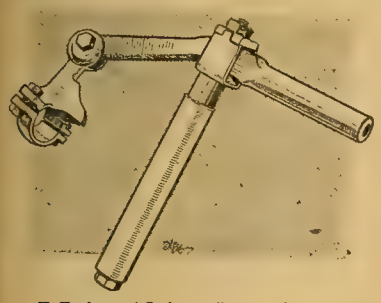
Side view showing magneto position and design of frame.

Showing how easily it may be lifted off the ground, as the machine weighs only 80 lbs. complete.

AMONG THE ACCESSORIES.

A Spring Seat Pillar.

The Cantilever Spring Seat Pillar, made by H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.C., should go a long way towards reducing the vibration of unsprung sidecar models. The pillar portion "A" is fitted to the seat tube in the ordinary manner. The bracket "B" is clipped round the top tube, and the springing of the pillar is worked by means of a coil spring concealed in the partion which fits inside the seat tube. The movement of the saddle is



H. Taylor and Co.'s cantilever spring seat-pillar.

through an arc, and has a vertical movement of about one inch. Our experience of this type of cantilever pillar is that it is very comfortable, and very acceptable on rough roads.

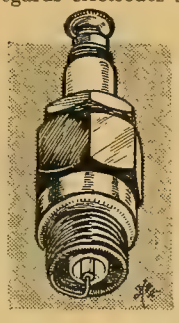
For those riders who believe in such things, Messrs. Taylor supply a policeman mascot, in cast metal, holding under his left arm an enlarged watch. His right arm is extended as if in the act of stopping a motorist. It is excellently made and will doubtless prove popular.

A New Gas Whistle.

The firm of H. M. Hobson exhibited at Olympia last week an interesting little warning whistle operated by the pressure of gas in the cylinder. As readers know, the usual motor cycle whistle is operated by the pressure of the exhaust gas. The one now under review is slightly different. Instead of the whistle being on the exhaust pipe it is screwed into the cap over the exhaust valve, the thread on the whistle being the same as on a sparking plug. Reference to the annexed sketch will show that the whistle projects a little higher than a long sparking plug, but on engines which have a fair clearance between the combustion head and the tank, or on engines which have combustion heads extending beyond the underside of the tank, there is sufficient space to fit the whistle and allow the lever to operate it. As will be seen, the lever is drawn downwards by the Bowden cable and wire, and, according to the position of "A," which is adjustable, the sound of the whistle is shrill or mellow. The address of the makers is H. M. Hobson, Ltd., 29, Vauxhall Bridge Road, S.W.

The Cup Plug.

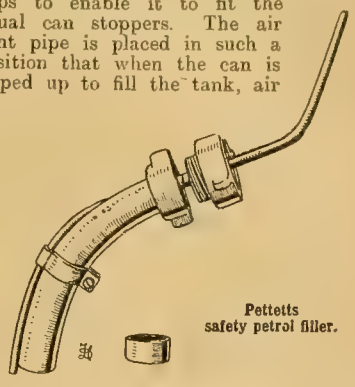
The new model Cup plug is illustrated herewith. This is quite new, both as regards electrodes and construction of the insulator. The earthed electro reaches nearly to the bottom of the cup. We have previously referred to the freedom from sooting up, and other well-known qualities of the Cup plug, which is designed and made under the personal supervision of Dr. A. M. Low, manager of the British Low Accessories Co., 15, Great St. Helens. E.C.



The latest pattern Cup, single point, one spark plug.

A Safety Petrol Filler.

We have tried several different petrol fillers from time to time, but we do not remember having found a more satisfactory one than the Pettetts safety filler, which is marketed by Mr. S. Pettetts, of 46a, Regency Square, Brighton. At garages, etc., petrol is usually measured out to motor cyclists, as the tanks seldom hold sufficient to enable two gallons to be poured in at one time; the filler therefore would be of little use on the road, but at home in the motor shed it is very handy, and the one we have used shows no signs of leakage. It is provided with two sizes of screwed caps to enable it to fit the usual can stoppers. The air vent pipe is placed in such a position that when the can is tipped up to fill the tank, air

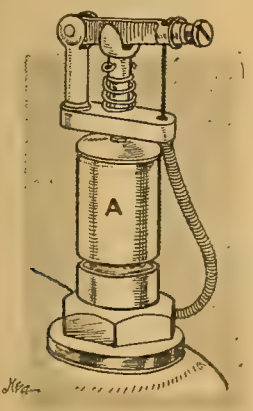


Pettetts safety petrol filler.

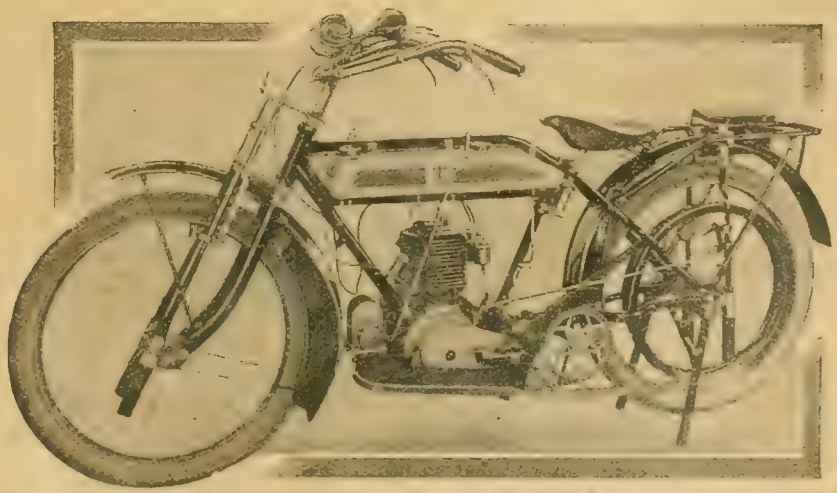
can enter, and immediately the petrol level in the tank reaches the end of the spout, the flow of petrol from the can ceases. When the clip on the spout is set in the required position, it can be lodged against the edge of the tank filler, and acts as a gauge for filling the tank to the required level.

Spring Suspension.

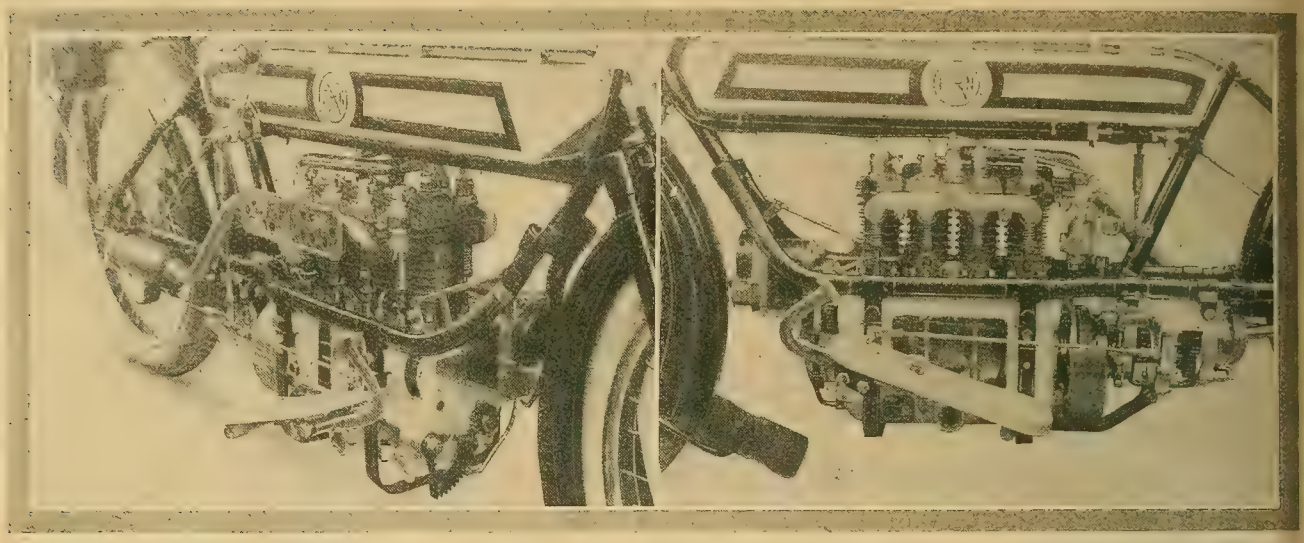
The N.A.B. spring suspenders made by the Reliance Works Co., Ltd., Southampton, for different parts of a motor cycle are specialities of this firm, and have been well-known for many years. This form of suspension is chiefly applied to the front forks, the back wheel and the saddle pillar on motor cycles, and an old machine may be modernised by these fitments. It is claimed that when a motor cycle is fitted with this form of suspension, extreme comfort is obtained in riding over even the roughest roads.



A novel type of exhaust whistle marketed by H. M. Hobson Ltd. It fits into the exhaust valve cap.



A spring frame motor bicycle fitted up with N.A.B. specialities



Both sides of the new 7 h.p. four-cylinder F.N. as shown at Olympia with sections cut away to show its working. Observe the arrangement of the kick-starter.

CLUB NEWS.

Bournemouth and District M.C.C.

A winter open one day reliability trial will be held on Jan. 7th, 1914, comprising a flexibility test, hill-climb, speed trial, and non-stop reliability test. The speed trial will be held in Canford Park, by kind permission of Lady Wimborne. A large list of prizes is promised, and the committee state that the trial will be run over good roads and no freak hills will be included in the course. Entry forms may be obtained from the hon. trials sec., Harry Counter, The Gymnasium, Boscombe.

Bristol M.C.C.

A twenty-four hours' open trial from Bristol to Land's End and back will be held on December 26th and 27th, and seems likely to be a very sporting event. The course is 402 miles and no secret checks will be used. All that a rider need do to qualify for a gold medal is to complete the journey in twenty-four hours, and avoid being more than fifteen minutes late or early at the Exeter, Land's End, Exeter, and Bristol checks. Breakfast and supper has been arranged for, and a club member is providing Oxo at Bodmin on the outward and inward journey. Already over thirty entries have been received and entries close December 18th. Full particulars may be obtained from the hon. secretary, Philip Grout, Keynsham near Bristol.

P. H. A. Mathews (3½ h.p. Rudge), winner of the 500 c.c. class in the Public Schools M.C. meeting at Brooklands on Saturday.

The Public Schools Club at Brooklands.

The Public Schools M.C.C. held a successful meeting at Brooklands on Saturday last, the 29th ult., when members were timed over the flying kilometre. The riders for the most part handled their machines in great style; one rider, however, had the misfortune to come off twice in exactly the same place. The weather was favourable.

Douglas machines were much in evidence and ran splendidly. Among other machines we noted Zeniths handled by A. J. Luce and L. P. Openshaw; Indians by Roy Walker and T. R. Browning; a Rudge, Hazlewood, Blackburne, Triumphs, and E. J. Gibbons's 8 h.p. overhead Martin, which has performed so successfully in both hill-climbs and speed trials, and which is more than a year old. The classes resulted as follow:

350 c.c. (Solo).—Flying kilometre.

	m.p.h.
A. Nicholson, Bradfield (2¾ Douglas) ...	50.84
P. C. Douglas, Marlborough (2¾ Douglas) ...	48.42
M. Cremetti, Harrow (2¾ Douglas)	48.40

500 c.c. (Solo).

P. Mathews, Clifton (3½ Rudge)	66.81
C. Roberts, Bradfield (3½ Blackburne) ...	56.73
R. L. Keller, Rugby (3½ Triumph)	54.83

Open Class.

E. J. Gibbons (8 Martin)	71.70
L. P. Openshaw (8 Zenith)	71.24
T. R. Browning, Eton (7 Indian)	60.76

Sidecar Class.—Under 600 c.c.

M. Cremetti, Harrow (2¾ Douglas)	40.81
P. C. Barton, Blundell's (Hazelwood) ...	37.79

Sidecar Class.—Open.

L. P. Openshaw (8 Zenith sc.)	56.20
A. J. Luce, Eton (8 Zenith)	52.76

Openshaw drove his 90×77.5 side-by-side valve Zenith, and Luce's engine had overhead valves.

Three-lap Handicap.

A. J. Luce (8 Zenith) had a handicap of 4m. 25s., and came in first 11m. 41⅘s after the first man had been despatched. In spite of being held back somewhat by a big car which was going round the track at the time of the race, his Zenith was lapping at close on 70 m.p.h.

Returning from Brooklands, Roy Walker was encountered bemoaning his luck. The roads were extremely greasy and the tail of his big twin had wagged so sturdily that he had just had his second or third fall. After leaving his machine at a garage, he took a seat beside a member of our staff in a G.N. cycle car.

Club News.—

Cheltenham M.C.C.

The annual general meeting took place on the 18th ult. The officers were re-elected *en bloc*, and a vote of thanks was accorded to Mr. A. W. Golesworthy, the hon. secretary.

Canberra M.C.C. (Sydney).

This club was formed quite recently, and now has over fifty members. Three hill-climbs and a reliability trial have been successfully held. The honorary secretary is Mr. A. A. Levi.

Cardiff Motor Club.

The annual dinner and distribution of prizes took place at the Whitehall Rooms, Cardiff, on Wednesday, November 19th. The president of the club (Mr. Daniel Radcliffe, J.P.) was in the chair.

Motor Cycling Club.

The instruction sheets for the London-Exeter-London Run have now been issued containing a full list of times and distances and detailed directions with regard to route. Entries close on Monday, the 8th inst.

Sutton Coldfield and Mid-Warwickshire A.C.

A members' reliability trial will take place on the 6th inst., starting at 11.30 a.m., from the Royal Hotel, Sutton Coldfield, over a secret course. Marks will be awarded for the Muratti-Ariston Trophy and Ixion Challenge Cup.

Insch and District M.C.C.

The members recently held a hill-climb at Luce Hill, Aberdeenshire. The surface was greasy and the gradient 1 in 6 followed by a sharp right-angled corner and a rise of 1 in 5. G. McHattie (3½ T.T. Rudge), W. Morrison (3½ Triumph), and J. Clarke (3½ Rudge sc.) made excellent ascents. The following failed at the bend: A. Cooper (2¾ Douglas), A. Rhynd (3½ Rudge), and J. Cooper (5-6 V.S.). Several riders considered the hill too bad to attempt.

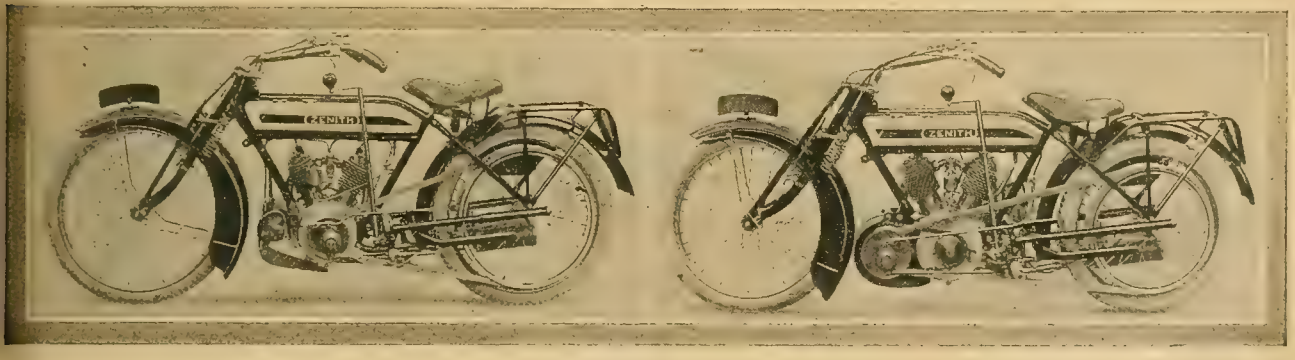
Mersey (Liverpool) M.C.C.

The annual dinner, followed by the prize distribution and a concert, took place on the 20th ult. The following officers were elected for the ensuing year. President, Mr. G. H. Lake; captain, Mr. W. E. Smith; hon. treasurer, Mr. G. Morley; hon. secretary, Mr. S. W. Carty, 5, Redcross Street, Liverpool. Four open trials were held during the year, the chief being the Colwyn Bay speed trials. The club membership has largely increased.

Oxford University M.C.C.

Under favourable conditions the speed trials were run off on November 19th. Messrs. Davis and Slingo did the timing. the Course was 860 yards. Best times were as follow:

Rider and machine.	Time.	Speed in m.p.h
Lightweights.		
D. L. Hall (2¾ Douglas)	33⅘s. ...	52.1
Cycle Cars		
C. G. Brocklebank (10 Mathis) ...	34s. ...	51.8
J. G. Coates (10 Singer)	35⅖s. ...	49.7
T.T. Machines.		
W. E. Russell (3½ Rudge) ...	28⅖s. ...	62
G. K. Pippett (3½ Singer) ...	29s. ...	60.7
J. W. Pedley (3½ Triumph) } —. Marshall (3½ Zenith) }	30⅕s ...	58.3
Twins.		
L. P. Openshaw (8 Zenith) ...	22⅖s. ...	77.9
C. F. A. Portal (6 Bat)	27⅖s. ...	64.3
Open Class.		
L. P. Openshaw (8 Zenith) ...	21⅖s. ...	82.19
G. K. Pippett (3½ Singer) ...	27⅕s. ...	64.7
W. E. Russell (3½ Rudge) ...	27⅖s. ...	64.3
Sidecars.		
L. P. Openshaw (8 Zenith sc.)	25⅘s. ...	68.2



TWO ZENITHS FOR 1914.

(1) The 3½ h.p. twin with drive direct from engine-shaft.

(2) The 8 h.p. model with counter-shaft gear in front of the engine by which means lower gear ratios may be obtained.

ADDENDA TO THE BUYERS' GUIDE.

The following particulars arrived too late for inclusion in our tabulated Buyers' Guide:

Motor Bicycles.

Arno.— 2¾ h.p., 77 × 81 mm., 377 c.c.; and 3½ h.p. 84 × 89 mm., 493 c.c., side by side valves, B. and B., Sturmey-Archer hub to order, Hutchinson tyres. Prices: £34 to £57 10s.

Brough.—3½ h.p. twin. Price £56 10s.

Calthorpe.—Precision engines, 2 h.p., 60×60 mm., 170 c.c., overhead valves; 3½ h.p., 85 × 88 mm., 499 c.c.; and 4¼ h.p., 89 × 96 mm., 597 c.c., side by side valves, drip feed, Senspray, Armstrong hub or Calthorpe counter-shaft gear, Michelin tyres. Prices: £26 5s., £55, and £48 10s. respectively. Weights: 108 lbs., 218 lbs., and 230 lbs.

Dot.—3½ h.p., 85 × 88 mm., 499 c.c.; 4¼ h.p., 89 × 96 mm., 597 c.c.; 3½ h.p. Jap twin, 70 × 64½ mm., 496 c.c.; 6 h.p. Jap twin, 76 × 85 mm., 770 c.c.; and 8 h.p. Jap twin, 85 × 85 mm., 964 c.c, side by side valves, mechanical lubrication, Amac, Armstrong or two-speed counter-shaft gear, Hutchinson tyres. Prices: £59, £60 18s., £63 10s., £67 4s., and £73 10s. Weights: 190 lbs., 200 lbs., 180 lbs., 200 lbs., and 220 lbs.

Hampton.—3½ h.p. T.D.C., 85 × 88 mm., 499 c.c., side by side valves, B. and B., Armstrong hub, Hutchinson tyres. £47 5s. Weight: 270 lbs.

Montgomery.—5-6 twin, 180°, 75 × 78 mm., 688 c.c., side by side valves, semi-automatic lubrication, Armstrong hub Mark VII., gears 5, 7½, and 11½ to 1. Belt, driven by pulley on camshaft.

P. and M.—The price of the standard model is £65.

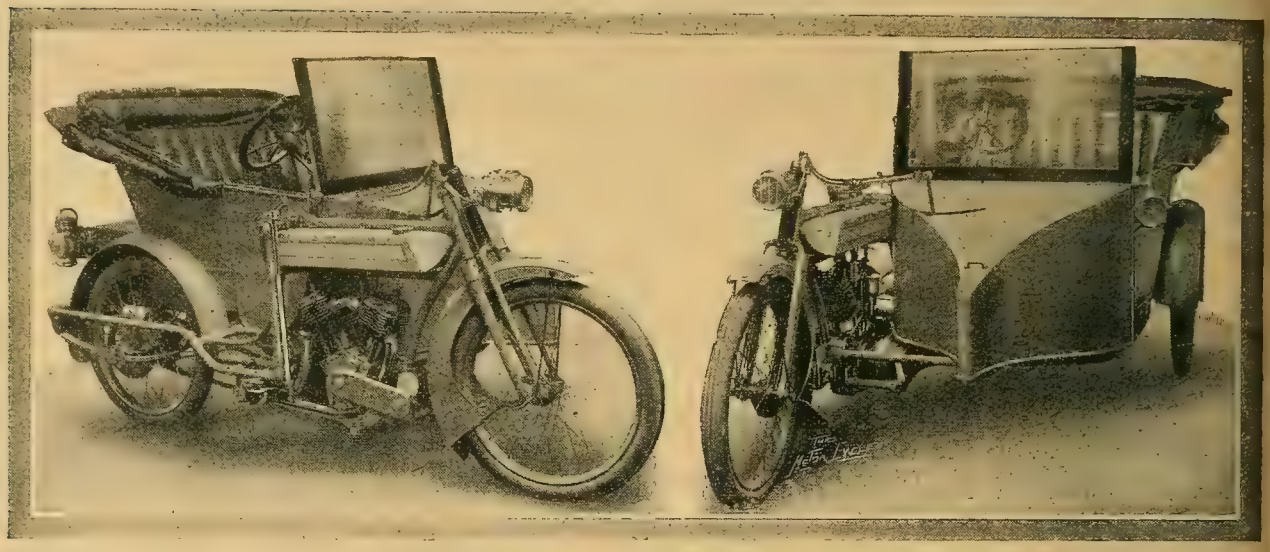
Triumph.—The price of the 4 h.p. model with three-speed hub is £60.

Cycle Cars.

Melen.—Alpha twin engine, 86 × 95 mm., 1,099 c.c., water-cooled, Solex carburetter, three speeds and reverse, 4, 8¼, and 13½ to 1, shaft drive, wheelbase 7ft. 6in., track 4ft., Dunlop tyres, 700 × 80 mm. Price £155 8s.

In justice to ourselves, we must mention that the prices first published were inadvertently supplied by the makers.

The H.S.M. Runabout.



(1) Side view showing counter-shaft gear, chain drive, and rear springing. (2) The pointed nose of the two-seated body, also showing wind screen and steering mechanism.

WE recently examined a 1914 model of this machine at the showrooms of Turner, Marr and Co., 9, The Arcade, New Broad Street, E.C., who are the sole distributing agents.

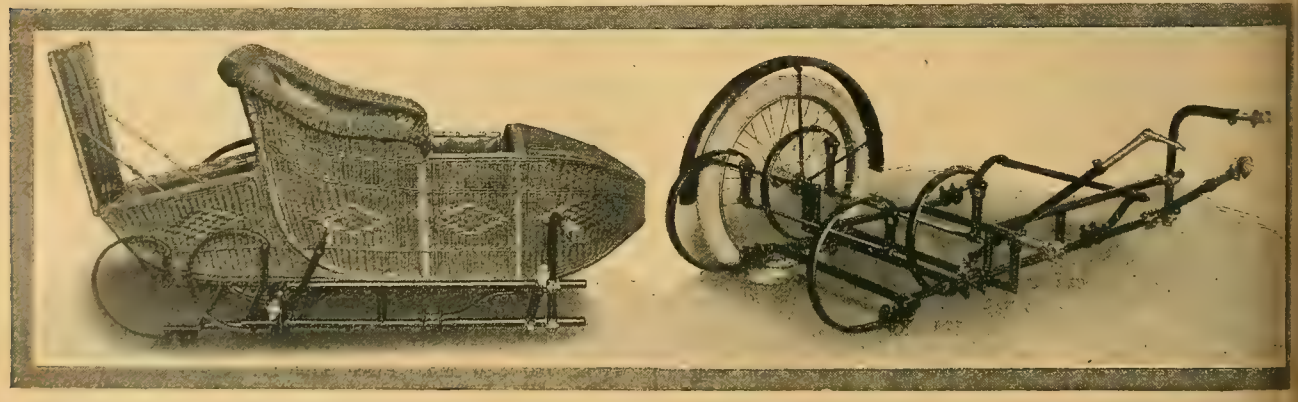
The engine is an 8 h.p. air-cooled twin-cylinder, fitted with Bosch magneto and the new pattern B. and B. carburetter. Lubrication is by drip feed and an auxiliary oil pump. Transmission is by chain throughout, and a multiple-disc clutch running in oil is fitted. The gear box gives three speeds, all shafts running on ball bearings. Wire wheels are fitted, and steering is by wheel. Speeds from 6 to 50 m.p.h. on top gear are claimed by the makers.

The body is a two-seater of the sociable type, fitted with two large tool lockers, wind screen, and Cape cart hood. The tyres are 650 × 65 mm. The makers intend to turn out three machines a week till Easter; they hope to turn out twenty machines per week after that time.

Impressions of a Trial Run.

It should be noted that the machine is built on the lines of a motor cycle and sidecar, but the frame is specially designed and strengthened. Chater-Lea spring forks are fitted to the front wheel, and the springing throughout is well arranged.

We were privileged to have a trial run on a machine of this type, the first that was built, and were favourably impressed. The only delays were caused in the first place by the driver of a cart who backed his cart into the front of the machine and smashed the lamp; in the second place by tyre troubles. The steering of the car required some adjustment, but as the car was in its fourth year and the engine in its seventh, as we were informed, one must expect to find some adjustments necessary. The advantage this handy little vehicle has over the motor cycle and sidecar is that both passenger and driver sit in comfort and are protected from the elements by the hood and screen. The engine pulled very well considering it was a veteran with automatic valves, and it was easy to start the machine from a standstill on a comparatively high top gear. The clutch was very smooth in its working. We drove the machine a short distance, and, except for the slackness in the steering, found it easy to handle. It is interesting to note that this machine comes well inside the £100 mark with full equipment.



Chassis and body of a tandem-seated sidecar of novel design with one-piece welded chassis. The twin axle pillar and duplicated support for rear coupling should be noted. This sidecar was on the N.S.U. stand at Olympia.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Curing Compression Leaks.

I have bought a second-hand motor cycle of unknown make. The cylinder has a separate head and air leaks out between the joining. (1.) Is there any sort of substance which I could put between the head and cylinder, as I have cleaned both parts and it still leaks? (2.) Oil leaks from the crank case; is there a remedy? —J.B.

(1.) If the surfaces of the joint are clean and true and a good copper and asbestos washer is used, there should be no chance of leakage. If, after you have verified these points and fitted a new good washer, a leakage still occurs, you might try painting the joint with fish glue. (2.) The same remarks apply here. Some improvement might be made by fitting a brown paper washer round the joints, or the fitting of an extra relief valve might cure the trouble. Seccotine is a useful substance to put on crank case washers to stop oil leaks. Even tightening of all bolts is essential.

Cost of Running.

I should be much obliged if you could tell me if there are any motor cycles which, for tyre wear, taxes, and petrol, would run at ½d. per mile on good London roads?—J.M.U.

It is the use of a clutch or low gear in traffic in London, not the road surface, that spoils one's petrol consumption. With very careful handling a lightweight 2½-2¾ single-cylinder might possibly be run at this cost, but it is rather doubtful. You make no mention of depreciation.

Two-stroke v. Four-stroke.

Would a two-stroke engine of 350 c.c. give off as much power as a 499 c.c. four-stroke? Also, would there be any difficulty in keeping a two-stroke of the above dimensions (air-cooled) cool?—A.P.G.

Certainly not. To all intents and purposes the four-stroke engine puts forth as much power as an equal two-stroke. To explain the reason in a few words, we would point out that the two-stroke engine cannot take in a full charge of gas every revolution, since there is a certain amount of burnt gas left in the cylinder after each explosion; also, part of the nominal cubic capacity is lost by the opening of the inlet and exhaust ports at the bottom of the stroke. Both engines run coolly.

Driving Advice to a Novice.

As a novice I should be much obliged if you will kindly answer the following questions: (1.) When the ignition lever to my Bosch magneto is placed in its correct position for starting, is it to be left in the same place for all speeds, or is it to be moved about to correspond with the different speeds? (2.) When riding down long hills, can the exhaust valve be raised for half a minute or so and then dropped again without the rider interfering with any of the other levers? (3.) Which is the correct way to stop the machine? Is it by raising the exhaust valve, or otherwise? (4.) Do you think a 2¾-3 h.p. three-speed model would be strong enough to take a person weighing 11 stones up most main road hills?—J.E.W.

(1.) No; when the ignition lever is placed in the correct position for starting it should be about two-thirds full advance, and when going at a fair speed it should be fully advanced. The chief thing to remember is always to drive with the ignition as far advanced as possible. If you have any signs of knocking you should retard the spark until the knocking ceases. (2.) The exhaust valve may be raised, but at the same time the throttle should be closed, since otherwise the exhaust valve is liable to be burnt. When the throttle is open a stream of gas has to pass the exhaust valve, and if this took place for any length of time the valve would probably become badly pitted. (3.) When you wish to stop, first close the throttle, when, if it closes completely, the compression of the engine gives a braking effect which helps the machine to pull up in a short distance. Personally, we never use the exhaust valve lifter except for starting purposes, and we drive on the throttle only on every possible occasion. (4.) A machine of the horse-power you mention, and fitted with three-speed gear, should certainly climb all hills you are likely to meet on average main roads.

Mr. G. H. Wait, of Leicester, with his daughter in a sidecar attached to the latest model twin-cylinder Clyde. A feature of this machine is that the engine is suspended in a loop frame.

Engine for Pumping.

I require a petrol engine of about 6 h.p. single-cylinder water-cooled, magneto ignition, with outside flywheel preferred. I want to rig it up to drive a 2in. high-lift centrifugal pump. For that purpose the shaft would have to be strong enough and long enough to enable a 5in. face pulley for flat belt to be fitted. Can you suggest anything to suit my requirements?—D.W.P.

We have personally had considerable success with an engine out of an Oldsmobile car. This is a large horizontal single-cylinder engine and can be run in quite a satisfactory manner on gas, paraffin, or almost any fuel. Such engines are occasionally advertised in our columns.

Starting Difficulties.

Could you kindly assist me in the following difficulty? My machine (1910 Premier) is very difficult to start on the road. On the stand, however, it starts almost at a touch without any trouble, hot or cold.—J.E.A.

In all probability your trouble is caused by the rocker arm of the magneto sticking slightly, or the points requiring readjustment. The faces of the points should be quite true, and parted by about half a millimetre. See that your plug points are not too far apart, and also be careful that there are no air leaks between the carburetter and the engine. The latter is a more frequent cause of difficulty in starting than is imagined.

Air Leaks.

I have been much troubled by the misfiring in the front cylinder of my 6 h.p. twin. Both cylinders will fire at about 20 m.p.h., but if I throttle down the front cylinder cuts itself out, and I run on the back cylinder only as slowly as about 5 m.p.h. if required. If I open the throttle, there is but little result until the front cylinder starts again, when the machine will rush off like a horse which has received a sharp cut with the whip. The spark is good, and I have tried several plugs. The compression is excellent in both cylinders. An examination of the plugs shows the points of the rear plug to be covered with soot, while the front remains clean. This, of course, points to the fact that the rear cylinder is getting too rich a mixture and suggests an air leak in the front, but I have very carefully examined all parts without discovering one, and have tried reversing the inlet pipe and wrapping the joints with insulating tape, but without result.—TWINCY

We agree with you that an air leak is the cause of your trouble, and we should advise you to search again very carefully for this. It would be advisable to start the engine up on the stand and rub all likely parts with oil, which will perhaps enable you to discover the position of the leak, which may be in some part not easily seen. Occasionally misfiring is caused by the plug points being too close together, but we think an air leak the most likely solution.

Carburetters and Benzole.

Would you kindly say if you consider benzole is to be recommended for a motor bicycle on the grounds of general economy and reliability, and can benzole be used with any carburetter?—E.H.G.

Benzole is quite suitable for use on motor cycles and cars, but with some carburetters a certain amount of adjustment, in order to give more air, is required. Benzole cannot be used with a carburetter fitted with a cork float as is the case with some American carburetters, owing to the destructive action of the benzole on the float, but a coating of shellac varnish carefully applied to the cork will sometimes work well. It is also possible to have a thin coating of copper deposited on the float, which would, of course, be the most efficacious method.

READERS' REPLIES.

Re your reply to "W.N.G." in your issue of November 20th he will find the following a much better route from Waltham Cross: On reaching the Four Swans at Waltham Cross, turn to left and follow tramlines for a couple of miles to Southbury Road on right. Tramlines from here to Enfield (about 1½ miles). On reaching Enfield go straight across the road, bearing left at fork, under railway bridge, to Potter's Bar (about four miles). Here turn left to High Barnet and join Watford Road at church. Total distance, roughly, ten miles. Good roads all the way, which can hardly be missed, and will save many, many miles—if he went straight, which I doubt, as the roads about Waltham and Northam are very complicated. An alternative route from Waltham Cross to Enfield is: Follow trams for half a mile, first on right to Forty Hill, turn left to Enfield. No trams, but not such a good road.—BENJ. HARVEY.

In your issue of the 20th ult. I notice "R.O." asks if a 3½ h.p., with his wife and two children up, would take a reasonable hill on this load. I have ridden hundreds of miles this season with my wife and child of 3½ years in sidecar, and boy of twelve on the carrier, without any difficulty. We recently had a spin of over fifty miles so loaded. The machine is a 3½ h.p. T.T. Ariel, and in August last took us a tour in North Wales, also with baggage.—No. 7715.

Removing Tar Stains.

In your issue of the 13th of November you advise a reader to use butter for cleaning tar off the enamel of a motor cycle. The best thing is to use essence of turpentine. Simply rub the tar with a cloth saturated with turpentine and it will come off and leave a beautiful polish on the enamel.—M. L. LEGRAS.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"J.M.W." (Sheffield).—Morgan runabout; comfort on bad roads.

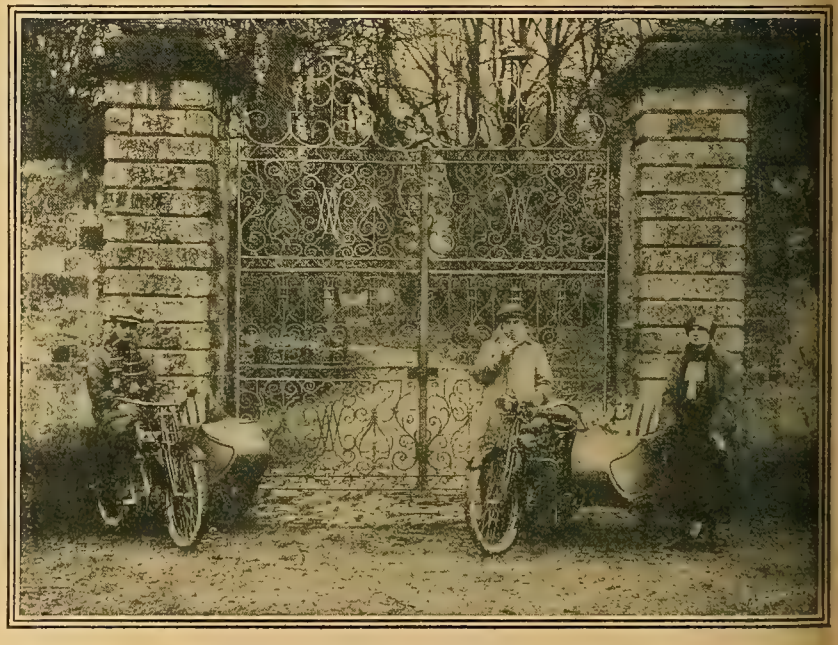
"A.C." (Godalming).—Carden cycle car. General reliability and comfort.

"F.B." (Birmingham).—Suitability of 3½ h.p. P. and M. to take sidecar in hilly country.

"F.L.R." (Burslem).—2¼ h.p. Levis, and 2½ h.p. Connaught, single speeds. Hill-climbing and reliability.

"B.O.S." (Middlesbrough).—Millennium Gear. Durability and reliability. Also power of light and durability of Voltalite lighting set.

"S.R." (Wolverhampton).—1911 and 1912 6 h.p. twin Rex two speed, with sidecar. Reliability and petrol consumption, solo and sidecar; also efficiency on benzole.



GATES AT THE ENTRANCE TO WROXTON ABBEY, THE SEAT OF LORD NORTH.
In the foreground are two Rover 1914 sidecar outfits.

I am just writing you a line to let you know how my Rushmore Lamp and Generator are going along.

The other night, a friend and myself went out for a ride into the hills, where it was absolutely pitch dark, no moon, stars or artificial light, and out of curiosity as we were standing by smoking, thought it might be interesting to know how far one could read ordinary print, so having walked a fair distance up the road, we stopped and tried, and finding it possible to read it, we paced the distance back to the lamp, and the distance was 154 paces, or I should say about 130 to 140 yards!

It gives me great pleasure in going out at night on a real dark road with a fine beam of light ahead, besides the fact it makes night riding nearly as fast and safe as day, thus doubling the pleasure of night riding.

The flame is absolutely as steady when moving as when standing and the Generator is perfect, you might describe the whole outfit as "IT."

Yours faithfully,
P. W. ENGELBACH.

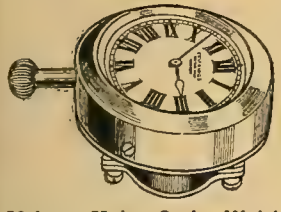
RUSHMORE MOTOR CYCLE LAMP

RUSHMORE LAMPS LTD
46 Brewer St London W

RUSHMORE MOTOR CYCLE GENERATOR

SELFRIDGE'S

CHRISTMAS GIFTS FOR MOTOR CYCLISTS



30-hour Motor Cycle Watch and Case (as sketch). Lever movement. Dust and weatherproof. With guarantee, **9/6**. In heart shaped case, **10/6**.

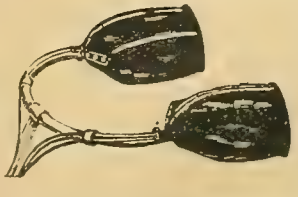
Double-twist Motor Cycle Horn (as sketch). Powerful deep note. In nickel, with adjustable clip fastening, **9/6**.

BY buying in large quantities we are able to offer you (we believe) a larger selection of accessories at a lower price, quality considered, than is elsewhere obtainable in London.

If unable to call, our Letter order department will carefully and promptly carry out your instructions. We pay carriage throughout the British Isles.

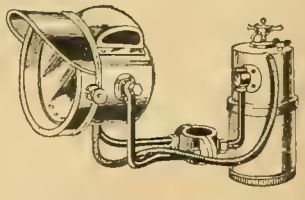
Spare Belt and Tube Case (as sketch), in solid leather, 6¼in. diameter, 3½in. deep, **6/9**.

Billiken Mascot (as sketch), will fit ⅞ and 1in. bar, nickel finish, **5/6**.



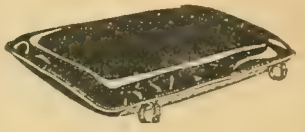
Motor Cyclist's Hand Muffs, self-supporting and flexible. Cover all levers, but do not interfere with free access to them. In Black Waterproof lined Grey Cloth, a pair **9/6**; in best Black Waterproof lined Tamo, a pair **15/6**; in Tan Waterproof Leather lined Fur, a pair **22/6**.

Authorised Agents for De Dion and Ford Cars.

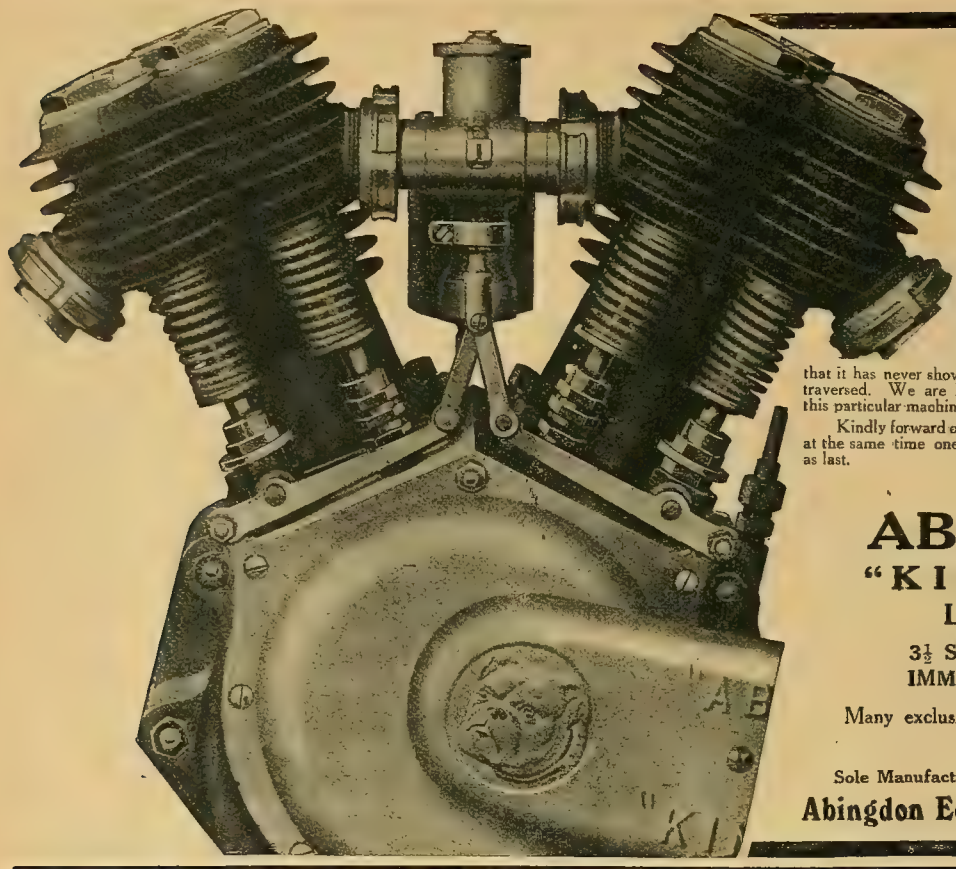


The "Sovereign" Motor Cycle Lamp Set (as sketch)—Lamp, Generator, and Bracket. Special price, complete, **20/-**.

Carrier Cushion (as sketch) for fitting over carrier, to provide a comfortable seat for a passenger. Made of leather, with Japanned top, and filled with Doe Hair. Size 15 × 7½in., and complete with four straps. Each **4/6**.



SELFRIDGE & CO., LTD., OXFORD STREET, W.



One of the many entirely unsolicited testimonials:—

Messrs. Abingdon & Co.,
Birmingham,
November 4th, 1913.

Dear Sirs,

In reference to your favour, dated August 19th, 1913, we are sending you herewith a report on the work done by your Abingdon Ecco Twin Cylinder Machine, which we feel it our duty, owing to the more than anticipated satisfaction it has given us. The machine in question was put on the road on Saturday, Oct. 11th, and since that date has done 1997 miles, which we think is a very severe test in a little over three weeks, but we must mention that this mileage is with a petrol consumption averaging 65 miles to the gallon, which is in our idea a record, with a heavy Millford Cabrio sidecar. In addition we would say that it has never shown any trouble on the steepest hills we have traversed. We are looking forward to doing a good business in this particular machine, as we have had several enquiries.

Kindly forward one Inlet and one Exhaust Valve, and despatch at the same time one 5/6 h.p. Twin Engine complete, the same as last.

Yours faithfully,

ABINGDON
"KING DICK"
Leads the way.

3½ Single. 5-6 Twin.
IMMEDIATE DELIVERY.

Many exclusive features, latest improvements, no complication.

Sole Manufacturers:

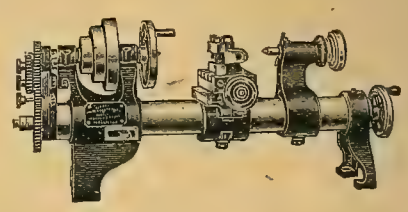
Abingdon Ecco Ltd., Tyseley, B'ham.

SAFEGUARD
YOUR POCKET

by installing in your garage a tool that will provide you with the means to solving the question of repairs. With a lathe in your garage, you will find yourself able to do a large amount of running repairs and the like that would otherwise have to be done outside; you will have always to hand the means of making adjustments, of tuning up, and of experimenting, while your machine will run all the better for constant and careful attention. You will find it a paying proposition.

£5 10s. is the price of the lathe illustrated below. This machine is a well-thought, well-made, and capable tool; it is screw-cutting, boring, and milling, and well able to undertake the thousand and one jobs that will crop up when motor cycling. The tool slide is removable by the undoing of one nut; this leaves a T slotted boring table to which work can be conveniently bolted, and the automatic travel put into operation. As the bed is circular this table can be partly revolved round it. Work bolted to the table can therefore be raised to various heights, thus doing away entirely with packing pieces or a vertical slide. This is an exceptionally convenient property of this lathe, and really converts it into a milling machine on which keyway cutting, slotting, etc., can be done, the cutter running on an arbor between centres.

Specification. The bed is of cast iron, hollow circular section, very stiff, and is ground on "Norton" grinders to a limit of error of 1/1,000 of an inch. The mandrel is steel, ground true, and runs in best hard gunmetal adjustable bearings, and not, as in some inferior types, in the plain casting. The tailstock will set over for long taper turning. The cross slide can be turned to any angle, and is graduated. A set of nine change wheels will cut from 5 to 48 threads per inch, Whitworth, also a great variety of odd and fine threads. All threads can be cut right or left hand. The above is only a very brief specification, but full details are given in an illustrated booklet, sent promptly on application.



DRUMMOND BROS., LTD., REED HILL, GUILDFORD, SURREY.

A Message from Canada

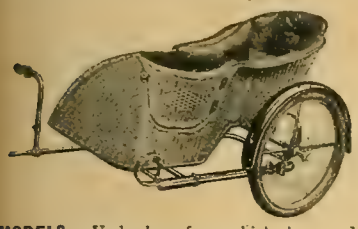
Concerning Coronet Sidecars

6, Bloor Street, E.,
Toronto,
October 29th, 1913.

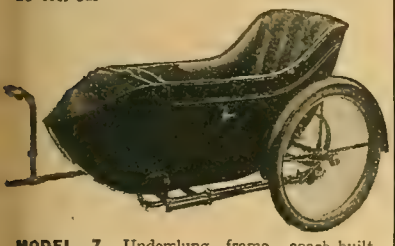
Booth's Motories.

Sirs.— I am very sorry I have not notified you before this that I received sidecar in first-class condition about 6 weeks ago. It quite surpasses my expectations in every way. I think I have the finest Sidecar in Toronto, being quite different from any of the other models now here. Hoping to have further dealings with you.

Yours truly, P. STANTON.



MODELS.—Underslung frame, high-class reed cane body, sides and floor lined to exclude draughts. "Coronet" detachable joints **£8 17s. 6d.**



MODEL 7.—Underslung frame, coach-built body, tool-box under front, also under seat. A real high-class sidecar. **£10 15s.**

SENT CARRIAGE PAID.
TRADE SUPPLIED.

24 Guineas only

secures a brand new

1914 2½ h.p. WOLF.

Immediate Delivery. **Write for Illustration.**

N.S.U. GEARS.

We have a few of these gears for any make of engine. The latest models fitted with adjustable pulleys. Write for particulars. Quick delivery.

Brand New Bosch Magnetos

We have a few Bosch magnetos suitable for twin engines. These are perfect in every respect and fully guaranteed.

49/- and 59/6.

Don't miss these.

NEW MOTOR CYCLE FRAMES.

Latest up-to-date pattern, low riding position, dropped top tube, back forks wide enough to take 3-speed hubs; **£1 12s. 6d.**

Set of malleable iron castings for Triumph pattern foot brake	1/6
Set of four engine plates for Precision engines	2/-
Set of castings and legs for kick-up stand	2/6
Set of castings for hand-starting device	2/-
Set of castings for heel brake	1/-

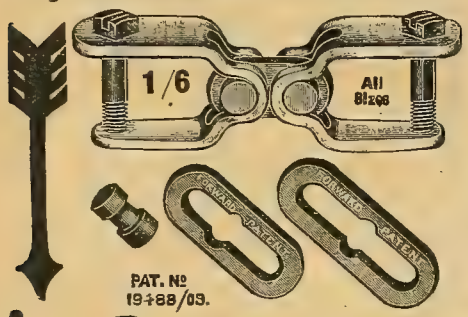
Special Quotations to the Trade.

"FORWARD" THE WORLD'S BEST Adjustable Belt Fastener.



Stronger than any other make of belt fastener and will outlast many cheap ones.

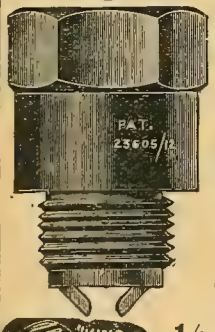
From all Agents, and Service Co., London.

FORWARD MOTOR CO., Summer Row, BIRMINGHAM.

"FORWARD"

That is the name to remember when buying a plug. Remember we guarantee to give you satisfaction and are always willing to send on 10 days' trial on receipt of cash.

Send for List of 10 Types.

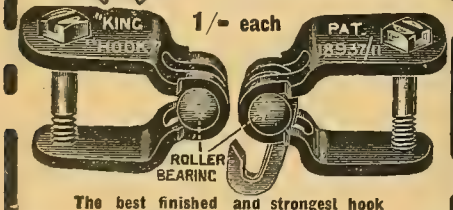


Type D illustrated, easily takes apart for cleaning.

NO PACKING. ABSOLUTELY and PERMANENTLY GAS-TIGHT.

"KING HOOK"

1/- each



The best finished and strongest hook fastener on the market.

"KNUT" Our cheapest fastener but thoroughly reliable. **9d. only.**

BEWARE OF CHEAPER FASTENERS.

MOTOR CYCLES FOR SALE.

Precision.

PRECISION, 1911, 3½h.p., T.T. roadster, Albion free engine clutch, engine just overhauled by makers, good order; £20, or easy terms.—Elce and Co., 16, Bishopsgate Av., Camomile St., E.C. [0400

Premier.

T.T. Premier 2½h.p. 1913 Lightweight, only run 600, new condition; £25.—Plastow, Grimsby. [4423

1912 2½h.p. Premier, exceptionally good condition; £23.—Stanley House, Beechen Cliff, Bath. [X7970

PREMIER, 1912½, 6½h.p., good condition; £24/10.—Box No. 4,589, *The Motor Cycle* Offices, Coventry. [X8487

PREMIER, 2½h.p., 1913, perfect condition, not done 500 miles; £28—.Penny, The Retreat, Witham, Essex. [4555

PREMIER, 1912½, 2½h.p., all accessories, splendid condition; £22/10, offers.—Reynolds, 7, Ramsgate, Louth, Lincs. [4445

END of Season Sale.—2½h.p. new lightweight Premier, £30; 3½h.p. 2-speed Premier, at £50.—Hall, engineer, Tonbridge. [4439

PREMIER, late 1912, 3½h.p., Sturmey-Archer, 3-speed, free engine, carefully used; £35. — Dr. Blackett, Audley, N. Staffs. [X8530

1913 2½h.p. Premier, fast, splendid hill-climber; £27/10; after 6, not Sunday.—Tham, 2, Pyrland Rd., Milmay Park, London, N. [4543

PREMIER, 3½h.p. (1913), 3-speed, and Speedwell sidecar, grand hill-climber, big F.R.S. lamp, best accessories and spares; £45.—Allen, "Guardian," Sheerness. [X8445

PREMIER, 3½h.p., counter-shaft 2-speed model, and £13 Montgomery sidecar, done 2,500, all as new; £50, lowest.—Hop 981.—1, The Crescent, Belvedere Rd., S.E. [4364

7-9h.p. Premier Twin Motor Cycle, complete with Gloria sidecar, speedometer, 2 lamps, horn, complete, latest model, unused; £85.—Myers and Burnell, Davygate Garage, York. [X7966

1913 3½h.p. Counter-shaft 2-speed Gear Box Free Engine Premier, new in May, perfect everywhere, new back tyre, Stewart speedometer, lamp, horn, spare tyre, valves, etc.; cost £62, accept £40.—Skinner, Knebworth, Herts. [X8559

3¾h.p. Premier, twin-cyl., the best 1912 model, Millennium 2-speed gear, Brooks new 170 saddle, splendid condition, very strong and speedy, will take sidecar anywhere, complete with canoe pattern cane wicker sidecar, Chater-Lea chassis; price £50. — G. Lloyd, Station St., Lewes. [X8562

Quadrant.

1914 7-9h.p. 2-speed Chain Drive Quadrant, Enfield gear, handle starting, etc., only ridden 100 miles; price 55 gns.—G. H. Cox and Co., Ltd., Castle Rd., Southsea. [4393a

Regal-Precision.

REGAL-PRECISION, 4h.p., 1913, with sidecar, Armstrong 3-speed gear, Palmer tyres, with apron, spares, and accessories, not covered 800 miles; £45 cash; seen and tried by appointment.—Beta, Godbold's Publicity Agency, 8, Bream's Buildings, E.C. [4456

Rex.

1913 Rex, 6h.p., de luxe, new, fitted with our new £14/14 tandem model sidecar; £66.

1913 Rex, 4h.p., de luxe, new; £40.—Bastone's, 228, Pentonville Rd., King's Cross, London, N. [4554

REX Sidette, 1913, 6h.p. twin, latest coachbuilt; offers.—22, Victoria Terrace, Leamington. [X8539

REX, 1910, 3½h.p., mag., good tyres, and excellent engine; £15.—Robinson's, Green St., Cambridge. [4481

3½h.p. Rex, B. and B., Palmer tyres, new belt, good condition; £8/10.—Wright, 94, Mill Rd., Cambridge. [X8524

5-6h.p. Twin Rex, free engine, and sidecar, good condition, very low; £11.—138, Catherine St., Leicester. [X7975

£9/15.—3¼h.p Rex and sidecar, condition and running guaranteed; bargain.—A. Lloyd, Maesgwyn, Ton Pentre, Glam. [X8573

REX, 3½h.p., free engine, handle starting, in good running order; £15, or nearest offer.—Creese, Garboldisham, Norfolk. [X8336

5-6h.p. Twin Rex, free engine, mag., splendid condition; offers.—Smith, 204, Edward Rd., Balsall Heath, Birmingham. [X7789

1912½ 6h.p. Twin Rex, special T.T., equal new, in splendid running order; £26; photo; bargain.—Baines, Crane St., Leicester. [4449

REX.—New 1912, 1913, and 1914 models from stock. Special exchange quotations.—Halifax Motor Exchange, Westgate, Halifax. [0387

REX, 3½h.p., 2-stroke, 2-speed, new Canoelet sidecar, perfect order, very complete accessories; at Holmes' Garage, Treville St., Plymouth; £35. [4197

LATEST 1913 Rex de Luxe, 6h.p., and new Rex sidecar, coach, Cowey speedometer, 2 lamps, spare tyre, belt, tube, kick start; abroad Xmas; £56, or nearest.—A. Booth, Rainow, Crewe. [X8335

1913 6h.p. Rex, 2-speed, Portland lounge sidecar, brand new combination throughout maker's price £80, our price £70; exchanges or easy payments.—Maudes', 136, Great Portland St., London, W. [2136

Novelty in Reliability Trials.

THOSE clubs who seek variety in competitions in order to stimulate further interest among members might do worse than take a leaf out of the book of the Sutton Coldfield and Mid-Warwickshire Automobile Club, which body on Saturday last held a novel, interesting, and yet instructive event. We have on several occasions pointed out the desirability of introducing more novelty in competitions if they are to retain their present popularity, and on that account welcomed the innovations introduced by the Streatham Club in their autumn trial, which included stopping and starting tests in addition to a speed test on Brooklands with certain minimum set speeds for the different classes. The points tested in the Midland trial referred to were flexibility as determined by slow and fast ascents of a certain hill, the ability to stop and restart, and acceleration powers, all on the same gradient and performed during the non-stop run, so that no special adjustments of the machine in order to show up particularly well in any individual test were possible. All that is needed is a course on unfrequented roads, so that the repeated procession of competitors shall not cause annoyance to other road users and residents along the route, and a comparatively straight hill. Of course, the points tested in the trial already referred to do not exhaust all the possibilities.

The idea might be carried on *ad infinitum*, such as by the measurement of petrol consumption, highest and slowest speeds on top gear, etc., but those headings enumerated are sufficient to impart a welcome variety in competitions of the future, and it seems to be generally agreed that the ordinary run of reliability trials has become exceedingly monotonous now that motor cycles have attained such a degree of reliability. We are at the moment commending this idea to clubs for closed contests; we realise that in an open trial with a large entry the conditions might become too complex; indeed, we well recollect the tedious delay in the A.C.U. Six Days Trials on the morning of the flexibility test on Warnell Fell. To carry out tests of this nature at all accurately requires a great deal of time and patience, and it would be a pity if by interposing too many different tests the trial was spoilt by its unwieldiness.

Excessive Garage Charges.

IN recent issues we have published letters on the subject of the charges made in various parts of the country for garaging motor cycles. We have since received a number of such letters which show that a charge of 1s. per day is not by any means unusual. Now, while most people will not complain of this charge for a single day of twenty-four hours, it certainly seems excessive when spread over a period of weeks or months. In fact, such a charge might equal or exceed all other running charges put together, including depreciation, and it is equivalent to the rent of a small house. A motor cycle takes up far less room than the smallest of cars and is much easier to handle, therefore the charge should be much less than for a car. Garage proprietors may claim to know their own business best and think that they have a right to charge what they can get. This may be so, but our opinion is that a satisfied customer is an excellent advertisement, and that on the other hand a garage where the charges are excessive will soon become known and avoided. Therefore, in their own interests, proprietors are advised to consider the future as well as the present or they will soon "kill the cow that lays the golden milk," as one of our politicians has so wisely said. The moral of this is that motor cyclists should ask what charges are made before they leave their machines. The man who bought a motor cycle without ascertaining the price and afterwards complained that the cost was excessive would receive little sympathy. Finally, this seems to be a matter into which the A.C.U. or A.A. and M.U. might enquire with a view to fixing some universal charge which would be fair to all parties, though we are fully aware that local conditions might in some cases make this difficult.

Freak Hill-climbing in Africa.

THE mania for climbing mountains is not by any means confined to Great Britain, for news reaches us that South Africa is now becoming the scene of such exploits, Table Mountain having capitulated before a 6 h.p. Royal Enfield. Let our correspondent tell the story.

"On November 2nd," he writes, "Mr. Donald Garlick made the first motor ascent on record of Table Mountain, riding a 6 h.p. Royal Enfield. There are only two bridle paths or routes by which materials and supplies are carried up the mountain on pack saddles to the employees on the reservoir services on the plateau behind the mountain face. The shorter, but more abrupt, of these bridle paths rises from the main road intersecting Groote Schuur at a point near Kirstenbosch. It was by this route, the Diamond Spring Path, that the remarkable climb was accomplished.

"The observer was dropped at a point well up the path where the track becomes too narrow for a sidecar, and the attachment had also to be dropped. From here the ascent was continued solo on track never more than 3ft. 6i wide, and frequently reduced width by boulders, thus lea ing less than eighteen inches of fr passage, with at times a sheer dr on the other side for hundreds feet into the gulley below. On t of this, the surface is mostly loo consisting mainly of rock chippin without earth binding. Excepti where in one or two places t Enfield was lifted over bould rising out of the path, it complet the climb to the Back Table e tirely under its own power.

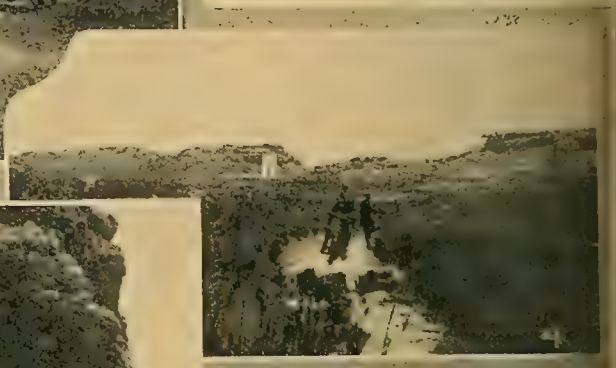

TABLE MOUNTAIN (CAPE TOW CLIMBED ON A MOTOR CYCLE

(1) Detaching the sidecar at the fo of Diamond Spring Path.

(2) A skid on Diamond Spring P due to loose surface on a right ang and The gradient at this point 1 in 6.

(3) One of the many narrow rid tracks with a surface of loose sto and a drop of several hundred f on the outside.

(4) The Back Table—2,400 feet above sea level.

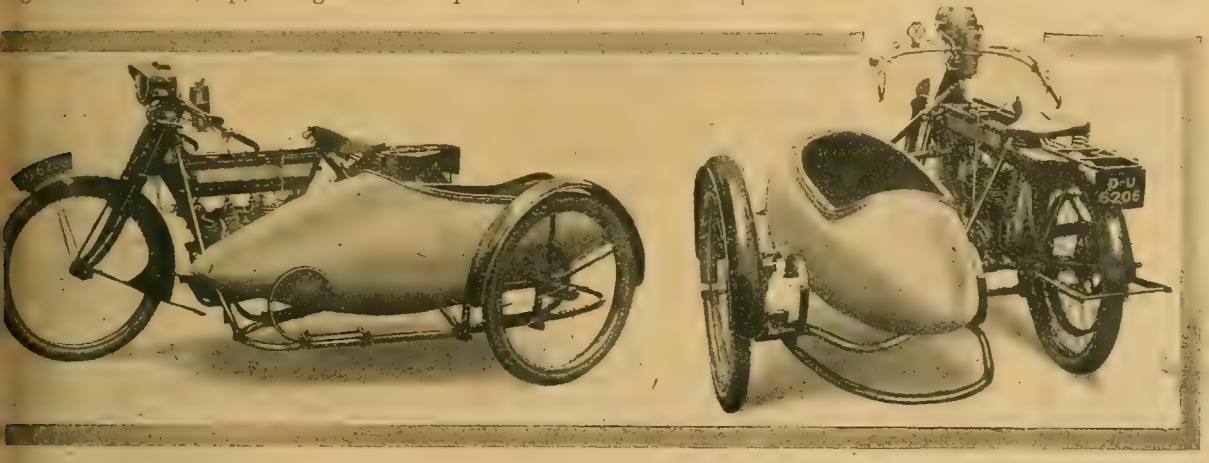
(5) A reed grass track on the Back Table.

(6) Wynberg Reservoir—one of on the plateau on the top of Ta Mountain.

Hill-climbing in Africa.—

The highest point ultimately attained was on a with the Woodhead Reservoir, at the top of Disa Gorge, about 2,400 feet above sea-level. n here the path was unrideable, and, petrol being in the tank, no attempt was made to find another to the face, 1,200 feet higher up. On the eau the rider was heartily congratulated by several ntain parties; and the mountain ranger, hearing exhaust (the silencer having been removed for ter road clearance), came down on the outlook for hers or forbidden guns.

The descent by the same route was even more ing than the climb up, owing to the steepness of the gradients, which at one part necessitated checking momentum by means of a rope tied to the back stay of the machine and held by an observer, to prevent the rider making a flying leap into space at the foot of a 1 in 5 drop. The presence of several true hair-pin bends caused some anxiety on the downward journey, as these were mostly hidden by foliage, with the straight ending precipitately, and with nothing to prevent overshooting the turning and ending disastrously in the ravine. But Mr. Garlick remained in the saddle all the way, and reached the foot of the mountain again without any accident. This ascent, when it became known, created considerable excitement in Cape Town."



A streamline sidecar fitted to a 3½ h.p. Motosacoche machine, designed and owned by C. L. Scott, of Sydney Westall's, Ltd., Great Portland Street, W., and built by Sidettes, Ltd., of Coventry. One of the several interesting features of design is an underslung chassis.

A PNEUMATIC ADJUSTABLE PULLEY.

r. J. Graham, 29, Perham Road, West Kenon, W., has invented and made an ingenious stable pulley, of which we show a section here-

The con- was entirely matic, and ted by a hi- pump fixed in nvenient posi- on the side of tank, and a g connection from the e to the con- on F. A few es of the p would raise pulley gradu- from the low high speed, e if the belt pressed up ist the nipple air would e fast or ually at will rapidly or ly lower the It appar- worked per- y and demon- ed the true

p. Pins.

elasticity of the belt. The pulley consists of a movable flange A and a chamber for the air bag D. On the air entering the bag it will expand and push the thrust plate E against the pins P, pushing the movable flange inward. Of course, the object of the pulley is to make the method of expanding and contracting very simple; and, though it may be anticipated that working by air pressure would cause trouble, this does not actually appear to be the case in practice. The cap C is screwed into the front of the boss, and carries the gland H, in which the nipple G is held loosely, so that the latter may remain stationary while the rest, of course, revolves. A non-return valve V is fitted, so as to be quite airtight.

THE QUESTION OF MAGNETO SUPPLY.

In a leading article in *The Autocar* of December 6th a matter of vital interest to all motorists is dealt with. This is the question of our dependency upon foreign manufacturers for our supply of magnetos. It can readily be imagined that this is a position fraught with grave risks to the welfare of the home industry. In the event of a political disturbance in Germany (by far the greatest magneto producer), or even a strike, our industry might very well be completely crippled until such disturbance had been settled. At the present time we believe we are correct in saying that the number of magneto machines manufactured in Great Britain is not sufficient to keep any one prosperous works supplied.

A Novel Rear Brake.

Another detail of intrinsic excellence, but unostentatious character, was to be seen on the new Rover machines. I refer to the rear brake. Standard brakes consist either of a concave V shoe on the inside of the belt rim circle, or of a convex V shoe on the outside of the circle. The former is the more powerful, but the latter needs no attention when a wheel is dropped out. The Rover design combines the merits of both types. A V block is fitted to the outside of the belt rim, which is, of course, provided with an extra flange for the purpose. The slight increase of weight thus necessitated is amply justified. We get the accessible rear wheel, the quest for which inspired the original Rudge convex outside V, now abandoned, because it was a shade feeble and apt to open the belt rim or otherwise distort the belt's bed, and simultaneously we get full brake power, and a true belt bed. This is one of the refinements which make for perfection.

Accessibility.

No! Wild horses will not drag the name from me; but there was, there really was, a machine in the Show from which neither valve caps nor sparking plugs could be extracted unless the engine were first dropped from the frame. I daresay the sparking plug indictment has an answer, for it was obviously possible to substitute midget plugs for the tall samples actually fitted, and midgets would have been removable; but fancy having to take the engine out of the frame if a valve cotter broke!

Bravo! the Zenith.

I should have been very sorrowful if the advance of the three-speed gears had driven the infinitely variables off the market. The danger was real and urgent. In their original forms these truly delicious gears did not admit of a lower-bottom ratio than 7 to 1, or thereabouts, and at this ratio the contact area of the belt was at its minimum, and the driving strains at their maximum. Simultaneously the 12 to 1 emergency gears of the three-speeders induced trials organisers to adopt routes bristling with hills which no 3½ h.p. could hope to climb on a 7 to 1 gear with a pulley screwed out to the diameter of an umbrella ferrule! Hence the infinitely variable 3½ h.p. was practically handicapped out of this season's chief trials, or in other words, banished from public attention, and I, for one, was distinctly afraid that the infinitely variable gear might either disappear altogether, or be restricted to solo mounts of abnormal and [illegible] horse power. But I reckoned without [illegible] Barnes; he has kept his clever gear, and he has contrived to embody a series of real emergency ratios, thus preserving for our use one of the most efficient and pleasant specifications on the road.

The Detachability of Three-speed Hubs.

I was a trifle disappointed that the designers of three-speed hubs had not managed to effect more in the direction of quick detachability of the wheel. To my mind the only real defect of the modern three-speed hub is the finickiness of its removal from the frame and of the reassembling. I presume the makers realise this difficulty as intimately as I do myself, and that nothing better is within the sphere of possibility. But some weeks ago a reader sent me details of a suggested modification which struck me as promising. He thought that the control rods might be coupled to toggles mounted on the chain stays, instead of on the spindle of the hub, so that the hub could drop clear provided the tips of its light internal push-rods clear the ends of the controlling bell cranks, these bell cranks being fixed to the chain stay brackets. The whole idea was strongly reminiscent of the Trium free engine control. At the time I thought the difficulty would lie in the fact that there is hardly any clearance between these push-rods and the bell cranks that the push-rods might be badly strained by careless riders during wheel removals; and that the scheme might render it very difficult to procure the precise nicety of adjustment required for such a delicate control. However, I ventilate the idea for what it is worth. Under existing design it is possible for a smart mechanic to get a wheel out and in again within a very short period; but the average amateur probably needs well over an hour to effect a tyre change.

Do Sidecars Skid?

My paragraph on this subject brought me a number of letters from riders who are unanimous in asserting that sidecars skid. The evidence is to the effect that they require efficient non-skid tyres, that they slide on sharp corners, that they are much steadier when the weight of a passenger gives the side tyre a firm grip, and that they skid when coasting down greasy hills with the valve lifted. This consensus of evidence rather surprises me, for, admitting that my sidecar experience embodies less than ten thousand miles, I honestly cannot recall a single instance of even a small skid with a sidecar or with a De Dion type tricycle, save only dry skids due to negotiating sharp corners at very unjustifiable speeds, *e.g.*, when insisting on tackling a corner when I had really overshot it by a yard or so. One correspondent suggests, however, that the average man is prone to exaggerate the seriousness of a skid. He describes how his sidecar skidded, and ejaculating, "By Jove that *was* a skid!" he dismounted to examine the wheel-tracks, and found that he had only erred about five degrees from the straight line for a couple of yards, whereas in imagination he had travelled crosswise for thirty yards!

The Low-priced Machines.

There is some risk that novices may credit the new ra-cheap motor cycles, listed from £25 upwards, h all the capabilities of the more refined and ex- nsive types, pace only excluded. It should be arly understood by the tyro that the service to be pected of a miniature four-stroke-engined bantam- ight, with direct single-geared belt drive, is of a y restricted character. It is equal to touring work level country, but it cannot climb severe hills un- s it receives pedal assistance of a somewhat exhaust- character; trouble with the transmission is to be icipated in bad weather, and the engine must be y carefully attended to, if "tune" is to be main- ned, for there is not the slightest reserve of power, l there is no emergency gear to fly to the rescue of enfeebled or badly driven engine. However, a ver driver can extract plenty of fun from one of se handy little lightweights, provided his riding onfined to a tolerably easy district. When we rise a higher price-stratum, and contemplate the three- eded four-stroke lightweight, or the two-speeded -stroker, matters are very different. A good nple of these types can go anywhere, and the big dsters will only beat it in the matter of speed uphill.

Twist-grip Control.

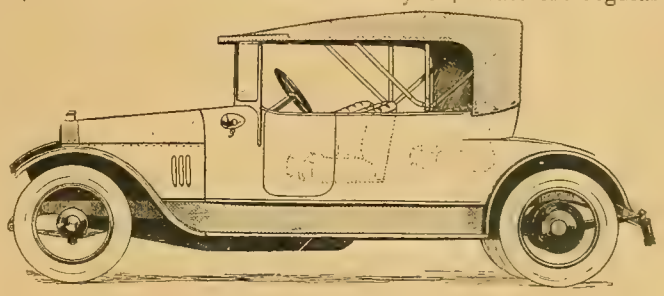
heard a fierce controversy raging between parently) an Indian and a Triumph enthusiast at Bowden stand anent the respective merits of twist- and radial lever control, the debate being ired by the Bowden people's inclination to push ir new twist-grip control. Probably 75% of my ng has been done with the standard radial lever trol, and my subconscious mind has become so roughly habituated to this type that try as I may, annot re-accustom myself to the twisting grips; in y emergency my right forefinger makes a wild h for a radial throttle, and, when I cannot find it, left-hand fingers paw the air madly in search of inverted valve lifter. I should opine that custom the controlling factor. A novice whose brain is in soil in this respect may well prefer the twisting , which has the advantage of retaining a "clean" idle-bar; but the man who has served a long renticeship with radial levers may experience my difficulty. How does the twisting grip serve in sy traffic with a really quiet engine? Can the erienced tell by the feel of the grip whether they risking an engine stoppage or not?

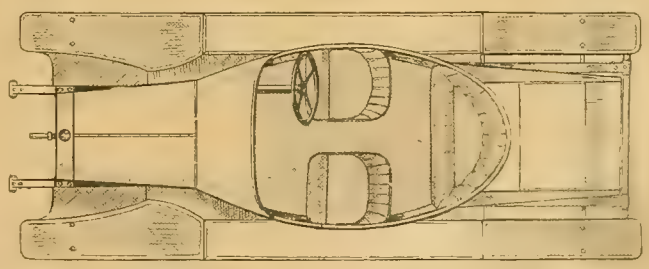
A Clyno Oiling Refinement.

Much as we all admired the widely-copied ingenuity the Connaught two-stroke oiling system (lubricant ng mixed with the petrol by the aid of a measure ched to the tank), we all failed to foresee the er advance on this notion appearing in the Clyno tweight. The oil tank is fitted with the usual np, but the feed pipe from the pump goes into the rol tank, and one or more pumpfuls of oil are in- ted into the petrol tank, according to the amount petrol inserted at a refill. This is a cleaner dodge, l obviates the nuisance of a lost measure. My only stion would be whether the oil and petrol can be sted to mix homogeneously; doubtless Frank Smith proved the idea pretty searchingly, and, of course, rol must slosh about considerably in the tank as the chine is running.

Body Room on Cycle Cars.

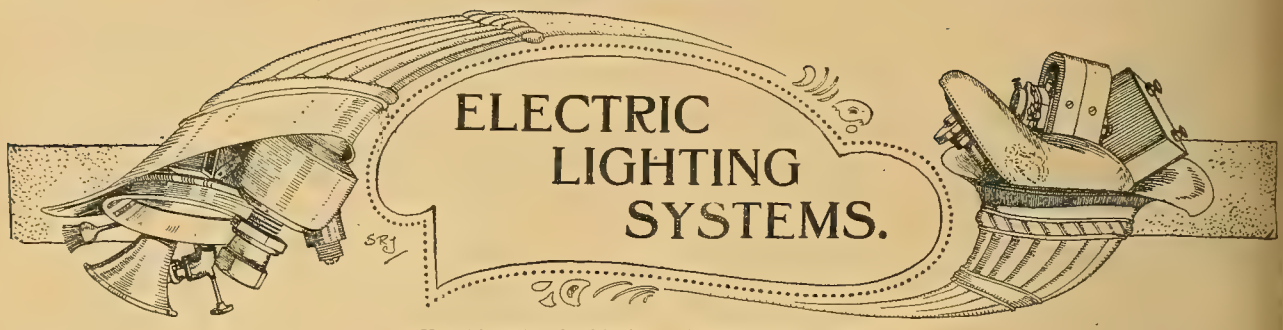
The cramped accommodation of many cycle car bodies is a defect which impulsive purchasers will not realise until it is too late. The Olympia exhibits showed great divergences in this respect. In some instances there was no tailboard whatever, and a tiny two-seated body, into which large passengers would apparently have to be insinuated with a gigantic shoe horn, was the sole provision; even running boards, to which bags can always be strapped, were occasionally missing. At the other extreme one found a roomy body, wide, substantial running boards, and a flat tail board capable of carrying two small suit cases or a medium-sized trunk. Any touring vehicle requires quite a quantity of room; rugs, extra coats, spare tins of oil and petrol, a bulky jack and pump, a hat box, and other minor items must often be squeezed in somewhere. If a machine is only wanted for a trip to the golf links, space must be found for a couple of cumbrous caddie bags, and a pair or two of spiked shoes. While I should heartily deprecate the regular





The three-seater design of Mulliner body, praised by "Ixion."

carrying of a third passenger, I think it should be possible to tuck in an additional passenger on occasional short trips, such as a three-mile trip to a football field and the like. On a car one can take a side door off the hinges, or leave the door open, and let the extra man sit on the floor boards with his feet on the step; but this is not possible on the average cycle car. For all these reasons I was interested in Mulliner's design for a three-seated cycle car. As the sketch shows, its plan resembles a foot-print. The heel is the bonnet; two passengers are accommodated across the widest part of the sole; and a third is bestowed in the blunt toe, thus giving the coachwork a stumpy streamline contour, which is neat without being clumsy. The dickey seat could easily be made to lift out, so that the well could be used as a luggage boot on long runs. It may be objected that such complete provision renders the cycle car design too cumbrous; but is there any real future for a vehicle so restricted in its accommodation that any small parcel has to be carried on the passenger's knees?



ELECTRIC LIGHTING SYSTEMS.

BY WILFRED G. ASTON. FIRST INSTALMENT.

IT is conceivable that the Motor Cycle Show which has just been concluded at Olympia will take its place in the history of the movement as that which saw the most notable and general development in cycle cars. On the other hand, it may be that the popularity and advent of the two-stroke engine will set it down as something out of the ordinary run. But to the writer's mind, it is more probable that it will live in history as being the Show at which electric lighting, as part of the equipment for motor cycles, first made its permanent mark. There is nothing new whatever in the idea of applying a dynamo installation for supplying the necessary light on a motor cycle, and, indeed, it but follows the direction which has been already laid down for it by its predecessor, the motor car. Not only so, but the writer recalls very vividly being shown by its very proud inventor, the manufacturer, a complete dynamo electric lighting installation, which was made something like eleven years ago for mounting on a motor cycle. The fact that it worked, although somewhat spasmodically, was taken to imply inevitable future success of the system. And if this hardy pioneer had had the good fortune to live and walk round the Motor Cycle Show just held, there is no doubt that his breast would have swelled with pride at the thought that he had so clearly prophesied a definite future development.

Nothing New.

Two or three years ago there appeared from the pen of the present writer an article in *The Motor Cycle* in which several small dynamos for motor cycle electric lighting work were described and illustrated. It may then seem rather strange that the past Olympia Exhibition is held to represent such a big jump forward in progress, seeing that it has produced nothing in the electric lighting line that can be justly regarded as absolutely new. The difference, however, is simply this. In past years such accessories as self-contained electric lighting sets have been regarded by manufacturers of motor cycles as appurtenances which might appeal to a few riders, and, therefore, might be left for them to pick and choose for themselves. At present, however, a different state of affairs exists, for no less than two leading motor cycle constructors have gone so far as definitely to adopt such lighting installations on, at any rate, some of their models. In other words, electric lighting for the first time has obtained the approval and satisfaction of motor cycle makers. From now onwards its future is absolutely assured, although, of course, it may not be subject to such rapid developments as have taken place with car lighting installations.

In the first place, it must be remembered that those who buy motor cycles have not quite so much spare cash, and have, therefore, to consider pounds, shillings and pence rather more carefully than buyers of luxuriously appointed motor cars. Secondly, there is rather less need for a self-contained equipment, which must be necessarily heavy and rather expensive to produce, in connection with the motor cycle, for it is really not very largely used at night except in cross-country work, where acetylene illumination has very few disadvantages. More than that, it is not necessary, as in the case of a car, to keep the side lamps going when the vehicle is stationary in order to comply with the law, because, in most cases, a bicycle can be pushed up an entry or leant against some convenient tree or wall. Both these considerations lead one to suppose that much water must flow under the bridges before we shall reach a time when no motor cycle can justly be regarded as being complete without its dynamo outfit. Hence, when it is said that electric lighting has come to stay, it must not be imagined that the writer means to convey that it will be absolutely *de rigueur* next year to the exclusion of all other forms of illuminant.

The Convenience Point of View.

As a matter of fact, acetylene lamps are considerably more convenient on motor cycles than they are on cars for long lengths of tubing are not required, and a single generator only is generally employed with a single lamp. Furthermore, the acetylene outfit is, as a rule, exceedingly light and simple to look after and, in contradistinction to the types of acetylene installation fitted on cars, the generator is generally within convenient reach of the rider, so that it can be easily regulated from the saddle.

Before proceeding to describe the installations which were exhibited at the Olympia Show—and this is the principal function of this article—it will be as well, perhaps, to consider the advantages electric lighting possesses over acetylene, bearing in mind that it is, at present at any rate, essentially heavier, requires more room, and is more expensive. First of all, one has a very much more efficient form of light, for which the reason is, perhaps, not so obvious as might be thought. Elementary optics teach us that for the best and most efficient projection of light, the source of such light should be as nearly as possible a mathematical point. This, of couse, is absolutely impossible in the case of an acetylene flame, which occupies considerable volume. It is, therefore, impossible to construct any form of reflecting mirror, which can give a high efficiency, for the fact that the flame is of large

lectric Lighting Systems.—

ize results in many of the rays being grossly dispersed. y using a short focus lens the best of results can be btained; still, a good deal of efficiency is lost, and it ust not be forgotten that the shorter the focus the ore likelihood is there of the lens mirror reflector being eriously damaged by the heat of the flame. Secondly, ith electricity one has an illuminant which can be rned off and on at will without getting out of the iddle.

A Tip.

This advantage is, in point of fact, very much ss notable in the case of a motor cycle than in a r where for the driver to get out of the car involves im in disturbing other passengers. Parenthetically, o, I may remark that acetylene lamps can very sily be lit without getting off a motor cycle, as yone may find out who happens to carry one of ose little pocket petrol cigarette lighters with him. this case all one has to do is to turn on the ater, open the front door of the lamp, and, making guess at the right position, let the lid of the lighter ap open when the familiar smell shows that there a sufficiency of acetylene available. Even the inperienced will obtain success after two or three ots with this method.

A third advantage is that there is no need for plenishment of fuel or water, and consequently there is no need from one season's end to another to mess one's hands, or run the risk of setting out on a journey with an empty generator. Fourthly, there is the benefit that a tail lamp, such as the law requires with sidecars, can be very easily fitted up without involving any complications to speak of. A perfectly safe and sure inspection lamp can speedily be fixed up, and can be used without the slightest danger of causing petrol fires. Lastly, there is this benefit, that, owing to the lighter construction which can be employed in an electric head lamp, there is less "moment of inertia" or flywheel action on the handle-bars, so that there is no additional tendency to wobble or roll in ruts of muddy roads.

Absence of Flicker.

I have already referred to the efficiency of the illumination. This is ascribable as well to the optical arrangement of the lamp as to the fact that the body of the lamp can be made practically airtight, so that the mirror does not tarnish, and, furthermore, to the fact that the constancy of current absolutely prevents any flickering as the result of road or engine vibration, or from boisterous and gusty winds. It is, in fact, not untrue to say that an unsteady, powerful light is not to be preferred to a perfectly steady light of less than half the penetration.

In the next issue of this journal the different electric lighting systems for motor cycles will be described and illustrated.

A BIT OF A PUZZLE.

N the old days it was not an uncommon event to encounter a defective motor cycle, the particular nature of whose malady utterly baffled detection the owner, if not by his more or less expert quaintances. Nowadays, owing to the more curate knowledge as expressed in the machines emselves as well as in the fertile brains of those o have to diagnose their diseases, it is seldom that fault can evade elucidation for any length of time; t the writer confesses to having been floored for considerable period by the following case, though solved it in the end quite satisfactorily.

The data are as follow: A new motor bicycle th a power unit comprising a 2½-h.p. single-linder engine, chain-driven magneto with fixed timing hind the cylinder, and carburetter behind that. brication was by external hand pump with transrent barrel. All the parts of the power plant were first-class popular make; the road wheels were free d the cycle work generally in perfect order.

The tank was charged with petrol and oil of good ality.

The Carburetter was Cleaned.

When the machine was started, the power imediately fell off, and in a few yards the firing ceased. urther attempts were equally unsuccessful, so it was ae to begin investigations. The sparking plug was anged, the high-tension terminal removed, and the ntact end of carbon pencil and contact ring aned. But these changes made no difference to the sult. The valve timing was then checked and und to be correct.

Down a fair incline the machine ran comparatively ll and fired regularly, which was something. The carburetter was now examined and carefully cleaned, but with the same result. It may be taken for granted that a trial trip was made after each altered condition and that the machine always behaved as on the first occasion—a few half-hearted explosions gradually growing feebler and expiring altogether, in about a score of yards. Larger jets were then tried.

The Exhaust Box Examined.

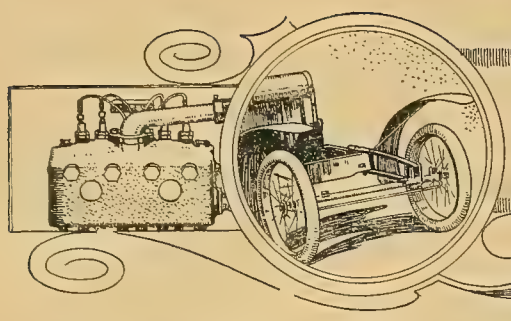
Really it was getting beyond a joke. The symptoms indicated that the engine was either starved or that its exhaust was bunged up. Off came the exhaust box first. Nothing in it at all beyond the bolt which held the cut-out against the perforated end—not even a baffle plate, and the exhaust pipe itself was perfectly free. The cylinder was now removed and the passages found to be quite innocent of any impediment. The parts were replaced and the valve timing tested once again, this time with a wire let down the compression tap.

Sometimes after an overhaul a machine will go all right, although the fault has escaped detection, the defect having been remedied unconsciously. It is an unsatisfactory ending in a way, though one would rather this happen than that the machine should not recover at all. But it was no good! Whatever could be the matter?

One more possible point remained. This was tested and the machine sailed away in excellent fashion.

DOUGLAS LEECHMAN.

[Our readers are invited to solve this problem if possible For the six most correct answers we offer a copy of one of our handbooks "Motor Cycles and How to Manage Them," "Hints and Tips for Motor Cyclists,'. or "Tracing Troubles." The correct solution will be published a fortnight hence.—Ed.]



Passenger Machines at Olympia.

By B. H. DAVIES.

I AM not going to say anything about the sidecar outfits. If you refer to our advertising columns, you will find there just exactly what I should say if I had the pen of an "ad." writer, for the simple truth is that the general quality was extraordinarily high. Here and there one could pass some small criticism on the ground of appearance or inaccessibility; but, on the whole, the modern sidecar outfit is simply impervious to fault-finding; and it is very hard to see where any radical innovation of merit or any urgently needed alteration can be found.

In the cycle car field we are not quite so forward. The Show was an unparalleled advance on last year. Some of the worst freaks which disfigured last year's exhibitions had disappeared unwept, unhonoured, and unsung—at least by this journal. The staunch old 'uns, which existed and ran before the term "cycle car" and all the controversies and reminiscences it suggests came into being, were there in all their glory, the G.W.K. and A.C. Sociable practically unaltered, the Morgan no longer childless, but proudly rearing its head amidst its grandchildren, several of whom have already outgrown their proud parent—that yellow Grand Prix Morgan inspired many a dream last week beneath waistcoat and blouses alike. Finally, the debutantes mostly deserved a warm welcome. Not all. There was one machine wrestling with two hefty enthusiasts who desired to test the clutch leverage. They got the pedal out when I and a big Leander oarsman held the machine for them, for, previously, the sole effect of pressure on the pedal of the clutch was to shove the machine off its stand and across the gangway. Having reluctantly come out, the clutch resolutely refused to go in until the machine was scotched, and a fourteen stone man danced the tango on the pedal. The rest of this machine was about up to sample—we will let it pass at that. There were machines with no universal joints in lengthy propeller-shafts, and others equally destitute in respect of short shafts, which is even worse, because the angularities are greater. There were machines with both engines and gears bolted direct to the frames—a fault the heinousness of which can be realised if we try to picture a man playing rugger in full-length trousers of tin. There were brakes which would be inefficient on a toy perambulator, and other varieties which I spare you.

But the general run of the cycle cars was admirable. They ranged from the "fire-extinguisher" Carden (an ideal winter mount for a man who lives in the level Midlands, has had three sideslips in the last week, and is getting fat) to the bigger A.C. and the Chater-Lea, which, by some miracle, contrive to squeeze a full light car de luxe specification, embodied in staunch stuff and sound workmanship, within the cycle car definition. I prefer to dwell chiefly on the vehicles which approximate more closely to accepted motor cycle lines, and in doing so I will omit our older friends, like the G.W.K. and the Morgan, because we have all tried them through a friendship that is growing hoary now, and we know we can trust them.

The Simple Type of Cycle Car.

Consider, for example, such an example as Mr. de Peyrecave's new Depford. It is a kind of glorified Zenith on four wheels, for its gears range from 4 to 16 to 1. It has a very simple gear box, supplemented by a movable back axle, which tightens or slackens the long side belts against spring pulleys, each having one loose flange. One cannot think of a cheaper or more ideal gear for the genuine cycle car—using the word in oblivion of formal definitions. The body is big enough to hold a pair of rugger internationals. The springing is so carried out that the car merely gives when a big man jumps on it—some of its rivals leap off their carpet with every tiny part cocking its ears, and a "Who frew dat brick?" expression. As a sample of the detail refinements, one may mention the pedal lubricator, which prevents the driver from having to writhe round the wheel to get at the dash. Its one visible defect is that the belts, which run behind the body panels, are a trifle inaccessible; but, after all, big belts running over spring pulleys of large diameter, should need very little attention, and almost anything is better than having two long lines of splash-

SMOOTH POWER.

The FLEXIBILITY of the passenger Big 4 NORTON is remarkable and its design prohibits lunging. Smooth power development with SIMPLICITY—THE essential of reliability—being the keynote of design.

The capacity of the engine is 636 c.c. and the power output is equivalent to the average 6-7 Twin. It is a SIMPLE SIDECAR SINGLE and will do what is required without the complication and weight of multi-cylinders, and at much lower cost of maintenance.

Passenger Machines at Olympia.—

stains right across the coachwork, as happens with so many belt-driven cycle cars.

The Crouch, which was not to be found within the Show, was performing very prettily outside, running more quietly and neatly than many others in the trial yard; but, of course, trial yards are not freak hills in a Six Days, and we mustn't stretch the evidence too far.

The Crescent showed how to inter-couple a foot and hand throttle in a light and inexpensive manner. Its throttle is operated by a Bowden wire from a steering wheel lever, and the stop of this wire is mounted on a link joined to the accelerator pedal, quite a good notion.

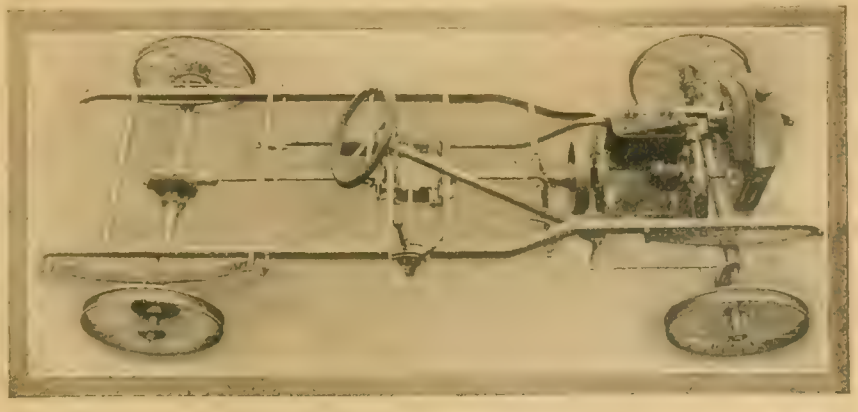
The Dew interested me much. It employs the front half of the Crestmobile drive—some of the old brigade will remember this pre-historic car with its twin friction-clutched chain and sprocket drive. "Concentrated essence of simplicity" best describes this very charming chassis, for there is nothing on it which a clever puncture-repair boy couldn't tinker up if it went wrong, and that is part of the cycle car ideal. The adjustment of the front chains is a heap better than most cycle devices. The engine is hung in slots cut through vertical cradle plates, against which big nuts lock it by friction; in front there is a winder-bolt attached to the apex of the chassis, and having loosened the friction nuts, you just apply a spanner and wind the engine to or fro as if you were changing a leaf in a dining table. The alignment is automatic and secure. One pedal controls both gears and the clutches, viz., up, top gear; half down, free engine; right down, low gear. No wonder the machine is cheap.

Good and Bad Points in Design.

Some of the water-cooling work was shockingly carried out, especially in respect of the lower pipe from radiator to engine. This should obviously be broad, straight, and horizontal. In many cases narrow pipes rose steeply *via* several kinks and twists. Presumably the chassis was designed, and many parts made or procured before an engine was selected; and then the selected engine didn't fit. There will be great trouble with some of the Show machines if the point is not rapidly remedied; I leave buyers to watch it for themselves. The spigot bearing of the clutch also requires more attention. Some had no provision of any sort for lubrication, except for such odd drops as might leak out from the engine. Others had half-inch greasers fixed to the top end of a 4in. length of ¼in. copper tube; the fact that very little grease could possibly be inserted through such a device does not particularly matter, for it would fall off within a hundred miles. Some had capacious greasers properly mounted. In some cases the teeth of the gears were narrower and the diameter of the pinions was smaller than the corresponding parts of certain motor bicycle counter-shaft gear boxes; *verb. sap.*, one cycle car had a very slender propeller-shaft 5ft. in length devoid of any flexible joint. I should be afraid of this crumpling under a sudden shock which embodied much angularity; another had a very short stiff shaft equally deficient of provision for flying. I am sure this would make a very harsh drive. Very few machines appeared to have compensated rear brakes, but the simplicity with which the Buckingham cables ran over their horizontal pulleys was excellent, whilst the Chater-Lea had a proper car swingle-bar type compensator. By the way, the Chater-Lea had its accelerator pedal mounted outside the brake pedal, and on a level with it—a design that, on the whole, I prefer to ordinary car practice, inasmuch as you don't have to crinkle your knee, and it is easier to find.

The Luggage Carrying Difficulty.

In some cases there was not enough mudguarding to keep the coachwork clean, or to prevent clobs of dirt being freely flung all over the passengers' faces or the screen—a particularly unpleasant choice of evils. There was only one bad point common to practically all the cycle cars in the Show, namely, absence of luggage accommodation. I admit that some of the three-wheelers may be provided with big carriers or grids astern, and that a vehicle like the G.W.K. may have a flat tailboard on which a small trunk can be strapped. But there is a sad absence of odd corners where a small handbag or a golf bag or other small impedimenta can be stowed away without any strapping. I went round the Show with a keen golfer, whose thoughts had been turned forcibly cycle carwards by a bad sideslip with his bicycle. He decided he would rather stick to his bicycle and risk another skid with the clubs round his neck, for there was not a single body staged in which there was reasonable accommodation for two men and their small baggage, unless such baggage was strapped on the tail or the running boards, or tucked into the folds of the hood. I admit I do not see how this problem is to be solved, unless a little well can be fixed under the hood, running the full width of the body, and measuring, perhaps, 9in. wide and a foot deep. Next year's cycle cars should be a splendid assortment; a little of the rubbish is dying hard, but it is nearly all gone now, and the number of the genuine brand is rapidly increasing.



Chassis of the four-cylinder water-cooled Chater-Lea cycle car. The overhead worm drive, three-speed and reverse gear box, and well-designed steering will be noticed.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Do Sidecars Skid?

Sir,—Noting your correspondence on above subject, I think it might prove interesting to relate my experience with a 3½ h.p. Bradbury and sidecar with passenger. Recently we were passing through a small Cheshire town main street, when the machine suddenly skidded most violently, mounting the pavement and crashing into a shop window on the sidecar side of machine. Fortunately we were proceeding slowly on middle gear at the time and were able to pull up very quickly on the slight incline of the road and avoided anything worse than a bent bracket. It should be stated that the road was very greasy and had a high crown, an objectionable feature of many rural macadam roads.

JNO. W. NEWALL.

Number Plates.

Sir,—The announcement in your issue of 20th November, that six motor cyclists were prosecuted at Auckland because their number plates did not comply with the law, is most disquieting.

I visited a large number of stands at Olympia, and was unable to find a single machine on which both number plates were large enough to take two letters and four numbers of the minimum legal size, and with the minimum legal spacing. In most cases neither plate was large enough.

Further, I believe the law requires that the number plates must be upright, whereas in some instances—including a new two-stroke lightweight, manufactured by a well-known firm—the back plate was inclined at a considerable angle.

Those motor cyclists, who do not know what the legal requirements are, will find them clearly stated on page 281 of "Motor Cycles and How to Manage Them."

ARNOLD SOUTHALL.

Electric Lighting Outfits.

Sir,—As so much interest is being taken at present in electric lighting for motor cycles, may I be permitted to give my ideas on the subject?

In the first place, I have used a simple but effective electric outfit for the last season, to wit, a pair of Cox-Walker twin head lights, which I run off a 16 a.h. 4 volt accumulator. These are comparatively cheap, the weight on the handle-bars is small, and the light in my opinion is far superior to acetylene, being a better colour. One lamp is enough for ordinary purposes, and the battery will give sixteen hours' light with one; the second is useful when an extra good light is wanted, and as a reserve in case of damage. At first I had trouble with two broken filaments, but this seems to be abnormal.

But for an ideal equipment a more elaborate outfit is wanted, and this is my specification:

Dynamo driven off engine, giving four to five volts at all speeds above 20 m.p.h., output eight amps., if required.

Two 4 volt 8 a.h. accumulators, 4 volt 16 c.p. head light, only run direct off dynamo, never by accumulators. Set of four 2 volt 2 c.p. lamps, normally run by accumulators, in two pairs in series, *i.e.*, right hand side light and tail light in series off one accumulator, left hand side light (which would be fixed on the sidecar when that is used, when it is not used it would be paired with the other like the Cox-Walker twins) and top tube lamp (for speedometer, watch, and route card or map case, and detachable as an inspection lamp) in series off the other accumulator.

No automatic arrangement is required to charge the accumulators off the dynamo, but a switch is to be provided by means of which this can be done, the dynamo then running the small lights as well, making up the total output of eight amps. I assume the efficiency of the lamps to be 1 watt per c.p., but I daresay it is lower with the stout filaments required). An automatic cut-out of course is essential for changing.

I do not consider it at all desirable to provide electric starting for the engine, nor to interfere with the magneto ignition. An electric horn would be a good addition, however, worked off the accumulators.

A few points in the design of the outfit may be mentioned. Brackets for the lamps should be brazed to the machine, and the lamps readily attached and detached. The big head light should come off, leaving its electrical connections behind in the bracket, but the small lights come off with flexibles attached. The tail light to be of a design lately suggested in *The Motor Cycle*, using a transparent number plate with a red disc.

There may be some unusual points about this specification, but there are reasons for them all.

P.A.L.

Sidecar or Solo.

Sir,—Every authority seems to be in agreement that almost the top-notch of efficiency in motor cycle design has now been reached, and fields of exploration and exploitation are narrowed to small limits. And this is probably true if the favour enjoyed by the solo machine continues. But will it continue?

I am convinced that the motor cycle, solo, has seen its day, and that the combination of motor cycle and sidecar is yet far from its zenith.

For your years I enjoyed the speed, convenience, flexibility and adaptability of the single mount, and look back with pleasure to outings totalling thousands of miles a-wheel. But over that period, although but one or two minor spills impaired the enjoyment, I recall the many hair-raising moments when the precarious features of the solo make me wonder if it were worth the risk when one realises the comparative perfect safety of the present day combination.

I am now an irreclaimable sidecar driver, and I doubt whether any new feature possible as a big improvement for the single and not for the "double" would drag me back to straddle a solo. I find perfect safety under all conditions of weather, traffic and road condition as against trouble spelt with a big T or contant gulps of thankfulness for having literally "squeezed through" difficult positions by sheer knowledge gained from the years of push cycle training. Sociability, unknown hitherto, has opened out fresh pleasures. The small extra cost of my high-powered twin Indian has been proved money well spent. I will engage to give a good account of myself even against the best singles under adverse conditions without suffering the danger the single would meet, to surmount a good hill with "life and go" throughout, and to get a clear 70 miles to the gallon. What else is required?

If all road solo riders, who have never experienced the delights of the combination would become initiates in the year 1914, the popularity of the single track machine for the man who rides for pleasure would end like a pricked bubble.

C. R. WADMAN.

[There are many expressions of opinion in the above letter with which we do not agree, but on the principle of giving all sides a hearing, publish Mr. Wadman's views.—ED.]

You made me love you!

THAT in a sentence sums up the expression of popular feeling shown towards HAZLEWOOD Motor Cycles at Olympia.

Press and public alike were unanimous in their praise of our latest models. Throughout the Show OUR STAND was the centre of attraction, and the amount of business done was a record.

Small wonder our motor cycles attracted attention —*Vide* Press:

> *"Throughout the hall we do not think there is anything more beautifully finished than this cluster of Hazlewood mounts, etc."*

But—the Buyer wants more than design, workmanship, and finish; he wants proved reliability and road-worthiness—a record of successful performances behind his machine.

The HAZLEWOOD owner gets that record!!

Hazlewood Motor Cycles have gained 100% awards in practically every important trial of the year. In the English A.C.U. Six Days' Trial—the most severe test of the season—TWO Hazlewood machines were entered, TWO gained GOLD MEDALS.

What bigger proof of RELIABILITY could you have?

A copy of our handsome new book "HAZLEWOOD Motor Cycles" sent post free on request.

POWERFUL

The extraordinary power of the B.S.A. Motor Bicycle has made it pre-eminent for solo riding or with side-car. The B.S.A. Engine not only develops more power than many engines of much greater capacity, but owing to its flexibility, low running costs and ease in starting and controlling, the B.S.A. Engine represents a far higher standard of efficiency. This has been conclusively proved in many recent trials.

The B.S.A. Motor Bicycle
(as illustrated)
fitted with B.S.A. 3½ h.p. Engine, B.S.A. Three-Speed Countershaft Gear, Chain-cum-Belt Transmission, B.S.A. Semi-Automatic Carburetter, B.S.A. Spring Forks.

Price complete -	£59 15s.

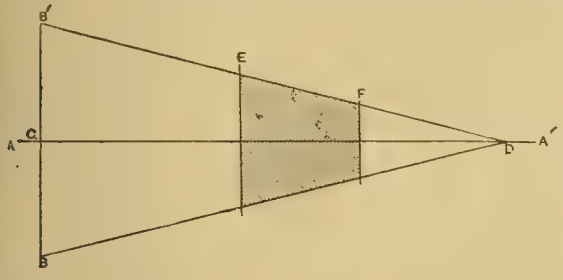
A Motor Cyclist's advice: "Always use B.S.A. Cylinder Oil for your Engine."

A Pulley Gauge.

Sir,—The owner of a belt-driven machine will sometimes find it useful to have a pulley gauge to test the angle for wear, check accuracy of re-turning, etc. The angle can be set out in about thirty seconds, thus: Double a piece of writing paper down the line AA_1, prick a hole through the double thickness at BB_1 any distance from the centre



How to make a 28° belt pulley gauge.

line or fold. Now open the paper and join BB_1, cutting AA_1 at C. On AA_1 mark off CD double of BB_1. Join BD and B_1D. BDB_1 will then be, as nearly as possible, an angle of 28°. Draw lines EF perpendicular to AA_1 in such a position as to give a gauge suitable for the pulley in question. This is shown stippled in the drawing, and can be cut out of sheet brass or copper.

PERSEPHONE.

Speedometer Drive.

Sir,—I notice that lately you have praised the Hendee Manufacturing Co. for supplying their 1914 Indians complete with rear driven speedometers. Driving to Plymouth the other day the back wheel of my Indian sidecar combination had a very busy time on hills, often revolving about six times in making a foot of progress, and I fancy that had my speedometer been fitted to the back wheel, it would have told me that the hills, which I ascended at a careful four miles per hour, were mounted at a gallant forty to fifty miles per hour. I hardly like to suggest it, but it seems to me that to drive at all, even under ideal conditions, a back wheel must slip to some extent. This slip may be mainly theoretical, but even at its lowest its effect could be seen in a year's mileage, while under the conditions induced by the normal British climate its effect must be considerable, and the Odometer readings of a single trip will show a big error. How this would affect the speedometer reading I dare not suggest, but perhaps some of your readers who are higher mathematicians could give us their opinions?

By the way, had "Ixion" been with me on the journey to and from Plymouth, I think he would have decided definitely that a sidecar combination, though perfectly aligned, can, and does, skid. WHEEL SLIP.

An Appreciation.

Sir,—As I have been a reader of your paper, off and on, for nearly ten years, may I be permitted to express my appreciation of your contributor "Ixion," and all his works. I am minded to do this by a somewhat pathetic little paragraph in your issue of October 9th (page 1316). When the English mail arrrives and brings with it *The Motor Cycle* amongst other home papers, yours is the first to be opened, and after reading the leaderettes, I somehow naturally turn to "Ixion's" weekly article, with the sure knowledge of finding in it something interesting, instructive, and well written. His seemingly never ending flow of sound commonsense, which, week after week, he has contributed for I don't know how many years, is, to me, astounding. And how very seldom does it happen that he is caught napping, but when it does happen—is he not always the first to admit he is wrong? How many luxuries and even necessities, which are incorporated in the modern motor cycle owe their existence to a suggestion of "Ixion's." How many battles royal he has fought with the trade on behalf of the common or garden rider. Modern riders can only realise what they owe to him by reading back numbers of *The Motor Cycle*, and very interesting reading they make too. One cannot but admire the fine way in which he seems to write "straight from the shoulder," and one can almost see him sitting in front of his cycle, after a long ride, and making note of anything that strikes him as being not quite perfect.

Long may "Ixion" and his contributions continue!

In conclusion, may I congratulate you on the success of your paper, and on your special overseas supplement, which contained any amount of useful information.

Kaipoogalla, Pundaloya. A CEYLON RIDER.

Large Wheels for the Colonies.

Sir,—Often one sees a paragraph in motor cycle papers that English machines are all that are needed for Canadian roads. While not disparaging the English motor cycle I think 28in. wheels with large tyres are necessary. Not for the reason persons in the trade generally think, that is engine clearance but for bowling over the rough surface. Any schoolboy knows that a small ball will not roll anything like so easily as a large one. I am looking forward to the time when English makers cater for the Canadian market. Perhaps the enclosed pictures will be of interest. These are typical sand roads which are quite common.

Toronto, Ont. Canada. A. W. HAMPSON.

The Effect of Benzole on Valves.

Sir,—I notice with interest a letter in last week's issue with regard to the effect of benzole on tanks.

My mount is a 1913 2½ h.p. two-speed Singer, in which I have been using benzole. I give my experience, and would like to know if any of your readers have had a similar one.

In September, both my valves were new. I began using benzole early in October, and after using about four gallons,

The difficulties of touring in Canada by motor cycle. Illustrations accompanying letter from A. W. Hampson.

I found my engine was losing compression, and requiring the low gear on hills, which it usually negotiated on top.

I dismounted the engine for the purpose of grinding in my valves, when I found the inlet valve in perfect condition, but the exhaust so badly burnt that it was hopeless to think of grinding it in, and a new one was necessary. It was a marvel to me how the engine was pulling at all, considering the state of the exhaust valve.

This I ascribed to the benzole, as it never occurred in my experience of petrol. I may say that, except for starting, I rarely use my exhaust lifter, and if I do it is always with the gas shut off, on a slope, to cool the engine.

I also found a much greater deposit of carbon on the piston head, after benzole than after petrol.

I have lately been trying a mixture of equal quantities of petrol and benzole, which gives me an increased mileage, very smooth running, and great flexibility; its effect on the exhaust valve I have not yet had time to notice, but the compression remains excellent.

With regard to the increased carbon deposit after benzole, I may say that it was not due to over-lubrication, as I have never sooted my plug; nor was it due to too strong a mixture—the engine was getting as much air as it would take without misfiring.

F. W. WAGNER.

Rear Lights.

Sir,—As there is so much discussion about rear lights in your excellent paper, the following may be of interest.

Recently in Croydon I noticed a red light approaching. The vehicle turned out to be a covered horse van, and the only light was so arranged that the red disc was pointing in a forward direction, while the light itself was illuminating the inside of the van. Very nice for the driver, no doubt, but a bit rough on other road users.

LUCIFER.

Sir,—I wish to inform you and also your readers that I wrote to the Local Government Board on the above vexed question, urging them to take some immediate and rational action in the matter, and I also took the liberty of enclosing a cutting of "Ixion's" strictures, and "J.B.'s" letter on the subject, from your issue of the 13th November.

I have received a reply to the effect that "the Local Government Board directs the secretary to acknowledge receipt of my letter of the 14th inst." and—nothing more!

Let us hope that the missive caught some official eye, before being finally cast into oblivion, or the w.p.b.

A.W.H.

Exceeding the Limit.

Sir,—The letter of Mr. Loughborough is entertaining, but if he lives, as the writer has, to be a motorist for over sixteen years, to have driven over 140,000 miles, and never to have been the cause direct or indirect of injury to anyone, to have picked up six people at different times, insensible, or groaning on the road, and to have relieved them and saved their lives, he may yet be stopped on a perfectly straight deserted road and be heavily fined by J.P.'s, whose own cars exceed the limit every time (as everyone else does) they go out. In a country where every poor worker is content to be on a par with a ticket-of-leave convict (with his insurance card) what else can be expected?

G. T. LANGRIDGE.

Two-stroke v. Four-stroke.

Sir,—I note that in your reply to a querist on page 1651 of your issue of December 4th, you remark that "to all intents and purposes the four-stroke engine puts forth as much power as an equal two-stroke."

This, allow me to say, is entirely contrary to my own experiences with each type. I have at present a two-stroke machine fitted with an engine of the single cylinder pattern, the bore and stroke being 73×70 mm. and the cylinder capacity 292 c.c.

With this machine I am constantly making trips in and around London, and oftentimes far afield, with a coach-built sidecar attached, and a nine or ten stone passenger. If there is anyone owning a four-stroke of equal size who would care to put the matter to the test, taking the same load and using the same gear ratios, I think I can promise to beat him handsomely on all points, and especially as regards hill-climbing. Standard machines in every particular to be used by both parties.

CHAS. S. LAKE

Petrol Gauges.

Sir,—I have been much interested in the correspondence in your columns with reference to petrol gauges. I am afraid I cannot agree with "Ixion's" remarks as to the sunk-in type of gauge being unreadable from the saddle, as my present mount, a 3½ Premier, is fitted with this type of gauge, and I can easily read it from the saddle by leaning slightly sideways. This type of gauge is also absolutely accurate, and I think most people who have had the opportunity of comparing this type with others on the market would not hesitate in the choice. It easily scores over the glass filler cap, as it is a question of guessing at night time with these so-called gauges owing to the fact that it is necessary to illuminate the interior of the tank, a by no means easy task on a windy night.

As for losing the needle valve through leaving it loose, I can only say that it would take a terrific jolt to jolt it four or five inches off its seating and right out of the gauge. It is, of course, possible to get a false reading by neglecting to loosen the needle when reading it, but I am afraid we cannot hope to get everything automatic, and if a man is sufficiently absent-minded to forget this point, he would probably forget to look at the gauge at all. In any case, the needle can be left loose if necessary, when the gauge will always record the depth of spirit in the tank.

S. P. SMITH.

The Motor Cycle in the Army.

Sir,—I feel, as one of the first officers to be given a commission in the Royal Engineers Special Reserve (motor cyclist section), that one who knows something regarding motor cycle matters in the Army should not let your correspondents' letter go unchallenged.

Dealing with fact (1). A motor cyclist's pay is in excess of 12s. *per diem*, when he receives his allowance of 8s. *per diem* for the motor cycle. (All motor cyclists do.)

Fact (2). Do your seven motor cyclists expect to be put to bed and tucked up for the night, and can they have any conception of what war is really like? One of the first duties of a soldier is to exercise a certain amount of common-sense. By using one's eyes and looking round, shelter can always be found for one's machine.

Fact (3). If they understood their regulations properly they would know that if a machine were damaged, application to the right quarter could cause that damage to be made good. Again, if they were but aware of it, in the case of accident a soldier's wife, sons and daughters (till the age of 16 years) receive an allowance. Orphans are looked after by "Service Institutions."

As an officer on duty on Irish Command Manœuvres and English Army Exercises, with a number of motor cyclists under my charge, I never encountered a single case of accident. Irish roads are notorious, and the weather was very bad.

The veiled contempt for the University O.T.C. men is most unfair. An officer on the Umpire Staff informed me that they did excellent work, and never shirked unpleasant night work. More than can be said of some of the Territorials. I would recommend motor cyclists, who desire to do military work, to join the Reserve, as the advantages are greater. They certainly would stand a better chance of seeing active service. The scheme is new, and naturally not devoid of minor flaws—these in the course of time will be eliminated.

R.E.S.R.

Two-stroke Lubrication.

Sir,—With regard to your letter in the issue of November 27th on the subject of "two-stroke lubrication" I should be glad to hear from Mr. Davison how Mr. Garrard found it possible to lubricate his four-stroke engine by the method employed on the Connaught and others.

The idea of mixing oil and petrol to assist piston lubrication is almost as old as the petrol motor, and has been employed for years by many owners. I myself always mix a little oil with the petrol when I have a new machine. On the other hand, if there is any way of lubricating the big ends and crankshaft bearings of a four cycle engine by this method I should be glad to hear of it, as it would considerably simplify lubrication troubles on standard machines.

I do not wish Mr. Davison to imagine that I am criticising, for I am really seeking useful information; but until some explanation is given, it may be as well to point out to

novices that in the usual type of two-stroke engine the oily vapour is drawn into the crankcase, where much of the oil separates on coming into contact with the hot engine parts, and thence is splashed much in the usual way, a small amount being passed to the piston head *via* transfer ports. In the four-stroke engine the mixture is drawn into the cylinder head where it also separates, and even that part which is not burned is unable to pass the piston rings and so reach the crank case TWO-STROKE.

Reckless Driving.

Sir,—I am much interested by the two letters appearing in *The Motor Cycle* of December 4th, signed by Mr. T. D. Thomas and "Fair Play," especially as I have lately had an experience very similar to theirs.

A few days ago I was riding my motor cycle down the Bath Road near Marlborough. The roads were exceedingly greasy, and I had considerable difficulty in "keeping up" at all. A large Minerva approached, and not only did it refuse to leave the centre of the road, but actually swerved into my side. The machine I was riding had wide T.T. bars, and so close did the car come to me that I was forced to snatch my hand from the off handle-bar, so sure was I that I should be fouled by the car's wing. This action deposited me in the ditch, and prevented my noting the car's number. R. A. H. WHATTON.

Sir,—With reference to Mr. T. D. Thomas's letter of last week about the meeting of motor cars on the road, I would like to suggest a little idea which I always adopt in meeting cars on the road. When you see a car coming, ride in the centre of the road (this, of course, is when there is only one car) until within a reasonable distance, then gradually turn to your proper driving side. You will find that the driver of the car is obliged to do the same, leaving plenty of room for you to pass. A great many cyclists when they see a car a good distance away immediately pull right into the side, and, of course, the driver of the car at once takes advantage of this. OWEN BLACKWELL.

Sir,—I am sorry to see my letter has drawn such a reply as that of "Fair Play." I have no intention of replying on those lines. No doubt motor cyclists sometimes suffer at the hands of unscrupulous drivers of cars. As a driver of a medium-sized car I have encountered such, but for the few of these I have met dozens of motor cyclists, on fast *solo* machines, taking absurd risks with other traffic, and, while they form a small proportion of the enormous number of motor cyclists, they are sufficiently numerous, and especially (I repeat) on the Portsmouth Road on a Sunday, within thirty miles of London.

The solo motor cycle is much the fastest vehicle on the road, being able to pass almost all cars, and it is only of a certain class of "nut" on a solo machine that I complain. The "utter astonishment" of "Fair Play" that I could ever have been a motor cyclist shows how utterly he has misunderstood my letter. I should have a motor cycle as well as a car, only I cannot afford both, for I still consider there is a zest in motor cycling (in fine weather) that car driving does not afford.

Surely it is possible to complain of the abuse of these high-speed machines by a few "nuts" without being charged with carping at the whole genus of motor cyclists. The great majority ride their machines like sensible people, but it is really a commonplace that the enormous potentialities for speed of the modern solo machine, and the ease with which (compared to a car) it can be got into racing trim, have led a certain type of silly rider to emulate Brooklands achievements on the road, to the annoyance of other people. To complain of this (and this is all that I do) is, I hold, perfectly reasonable. CAR-OWNER-DRIVER.

A Problem of the Future.

Sir,—Your comments in your issue of December 4th on the features of the 1913 Show, are, as usual, interesting, and I should like to support your view as to the need for real mudguarding. The point which most impressed me at the Show was the childishly ineffective mudguarding which most machines still adopt. In this respect there seems to have been very little improvement since last year, though correspondents have repeatedly urged the point in your paper. The excellent practice of fitting black celluloid-covered handles was only very sparingly adopted, and the belt-guard to protect the engine from mud thrown forward by the belt, and to protect the belt itself from road mud, was almost unknown.

I also noticed that little progress has apparently been made towards the ideal frequently preached in your columns of a "ready for the road motor bicycle," complete with lamp, horn, etc., at an inclusive price. Surely makers would find it worth while to turn out cycles complete, and so save their customers the annoyance of having to spend a good many pounds with the accessory firms in lamps, effective mudguarding devices, nail-catchers, etc., all of which ought to have been provided at the outset. This principle has been adopted with marked success by many makers of cars, light cars, and cycle cars.

It also seemed to me that the accommodation for the tools and spares which a careful amateur rider must carry, especially on tour, was very deficient on practically all machines. In spite of all we are told, motor bicycles are *not* yet perfect, and *do* go wrong at times, and sufficient room ought to be provided for the needful spares, etc. Why is the tank-top tool-box not fitted more frequently in addition to the panniers? It is very convenient for the tools in most frequent use, and for such other things as cannot be accommodated in the panniers, and the makers could find room for it amongst the numerous other tank-top fittings if they wished to do so. G.T.Y.

Sir,—In the last issue of *The Motor Cycle* you invite readers' opinions on the subject of motor cycle design, pointing out, and I think very rightly, some of the several drawbacks to the motor bicycle, one, and almost the principal one, being the lack of protection provided from the weather. With almost every vehicle other than the motor bicycle such protection is possible, and, with all the ingenuity displayed in the construction of the motor bicycle, it still lacks this essential feature which leads one to the natural conclusion that, with the motor bicycle in its present form, such protection from the weather is impracticable, and that its pleasurable enjoyment is only possible in fine weather. What with the possibility of a side-slip and getting covered with mud, many riders put their motor bicycles away for the winter months.

Perhaps in one's early youth one can put up with these drawbacks, but as one gets on in years one owns a car, for probably the very drawback above mentioned. The question of price is not of much count when one can buy a more or less reliable second-hand car for very little more than the cost of a motor bicycle and sidecar. Now, to my mind, all this points to the possibility of solving the difficulty by putting a little torpedo body on three wheels, with the engine either in front or at the rear.

With a body of some kind to sit in and proper mudguards the difficulty of keeping the mud off one's clothing is solved, so also is the question of side-slip. That such a contrivance is possible at much the same price as a good motor bicycle I feel sure, and the pleasure engendered in driving such a vehicle is infinitely greater than sitting on a motor bicycle and having the mud plastered over one's garments, and, by-the-by, one can keep one's feet warm, which has a lot to do with the pleasure of motoring.

LEONARD JONES.

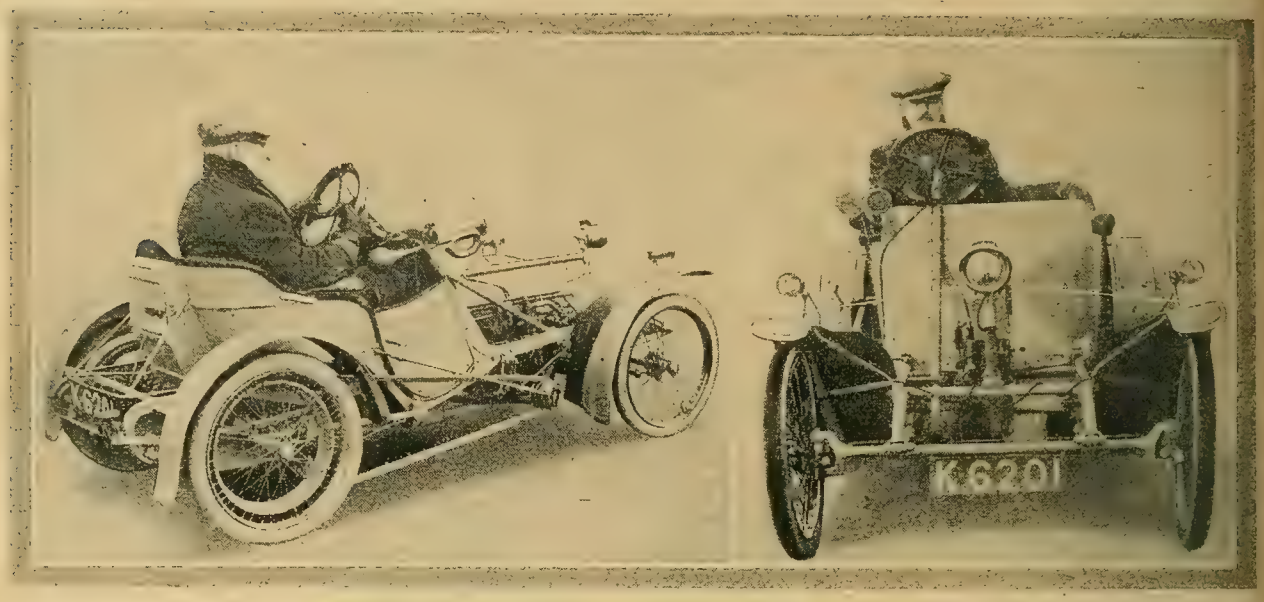
A Statistical Curiosity.

Sir,—The figures which you give in your issue of December 4th of the attendance at Olympia on each of the six days of the Show week reveal a very curious repetition. Taking each day's attendance as a percentage of the total week's attendance, you get the following result:

	1912.	1913.
Monday	11.6%	11.6%
Tuesday	13.7%	13.7%
Wednesday	20.9%	22.4%
Thursday	19.5%	19.2%
Friday	12.9%	13.1%
Saturday	21.4%	20.0%
	100.0%	100.0%

This correspondence is not, of course, a mere coincidence. Very likely the figures for 1911 would give approximately the same result (I have not got them), and the figures for 1914 will be the same again. But why? C.D.S.

A HOME-MADE CYCLE CAR.

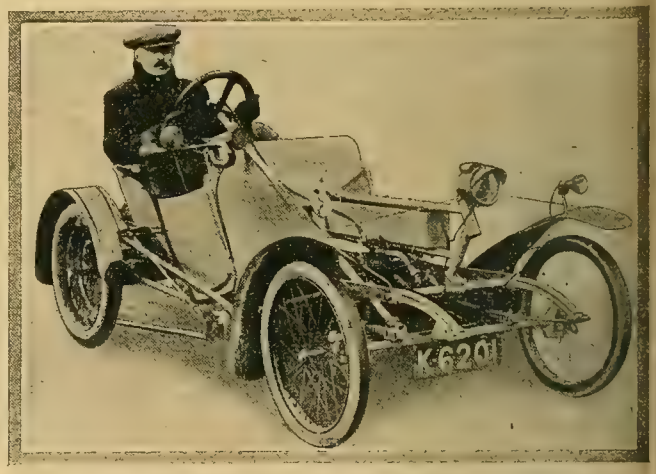


AN INTERESTING CONVERSION IN THE FORM OF A FOUR-WHEELER.
Side view showing single-belt drive to right hand side rear wheel, also N.S.U. gear. Front view. Observe method of springing, front axle, etc.

A CYCLE car has been constructed by one of our readers near Liverpool from parts of a 7 h.p. N.S.U. and sidecar. The complete power unit was fixed in a pressed steel frame, with semi-elliptic springs, by means of cross tubes and wood blocks clamped solid. The coachbuilt sidecar body was split in the middle and widened to make a two-seater body. A scuttle dash was constructed of sheet iron attached to a wooden frame. The tanks were fitted in such a way that the oil pump was situated under the dash.

As regards the transmission, a Chater-Lea plate clutch was fitted and operated by pedal or outside lever. The N.S.U. two-speed gear has been retained and fitted to the counter-shaft, power being transmitted by belt. Engine starting is effected by winding a flat belt round a pulley provided for the purpose. Both back wheels carry belt rims, though only one wheel is driven; both rims, however, are fitted with brakes. Steering is by reel and cable. The wheelbase is 6ft. 6in., track 3ft. 10in., overall length 9ft., extreme width 4ft. 5½in., weight 5½ cwts., while the cycle car is capable of a speed of 33 m.p.h., and petrol consumption works out at 46 m.p.g. The high gear ratio is 5 to 1 and the low gear 7½ to 1, and 26in. × 2½in tyres are fitted

It is most interesting to note that nearly every part of the sidecar combination has been used in the construction of this cycle car—certainly every part that was possible.



Three-quarter front view of Mr. H. Porter's cycle car, showing engine position, steering column, motor cycle tank, and belt drive.

THE PROGRESS OF WATER COOLING.

About twelve months ago prophets were quite confidently predicting that a great increase in water-cooled motor cycle engines would be experienced, especially for passenger-carrying work. As a matter of fact the last Olympia Show revealed that very little headway had been made. The old adherents of this system still stuck to their guns, notably the Williamson, Green-Precision, and the Scott, while an interesting new-comer is the 3½ h.p. water-cooled Humber. This state of affairs is rather surprising, for there is no doubt that a great deal of hard slogging and low gear work can be done on quite small engines under heavy load when water-cooling is employed. But the reason for the prevalence of air-cooling is probably due to other causes than fear of leakage in the radiators. Cylinder casting is now such a fine art that overheating is not to be feared, the only danger being valve breakage occasionally, but this is a minor trouble. And lubrication systems, despite abuse from the ultra-critical, are nowadays very good.

A TWIN-SEATED SIDECAR.

ALTHOUGH not absolutely novel (as we illustrated a double-seated sidecar machine in *The Motor Cycle* of 1903), the accompanying photographs of an Italian production, which is at present at the depot of Messrs. Robertsons, 157, Great Portland Street, W., will be of interest. The bodies are made of sheet steel, and present a pleasing appearance. There is no reason whatever why a motor bicycle should not be converted into a twin or double-seated sidecar on the lines of the photograph, except for the one fact that it makes it a four-wheeled vehicle, and therefore subject to motor car taxation. We cannot say that we have had much riding experience with a double-seated sidecar, although we illustrated it once as stated. We only drove it for a very short distance, and it is so long ago that we cannot remember any particular vices it had. There is no reason, however, why it should not steer quite safely and well if the passengers' weights are fairly evenly balanced. Naturally, a powerful motor bicycle is necessary to pull a double weight, but there are numerous motor bicycles on the market which are quite capable of pulling the weight of two passengers in addition to the driver. In the present case the double-seated sidecar is shown attached to an Enfield 6 h.p. motor cycle, a machine which is constructed especially for sidecar work.

A novel twin-bodied sidecar to be seen at Robertson's Motor Agency.

THE A.R. ROTARY ENGINE.

A Variable Stroke Engine of Unusual Design.

THE A.R. engine, which we had demonstrated to us recently, is a very unconventional one in design, and is claimed to be highly suitable for cycle cars. Of course, it will be in a considerably smaller form than that in which we saw it the other day. The engine is of the rotary type, and consists of two pairs of cylinders mounted on independent shafts, connected by a universal joint. The engine is a two-stroke one and the pistons are stepped, the lower portion of the cylinder acting as a compression chamber. After the gas has been compressed in one cylinder it descends through the transfer ports to the combustion chamber of the cylinder beneath it. The cylinder on the top is always the one which is firing. The gas is brought from the carburetter through an inlet pipe to a chamber at the top of each pair of cylinders, whence it reaches these through the inlet ports.

The chief peculiarity of the engine is the fact that the angle between the planes of each pair of cylinders may be varied through certain limits, the variation being effected by means of a small hydraulic pump, shown on the left of the illustration.

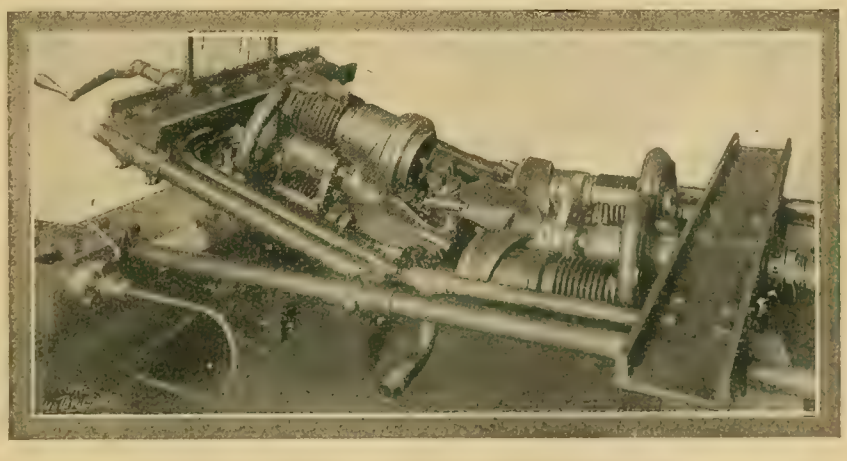
The bore of the engine is 3in., and the stroke may be varied by altering the aforesaid angle from 2in. to 4in.

The lubrication is effected by leading the oil into the shafts on which the cylinders revolve, whence it is conveyed by ducts to the various moving parts by means of centrifugal force.

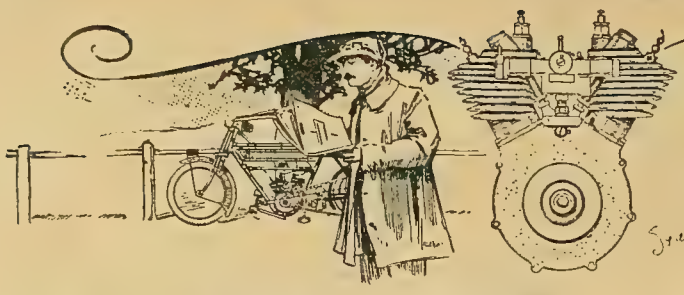
We understand that the engine will also be manufactured on the four-cycle principle. When it was demonstrated to us it was suspended by means of ropes from the ceiling of a garage, and when running appeared to vibrate very little indeed.

At its present stage it has not yet been fitted into a vehicle of any kind.

Enquiries respecting this engine should be addressed to Mr. A. R. Davenport, 68, St. James's Street, S.W.



An experimental rotary engine which has a variable-length stroke.



Testing Flexibility and Acceleration Powers.

QUITE a welcome change from the ordinary run of reliability trials was the closed event of the Sutton Coldfield and Mid-Warwickshire A.C., held on Saturday last in dismal weather, rain falling continuously.

The course was kept secret until the start, which was timed for 11.30 a.m. The route arranged was four times round a circuit of twenty-one miles, though police interference caused it to be slightly curtailed.

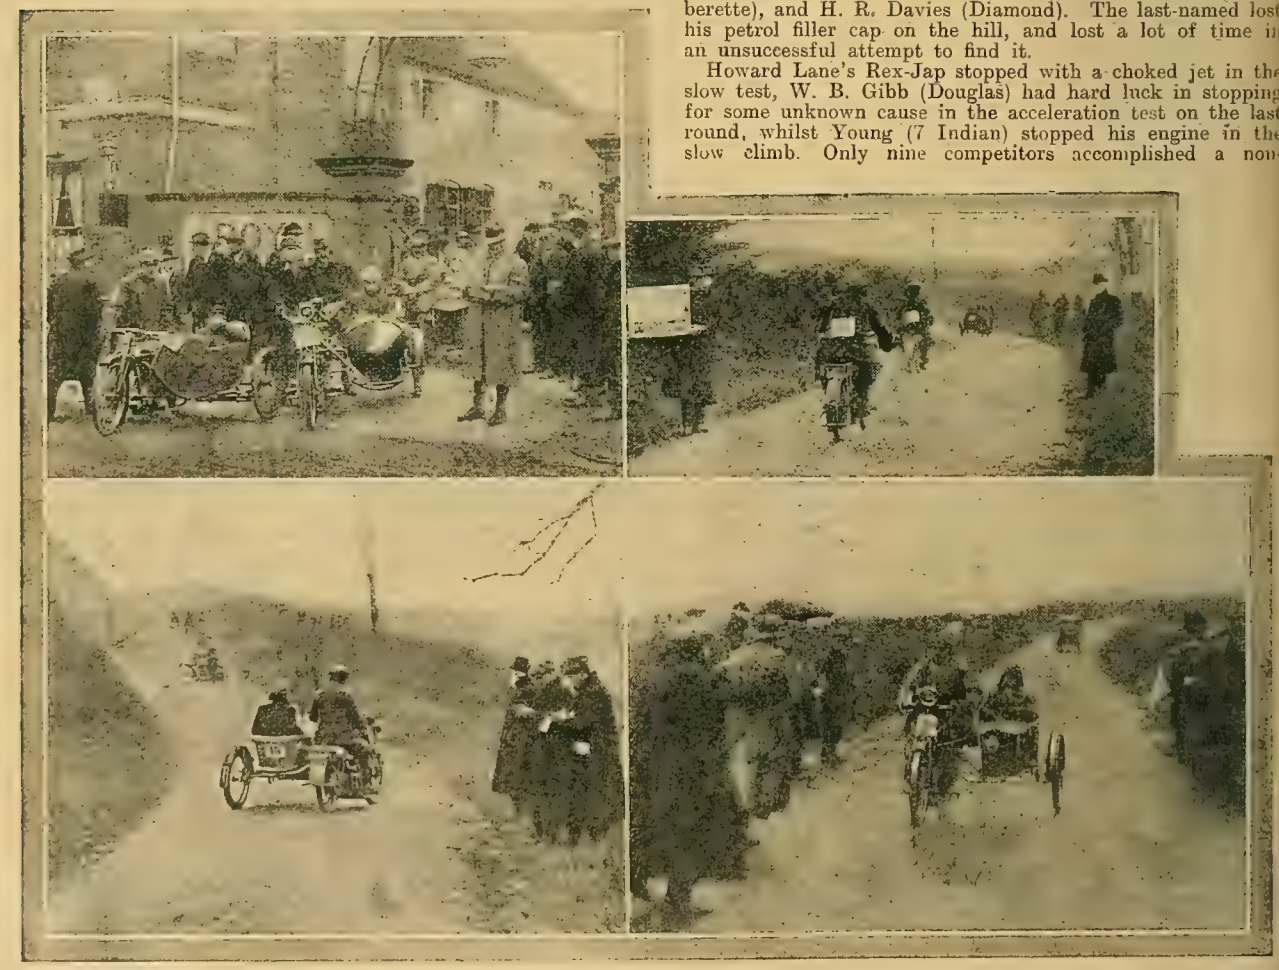
The tests, apart from the test of reliability, were confined to one hill, having a gradient of about 1 in 10, and here on the different circuits, the following desirable points were tested:

(1.) Slow hill-climbing.
(2.) Fast hill-climbing.
(3.) Stopping and re-starting.
(4.) Acceleration

Now, seeing that each test was carried out on the run, and precisely the same adjustments were perforce in operation (except, of course, any variation of conditions controllable from the saddle), the results were most interesting.

There was a rather high percentage of failures, but they were mostly due to taking liberties with the engine, such as travelling at a crawl up hill in the slow test. Busby (3½ h.p. Sunbeam) and Pollock and Dixon (twin James) were outstanding figures in this test, whilst Mrs. Riley handled her Enfield sidecar with great skill, being only equalled by H. T. Miller on a Crescent cycle car. There were other splendid examples of expert handling of machines, and it may be mentioned that it required a considerable amount of skill to perform the several different tests at the first time of asking without blemish. Reg. Holloway on a smart Grand Prix Morgan, its beautiful orange finish bespattered with mud, showed up well each time, as also did Woodhouse (7 h.p. Quadrant sc.), J. S. Watson (6 h.p. Sunbeam sc.), D. M. Brown (Rover), M. Anderson (Humberette), and H. R. Davies (Diamond). The last-named lost his petrol filler cap on the hill, and lost a lot of time in an unsuccessful attempt to find it.

Howard Lane's Rex-Jap stopped with a choked jet in the slow test, W. B. Gibb (Douglas) had hard luck in stopping for some unknown cause in the acceleration test on the last round, whilst Young (7 Indian) stopped his engine in the slow climb. Only nine competitors accomplished a non-



(1) SCENE AT THE START. In the foreground are T. Silver (Quadrant sidecar) and H. Lane on the 1914 8 h.p. Rex-Jap sidecar, followed by J. Stevens (3½ h.p. James sidecar).

(2) The first test. The first portion of the hill was covered as slowly as possible and the last part at full speed.

(3) Zigzagging up the hill in the slow test.

(4) J. Stevens (3½ h.p. James sidecar) in the stopping and restarting test.

The Official Results issued by the Sutton Coldfield Club provisionally.

W. Gibb (2¾ Douglas)	34	13	= 21	11	75	14	27	5	Stop	—	One stop, acceleration test.
M. Anderson (8-10 Humberette)	29	18	= 11	17	65	17	32	9	21	8	Non-stop; on time.
P. W. Hill (5-6 A.C.)	34	30	= 4	18	196	1	—	—	—	—	Off course; puncture.
E. E. Elwell (8 Matchless sc.)	18	14	= 4	18	—	—	—	—	—	—	Retired first circuit; off course.
B. W. Lee (3½ B.S.A.)	30	14	= 16	14	66	16	31	8	16	4	Non-stop; on time.
Mrs. M. L. Riley (6 Royal Enfield sc.)	57	18	= 39	3	131	5	30	7	29	9	Stopped within one mile finish; broke inlet valve; finished under power.
R. W. Lovegrove (3½ Ivy-Precision)	45	15	= 30	8	99	12	26	4	Stop	—	Ignored stopping test; stopped acceleration test.
H. T. Miller (8-10 Crescent)	55	22	= 33	6	165	2	45	12	35	10	Non-stop; on time.
J. H. H. Veasey (2½ Levis)	15	12	= 3	19	Stop	—	28	6	20	7	Stopped slow test.
H. R. Davies (2¾ Diamond)	Stop			—	113	8	Stop	—	—	—	Retired third circuit.
R. Holloway (8 Morgan c.c.)	30	12	= 18	13	80	13	27	5	16	4	Non-stop; on time.

stop run throughout, and performed each special test satisfactorily.

It says much for the enthusiasm of the officials and time-keepers that they turned out on such a day, for there was no shelter on the test hill, and the trial lasted over four hours.

It will be noticed from the table of results that only nine succeeded in finishing with clean sheets. The hill on which the tests took place had a maximum gradient of 1 in 8. For the flexibility test competitors had to travel their slowest over the first stretch of 75 yards and then accelerate over the second part, which was of the same length but steeper. For the stopping and starting test machines were started at the bottom, stopped in the middle and immediately sent on to the top. The acceleration test took place over the last part of the hill and competitors were started with engines running. Watson's performance in the flexibility trial was a particularly fine one, and Hill's A.C. showed up wonderfully in the slow climb. The fastest time in the speed test was made by V. Busby, on a 1914 model 3½ h.p. Sunbeam, and he wins the Sutton Cup.

The Results in Order of Merit.

Rider and Machine.	Marks on Tests. Flexibility	Slow.	Stop and Start.	Acceleration	Total
1. V. Busby (3½ Sunbeam)	2	4	2	1	9
2. J. Woodhouse (8 Quadrant sc.)	1	3	4½	3	11½
3. D. M. Brown (3½ Rover)	6	6	1	2	15
4. H. G. Dixon (3½ twin James)	5	5	3	5	18
5. T. Stevens (¼ James sc.)	4	2	6½	7	19½
6. H. T. Miller (8-10 Crescent c.c.)	3	1	9	9	22
7. R. Holloway (8 Morgan c.c.)	7	7	4½	5	23½
8. B. W. Lee (3½ B.S.A.)	8	8	6½	5	27½
9. M. Anderson (8 Humberette c.c.)	9	9	8	8	34

Results subject to further investigation in the case of three of the above competitors.

N.W. Automobile Association and the A.C.U.

THE Executive of the new North-Western Automobile Association held their first meeting on December 6th, in Liverpool. Mr. F. Whitehouse (Oldham) presided over a representative gathering.

The Hon. Secretary said that he had unofficially attended whilst at the Olympia Show a meeting of the Auto Cycle Union officials, and as a result of this meeting the secretary of the A.C.U., Mr. Loughborough, was with them this evening, in order to place before them the attitude to be taken up by the A.C.U. with regard to the new Association.

At the outset, Mr. Loughborough stated that the A.C.U. had not yet definitely settled its new policy which would commence in 1914. He said that the financial aspect had yet to be considered, but he would give them a brief outline of their intentions, from which they would easily see the advantages which would follow their amalgamation. The A.C.U. had now only a Midland centre, although it had formerly had local centres, and it was impossible to guarantee the existence of a centre unless a paid secretary was maintained. The formation of local centres was under consideration. These centres, although, of course, conforming to A.C.U. rules, would be self-governing in local matters, and all clubs affiliated to the local centre would also have to be affiliated to the A.C.U. through their centre, perhaps on the basis of 6d. per head, with additional charges for those members who were desirous of having more than the ordinary affiliated club privileges. They were anxious to form a centre in the North-western counties, which would take in the whole North-western area between Newcastle and the Midlands.

It was the A.C.U.'s intention to give the organising secretary a salary, and he would have to look after other departments of the A.C.U. business, such as police matters, etc., in addition to attending to the directions of the local committee. Mr. Loughborough also said he was not prepared to put this scheme in writing until everything had been settled, but he suggested that the N.W.A.A. should keep in close touch with the A.C.U. until the scheme was formally brought forward.

Mr. Carty pointed out that the N.W.A.A. had already commenced working, and could hardly wait three months for the A.C.U. scheme. He also wished to know—as they would probably fix up competitions at once—whether riders competing in these events would be barred from A.C.U. competitions.

In reply, Mr. Loughborough intimated that the A.C.U. could hardly expect the N.W.A.A. to suspend business in the meantime, seeing that they had not yet had the opportunity of refusing to amalgamate with the A.C.U., and that, as they desired their co-operation, it would not be to the A.C.U.'s interests to victimise members of the N.W.A.A.

A unanimous vote of thanks was accorded to Mr. Loughborough for his kindness in coming to address them, and the Committee then confirmed the appointment of Mr. S. W. Carty as secretary of the Association, and also appointed him treasurer.

The Committee decided to hold a club team competition on February 8th, each team to consist of three solo and three passenger motor cycles for each club competing.

LONDON-EXETER-LONDON.

Over Two Hundred Entries for the Strenuous M.C.C. Christmas Run.

THE largest number of entries ever received by the Committee of the Motor Cycling Club for any of the closed events promoted by that club has been received for this run. The start will take place at 8 p.m. on Boxing Day from the Bridge House Hotel, Staines, where competitors must report not later than 5.30 p.m. in order to have their numbers allotted and fastened to their machines. It is expected that 230 competitors will have to be despatched, and as they will be sent off in pairs at one minute intervals, there will be something of interest for the spectators from 5.30 till about 10 p.m.

With such a huge number of riders, it is needless to say that the rule prohibiting cut-outs will be most rigidly enforced, and offenders in this respect will be disqualified.

On the map which we publish are printed the times at which the riders may be expected to arrive at the principal places *en route*. There will be a check at Salisbury on the out and home journey of one hour, and one and a half hours will be spent at Exeter.

To gain a gold medal competitors must not vary more than fifteen minutes either way at each control, and must climb Chard Hill and Trow Hill without stopping, and those who carry passengers must not shed them, nor must the passengers assist in any way to propel the machine. Great care is being exercised by the M.C.C. to arrow the course thoroughly, and the two test hills will have illuminated signs at the base marked N.S.

Entries have now closed. There are a dozen more entries to be considered by the M.C.C. committee and after being passed the entry will reach 230. Last year's total was 163. This year's London-Exeter run has proved the largest competition run by the M.C.C., open to members only. As a comparison, this year's London-Edinburgh run received 200 entries.

We have already published a number of entries. The following are the latest to enter, bringing the total to approximately 230 :

List of Entries, Map of Route, and Times of Arrival.

Lieut. D. J. McMullen (3½ Blackburne)
R. Bamford (10 Singer c.c.)
R. R. Garlick (6 Enfield sc.)
J. Baker (8 G.W.K. c.c.)

Max Heinzel with the 2 h.p. N.S.U on which he recently beat the three hour record in class A. at Brooklands, covering in that time a distance of 135 miles 1,101 yards. The engine is only 190 c.c. so that its average of 45¼ m.p.h. is all the more remarkable.

RESULTS OF THE GOMETZ-LE-CHATEL HILL-CLIMB.

The above annual hill-climb was held at the beginning of the week, when an Alcyon rider beat the record for the hill, averaging 104 kilometres an hour. The results were :

CLASS 1.—250 c.c.

Vulliamy (Nabor) ... ... 34⅕s.

CLASS 2.—350 c.c.

Lehmann (Alcyon) ... ... 27⅗s.

CLASS 3.—500 c.c.

Decaup (Alcyon sidecar) ... ... 21s.

CLASS 6.—350 c.c.

Lehmann (Alcyon) ... ... 65⅘s.

CLASS 7.—500 c.c.

Touchet (——) ... ... 43⅕s.

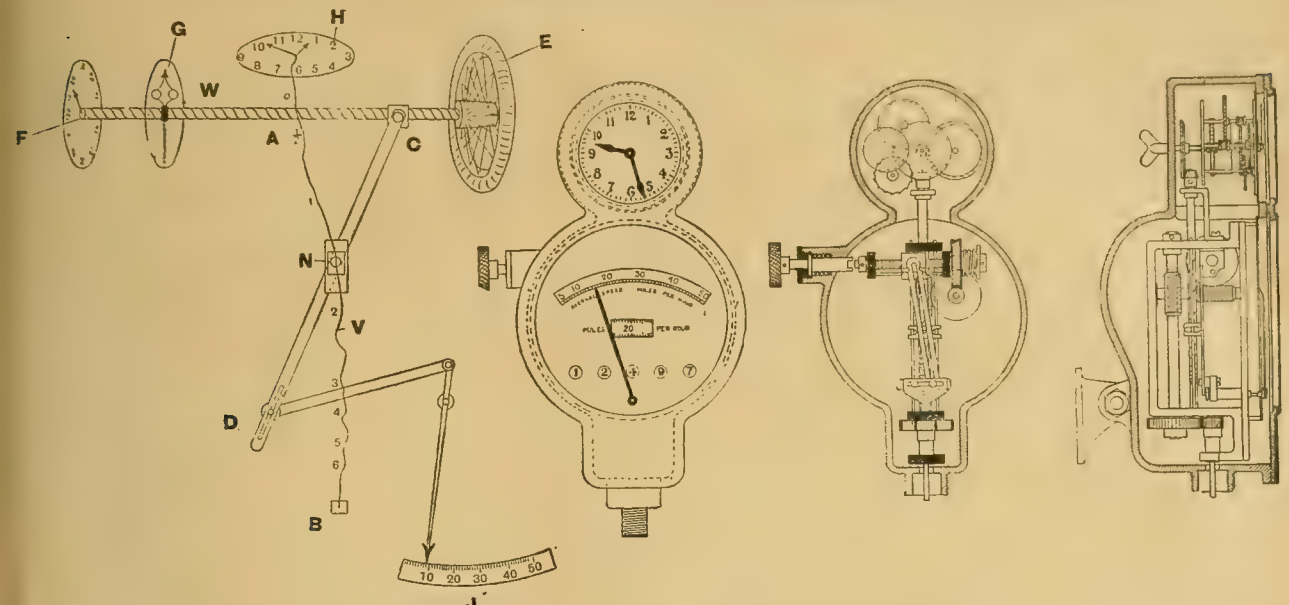
CLASS 8.—750 c.c.

Jouvé (Lurquin-Coudert) ... ... 81⅖s.

In the cycle car class, Bonville (Bedelia) won in 41⅖s.

THE AVEROMETER.

Dr. Low's Latest Device for Registering the Average Speed Accomplished.



Diagrammatic sketch of Dr. Low's Averometer. Diagrammatic travel of nut on worm rod

A.B.C.D. Leg of divisional compass.
W. Worm rod.
N. Nut on worm rod W.
A.N. Diagrammatical movement of nut N on worm rod.
F. Distance recorder.
G. Speedometer.
H. Watch dial.
E. Road wheel.
J. Averometer.

(1) Elevation of complete instrument showing watch dial, Averometer dial, miles per hour, maximum speedometer opening, and distance recorder.
(2) Part sectional elevation of the apparatus.
(3) Part sectional side view of Dr. Low's Averometer.

DR. LOW is now known to our readers as a fertile inventor of clever devices in connection with motor vehicles of all types. His latest achievement is an instrument termed the "Averometer," which registers the average speed accomplished over a given distance. As a check on trials competitors this instrument should prove invaluable, as the release, which may be operated every six hours or so, can be locked and sealed. Below we give extracts from the inventor's description of his novel device.

"The Averometer has to give the average speed from the time of starting at any moment the dial may be inspected, *i.e.*, to divide the distance covered at that instant by the total time. This may sound simple, but I have given more work to this device than almost any other.

"In its first form the division was accomplished by the subtraction of the logarithm of time from the logarithm of distance, the instrument indicating the difference between two ordinates on curves plotted to give the logarithms of time and distance. Another method which suggested itself was to have a small but long cylinder, in which the piston was slowly moved out by a clock at a uniform speed and into this cylinder a pump worked by the road wheels was to pump air, a gauge on the cylinder was to be graduated in average speed; this method was found scarcely practicable.

Energy Storers.

Another scheme tested was an apparatus so simple as to appear obvious. Behind an ordinary dial were placed two "energy storers" in the shape of two plain clock springs, which were fastened respectively at one end to a spindle rotated uniformly, representing time and to a spindle rotated by a positive worm drive from the front wheel. The other ends of the springs were connected direct to opposite ends of the needle, which was supported by a balance spring.

"At the end of every ten hours or so, by touching a button (which could be locked by the owner) both springs were released and the instrument commenced to register afresh. The great disadvantage of this and of any storing apparatus such as a water lever and pump integrator is that a balance is needed, introducing the complication of a third spring or of a specially calibrated dial marked in time divisions.

"The final solution of the problem is shown pictorially herewith. We all know the divisional compass, and we have got to divide total distance up to any point by total time since the start of the run, or the moment when the registration begins. In the Low "Averometer," as shown in the diagrammatic sketch, which represents a road wheel of a cycle or car driving the worm rod W, A B and C D are the legs of a divisional compass which is so arranged that the end of one leg is moved out at a regular speed by the worm rod W. The divisor of time depends on the position of the nut N on the worm V. Clearly, if A C represent the distance travelled, then B D is the average speed or distance A C divided by time A N on the worm. It is obvious that A B cannot move at a regular angular velocity, or cannot be connected to equal this motion plainly, unless both arms of the "compass" are operated. This is simplified by fixing one arm and moving the other only, and the consequent angularity is corrected by a slot mechanism, as shown in the diagram, so arranged that the inaccuracy of each motion is opposite in effect.

"As a matter of fact, just as the division on a proportional compass are unequal, so the worm is proportionate, and its pitch at the top is so steep that the instrument does not indicate for about the first fifteen minutes, a point which is of no importance.

"The Averometer can be made to indicate averages right up to the end of a trip, including all the time spent behind slower traffic or in necessary stops. The instrument always points inexorably to average speed, and tells us how fast we must needs go to maintain a definite pace.

"If necessary one can throw the mechanism out of action when stopping so that running time alone is counted. Other details are, a clutch to turn back the distance to zero, a correction for time, and a clock, so that on one instrument are shown the actual distance, time of day, average speed, and by a simple addition, speed in miles per hour.

"Now I claim that no speedometer can be so simple in construction as this average indicator, as its working is quite *positive* without the aid of a governor, also that a trial of motor cycles or cars with sealed Averometers fitted is quite simple, for the instrument would "observe" all the stops, and "hand in" the result at the end of the day."

TIME TO LIGHT LAMPS.

The Bournemouth Club's Trial.

A circular course of 105 miles will be covered in the Bournemouth and District M.C.C.'s open trial on Wednesday, Jan. 7th. In order to reassure those who unfortunately went wrong in the last event, the club's preliminary announcement states, "Guaranteed arrowed and marshalled route. No freak hills. Good surfaced roads."

The Mudguarding Question.

Our leaderette of last week on "mudguarding"—the problem of the future—has created a good deal of discussion. This week we publish a selection of letters received in reply to the article.

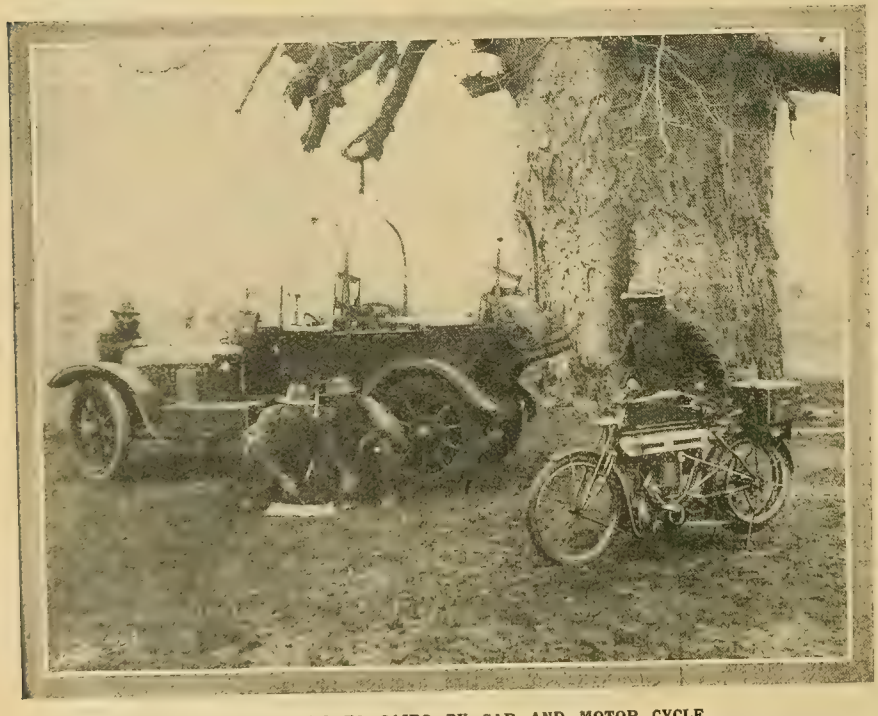
A suggestion has been made that a prize be offered in reliability trials for the cleanest machine, but we fear this would hardly be practicable, seeing that in a trial on main roads with so many competitors, much of the mud splashed on to a machine comes from the wheels of passing motors.

Liverpool Open Trial.

The first open trial of 1914 for motor cycles, sidecars, and cycle cars will be held on Jan. 3rd by the Liverpool A.C.C. The trial will be run over easy roads and under simple conditions, with the object of rendering it suitable for novices and new vehicles. The route will be from Liverpool to Carlisle and back, over the main road. Entries close on the 27th inst., and the trial will be cancelled unless at least thirty-five are received by the secretary, Mr. S. W. Phillpott, 1, Oakdale Road, Mossley Hill, Liverpool.

The Late Mr. Arthur Drew.

We much regret to record the death of Mr. Arthur Drew, of Birmingham, designer of the Druid spring fork, which took place on Friday last. Mr. Drew has been in failing health for some considerable time past, and a year or two ago undertook a long sea voyage, visiting South Africa. We well recollect Mr. Drew first calling at our offices in May, 1906, and exhibiting with pride his first Druid spring fork as fitted to a 3½ h.p. Singer. In his most sanguine moments we doubt if Mr. Drew imagined that his invention was destined to be so universally adopted on motor cycles as has turned out to be the case.



FROM THE CAPE TO CAIRO BY CAR AND MOTOR CYCLE.
The illustration shows an Argyll car and 3½ h.p. three-speed Triumph which are taking part in this long distance run. The occupants are studying a map. The photograph was taken in Southern Rhodesia.

SPECIAL FEATURES:

NOVELTY IN RELIABILITY TRIALS.
ELECTRIC LIGHTING SYSTEMS
(First Instalment.)
THE SIGNPOSTING SCHEME.

A Motor Tragedy.

It is our unpleasant duty to record that Mr. Francis Wilde, assistant secretary of the A.A. and M.U., died at the Middlesex Hospital, on Sunday afternoon, as the result of injuries sustained in a motor car accident in Marylebone Road early on Sunday morning.

The Late Mr. Percy Lambert.

It was suggested in *The Autocar* of November 29th that a memorial should be instituted to the late Mr. Percy Lambert, which would take the form of the endowment of a bed in the Weybridge Cottage Hospital. Mr. Lambert's prowess as a motor cyclist may be well remembered by those who have followed the movement from its inception, and we can think of no better way of perpetuating his memory than by subscribing to this fund. The Weybridge Cottage Hospital is of particular interest to motor cyclists and is well worthy of their support. Subscriptions addressed to the Editor of *The Motor Cycle* will be sent to the proper quarter.

The Motor Cycle in Central Africa.

The Kelsey expedition from the Cape to Cairo, which is now in progress, on a 25-50 h.p. Argyll car, specially fitted up for the undertaking, is making use of a motor cycle as its tender. The machine in question is a 3½ h.p. Triumph, and the duties of the rider are to go ahead, inspect the routes, and prepare the inhabitants for the arrival of its larger brother, bearing the members of the expedition. It is interesting to note that the motor cycle is evidently as go anywhere a machine as the four-wheeler.

Rear Lights.

The L.G.B. Rear Lighting Order (now in draft) will, we understand, be issued this week. The motoring associations, *i.e.*, the A.C.U., R.A.C., and A.A., are not expected to complete their investigations and send in their replies to the Local Government Board until this issue is in our readers' hands. It is, however, most unlikely that the present terms, particulars of which we gave last week, and forecasted exclusively three weeks ago, will be altered. It provides that solo motor bicycles need not exhibit rear red lights, but, in future, two-track machines such as sidecars, and three-wheeled runabouts must carry a red warning light after dark

A. W. Bentley, at the finish of his End-to-end ride, June, 1908.

The Late Mr. A. W. Bentley.

It is with very great regret that we have to announce the death of Mr. Arthur W. Bentley, who, about five years ago, was a very keen motor cyclist of whom a great deal was heard in the motor cycle world. Mr. Bentley, whom no-one thought seriously ill of tonsillitis, passed away peacefully in his sleep a few days ago at Stanmore, where he was living with his brother, Mr. Horace Bentley.

It was in the second week in June, 1908, that he broke the Land's End to John-o'-Groat's record, which previous to that date was held by Harold Williamson. This record poor Bentley lowered by 7 hrs. 8 mins. after a very fine ride. This was on a 3½ h.p. Triumph. In the following year, in company with his brother, Horace Bentley, he broke the End-to-end sidecar record on a 6 h.p Rex, bettering Olsson's performance by 6 hrs. 7 mins., despite unfavourable weather. It is interesting to note that on the occasion of this record ride they were accompanied from Warrington by the late Arthur Moorhouse, who also checked them at Bridgwater. Mr. Bentley was a favourite with all who knew him, a real sportsman, and a genuine amateur. He was a fine, well-set up young fellow, very handsome, and though his face had a certain pallor he was always in the pink of condition.

Poet, Boxer, and Motor Cyclist.

M. Maurice Maeterlinck, the Belgian poet and dramatist, is a man of sport as well as a man of letters, and is tremendously keen on boxing. He has been a motor cyclist for some years, and now rides a powerful twin machine and is said to be fond of speed work. He is evidently a fine example of *mens sana in corpore sano.*

Record Entry for Christmas Trial.

Over 200 entries have been received for the M.C.C. winter run from London to Exeter and back—an easy record.

The Car Race in June.

Many of our readers will, no doubt, visit the Isle of Man to see the International Tourist Trophy Race for cars. The entries at ordinary fees closed on the 1st inst. with a total of twenty-three cars, thirteen of which are British, but it is expected that other cars will be entered before the closing date.

Taxation in France.

A driving licence in France costs two francs only, and when once issued it lasts for the whole of the owner's lifetime. The French Minister of Finance is not so keen on motor taxation as our own Chancellor, as a licence for an 85×120 mm. engined car is only 40 francs per annum. The same car in England costs £2 2s. per annum, and the driving licence 5s. each year. £2 2s. equals nearly 53 francs. Motor bicycles are also taxed at very much lower rates and are not subjected to anything like the same absurd restrictions.

Petrol Prices.

As a substitute for petrol the Irish are said to be pinning their faith to fuel distilled from peat. The daily papers last week published paragraphs intimating that the retail price of petrol would be increased 3d. per gallon very shortly. The constant increase in the price of petrol is a menace to the British motor industry, and if steps are not taken to provide adequate supplies of other fuel British labour and the market in motors will suffer the consequences in due course. At the moment we are quite happy with a mixture of benzole and petrol, or all benzole; in fact, we think that we get better results from it than when using petrol alone

A Trial in the Wet.

The weather conditions in the Midlands last week-end were most uncomfortable, but the Sutton Coldfield A.C. carried to a successful issue a reliability trial for which thirty-four entries were received. Several new models made their *début* in this event, including an 8 h.p. Rex-Jap three-speed chain driven machine and a 1½ h.p. Precision Junior.

The Bristol Motor Cycle Club also held a trial despite the continuous rain.

FUTURE EVENTS.

Dec. 26-27.—Motor Cycling Club Winter Run from London to Exeter and Back.
" 26-27.—Bristol M.C.C. Open 24 hour Trial to Land's End and Back.
" 27.—Birmingham M.C.C. Reliability Trial to York.

1914.

Jan. 3.—Liverpool A.C.C. Open One Day Trial.
" 7.—Bournemouth. M.C.C. Open One Day Trial.
" 14.—A.C.U. Annual Dinner.

Mar. 7.—A.C.U. Spring One Day Trial.

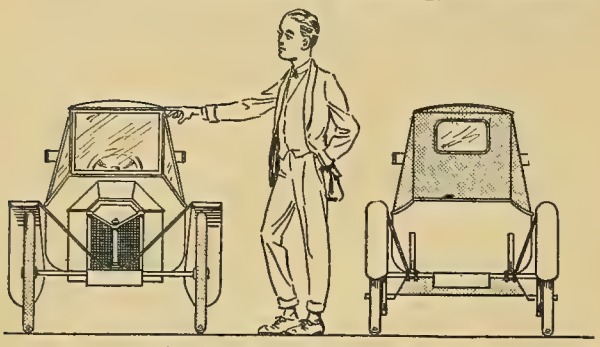
Routes for the Holidays.

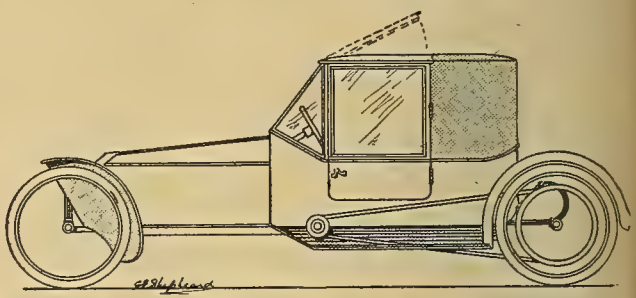
The number of route queries which we are receiving is immense, due, we presume, to the close proximity of the Christmas holidays, when many motor cyclists visit their friends and relations by means of motor cycles. Given fairly good weather and highways not covered with snow, there is nothing more enjoyable at Christmas time than travelling by road. All trains are crowded, and if the distance be not too far and the company congenial, a motor cycle and sidecar provide a most pleasurable way of visiting relations at the one time of the year when all are desirous of meeting.

THE SUTTON COLDFIELD A.C MEMBERS' RELIABILITY TRIAL.
Mrs. Riley (6 h.p. Enfield sidecar), T. Pollock (James), and H. T. Miller (8 h.p Crescent) climbing the test hill.

CYCLE CAR COMFORT.

How Tandem Seating, Protection, and Conversation may be Combined.





IT is generally agreed that, if price and light weight are to be the determining factors in cycle car design, the tandem seated variety is easily the most simple solution of the problem. But unfortunately there is a very serious drawback attached to all models of this description as yet placed on the market, for conversation between the driver and the passenger cannot be carried on unless shouting be indulged in or a telephone installed. Mechanically, this arrangement of disposing of the load has everything to recommend it, as it enables light weight and consequently a cheap transmission and small tyres to be used. A narrow frame also can be used which makes the mounting of the engine and cross bars to carry the gears or counter-shaft an easy and simple matter; also the narrower the track the less the necessity of the differential, and, as belts are deputed in this class of vehicle to perform the work of that expensive fitment, less work for the belts to do, and consequent longer life.

Convenience of a Sounding Board.

Now the whole secret of retaining a conversational atmosphere is to have a top of some sort to act as a sounding board. With a canopy the occupants can converse in normal tones, but a canopy alone is both unsightly and exceedingly draughty, and gives a very half and half look to the vehicle. Under an Indian sky such an arrangement may be admirable, but in our more rigorous climate it would meet with a poor reception. Why not, therefore, "go the whole hog" and make a totally enclosed body capable of being partly opened at will? With this point of view in mind our artist has sketched a series of designs, the application of which to vehicles of this class would undoubtedly go far to remove any existing drawbacks which may attach to the tandem seater. These show two varieties of a similar type, and the design, it will be acknowledged, is very taking and has great possibilities. With the use of aluminium a very rigid and exceedingly light *carrosserie* can be made, and the height kept down to about five feet. A hinged roof, which being no higher from the ground than the driver's chest, can be easily opened and closed, and would give an easy access to the interior; the curved sides, in conjunction with a rounder stern, would reduce wind resistance to a minimum. Once inside perfect protection could be afforded against the weather, while excellent ventilation could be secured by leaving the half roof open. The driver's legs would, of course, be sheltered under the long bonnet. It would be easy to add refinements such as complete suspension of the chassis on C springs at the rear, in which case such a vehicle should prove one of the most comfortable on the road. It would also be exceedingly easy to clean, owing to the very smooth exterior presented to the hose pipe. It would, of course, be necessary to provide means of opening wholly or in part the front window, in order to drive in wet weather, but probably a sliding glass panel, as used on many cars, would solve this difficulty.

Extra Wind Pressure Negligible.

A good many owners of this type of runabout might fear that the extra frontage presented to the wind would throw a load upon an air-cooled engine that would be highly deleterious to its running. They need have little fear, however, for if the shape of the rear panel be convex there is little suction. Brooklands has proved that it is the shape of the back of a car, and not so much the front, that that must be considered when avoiding back suction, and luckily for designers of streamline bodies, appearance and speed go hand in hand.

The A.A. & M.U. Signposting Scheme.

Some Suggestions for a Complete Road Indication Scheme.

ONE cannot but commend the Automobile Association in their latest endeavour to simplify motoring by the suggested erection of easily read and properly placed direction posts. There are, however, many items which are likely to cause the A.A. considerable thought. Naturally, nobody undertakes a big scheme of this kind without having thought the matter out beforehand, and the A.A. doubtless have the scheme well cut and dried.

One of the suggestions is to erect very large signs at such a distance from a corner or cross roads as to obviate the necessity for the use of the present warning signs. The present warning signs are, in many instances, situated badly, so far as motorists are concerned—that is, they are obscure, too close to the corner, and mostly situated on main roads, the cross-roads being left unprotected; *i.e.*, anyone driving on what is admitted to be an inferior class of road to the main route would find that on approaching the corner there would be nothing to denote that he was about to cross a trunk artery, swarming with swiftly moving traffic. He therefore may plunge ahead, often with disastrous results. The warning signs are placed on main roads in the majority of cases to warn drivers that other traffic is likely to cross their path in a few yards. That is really what it amounts to, and on any road except motor roads it would be absurd. Speaking after many years' motoring experience, we do not want the roads in this kingdom converted into tracks for speed cars; neither do we want an elaborate system of signalling or signposting so that driving a motor cycle or car would become very much the same as driving a locomotive—full speed ahead, and then slow down or stop only when one sees the signal. Motoring is a pastime, and should be enjoyed as such; to control it by arbitrary signposts and signals would be robbing it of half its pleasures. No one will object, however, to reasonably sized and well placed signposts, particularly if they be of the type which give first of all the minor places through which one is about to pass, and then the important town for which one is making.

Suggestions for Signposting.

As an example of how this signposting might be done, but very likely the A.A. and M.U. have some very much better scheme up their sleeve, we would suggest that, starting from large cities like London, Manchester, Birmingham, or Liverpool, there should be a central post from which all the arms should radiate, *i.e.*, the signpost should be in the form of a star in the centre of the city. It should have a sufficient number of arms fixed at various heights to denote the main roads to all the important centres—north, south, east, and west. This is, however, an obvious arrangement. The trouble will be to divide up the country into sections, so that one centre will, so to speak, govern the other.

For example, if one were in Liverpool and wanted to get to Birmingham, one would enquire the way to the central signpost. There an arm would be found directing to Birmingham, and a number of other places would be mentioned through which the route passed. These places could be noted; probably there would be about five or six, each having other central signposts.

The first place reached *en route* would be Chester, the road being comparatively easy to find, but it would be possible to mention on the first signpost three or four of the minor places passed through. Arrived at Chester the central signpost would be again sought, and the road followed to Nantwich, by Tarporley, and so on, the centres being, say, Chester, Nantwich, Stone, Rugeley, and Lichfield.

Suggestions for Main Road Signs.

Another suggestion is to paint the names of the various main roads on the vertical post of the sign, such as Birmingham-London, Manchester-Glasgow, etc. If it could be arranged it would be an excellent idea, in our opinion, to allow colours to denote the various roads. Certainly, it would be rather difficult to ring the changes of the colours sufficiently to get an adequate number of hues to denote all the main trunk roads in the kingdom for which grants have been made by the Road Board, but it would be possible so to paint the telegraph poles that one would know whether one was on the Great North Road or the Holyhead Road. Different schemes of colouring could be used when the number of the ordinary colours was exhausted, and a little coloured indication card would show at a glance the road one was travelling on.

As to whether there should be any elaboration of the signpost scheme in the form of illuminated signs is a matter for the future, but we really see no reason why many signposts should not be illuminated at night. True, they would be legible by the light of the average car lamp, but a motor cyclist would have to carry a tilting head light if he were readily to read the top arm of a very high post.

It was mentioned a few days ago that the Continental signposting, though excellent in its way, was not ideal, and we can confirm this opinion. The signs in France are metal plates with embossed letters picked out in white with a smoky blue background. They are rather difficult to read at any speed, and somewhat bewildering to those who have not studied them. This is where the average British road engineer will score over the Continental organiser; for example, France has had a splendid system of signposting and road making for years past, but it has not done very much lately to improve its roads. Most of the French *Routes Nationales* were constructed for military purposes, but, with the introduction of the railway, they were, to some extent, neglected, although the *Routes Départementales* were considerably improved. The signs were designed for comparatively slow moving traffic, and would be very much better if they were larger. The A.A. and M.U. have, of course, taken a note out of the Continental handbook, and will not make any such error. There are already signs in existence in this country erected by the A.A., M.U., R.A.C., A.C.U., etc., which are very much on the lines of those which will probably be used if the A.A. scheme meets with the approval of motorists and the general public. We do not think, however, that the organisers are expecting to receive very much support from the public—cyclists, pedestrians, and other road users—though it seems hardly fair that the cost should be borne entirely by motorists alone.

As an example of bad road signposting, it would be extremely difficult to find a county more devoid of signposts—and those of the most misleading type—than Devonshire. The writer was down there this summer, and had to travel from Plymouth across Devonshire to Bideford. All was plain sailing until Okehampton was reached. The road from this point across to Bideford was most wretchedly signposted; in fact, so difficult was the road to find that, although it was traversed slowly and every precaution taken to read the signposts, and consult a good road map and book, many mistakes were made, and finally the wrong road was followed. Of course, we do not pillory Devon as absolutely the worst example; there are probably others which are quite as bad.

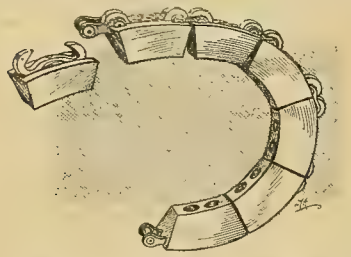
The Spirit of Adventure.

The organisers, in their endeavour to simplify motoring for their members, must not overlook the fact that they can do too much for motorists—that is to say, they can make things so simple that there is nothing to do but to sit back and steer. When this stage of the pastime is reached there will be less inducement to follow it. It is that certain element, however small, of adventure that the motorist feels when he turns his front wheels into the wilds of Scotland, or the mountain roads of Wales, that gives road travelling its charm.

Therefore, those who have the scheme in hand, should go warily and not attempt too much at first.

CHAIN BELTS.

A chain belt fitted with V rubber blocks which has been marketed for a year or two by Messrs. Haslam and Co., Goodson Road, Fulham, S.W., is known as the Haslam chain belt. The links

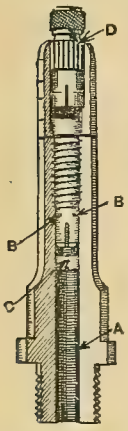


A novel type of chain-belt by Haslam and Co.

of the chain are laid along the top of the V blocks and attached to the rubber by screws, which are in their turn threaded through washers counter-sunk into the underside of the V blocks.

AN AUTOMATIC VAPORISER.

The "Vapo" Patent Atomiser is a device which takes the place of the ordinary jet in the carburetter and can be fitted to any type of spray carburetter. It is claimed that it completely transforms the running of the engine and increases the efficiency of the carburetter from fifteen per cent. to thirty per cent. It will be seen on reference to the sectional sketch that the jet is so made that it splits up the fuel into very fine particles and automatically governs the fuel supply in such a manner that the mixture tends to weaken or strengthen as the engine speed increases or decreases. The fuel flows up through the body of the central tube A and through holes B, the area of which is controlled by screw C. Thence fuel passes up and around the fluted spraying nozzle D. The fuel remains normally at the level of the spirit in float chamber, but as the quantity reaching the nozzle D is controlled by screw C, which is situate below this level, the level at the nozzle falls gradually as the engine revs. increase, because more spirit is induced from the nozzle than can enter past the screw C. As the depression decreases the spirit rises in proportion and so on. The price of this device is somewhat expensive as compared with the cost of a motor cycle carburetter. It is marketed by Brown Bros., Ltd., 15, Newman Street, Oxford Street, W.



We shall be testing one of these atomisers in a motor cycle carburetter very shortly.

In the issue of *The Motor Cycle* dated November 27th, the dimensions of the Pope motor cycle engine were given as 76 mm. × 89 mm. This should be 84½ mm. × 89 mm.

THE ISOCHRONOUS SPEEDOMETER.

We have frequently alluded in *The Motor Cycle* to the Bonniksen Isochronous speedometer. This is one of the most ingenious and, it may be said, most accurate devices on the market, and not only does it register speed, total mileage, and trip, but also acceleration. The two large hands are both engaged in this work. Let us suppose that a motor cycle is running at 20 m.p.h. One of the hands moves round from zero to 20 m.p.h., remains there for five seconds and then proceeds to zero, while the other hand takes up the work. If the speed is constant at 20 m.p.h. the second hand goes to the same spot as the first, but if the speed has increased or decreased the hand registers such differ-

New design Bonniksen speedometer.

ence from the former hand's registration also for five seconds. It will thus be seen that within a very fairly accurate radius the acceleration and deceleration speed is recorded. The latest Bonniksen has been improved. On the face are two smaller dials, the one on the right registering the separate miles up to ten. When ten have been recorded the left-hand dial records one movement, which is equal to ten miles, and the right-hand one recommences its duty of recording the next ten miles.

The old patterns of the Bonniksen Isochronous speedometer may have the trip mileage recorder fitted at a cost of twenty shillings. The instrument is extraordinarily accurate. It is manufactured by Mr. B. Bonniksen, 16, Norfolk Street, Coventry.

BRITISH IMPORTS AND EXPORTS.

From the undermentioned figures, culled from Board of Trade returns, an idea will be gained of the vast increase both in imports and exports of motor cycles for November and the eleven complete months of the present year:

IMPORTS.

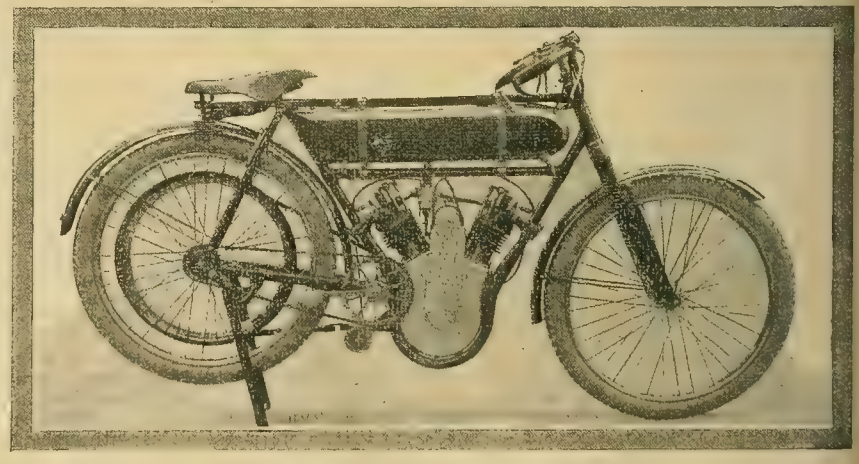
Month ended November 30th.	1911. £	1912. £	1913. £
Motor cycles ...	2,216	2,180	2,205
Parts thereof ...	7,177	12,248	25,711
Total ...	£9,393	14,428	27,916
Eleven months ended November 30th.			
Motor cycles ...	39,955	40,436	55,092
Parts thereof ...	62,024	147,110	186,558
Total ...	£101,979	187,546	241,650

EXPORTS.

Month ended November 30th.			
Motor cycles ...	46,113	60,581	64,373
Parts thereof ...	11,367	19,299	23,176
Total ...	£57,480	79,880	87,549
Eleven months ended November 30th.			
Motor cycles ...	244,406	481,379	676,786
Parts thereof ...	67,935	170,566	231,407
Total ...	£312,341	651,945	908,193

THE 1914 ALCYON MODELS.

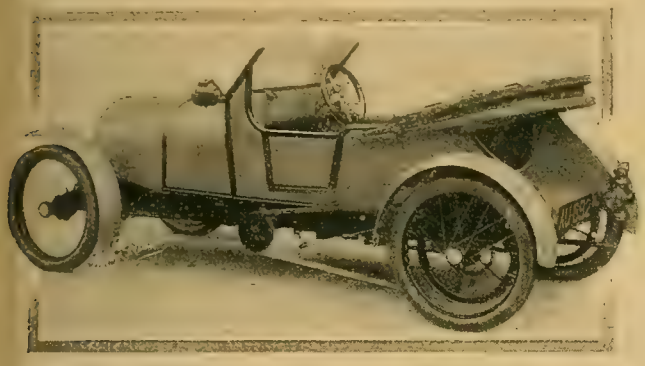
The Alcyon, which is manufactured at 30, Avenue de Noailles, Lyon, has for some years been one of the more noteworthy of the motor cycles produced in France to French designs, and the latest models are quite attractive mounts, though, outwardly some features seem a little strange to English eyes. But the motor itself is admirable, and, indeed, the Alcyon has always been a good power producer for its size, for the early machines had only small engines. Now, however, a 5 h.p. twin with a two-speed counter-shaft gear and chain drive is manufactured, also a 5 h.p. belt driven single gear twin made on sporting lines.



The latest twin-cylinder Alcyon—a popular French mount

THE STAG CYCLE CAR.

ON page 1150, September 4th, we reproduced illustrations and published a description of the Stag engine for cycle cars. The makers, the Stag Co., Ltd., Sherwood, Nottingham, are placing on the market a simple type of cycle car at a reasonable price. These cycle cars will be made in their own factory, which is capable of dealing with quantities. The engine is a 5-6 h.p. single-cylinder air-cooled model of 90 mm. bore by 120 mm. stroke =763 c.c., and is specially designed for cycle cars, being provided with a unique cooling arrangement which makes use of the large diameter flywheel inside



Threequarter rear view of the Stag.

an aluminium case to act as a high speed blower or fan. The engine revolves in the direction in which the vehicle runs, and the first drive is by chain to a clutch on a Jardine three-speed and reverse gear box providing ratios of 4½, 7, and 13½ to 1 forward with a reverse of 13½ to 1.

From the gear box to the counter-shaft the transmission is by chain, the final drive from counter-shaft to road wheels being by two large V belts running over 7in. pulleys to 16in. belt rims on the wheels.

The hand brake is by contracting bands operating on drums on the rear wheels, and the pedal brake is a contracting band on the counter-shaft.

The clutch is operated by the left foot, thus giving the orthodox control of a standard motor car.

The steering is by bobbin and double cables, and the back springing is by quarter-elliptic leaf springs provided with radius rods. Transverse springing is employed at the front with radius rods running to a central point on the chassis.

The wheelbase is 7ft. 4in. and the track 3ft. 6in., both axles being 1¼in. steel tube, while the front has ball steering heads and solid swivel axles.

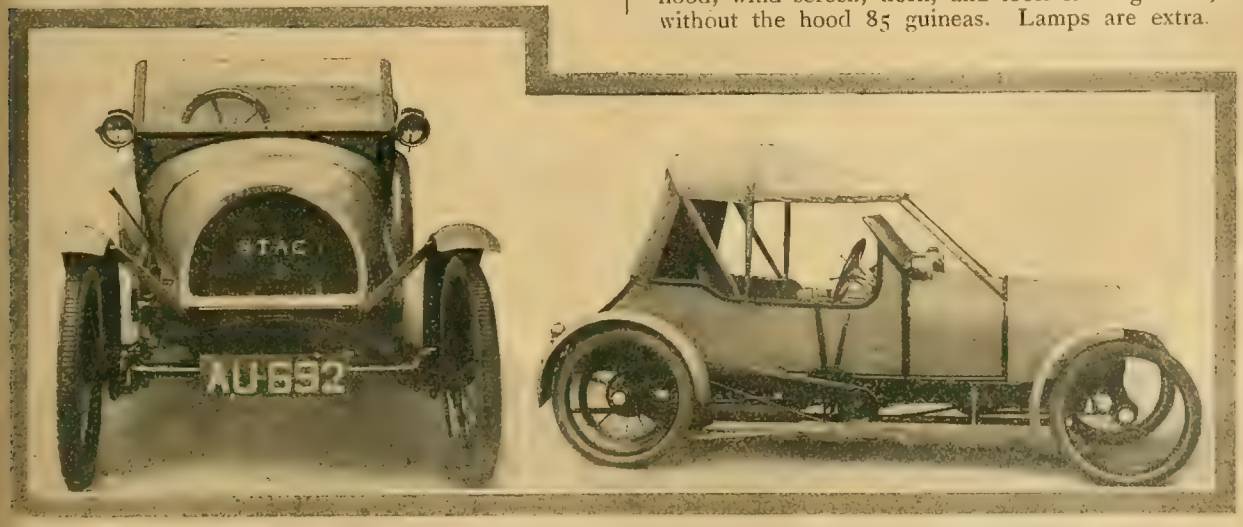
The control of the Senspray carburetter and Bosch waterproof magneto is brought up on to the steering wheel, as is also the control lever of the half-compression cam, which can be used to run the engine very slowly when standing and also to relieve compression when starting. If the vehicle be started on a down grade, there is no necessity to crank the engine, as by the use of the half-compression cam and letting in the clutch gently the engine can be started quite readily.

The seating is arranged so that the driver is a few inches in front of the passenger, providing plenty of elbow room and comfort for both. At the rear of the driver's seat is a locker which reaches half-way to the back of the seat. This is constructed to hold a two gallon tin of petrol and a half gallon tin of oil, leaving also room for other articles inside and on the lid. In addition, each spring-cushioned seat can be lifted up, when a space will be found underneath for tools, spares, etc.

The sides of the body are nicely upholstered inside, and at the rear is a cupboard for carrying the spare wheel. It is only necessary to lift this wheel out when wanted, as there are no straps to unfasten. Behind the wheel is a good flat space for luggage.

The tank inside the dash is readily accessible for filling, and the sight feed pump and petrol tap conveniently placed for the driver's hand.

The complete vehicle includes five detachable wheels, Avon 26in. × 2½in. Sunstone tyres, wide dome guards, and undershield. The weight is 5¼ cwts., and the petrol consumption is said to be low. The price with hood, wind screen, horn, and tools is 88 guineas; or without the hood 85 guineas. Lamps are extra.

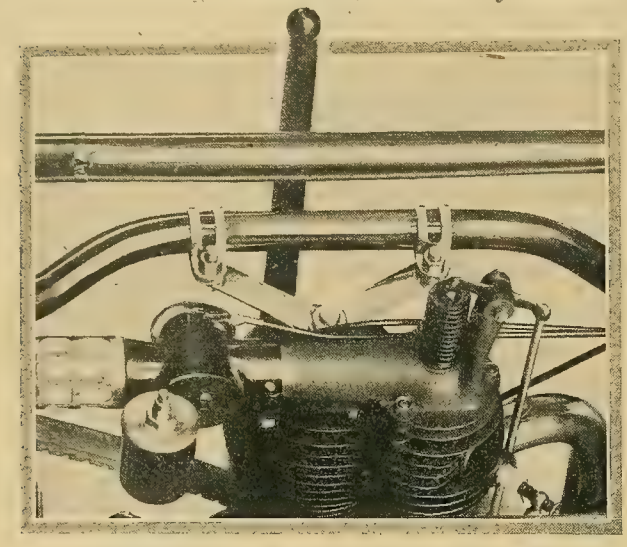


Front view showing dummy radiator and transverse leaf springing

Side view Observe the clean lines and long belt drive

A RUDGE REFINEMENT.

We illustrate herewith the steadying braces now supplied to support the cylinders of the 750 c.c Rudge. They are fixed to the curved bottom rail of the frame by detachable



Steadying braces to reduce vibration on the long stroke Rudge.

clips. The supports are said to reduce vibration to a minimum, and another advantage is that they can easily be fitted to existing machines by the owners.

RESULTS OF THE ROBBIALAC COMPETITION

The Winners of the Ten Clyno Motor Cycles.

In connection with the Robbialac competition, introduced and run by the County Chemical Co., Ltd., we are now in a position to place before our readers the names and addresses of the fortunate ten, each of whom receives a Clyno motor bicycle costing £75.

That the competition has been a huge success goes without saying, the work of staging the many hundreds of excellent entries being in itself a stupendous task. The judging was undertaken by the Editors of *The Motor Cycle* and the *Cycle Trader*, and the greatest care was taken to see that the best work, and only the best work, which at the same time was also the unaided work of the competitor, won.

The organisers of the competition have taken great care to eliminate the professional element, and each of the winners has been called upon to hand in a signed and witnessed declaration proving his amateur status.

The names and addresses of the fortunate ten, who by this time are in possession of their valuable prizes, are:

J. Lewis, 40, Aubrey Road, Small Heath, Birmingham.
W. H. Evans, 45, Albert Street, Queen's Park, London, W.
E. J. Clarke, 292, High Road, Leytonstone, Essex.
W. W. Westlake, The Pharmacy, Church Road, Ashford, Middlesex.
T. Mead, 98, Robertson Road, Eastville, Bristol.
E. D. Phillipson, c/o Mr. Cousins, 58, Beresford Street, Skelton, Stoke-on-Trent.
Thomas C. Clissold, 6, Poplar Terrace, St. Mary's Cray, Essex.
D. Hugget, Ringmer, Sussex.
F. Parsons, 27, High Road, Lee, London, S.E.
K. Beard-Brown, 96, Park Road, St. James's, Northampton.

CLUB NEWS.

Bristol M.C.C.

A half-day trial took place on the 6th inst. in very bad weather. There were eleven starters, and the results were as follows: 1, W. H. Shaw (6 A.J.S. sc.); 2, P. Mathews (3½ Rudge-Multi); 3, M. Slatter (Swift c.c.).

Tyldesley and District M.C.C.

The annual dinner and distribution of prizes took place at headquarters, Leigh, on the 3rd inst., when about sixty members and friends spent a very enjoyable evening, the president, Mr. A. Hobson, presiding.

Purley and District M.C.C.

At the annual general meeting held on the 3rd inst. the whole of the officers were re-elected. At the concert which followed there was the very good attendance of forty-six. The hon. sec. is Mr. Sydney H. Taylor, Wallington, Surrey.

The Public Schools M.C.C. (London).

Mr. Clive Preen, 17, Basinghall Street, E.C., has been elected honorary secretary of this club. The annual general meeting will take place on February 5th, 1914. The annual dinner will take place to-morrow evening (the 12th inst.) at the Waldorf Hotel at 7.30.

The Motor Cycling Club.

A very interesting pamphlet has been issued by the M.C.C., giving a list of the various cups presented by the club and their winners—and a very handsome collection of trophies has been put for competition during 1913. A complete list of prizes and awards gained in M.C.C. club competitions this year is also given in tabulated form.

Coatbridge and District M.C.C

A club, as above, has just been formed. Officers: President, Mr. Robert Spittal; captain, Mr. A. B. Whitton; hon. sec. and treasurer, Mr. William Henderson Jardine (Hendersyde, Coatbridge)

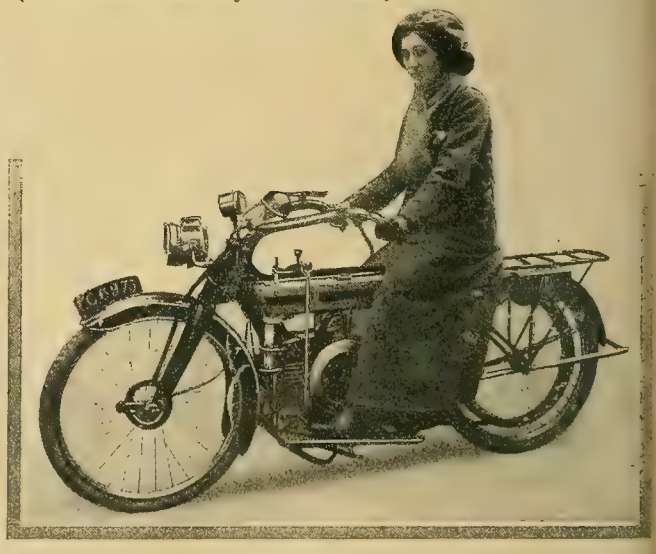
A fault-finding competition is arranged to be held in the headquarters of the club, 16, Ross Street, on Tuesday, December 16th, at 7.30 p.m.

Burton-on-Trent and District M.C.C.

A lecture on variable gears was delivered before the members of this club on the 1st inst. by Mr. T. F. Hunt, of Messrs. Sturmey-Archer Gears, Ltd.

Cardiff and District M.C.C.

A meeting of about fifty motor cyclists took place at the Albert Hotel, Cardiff, on Wednesday, 3rd December, when it was unanimously decided to form a club with the above title. Mr. E. E. Chapman, 64, Crwys Road, Cardiff, was of Messrs. Sturmey-Archer Gears, Ltd.



A BUSINESS GIRL'S MOUNT.

Miss C. Moss, of Greenwich, and her Model R Douglas. She is in business in the West End, and almost daily irrespective of the weather rides to and fro, preferring her Douglas to travelling by motor 'bus or rail.

Club News.—

Proposed Ladies' M.C.C.

A meeting will be held at the R.A.C. in a room lent by the A.C.U. some time near the beginning of January. All ladies who are interested are invited to attend. The hon. sec. is Miss Mary Ellis, 35, Portland Place, London, W.

Eastern Province M.C.C. (South Africa).

A reliability trial recently took place from Port Elizabeth to Grahamstown and back. Considering the state of the roads and the high temperature, the loss of marks due to mechanical troubles was exceedingly small. Thirteen riders completed the run; of these the following made non-stops: 1, W. Wilson (3½ h.p. New Hudson), marks lost 8½; 2, R. C. Inggs (3½ Humber sc.), marks lost 28.

Bristol B. and M.C.

The annual general meeting of this club was held on November 12th, a large company being present. Mr. E. J. Prosser was re-elected president, Mr. F. Bevan motor captain, and Mr. A. S. Richards, 11, Cornwallis Crescent, Clifton, hon. secretary.

The annual supper will be held on Saturday, December 13th, at Maxwell's Restaurant, Bristol, when the prizes and medals won during the past season will be presented.

The Cyclecar Club.

The annual general meeting took place at the Connaught Rooms on the evening of the 3rd inst. Mr. Glynn Rowden was in the chair. The Treasurer reported that the club had cash in hand to the amount of £70 14s. 7d. Some discussion took place as to whether members' entry fees should be placed to the reserve fund, and after some discussion, in which Mr. de Peyrecave and Mr. Bonnet took part, it was decided to recommend that a certain sum of money should be placed to the reserve fund annually. The next item on the agenda was the election of officers for 1914, and it was announced that a gentleman well known in automobile circles would be invited to take the presidency. Messrs. W. G. McMinnies, Glynn Rowden, and Dr. A. M. Low, were elected vice-presidents. Mr. A. C. Armstrong was elected honorary secretary, Mr. A. P. Bradley assistant honorary secretary, Mr. A. W. Torkington treasurer, and Mr. F. Thomas captain. The committee for 1914 was composed as follows: Messrs. Lionel Martin, A. B. Phillips, L. de Peyrecave, C. E. Bonnet, A. W. Lambert, E. M. P. Boileau, G. N. Higgs, F. Bale, and H. Selwyn. A new rule was passed, empowering the committee to form branches of the Cycle Car Club. The latter was discussed at some length, and it was eventually decided that these branches should be run under similar rules to the main body, subject to such revision as may be permitted by the committee of the club.

Malvern and District M.C.C.

A hill-climb was held recently, with the following results:

CLASS I.—Up to 350 c.c. on Time. Any machine.
1. J. H. Marsden (2¾ Douglas) ... ... 14s.
2. E. C. Heis (2¾ Douglas) ... ... 15⅕s.
3. F. G. Cutler (2¾ Douglas) ... ... 15⅗s.

CLASS II.—Up to 500 c.c. on Time. Standard touring machines.
1. J. Harrison (3½ Triumph) ... ... 11s.
2. B. Bladder (3½ Rudge Multi) ... ... 13s.
3. W. Walker (3½ Triumph) ... ... 15s.

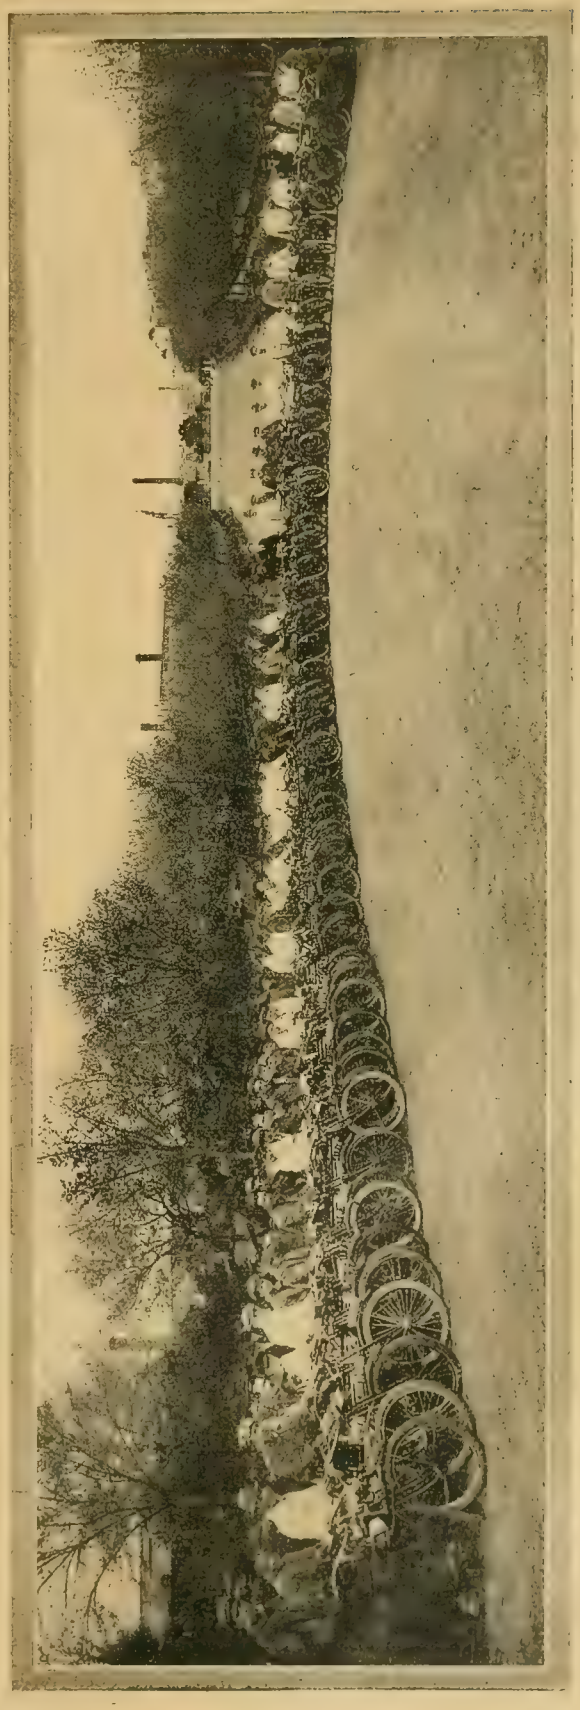
CLASS III.—Up to 500 c.c. on Time. Any machine
1. E. Surman (3½ Alldays) ... ... 10⅖s.
2. J. Harrison (3½ Triumph) ... ... 11s.
3. R. Drew (3½ Triumph) ... ... 12⅕s.

CLASS IV.—Up to 1,000 c.c. on Time. Any machine.
1. H. J. S. Greatwick (6 Wright) ... ... 9⅖s.
2. J. Harrison (3½ Triumph) ... ... 10⅖s.
R. E. Surman (3½ Alldays) ... ... 10⅖s.

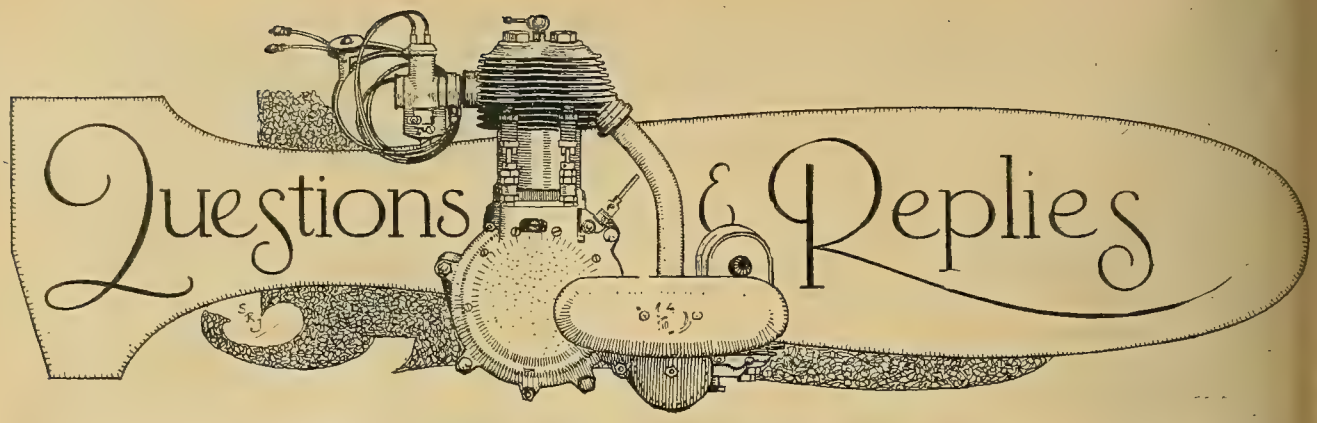
CLASS V.—Up to 1,000 c.c. on Formula. Any machine.
1. B. Bladder (3½ Rudge Multi)
2. H. J. S. Greatwick (6 Wright)
3. J. Nickson (3½ Rudge Multi)

CLASS VI.—Up to 1,000 c.c. on Formula. Sidecars and cycle cars.
1. H. J. S. Greatwick (6 Wright sc.)
2. E. C. Heis (8 Morgan cycle car)
3. R. D. Oliver (8 Morgan cycle car)

The Motor Cycle formula was used.



THE MOTOR CYCLE IN AUSTRALIA.
A big group of motor cyclists of Melbourne and neighbourhood. A large proportion of the machines shown are of British manufacture.



Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rear Lights.

Will you kindly tell me whether it is necessary, in view of the recent ruling, to have the rear number illuminated so long as one has the front one illuminated?—H.F.F.

It is not *necessary* to illuminate the rear number plate, but you can do so if you wish, in which case no illumination is required on the front plate. The question was not definitely settled on going to press, but the draft regulation of the Local Government Board makes it unnecessary for the present to provide a rear red light on a single track machine, but this is necessary when a sidecar is attached.

Machine out of "Tune."

I am the owner of a 1913 three-speed 3½ h.p. machine, which I bought late in June last, and, although I have scarcely ridden 800 miles on it yet it seems to have lost a lot of its freshness. At a speed of fifteen to twenty miles an hour it goes all right, but at low speeds it makes a most peculiar noise which ceases when I cut down the air a bit. This noise is not so loud as the "clacking" of the valves on the tappets, and it has not any "metallic" sound about it which would indicate "knocking." The inside of the cylinder, from what I could see when the valve caps are removed, is pretty dirty, for, being a complete novice when I bought the machine, I over-oiled it of course. (1.) Would you advise me to take down the cylinder and clean it? I have read up a good deal about dismantling the cylinder; the only thing that I am afraid of is the taking off and replacing the rings on the piston. (2.) Is there any particular position on the piston for them, or can I replace them "any way"? (3.) I cannot keep the exhaust valve clean from burnt oil. No matter how often I take it out and clean it it gets dirty again very quickly. I oil the machine only very sparingly now, still the oil comes out, and the putting on of a new valve spring has not made any improvement.—B.O'C.

As far as we can see the only trouble with your machine is lack of "tune." We should strongly advise you to take down the engine, clean off the carbon deposit, and re-adjust the tappets. Clean deposit from underside of piston and from behind piston rings. (1.) The peculiar sound you refer to is probably due to the fact that the carbon deposit in the cylinder becomes partially incandescent; that, of course, causes pre-ignition, which means that the charge is fired before the piston reaches the top of the stroke. (2.) As regards the piston rings, these are easily removed by placing strips of tin under them and sliding the rim off over these strips; they can be put on in the same way. It is necessary to see that the slots in the rings are not in line, as this would cause lack of compression.

A MOTOR CYCLIST AVIATOR.

Hubert C. G. Allen, late of Coventry, for many years a motor cyclist, and owning Rex, Clyno, and Humber machines, has forsaken motor cycling for aviation. He now has a 35 h.p. Bleriot monoplane with three-cylinder Anzani engine and a hangar at Hendon.

(3.) We should recommend you also to grind in the valves, taking out pits, and giving the seat a bright surface, with a final polish up with a little petrol.

The Question of Insurance.

I should be glad of your advice on the question of insurance of my motor cycle and sidecar. I notice from various insurance prospectuses that rates for practically equal risks vary enormously. Can I safely take advantage of the low rates quoted by some companies?—A.B.

Your best plan is to compare the prospectuses of various insurance companies. Do not go by the cheapest but by the one which gives best value for money. Insist upon having full particulars and make careful investigation as to the settlement of claims, and any restrictions that are not mentioned in the prospectus. Then, if you find the cheaper policy includes everything you require, by all means insure under it. The really important thing to remember is to be fully covered against third party risks.

Removing Small Piston Rings.

Can you tell me how to remove piston rings without breaking them? I am riding a F.N. four-cylinder, and in removing the rings I broke five. I tried strips of tin as advised in "Motor Cycles and how to Manage Them," but the rings went before I got the three strips under them. I then tried one strip opposite the slots, and raised the slot ends one by one with an old knife, but with little success. Is there any way of removing carbon from back of rings without removing them?—F.S.F.

No. You cannot remove carbon deposit from the grooves without taking out the piston rings. Personally, we always use strips of tin for the purpose of removing the rings. Possibly with your small pistons three hairpins might be more suitable, or perhaps a special tool for the purpose as advertised in our columns. This is similar to a pair of pliers, specially made to expand the ring without breaking it.

DUNLOP

ALWAYS LEADS AT OLYMPIA

Notwithstanding the claims made by other tyre manufacturers, there were

MORE MOTOR CYCLES

fitted with

DUNLOP TYRES

than any other make.

Also there were

MORE MOTOR CYCLES

fitted with

DUNLOP BELTS

than any other make.

First in 1888; foremost ever since.

When ordering tyres or belts, specify Dunlop, the most popular.

THE DUNLOP RUBBER CO., Ltd.,

Aston Cross, BIRMINGHAM. Alma Street, COVENTRY.

BRANCHES: London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

NEW RECORDS

established by the famous N.S.U.

On November 20th, Lieut. R. N. Stewart, riding a two-cyl. N.S.U. (54½ x 75 mm.=349 c.c.), established new records in Class B for the following distances and times:

350 miles .. .. 8h. 32m. 4⅘s.=41.01 m.p.h.
8 hours .. .. .. 328 miles 184 yards=41.00 m.p.h.
9 hours .. .. .. 369 miles 1,454 yards=41.09 m.p.h.

Of this performance, "The Motor Cycle," November 27th, says: "This ride was noteworthy, as it was a genuine amateur attemp to verify Stewart's ability to ride nine hours at Brooklands to settle a sporting bet made by Stewart with his fellow officers in his regiment. He had no trade assistance whatever, and had his own orderly and servant to assist him. He ran most consistently from start to finish, and would doubtless have done much better but for the very high wind which prevailed all through the ride."

MODELS FOR 1914—ALL TWINS.

3½ h.p. Twin-cylinder, 498 c.c., 2-speed gear and free engine, belt drive.

6-7 h.p. Twin-cylinder, 830 c.c., chain drive, three-speed countershaft gear, 26 x 3in. tyres.

7-9 h.p. Twin-cylinder, 996 c.c., chain drive, three-speed countershaft gear, 28 x 3in. tyres.

THE N.S.U. MOTOR CO., LTD., Offices and Showrooms: 186, Great Portland Street, London, W. Goods and Repairs: 83-85, Bolsover Street, London, W.

Northampton to Eastbourne.

I shall be obliged if you will kindly forward me the best route to Eastbourne without passing within fifteen miles of London. —M.F.

Your best route would be as follows: Northampton, Newport Pagnell, Woburn, Dunstable, St. Albans, Watford, Rickmansworth, Uxbridge, Staines, Chertsey, Guildford, Horsham, Cowfold, Partridge Green, Hurstpierpoint, Hassocks, Ditchling, Lewes, Polegate, Eastbourne.

Oil Escaping from Engine-shaft Gear.

I possess a 3½ h.p. N.S.U. with free engine and two speed gear, which I bought second-hand from a commercial traveller, who apparently troubled little about the machine as long as it would run. I may say I overhauled the engine and found it to be in fair condition. The tool marks are still showing on the piston rings, which I understand were fitted about last February. Owing to a smash the engine was sent to the makers, where a new crank case was fitted, new piston and rings, and it was re-bushed. I found on examination both top and bottom a full $\frac{1}{32}$in. slack, the small end having $\frac{1}{16}$in. side play. The pulley shaft is tight but has side play of $\frac{1}{8}$in. As you are doubtless aware, the left hand engine shaft to which the two speed gear is fixed is hollow. And in a description of the N.S.U. two speed gear I have seen it stated that "the gear is lubricated by means of the engine release valve on this hollow spindle." Before starting the engine on the stand when I reassembled it, I injected three or four pumps full of oil into the crank case, and after the engine had been running for a little while the oil was sprayed in a considerable quantity over the whole engine and was apparently partly exhausting through the two speed gear. The engine appeared to me to be abnormally hot, including the crank case, and I am under the impression that the oil in the crank case becomes heated and is sent through the hollow shaft of the engine on the down stroke (of the engine). I am desirous of learning what quantity of oil should be pumped into the crank case, and the normal level of same. As regards the running of the engine it picks up very quickly and runs without any fuss, with the exception of throwing the oil about. I may also state I did not touch the two speed gear in any way—which works very well. If you can kindly let me know your opinion on the oil trouble, seeing the engine has only recently been re-bushed, and in what way I can remedy the matter, and whether the excessive heat is anything to trouble about, I shall be obliged.—S.A.J.

Provided your engine does not lose power through overheating and runs satisfactorily there is no need to worry about the temperature of the oil. We should recommend you to consult the makers of your machine, and perhaps they will be able to supply you with another type of crank case release, which would cure your trouble in the matter of oil escape.

High v. Low Gear for Starting.

I had an argument recently with a friend, and should esteem it a favour if you would give me your opinion. My friend told me that his machine, a 1912 free engine Triumph, was very difficult to start by the pedals, and he said he thought that it was owing to his gear being too high. I told him that that would make starting easier than if his gear was too low, my contention being that, though more revolutions of the engine would be obtained with a low gear, it would require a greater effort, whereas the reverse would be the case with a higher gear, and would make for easier starting.—E.J.W.

The higher the gear, the more easily can the machine be pushed over compression when cold or gummed up. Once warm, the difference is less noticeable. Your statements expsess our own opinion in the matter.

READER'S REPLY.

A Curious Complaint.

In your issue of the 27th ult., one of your readers describes "a curious complaint" that his machine has. I have an engine of the same make and power: 5-6 h.p. twin Rex, which troubled me in exactly the same way, and I traced the cause to the petrol pipe, not tank as you have suggested. The pipe has a twist in it in a vertical direction. The cure was to alter this bend to a horizontal one, or in such a way that no air lock can form.—E. J. Cope.

Having had a similar experience to "E.M.'s" (page 1619) with my 1912 Rudge Multi and sidecar, I venture to suggest that if he used tappet adjusters he would cure his trouble. Mine was due to an adjuster having worn down, and consequently the exhaust gases could not escape, and the stoppages were due apparently to overheating and loss of power, as only a little gas entered the engine. On another occasion loss of power was due to a broken rocker roller in the exhaust valve, and consequently the tappet did not receive the full lift of the cam.—Rudge Rider.

EXPERIENCES WANTED.

"C.I.D." (St. Andrews). — Reliability and foolproofness of Rex two-speed hub.

"L.C.R." (Norfolk).—Brampton gear and Mabon clutch for 3½ h.p. Premier, 1911 pattern fixed engine. Reliability.

"J.R." (Tonbridge).—4¼ h.p. Lincoln Elk with sidecar. Reliability, consumption, and efficiency of two speed gear.

"H.M.B." (Westcliffe).—3½ h.p. Blackburne. Reliability and general efficiency.

"D.P.W.M." (Armagh). — Hutchinson tyres on 3½ h.p. Rudge and sidecar.

"G.B." (London).—3½ h.p. Alldays Matchless, three-speed counter-shaft chain drive. Power with sidecar, hill-climbing and general efficiency.

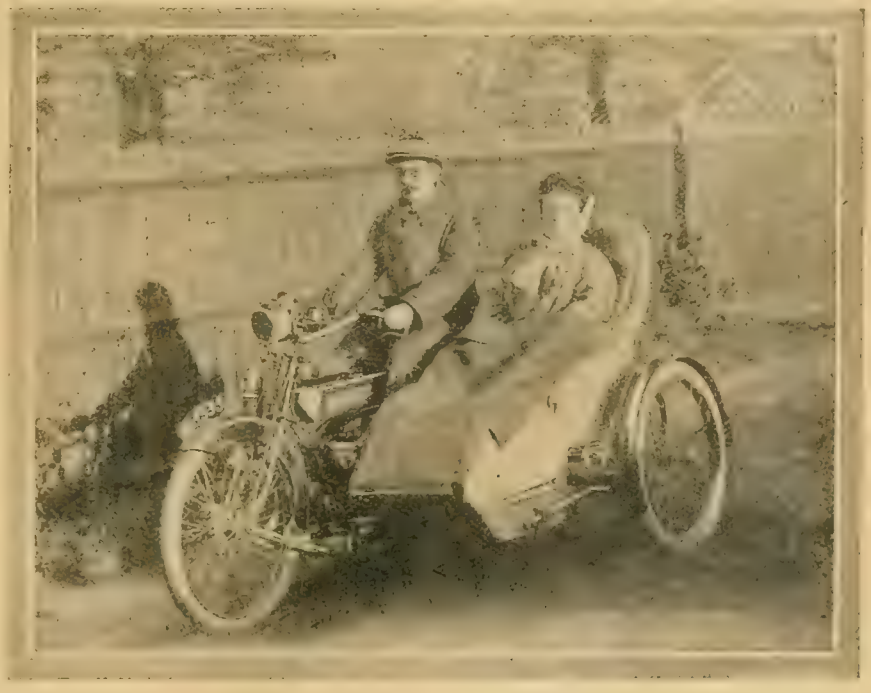
"B.L. 2674" (Wimbledon).— K model 1912 Douglas with sidecar. Rom steel-studded cover.

"J.C.B." (Liverpool).—1913 Forward, 2¾ h.p. T.T. Reliability, efficiency, consumption, etc.

"P.H." (Glasgow).—Two-stroke Scott, especially reliability of gear and cooling system. Twin Matchless, 6 or 8 h.p. Power of each for sidecar work.

"W.F." (London).—1913 A.C. Sociable. Average miles per hour over give and take roads, petrol consumption, life of back tyre, and skidding.

"H.V.B."—Enfield 6 h.p. Reliability of slip arrangement of sprockets on engine-shaft; clutches, chains, carbonising of cylinders, and general running.

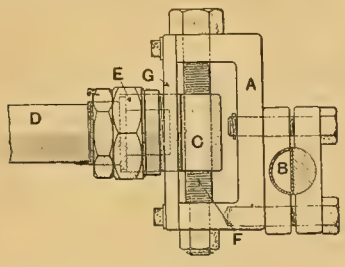


SIDECARRING WITH A 3 H.P. MACHINE.

J. Hart Smith on his 3 h.p. Enfield sidecar outfit. Though the 3 h.p. Enfield is not recommended for sidecar work by the makers, Mr. Hart Smith has successfully covered several thousand miles with a sidecar without trouble.

An Improved Sidecar Clip.

This clip allows the sidecar to be adjusted both as regards height and wheel alignment. The jaws A are more or less permanently clipped to the motor cycle chain stay, which is represented at B, and the part C is attached to a member D of the sidecar, which may be its axle tube. The parts D and C are coupled together by a quickly detachable coupling nut E. The part C can be vertically adjusted along the spindle F, and can be swung about the axis of that spindle, being prevented from accidental movement of this nature by means of a plate G. It will be noticed that the jaws A and B are unequal in length, so that by reversing this part two different heights of axle D can be coped with, apart from the adjustment provided by the screwed spindle F. By this means the same parts can be used for 26in. or 28in. wheels.—W. Montgomery, No. 24,482, 1912.

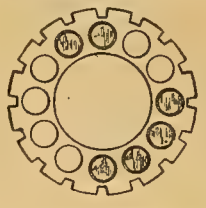


PATENTS

BY ERIC W. WALFORD, F.C.I.P.A.

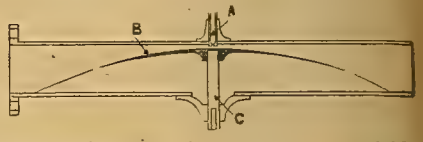
A Clutch Plate Improvement.

A difficulty experienced with plate clutches is that there has to be fairly considerable movement of the operating member to separate the plates, and to obviate this is the feature of this invention. The alternate plates are made somewhat thicker than usual, and are formed with holes, in each of which is a loose circular block slightly thicker than the plate. The blocks take the pressure and the perforated plates serve merely as carriers. Such an arrangement possesses the additional advantages of improved lubrication and cheapness of renewal, as the blocks alone have to be replaced.—Triumph Cycle Co., Ltd., and C. W. Hathaway, No. 25,668, 1912.



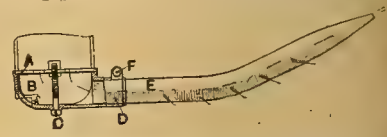
A Simple Variable Choke Tube Carburetter

The jet nozzle A projects horizontally into a square pipe which forms the spraying chamber of the carburetter. In this is arranged a bow spring B, the same width as the square pipe, and this is attached to a sliding stem C. It will be clear that the spring tends to take up the position illustrated, in which the passage over the jet nozzle is small. By moving the stem and spring the passage is increased and in this way a variable choke tube effect is obtained.—V. March, No. 22,780, 1912.



A Silencer Conversion Device.

Long exhaust pipes are now becoming the rule, and the illustration shows a neat construction for effecting the conversion of an ordinary silencer, provided with a "cut out." The end A has the ordinary "cut out" removed, and in its place is screwed a dome B, the stud C fitting the ordinary "cut out" stud hole.



The dome is formed with a split lug D into which is inserted the extension pipe E, which is then secured by the stud F.—W. F. Newsome and R. R. R. Fletcher, No. 7,185, 1913.

A Sturdy Two-stroke.

In our Show Report we referred to the Veloce as a 2 h.p., whereas this is actually rated at 2½ h.p., and, we are informed, develops on the brake about 3.6.

Hub Gears at Olympia.

We are informed by the Sturmey-Archer Gears, Ltd., that there were eighty-nine motor cycles in the Show last week fitted with Sturmey-Archer hubs.

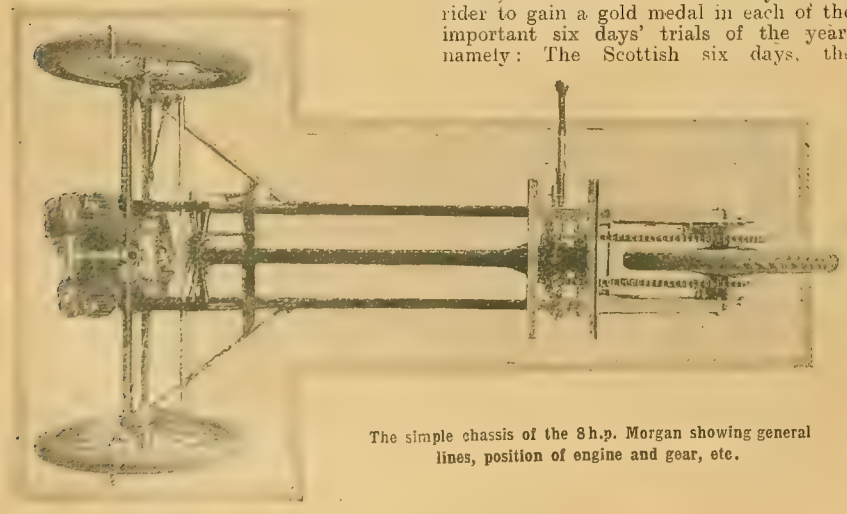
A North London Garage.

Messrs. Mills Motors, Ltd., sole district agents for Premier, Indian, Rover, Bradbury, Royal Enfield, Zenith, etc., have re-opened at 4, Woodside Parade, North Finchley.

SPARKLETS

A Fine Sidecar Record.

One of the most successful riders during the past season on a 3½ h.p. Bradbury and sidecar is Hugh Gibson of the Bradbury Company. This rider has a long list of gold and other medals to his credit, and claims to be the only sidecar rider to gain a gold medal in each of the important six days' trials of the year, namely: The Scottish six days, the English A.C.U. six days, and Irish end-to-end. The total mileage of the three events was 2,140 miles, and in the Scottish and English six days, Gibson's sidecar was the only single cylinder sidecar machine to finish. It is interesting to note that Gibson used Dunlop tyres and belts in all the important events in 1913.



The simple chassis of the 8 h.p. Morgan showing general lines, position of engine and gear, etc.

Accessories.

A new firm specialising in tap work and accessories for motor cycles, including electrical equipment, is Wood and Lamplugh, Ltd., King's Road, Tyseley, Birmingham.

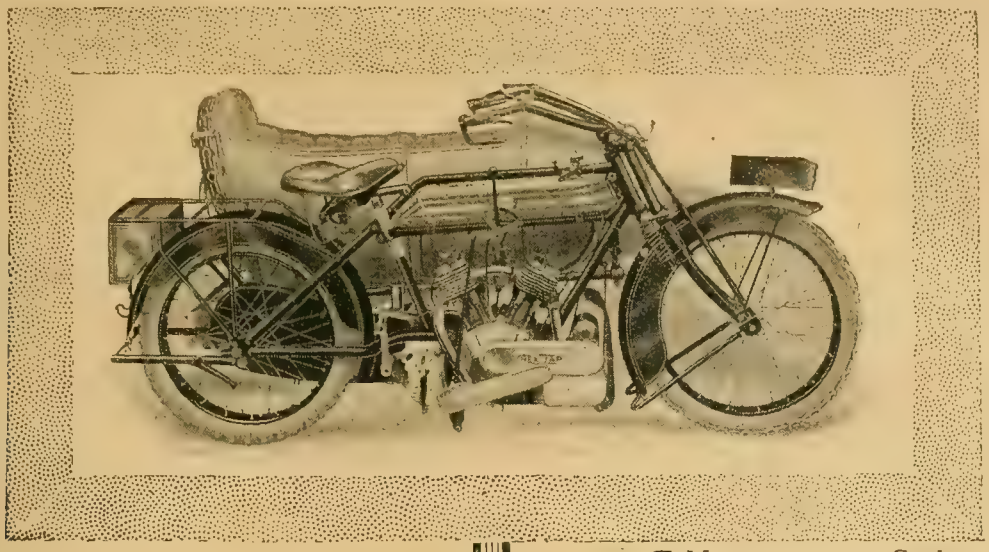
Morgans in France.

The Morgan Motor Co., Worcester Road, Malvern, inform us that they took orders for over 700 three-wheelers at the Show. 150 were ordered by their French agents, and two have been entered for the Paris-Nice Trial. The firm hope shortly to complete large extensions to their works, having purchased a site of 2½ acres at Malvern Link. Among their contracts is a large order from Switzerland, in addition to the French one mentioned above. They are also represented by 50 agents in Great Britain and Ireland.

Catalogues Received.

The Service Co., Ltd., 289-293, High Holborn, issue an excellent list of second-hand motor cycles, cycle cars, and sidecars which they have in stock.

"About the Rudge Multi" is the title of a new booklet, attractively illustrated, issued by Rudge-Whitworth, Ltd. It records in an absorbing and convincing manner the progress of the Rudge during 1913. Copies may be obtained free upon application to the works.



REX-JAP

New Type, with COUNTER-SHAFT 3-Speed GEAR, enclosed CHAIN DRIVE, and KICK STARTER.

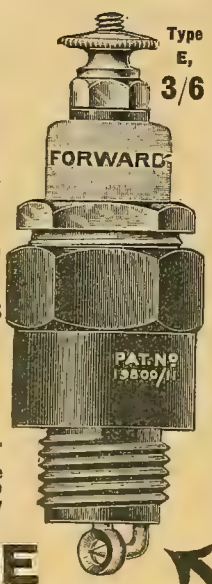
EVERY DAY BRINGS FRESH PROOF of the UNFAILING RELIABILITY of 'FORWARD' British Plugs



Read this **unsolicited** letter:

Dec. 1st, 1913.

Dear Sirs,

I have been using one of your FORWARD EJECTOR plugs in my 3½ h.p. RUDGE motor cycle for the past five months. During this time I have done some three thousand miles all over England, from Anglesey to the south of Kent, and have never in that distance experienced a moment's trouble from the plug. I habitually travel fast, and over-lubricate while doing so, but with clouds of blue smoke emerging from the silencer there has never been a suspicion of a "soot up." Once or twice I have removed the plug to examine the points, and have found them in each case dry and absolutely free from carbon. The Ejector plug has solved the "soot up" trouble. I am riding a 5-6 h.p. Rudge in the Sutton Coldfield Club's "Sutton Cup Trial" next Saturday. This machine is fitted with a plug of well-known make, which, incidentally, has already been giving trouble, and I do not feel inclined to run the risk of spoiling a non-stop run by a sooted plug. Please send me an "Ejector," for it will free me from all anxiety as to the exact amount of oil which will be enough for the engine without sooting the plug.

Yours faithfully,
GEOFFREY S. DAVISON.

MOTOR CYCLES FOR SALE.

Humber.

1912½ Humber 2¾h.p. Twin, F.E., 3-speed gear, excellent condition, lamp, speedometer, all accessories; immediate sale £30, or nearest offer.—14, Manor Rd., Coventry. [X9284

1913 3½h.p. 3-speed Humber and Sidecar, demonstration model, fine machine; offers.—The Stamford Hill Motor Co., 128, High Rd., S. Tottenham. 'Phone: 1982 Tottenham. [X9499

1912½ 3½h.p. 2-speed F.E. Humber, Cowey speedometer, Lucas lamp, horn, belt case, etc., splendid condition; inspection invited; £32.—Morgan, 148, Loughborough Park, Brixton. [4687

1912½ 3½h.p. Humber, 2-speed, free engine, grand sidecar machine, Lucas headlight, whole lot equal to new; £31; first-rate bargain.—The Colmore Depot, 49, John Bright St., Birmingham. [X9178

Indian.

£23.—Indian, 5h.p., 1910, splendid condition; quick sale.—23a, London Rd., Leicester. [X9197

INDIAN, 1911, 7-9h.p., mag., perfect order; £29/15; exchange.—68, Elmsleigh Rd., Wandsworth. [X9463

INDIAN, 1913 (April), 7h.p., 2-speed, F.E., complete Lucas set, as new; £55.—Willways, St. Augustine's, Bristol. [X9440

INDIAN, 1911, 7h.p., blue, free engine, with horn, splendid order; £30.—Willway's, St. Augustine's, Bristol. [X9441

INDIAN, 7-9h.p., 1913½, free engine model, low torpedo sidecar, combination splendid; £55 cash.—R. F. Fuggle, Edgware. [4662

INDIAN, 7h.p., new May, 1913, practically as new, with 30/- lamp, complete; £52.—Bennett, 34, Dicconson St., Wigan. [X9425

INDIAN, 1913, 7h.p., 2 speeds, spring frame, just overhauled, excellent condition; £55.—P. J. Evans, John Bright St., Birmingham. [X9408

INDIAN, 1913, 7h.p., 2-speed, Mills-Fulford 20 gn. sidecar, Lucas lamp, in perfect condition; £75.—Simpson, Thorne, Doncaster. [X9326

INDIANS.—Earliest deliveries of 1914 models; easiest of easy payment terms or exchanges.—Maudes, 136, Great Portland St., London, W. [4840

INDIAN, 5-6h.p., 1911, free engine, recently overhauled, Millford 1912 sidecar, Autoclipse lamp, horn, tools, accessories; £33.—R. Garry, Great Mead, Wokingham. [4604

INDIAN, 7h.p., 1913, new June, sidecar to match, splendid accessories; cost £100, take £75; like new; trial.—Wild, Killarney, Spring Grove Rd., Richmond, Surrey. [4615

INDIAN, 1913, 2-speed, P.M.C. special sidecar, all red, delivered August, unpunctured, including all spares and accessories, perfect condition, done 1,400 miles; £70.—Bircumshaw, Skegness. [X9231

INDIANS.—Buy one, and take no man's dust; luxury and speed; place your order now; second-hand machines in stock.—Wm. Turner and Co., Indian experts, 185, Markhouse Rd., Walthamstow. [X9198

INDIAN, 7h.p., 1913, new April, Lucas horn and head lamp, speedometer, tools, Mills-Fulford coachbuilt sidecar, back-rest saddle, 2 speeds, good as new; £69; any trial.—Rev. Nicholls, c/o 133, Devonshire St., Sheffield. [X9142

INDIAN, 1913, 7h.p., 2-speed, F.E., black, plated Lucas lamp and generator and horn, speedometer, spares, and spring wheel sidecar, cane body, in perfect condition; £70; exchanges considered.—Quorn Garage, Leicester. [4833

7h.p. 1913 Indian and P.M.C. red sidecar, Miller, Stewart, horn, accessories, delivered September, mileage not exceeding 500, everything as new; cost over £90, sell 75 gns.; offer; buying electric starter.—Das, University, Edgbaston, Birmingham. [X9417

Ivy-Precision.

IVY-PRECISION.—Earliest delivery.—Northern Depot, Ltd., Liverpool. [X9333

IVY-PRECISION, 3½h.p., 1912, lamp set, perfect; £25.—Peacock, 274, High Rd., Balham. [4733

J.A.P.

J.A.P., 6h.p. Twin, Bosch, Chater No. 9, new belt, good tyres, sidecar, all good condition; £26/10.—67, Newington Green Rd., N. [4806

4h.p. J.A.P. built to order from £30; cylinders rebored, new pistons, engines rebushed.—Hopley, Upper Highgate St., Birmingham. [X9389

1913 Bat, 6h.p. J.A.P. engine, 3-speed, foot starter, Kempshall tyres, Lucas lamp and horn, perfect; any trial; £52/10.—Thompson's, The Moor, Sheffield. [X9300

TWIN J.A.P., latest type engine, Sturmey 3-speed, complete with underslung sidecar, canoe; lot cost £87/10 in Sept. last, what offers? cash wanted.—66, Norbiton Av., Norbiton, Surrey. [4747

4h.p. J.A.P., multi-speed gear, free engine, semi-automatic drip lubrication, Millford sidecar, handsome combination, in perfect condition; £39, no offers.—30, Ravenswood Rd., Balham. [4694

James.

WE can give immediate delivery of the famous James 3½h.p. twin, etc.; you cannot get better terms and delivery, try us.—Townley's Garage, Lancaster. [X9204

—is always enjoyed by rider and passenger when the machine is fitted with the world-famous "DRUID"

—The "DRUID," by reason of its SCIENTIFIC DESIGN and PERFECT SPRINGING PRINCIPLE, completely absorbs vibration—every obstacle is met with a velvety touch—no shocks, no jars, no bouncing—the machine runs with a "silky-smoothness" of motion, always.

—Further, the "DRUID" ensures perfectly true steering—admits of no side-play whatever—decreases wear on tyres—and increases the life of the machine.

—The "DRUID" is the *only* Spring Fork that makes possible these *ideal* riding conditions—hence its adoption on the leading machines of the day—and its world-wide popularity.

—Be sure and see that the mount you buy is "DRUID-equipped"—and ensure *perfect comfort awheel.*

—Ask for "Explanatory Booklet."

Cycle Cars in Competition.

THE rather anomalous position in which cycle cars find themselves gives rise to some very interesting queries as to their future in competitions. Many of the best known machines which started life as cycle cars have now cast off their early cloak of disguise and blossomed forth into light cars proper. At the recent Olympia Show there were cases of vehicles whose birth was heralded with an acclamation as conferring distinction on the already existing band of cycle cars, being actually cast forth from the Show because in their short career they had grown a little too heavy, and were thus over the prescribed weight. And it must be said that in this class were to be found some of the most attractive little machines made, call them cycle cars, light cars, voiturettes, or what you will.

Now, what part have these heavyweights to take in competitions and races in 1914? If they can train down to the defined weight will they be allowed to start, or will they be officially ruled out by the authorities as out of place, even as they were at Olympia? In other words, are these Olympia expulsés to be classed as light cars when in standard touring uniform, and cycle cars when cut down in weight to conform to the definition? The point is that practically all the light four-cylinder cars which are at the moment enjoying a well deserved popularity exceed the 6 cwt. limit by a small amount only, and if put into racing trim could easily be brought within the cycle car definition.

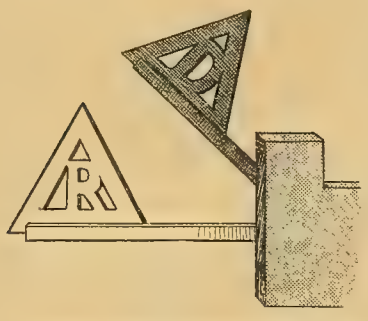
Gilbertian Situation Possible.

IF this procedure is permissible, surely the true cycle car will have no chance at all in the cycle car race arranged for their particular benefit, and the event would be more correctly termed a "light car race." If light cars in racing mufti are to be regarded as cycle cars all sorts of complications will ensue. We may find the curious anomaly at the next Olympia Show of the winner of the Cycle Car T.T. Race not allowed in the Show! It sounds ridiculous, but it is a position that may easily arise under conditions such as at present obtain, and if these little cars may be stripped down for racing what chance has the real simple cycle car fitted with an air-cooled engine, and perhaps belt drive, and only two speeds, got against these miniature racers? In answer to this question it is only necessary to remind readers that a stripped light car type of machine has covered over seventy-two miles in one hour at Brooklands this year, and, as it appeared on the track, it was under the cycle car weight limit, while the highest speed obtainable from the lighter and simpler type machine is about sixty miles an hour. Thus it behoves one to ask whether the A.C.U. is going to allow any vehicle to compete in the Cycle Car T.T. Race which can be squeezed inside the weight limit by extensive drilling and general lightening of parts and afterwards to debar the same machine from competing in reliability trials in touring trim which would bring it over weight? And if the A.C.U. allow such vehicles in the T.T. Race, will it allow the winner, if provided by this type, to be exhibited in touring form at Olympia? For, after all, the T.T. Race, as its name implies, is to encourage the touring type of machine. Of course, the A.C.U. conditions governing this race are not yet announced, but we sincerely hope that they will not permit the running of mere chassis, but will insist upon some semblance to touring conditions in the equipment of the competing machines. The whole question of the future of the cycle car proper depends on the way in which it is treated at the present time by the authorities responsible for the sporting side of the movement. As we have several times pointed out, if it is given a fair field and is not allowed to be overshadowed by its bigger brethren, the true cycle car will survive, but if unfair competition is allowed it means practical extinction.

The simple type of machine has had quite enough to struggle against already without adding to its burdens. Too much has been expected of it in the past, and it ought to be given every chance to show up well in the future.

A DISTRESS SIGNAL.

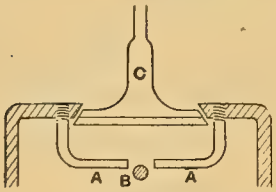
MR. A. E. DOVER, of Messrs. Dover, Ltd., Northampton and Coventry, recently drew our attention to an ingenious device for showing when a motorist does or does not require assistance on the road. Readers know that they very often stop their sidecars or cycle cars on the roadside for luncheon and other purposes. Passing motorists seeing a vehicle stopped, usually slow down or stop and enquire if assistance is required, only to be met with thanks and a wave of the hand indicating that they should drive on. The Dover distress signal is a small metal sign, consisting of two diamonds with the letters D and R in the centre of each. These signs are attached to the inside of the wood frame of the screen, and can be swung outwards as illustrated. The letter R in the centre of the white diamond signifies "resting," while D in the centre of a red diamond denotes "disabled." This device should prevent any misunderstanding in future, and its simplicity will appeal to all who wish to save their fellows inconvenience or delay. Members of the R.A.C. will be able to obtain the device with the R.A.C. badge at the top of the diamond, and members of the A.A. and M.U. will also be able to obtain their insignia in letters denoting the body to which they belong.

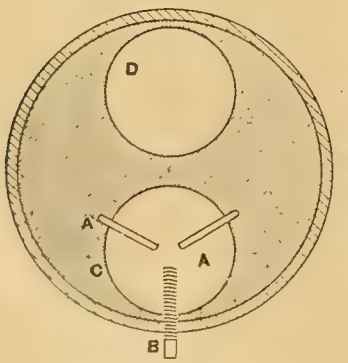


A "distress" signal introduced by Dover, Ltd.

HOW TO PREVENT VALVE HEADS DOING DAMAGE.

AS almost every motor cyclist knows, the maximum efficiency is obtained with engines of the overhead valve type. Such engines are commonly used on racing machines, but the reason they are not popular for touring is on account of the liability of a broken valve head falling into the cylinder and puncturing the piston.





Recently we were shown a method of preventing broken exhaust valves from dropping into the cylinder, which consists of nothing more or less than $\frac{5}{16}$in. steel rods (marked A in sketch), bent to shape and screwed into the cylinder top. B is a stud screwed through the cylinder wall, which projects about 1¼in. inside. C is the exhaust valve and D the inlet. To remove a valve, B is unscrewed and the two angle pieces are unscrewed a quarter turn. One-sixteenth of an inch is allowed to clear the valve head at the sides, and about one-eighth clearance is left for the valve in its open position.

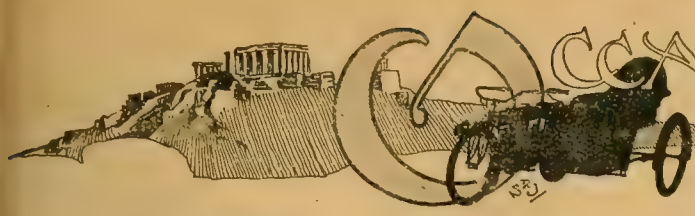
In examining the idea, any experienced motorist might be pardoned for suggesting that the projections would cause overheating and pre-ignition, but such is not the case.

The Device in Use.

Mr. J. H. Wilkinson, of 40, Jubilee Road, Doncaster, who has used the fittings on his T.T. Matchless-Jap for some hundreds of miles, originally experienced more than one valve breakage which always resulted in a broken piston, till at length he "doctored" his engine in the manner described and has had no trouble since. He assures us that no ill effects have resulted from the additions and that the engine runs perfectly at all speeds. We may add that having personally tried the machine on the road, it would be impossible to detect the presence of any such device. Incidentally, one of the pistons Mr. Wilkinson is at present using was one which had a 1½in. hole knocked through the top. Noticing an advertisement in *The Motor Cycle* of Messrs. Binney and Sons, Kirkstall Road, Leeds, Mr. Wilkinson sent the piston to be oxy-acetylene welded, and it has given every satisfaction since it has been submitted to this process.

A NOVEL TYPE OF PASSENGER MOUNT.

An American couple, Mr. and Mrs. Strogonoff, who use a twin cylinder Emblem bicycle with seats arranged side by side. At the back there are two smaller seats for children.



OCCASIONAL COMMENTS

BY "IXION"

Handy Lubricators on Cycle Cars.

Much experience of a light car with dashboard drip oilers mounted in the cavernous depths of a mighty scuttle inspired me to appreciate the Depford foot oiler. On a car there is just room for a corpulent driver to slide round the edge of his steering wheel and reach the tip of his finger deep down under the scuttle to adjust a drip or operate a hand pump. But these gymnastics are not possible in the narrow cross width of a cycle car, and a foot oiler is urgently desirable unless the "instruments" are mounted on a little wooden drop curtain, hanging down just far enough inside the scuttle to protect them from rain; an inch or two will suffice, as rain is very seldom blown in under the scuttle from the rear.

The Non-skid Sidecar.

A correspondent with trade connections offers me his conclusions on the skidding of sidecars with the authority that a sidecar mileage topping the 50,000 mark confers. He thinks that skidding can be practically eliminated by the following precautions: The use of a light car tyre (studded) pumped board hard on the driving wheel; the use of a good studded tyre on the sidecar wheel; fitting the sidecar dead in line with the bicycle plumb upright and the sidecar wheel two inches in front of the bicycle wheel; tackling grease firmly and steadily at about twenty miles an hour on top gear (steering is never firm with a nervous driver who has dropped on to a low gear); and using a stiff, broad saddle which prevents the rider swaying his weight about. The last recommendation appears a trifle meticulous where a sidecar is concerned; but I have always believed that a saddle capable of much side sway and mounted too far back on the frame is a great provocative of sideslips on a two-wheeler. For a greasy ride on a bicycle, give me a stiff saddle mounted well forward, and a board hard rear tyre—then I'm happy. There are very few—uncommonly few—saddles which do not rock sideways.)

Winter Gears.

Talking of sideslips, I am killing two birds with one stone this winter. There is nothing I detest more than belt trouble on a cold wet day (stay! I forgot punctures), and I conceived the brilliant idea of fitting out my roadster with a real Brooklands pulley, so that my top gear ratio is about 3½ to 1, and driving normally on the second gear of my Sturmey hub. Incidentally, this tip will lead to a magnificent test of the hub's durability, for an indirect gear is in operation most frequently. But I started to describe my *modus operandi* because a recent experience showed me the value of the old tip about using low gears in winter. On my ride, just as dusk came on, and I was feeling very cold and miserable, I struck some very greasy roads, and my misery affected my nerves, so that I funked the slime as if I had been a novice. I had been purring along on the 3½ ratio, and changed down to the second (say about 5½) when I hit the grease, and on one particular virulent patch I did some pretty figure skating, though I neither turned completely round nor yet took a toss. Two or three more violent back wheel wobbles actually disposed me to dismount, when I had to slide through very narrow openings between trams and carts or stop; and suddenly it dawned on me that I was practically using a summer gear, and I dropped gleefully to the bottom ratio of 8½. With the engine turning over thus merrily, I negotiated the remainder of the greasy wood without wobble inside or out. 5½ to 1 is a fine gear for winter work, and when a three-speed hub enables you to obtain it in conjunction with a six-inch engine pulley, it is a much finer gear than when you are taking it direct off a three inch pulley; but, of course, my procedure demands a certain confidence in the innards of your hub.

Single-cylinder Cycle Cars.

I heard a number of quondam Rover and De Dion enthusiasts lamenting the scarcity of single-cylinder cycle cars at Olympia; their experience with "one lung" cars had led them to prize the simplicity and well maintained power of a type of engine which is now practically extinct, and they regarded the numerous valves, gadgets, and twiddly bits of the *monobloc* four-cylinder engines with a certain apprehension. The single-cylinder engine is dead, so far as cars are concerned, because of its noise and vibration. It certainly developed its power with the minimum of friction, and it was so simple that even a duffer could keep it in decent order; but it was doomed as soon as it had to compete with the even hum and smooth torque of a bijou four-cylinder. Those surviving Rover and De Dion enthusiasts, who regret its demise, should consider such vehicles as the £100 A.C. for the moment, and look forward with hope to the arrival of the twin-cylinder two-stroke cycle car (there is one being made)—a machine which should combine the virtues of the four-cylinder with the simplicity of the old one-lunger.

Oversize Singles.

One or two single-cylinder enthusiasts take exception to my prophecy that the twin will eventually be almost universal in sidecar work; and one local agent informs me that he can get slower and smoother top gear work from a 600 c.c. single than from an 8 h.p. twin in his possession. That may well be; there are good singles, and there are bad twins. If we had to draw conclusions from single instances—a particularly vicious form of induction—we should have to confess that the slowest running motor cycle ever demonstrated in public was the late D. G. Gilmour's 8 h.p. Jap, which fired quite evenly at about three miles an hour on a gear of about 3 to 1; but to argue that the 8 h.p. twin is the slowest running engine in the world would be pretty foolish.

Mechanical Alarms.

Can any reader supply authentic information on the merits of the mechanical alarms shown at Olympia and marketed by several firms during the year? My pessimistic views on the subject of exhaust whistles are already public property. Since I gave up exhaust whistles, I have been busy experimenting with electric hooters, and though they may be immensely suitable for cycle cars, and even for sidecars, I have no great opinion of them as applied to motor cycles. They are excessively heavy when the weight of the battery is included, and my recent experience with batteries has given me small cause to modify the detestation of them with which accumulator ignition inspired me in the prehistoric period of the motor cycling era. I find, too, that the penetration of the squawk is exceedingly sensitive to the condition of the battery; when the voltmeter registers 4.2, you can get a sound like the dying yell of a dodo, but when the battery is down to 4 volts, the hooter whispers like a punctured doll trying to ejaculate "mamma!" Olympia staged a number of hand-operated mechanical devices in which a geared down striker hit a resonant diaphragm, etc. Some of them generated a very satisfactory noise whilst brand new. Does anybody know how they wear, and whether they withstand the vibration of a handle-bar successfully? If so, they should have a future.

Petrol-oil Mixture on Four-stroke Engines.

Like Messrs. Davison and Blumfields, I used a mixture of oil and petrol on the primitive Clement-Garrard machine of 1⅓ h.p., and now that I know more about the internal combustion engine, I wonder however the system worked. The engine in question had an external flywheel, and I remember very little more about its details except that its compression was very poor. One would presume that the rings were rather a sloppy fit, and that oil ran freely down the cylinder walls past the rings into the crank case; but even thus, we must have used a much larger percentage of oil in the petrol than is necessary with the modern two-stroke. I distinctly recall filling the little plated cylindrical tank behind the saddle in which the petrol was carried, but memory fails when I try to remember the proportion of petrol to oil.

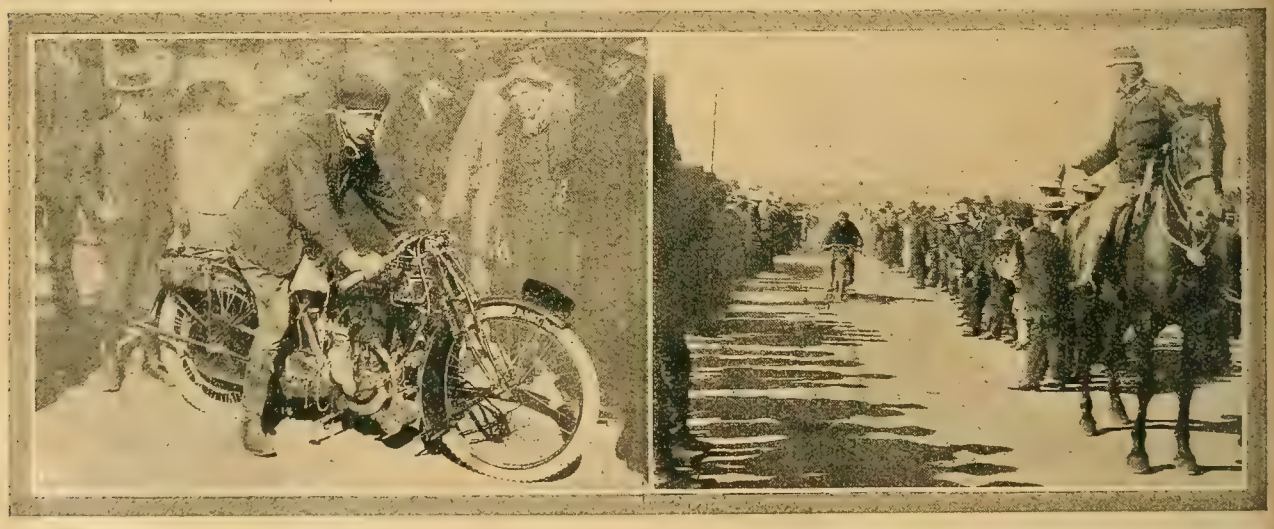
Hub Troubles and Oil Leaks.

One of my correspondents points out that riders' experiences with the earlier three-speed hubs seem to have been very varied, for while one man enthusiastically claims a five figure mileage without a whiff of trouble, another asserts that his hub seized up or collapsed after a much less imposing distance. He suggests an interesting and plausible explanation. Everybody who has used three-speed hubs since their inception must have noticed how their oil-retaining qualities have been improved. My first sample was a frightful sinner; practically the whole of an oil-injection was distributed over the spokes and tyres before I had got the stand up. My 1913 hub barely stained its spokes. Enquiries have proved that some of the 1911 and 1912 hubs retained their oil almost as well as the latest models, so it is at least possible that variations in the oil-retaining qualities of particular hubs account for the divergent testimonies we hear.

MOTOR CYCLE RACING IN AUSTRALIA.

We have already published the fact that the Western Australian T.T. Race run in November last was won by Norton on a T.T. Triumph. We now hear that second place was taken by F. W. Cato on a 2¾ h.p. two-speed Sunbeam, who finished well up behind the winner, third place being taken by C. Lewis on a 2¾ h.p. New Hudson. A large number of English machines took part in this 150 miles race, the makes represented being Triumph, Sunbeam, New Hudson, Rover, Bradbury, Kerry, Rudge, and B.S.A.

The event was run on a handicap basis, and also a maximum time limit was imposed to ensure a briskly run race. The winner received one minute start, while Cato was in receipt of twenty minutes' allowance. The winner's average speed was 39¼ m.p.h., while Cato achieved a mean speed of 35½ m.p.h.



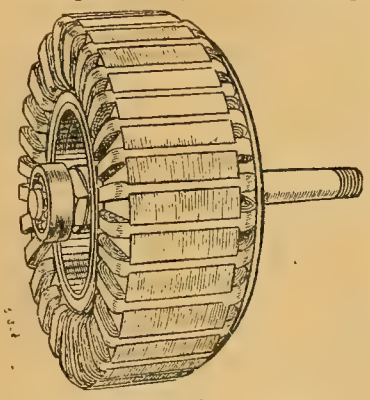
F. W. Cato on the 2¾ h.p. Sunbeam directly after the West Australian T.T. Race in which he gained second place. In the right hand illustration he is seen at full speed passing down between the lines of spectators at the finish. Great interest was displayed in this event all along the course, especially at the finishing point.

ELECTRIC LIGHTING SYSTEMS.

BY WILFRED G. ASTON. SECOND INSTALMENT.

The New Indian Installation.

IN the following description it is only appropriate to deal with the Indian installation first, for not only is it the most important and complete equipment that has ever been placed on a motor cycle, but it is also a standardised article which forms a definite part of the Indian programme for the year 1914. Further than that, it is not only a lighting system, but embraces an electric self-starter and the ignition system as well. The question as to whether it is advisable to do away with so absolutely trustworthy and reliable a mechanism as the magneto in favour of an accumulator ignition, in which the accumulators are kept in a constant state of perfect charge by means of a dynamo, is a moot one, and may be left to a future article for discussion. There can, however, be no two opinions as to the value of a combined dynamo and electric self-starter, although it must be conceded that the starter itself is not of so much use on a motor cycle as it is on a motor car, for, after all, a great deal of physical effort is not required for starting a variably-geared machine, and, as a matter of fact, the Indian itself is notably good in this respect. On the other hand, with a sidecar outfit, where stoppages are perhaps more frequently involved through the desires of the passenger, the self-starter should certainly prove a very great convenience, if not a necessity.



Indian armature showing internal commutator.

The electrical machine, which performs the dual function of providing current to the battery and acting as a starting motor, is illustrated in several of the adjoining sketches, which show it complete and in parts. It consists of a multi-polar motor dynamo with an armature of rather peculiar design. This is built up of laminations of soft iron and wound with oblong section strands of fairly thick wire, which is double cotton covered, and further insulated with a dressing of varnish. Four former-wound field magnets surround this armature, and are placed on the inside of an iron case which encloses the whole mechanism. It will be observed from the sketch of the armature that the commutator is of quite a new type, that is to say, instead of the brushes bearing on the outside of a ring, the four brushes in this case bear on the inside of a segmental copper body. The armature spindle is carried on ball bearings, and is chain driven from the engine shaft, the ratio being as 17 is to 9. Owing

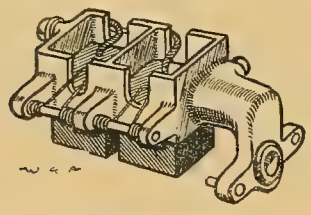
to the large diameter of the armature, a considerable torque is exerted by the series wound motor to enable the engine to be easily started on this ratio, and this, of course, does away with the necessity of employing any double form of gearing, in which one ratio is used when the machine is employed as a dynamo and the other brought into use when it is performing its function as a starting motor. The illustrations also show the very neat design of the spring-propelled brush gear, incorporating two carbon brushes, either of which is sufficient to carry the necessary current.

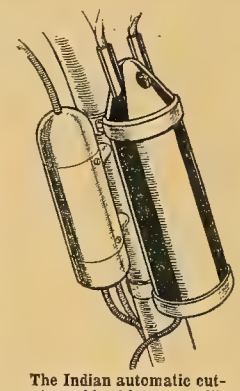


Indian brush gear.

The Working of the Dynamo.

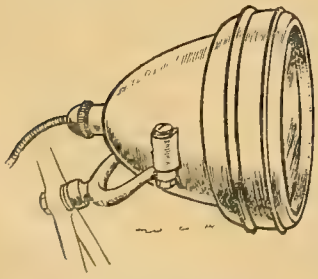
When the machine is working as a dynamo it passes the current through a battery of accumulators, which are carried underneath the rider's saddle. These are connected in series for starting purposes, when they give a pressure of twelve volts, and in parallel for charging and lighting, when the pressure is six volts. The output of the dynamo is five ampères at eight volts, but it is a very much more efficient mechanism as a starter, when it gives a power of, roughly, 1 h.p., passing sixty-four ampères when the compression is full and fifty-four when the compression is released by means of the neat decompressor device now fitted to Indian machines. The batteries have a capacity of thirty-five ampère hours at twelve volts, and of seventy ampère hours at six volts.

The head and tail lamp take approximately two ampères, so that there is at least twenty-four hours' light in the battery with a considerable margin for leakage.



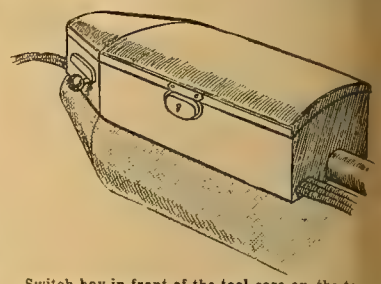
The Indian automatic cut-out combined in case with current regulator and coil. They are fixed to the rear down tube.

The dynamo cuts into action at 800 revolutions, that is to say, about 400 engine revolutions. In order to prevent the voltage rising above a predetermined minimum, a vibrating armature has its coil run in series with the field magnets, and has the effect of preventing the voltage rising, however high the speed of rotation of the armature may be, as this vibrating armature only passes a strictly limited and definite amount of current to the field windings. Combined with the regulator armature, and carried in the same waterproof case with it, is an automatic cut-out, which ensures that the dynamo is disconnected from the battery when the output of the former is insufficient to charge the latter.



Design of Indian head lamp.

The armature spindle is fitted with a simple form of cone clutch, which acts as the shock absorber, both when the machine is being driven as a dynamo and when it is driving the engine as a motor. This considerably relieves the strain and stresses which would otherwise be imposed upon it through a chain drive connecting it to an engine in which the explosion impulses occur at uneven intervals.



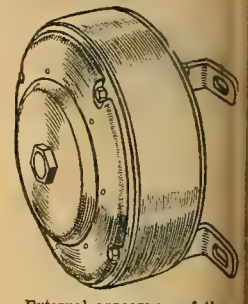
Switch box in front of the tool case on the top tube of the latest Indian.

In order to withstand the very high discharge which is required for starting purposes, the batteries are of a special construction in which the plates are protected by wooden packing pieces, which also serve to prevent any likelihood of the electrolyte spilling or washing about. The batteries weigh 23 lbs. and the motor dynamo 24 lbs., but it is claimed that the total addition to the machine is not more than 25 lbs., taking into consideration the fact that it does away with the ordinary foot starter, the acetylene generator, and the lens mirror head lamp. The designer of the Indian system gives it as his opinion that since a dynamo alone would weigh from 10 lbs. to 15 lbs. without any mechanism to make it suitable for being run as a starting motor, the starting apparatus only means a nett increase of 9 lbs. to the weight of the machine. One may, however, regard these figures as decidedly problematical, as there is no doubt that an efficient dynamo, a head lamp, and a very small tail lamp could certainly be made at a much less weight than 10 lbs., and, in point of fact, several examples have been produced well under this weight.

The coil which is used in place of the magneto is of a special type, and is claimed to be of considerably higher efficiency than those previously used for motor cycle work. It is fitted with a separate condenser of unusual size, and it is claimed that the spark it provides is more efficient for firing the mixture than that which is produced by a high tension magneto. The coil is of a waterproof type, and is mounted on the down tube below the steering column, and close beside it is the case containing the cut-out and automatic regulator previously referred to.

The head lamp is of very neat form, as shown in the illustration, and embraces a silvered parabolic reflector. It is practically airtight, and therefore is not liable to tarnishing through bad weather. The focussing attachment by which the glow lamp is carried embodies also a very neat push-in switch, which does away with the necessity for any other form of control.

In order to change the electrical machine over from a dynamo to a motor and *vice versa*, a single switch is all that is required, and this protrudes from a small metal box, which is carried forward



External appearance of the Indian dynamo and starter

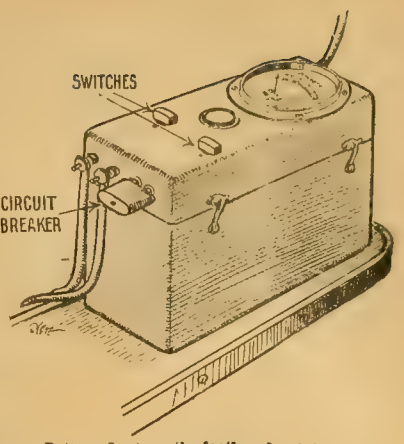
Electric Lighting Systems.—

on the tool case, mounted on the top of the tank. This box contains a rotary switch, which connects the battery cells in series or in parallel as required. For starting purposes the switch is pressed forward, and when released springs back into the charging and lighting position. Underneath the rider's saddle, and attached to one of the tubes of the frame, is a vulcanite body containing two interrupter plugs, which when withdrawn absolutely prevent anybody from tampering with the electrical outfit whilst the machine is left unattended. The wiring throughout is carried in metal-covered cables, and the whole installation is a wonderful example of neatness in design and construction. A small tail lamp is fitted at the rear, and the cable for this purpose is housed inside the head of the rear mudguard.

The Motosacoche, another Example.

The only other machine exhibited at Olympia with an electric lighting equipment incorporating a dynamo was the Motosacoche, in which, however, the installation is on a considerably less ambitious scale. It is, however, particularly interesting, as it is the sort of lighting equipment which can be very readily adapted to the ordinary standard type of machine.

The dynamo in this instance is quite a small affair, and is supported on a bracket carried by one of the saddle fork tubes at the rear of the machine. Its armature spindle is furnished with a small roller which is held by a coil spring in contact with the wall of the tyre, which drives it by friction. The roller is scarcely more than an inch in diameter, and consequently a very large gear ratio is provided. Accordingly, at thirty miles an hour, the dynamo spindle has a theoretical speed of nearly ten thousand revolutions per minute, which is, of course, extraordinarily high, but no doubt a considerable slip will take place and so act in the nature of a self-regulating device. The machine itself incorporates a single bell-shaped magnet arranged in a similar manner to that adopted on the Mea magneto. This magnet is of the permanent type, and the armature re-action which follows upon the use of such a magnetic field, is relied upon to prevent the voltage of the output rising above a desirable amount. Unfortunately, detailed particulars of the internal construction of this compact little outfit were not available. The case of the dynamo contains an automatic magnetic cut-out, which disconnects the dynamo with the battery when the former is running at an insufficient speed. This occurs at a speed of the machine equal to about seven miles per hour. The dynamo lights the lamp through a battery which it keeps constantly charged. This battery is contained in a neat metal case, either carried on the footboard of the machine or clamped to one of the sidecar tubes. The top of the battery box is complete with a voltmeter and ammeter, alternate readings of which can be obtained by pressing a push switch, and two small rotary switches which control respectively the head lights and the tail light and side lamp attached to the sidecar. The dynamo output is about nine watts or one and a half ampères at six volts. The head lamp is a neatly constructed unit, and although of comparatively small size gives a very large volume of light. The sketch shows its neat appearance and the light form of bracket which is employed to support it from the steering head.



Battery fixed on the footboards of the Motosacoche machines.

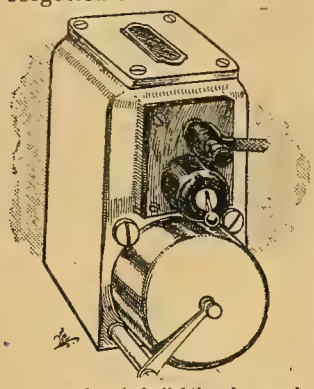
Head, inspection, rear, and sidecar lamps respectively on the new Motosacoche machines.

Electric Lighting for Cycle Cars.

Several stands in the Gallery contained dynamo outfits more or less suitable for cycle cars, and one with a stretch of the imagination might have been regarded as being suitable for motor cycle use, though its size was rather large and its weight not inconsiderable. This was shown on the stand of Messrs. S. Wolf and Co., and was a twenty-five watt machine with an output of three ampères at eight volts. This employed an H section armature with a special design of commutator. Inside the dynamo carcase is placed a simple form of magnetic cut-out for the purpose of disconnecting the dynamo from the battery when required. A sketch is given of the six volt accumulators used with the set, which was not, however, shown in a complete state. The batteries are carried in a wooden box, which is covered by a leather wallet, designed to be attached to any suitable point of the frame. Something a little more permanent than this would, the writer believes, be required by a dis-

Electric Lighting Systems.—

criminating motor cyclist, as those who had experience of accumulators in the early days will not have forgotten that on some of the original lightweights, in which the accumulators were carried in a somewhat similar manner, the near presence of acid and acid vapour caused the leather very soon to perish, and the inevitable result was that the accumulator was deposited on the road when the machine met with a more than usually large "bump."

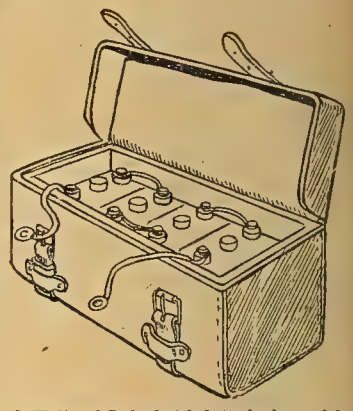


A small electric lighting dynamo by S. Wolf and Co.

Why not a Two Filament Lamp?

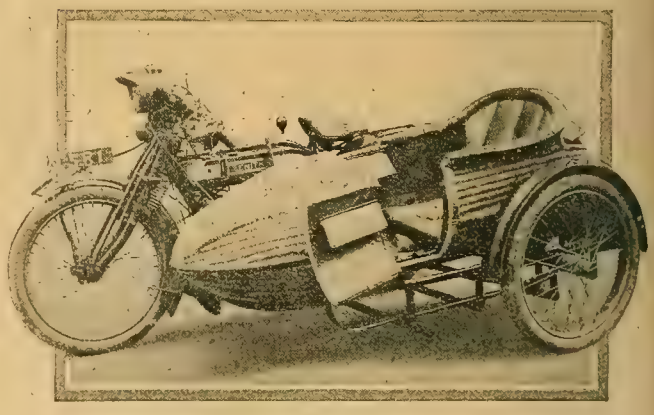
It will be seen from the figures connected with the Indian outfit that roughly fifty per cent. of the total weight (which is, of course, the most serious objection to electric lighting for motor cycles) is due to the accumulators. If the electric machine is to serve as a self-starter, and if as a secondary function it is to serve, as it is claimed the Indian machine can serve, as an auxiliary to the engine at low speeds, since it gives approximately one horse-power, then the weight of the accumulators cannot very easily be cut down. On the other hand, if the dynamo is required solely for lighting purposes, then it seems to me that a very easy way out of the difficulty can be found, and in fact the weight of accumulators reduced by as much, perhaps, as seventy-five per cent. It should be borne in mind that it is only when the machine is travelling from, say, six miles an hour upwards, that a full volume of light is required. Below this speed light is only wanted in order to comply with the law. This being so, it is obvious that unless the machine is standing stationary, there is no particular difficulty in obtaining a dynamo which would give all the current required practically irrespective of a battery altogether, and consequently the battery would only be used when the machine was stationary, which, as pointed out above, need, and probably would, be very seldom. The battery, however, is essential, for the purpose of acting as a cushion between the dynamo and the filament of the lamp, otherwise with slight increases of voltage the filament would be overloaded and would very rapidly wear out. Now it seems to me that the difficulty of weight could easily be got over by the use of either two separate bulbs in the same lamp, or, if necessary, of two separate lamps, or what would be better still of two filaments inside the same bulb, one giving only a very little light and taking, say, one-half of an ampère, whilst the other would be the principal source of illumination. Any convenient form of switch would serve to connect up either filament as desired, but it might be possible to incorporate this switch with the automatic cut-out so that the connection would be effected quite automatically. If this were done a battery of about ten ampère hours capacity would be ample for all purposes, as this would give a constant light for at least ten hours, which would be far more than anyone would think of leaving a motor cycle out unattended. In taking very bad corners or difficult bends on steep hills at night the speed of the machine might drop below that at which the dynamo commenced to charge the battery, and therefore the full discharge of the large filament would be taken from the battery. This, however, is a state of affairs which would probably last only a very short time, so that there would be always plenty of margin for safety. The best idea with a variably geared engine would be, however, to drive the dynamo from the motor itself, as is done in the case of the Indian, and not rely upon mere road speed for providing the necessary current generated.

There is nothing new in the two-filament lamp, which is a commercial product that has been in use many years, and this would prove undoubtedly the best solution to the problem, as it would enable one filament to be perfectly focussed in the lens mirror without allowing the other to detract from the volume of light given. If two bulbs were used in the same lamp, a black shadow would be projected forward, whilst if two sets of lamps were used the objection might be made that they were providing an unnecessary and possibly unsightly complication.



S. Wolf and Co.'s electric batteries in special leather wallet.

In conclusion, it is perhaps worth reminding readers that before very long there is a very considerable chance of motor cyclists seeing a practical and efficient system in which illumination is obtained by means of the petrol contained in the tank, which is volatilised and led to a special form of incandescent burner in connection with a head lamp of the ordinary type. This, in motor cycle work alone, is probably the most serious rival which electricity has to face, and it is even lighter than an electric installation, involving, as it does, no extra parts, whilst it can probably be constructed at a very much lower price.



A cane bodied torpedo sidecar marketed by Maude's Motor Mart, 136, Great Portland Street, W., the chief features of which are an underslung chassis, a large box for spares at the back of the body, cee-springs, four-point suspension, luxurious upholstery and an extra heavy spindle.

AVON

An ENDURING Non-skid.

THIS AVON Combination Cover, with its clean-cut bars of thick rubber alternating with steel studs, is rapidly acquiring a unique reputation in cycle car work. It combines the road-gripping qualities of the fully-armoured type with the durability of an all-rubber tread, and stands up to the severest work with remarkable vitality.

A.J.S. & Six Days' Trial.

Messrs. A. J. Stevens and Co., Ltd., Wolverhampton, writes:

"There has long been a need for a tyre to fit to the driving wheel of a passenger combination, and we think you are the first to supply that one. Some time ago we gave one of your combination tyres a thorough test, and we were so satisfied with its behaviour that our Mr. A. J. Stevens decided to use one in the Six Days' Trial. For the first time he was able to go through the whole Trial without having to change the driving tyre.

"It would perhaps be as well to explain that the necessity for changing tyres in the previous Trials was not because the tyres wore out, but because the non-skid properties entirely disappeared in about three days, and a new tyre would be necessary, to prevent slip when climbing very steep hills. In the case of your tyre, however its non-skid properties were as good at the end of the Trial as at the beginning.

"We have recommended your combination tyre to many of our clients, and in every case they have been well pleased with the result."

Every motor cyclist should carry a shilling box of KURKUT (Cure-cut), a handy stopping for the instant "healing" of cuts and gashes. KURKUT is the "stitch in time that saves nine."

HORLICK'S MALTED MILK LUNCH TABLETS

MALTED BARLEY, WHEAT AND MILK, IN TABLET FORM.

A Delicious Food Confection to be dissolved in the mouth.

FOR MOTOR CYCLISTS AND ALL TRAVELLERS

Horlick's Lunch Tablets contain all the valuable nutriment of full cream milk and choice malted grain in a convenient tablet form. A few dissolved in the mouth from time to time will supply the necessary nutriment to maintain strength and vigour, and restore energy when Touring or Racing, and are useful at all times.

Supplied in Glass Pocket Flasks, ONE SHILLING each.

May be refilled as occasion requires from larger bottles mentioned below.

A SPECIAL OFFER TO MOTOR CYCLISTS.

One of these Flasks of Tablets, as illustrated, and also one of our New and Accurate Road Maps of ENGLAND and WALES in Leatherette Case—all Roads shown in Colours and Classified—will be sent by post to any address, on receipt of stamps or postal order for **ONE SHILLING** Mention "The Motor Cycle."

Two-third actual size.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Curious Case.

Sir,—In *The Motor Cycle* of October 16th, the letter "A Curious Case" reminded me of an instance when I was troubled by missing and firing in the carburetter. I was jogging along all day without finding out what was the cause, until it became dark, and I then saw what was the trouble. The carburetter control wire had come slightly adrift, and was swinging on to the sparking plug.

I take much pleasure in reading "Letters to the Editor" in *The Motor Cycle*, and have gained many useful tips from them. M. MACFARLANE.

Nishihu, Osaka.

Reckless Driving.

Sir,—I am quite in agreement with Mr. Thomas's remarks published in your issue of the 4th inst. relative to reckless driving on the part of some motor car owners and drivers.

A goodly number of motor car drivers, around this part of the country at any rate (Watford, Herts.), appear to be under the impression that the roads are constructed and maintained solely for their own use and pleasure, and they show but scant regard for cyclist, pedestrian, or motor cyclist either.

As a case in point, I would like to mention that only three weeks ago, whilst travelling on my motor cycle between St. Albans and Watford, when negotiating St. Stephen's Hill, I met the driver of a fairly large car, who took the bulk of the road (which, by the way, was the only part dry and in good condition), forcing upon me the alternative of either taking a kerbless footpath or trying my luck on a narrow, loose, and greasy piece of roadway. Since the law forbids us to use the footpath my choice fell on the latter. Result—a bad sideslip, ending in a cut and bruised knee, to say nothing as to damage incurred to my machine. The car, I may add, did not stop, notwithstanding the fact that two friends, following some distance behind, called out to the driver as he passed.

Such circumstances as these do not suggest fair play or create a feeling of goodwill towards the car owner.

A. E. TWIGGER.

Lightweights.

Sir,—I noticed with interest the advent of several lightweights which give promise of more closely harmonising with general expectation than any previous specifications that have come under my notice.

As you have pointed out the name "lightweight" is often a misnomer, since it is not at all uncommon to find it scaling as much as 150 lbs. Possibly, however, there is some method in their madness here, as witness the stock advertisement of one well-known model to the effect that the machine will not tumble to pieces after one or two season's wear. Of greater importance, however, than even the question of weight is that of gearing, so persistently insisted on in your journal. To cut down the h.p. and to give no compensating gear ratio is surely the height of fatuity. As you remark, what ought to be considered a *sine quâ non* is the incorporation of an emergency gear. The advantage of three gears as against two is hardly matter for argument, and the increased cost would surely be infinitesimal. The tendency is to imagine that a few extra miles per hour on the level is what really matters, and that power on hills can be left to look after itself.

SHAFT-DRIVE.

Garage Charges.

Sir,—With regard to the question of excessive garage charges, I should like to call attention to the fact that whilst on holiday this year I, on several occasions, "put up" my motor cycle at G. R. Barrett's garage in Canterbury, and although the season was in full swing—in fact it was Cricket week, when every garage was taxed to the utmost—I was only charged 3d. for a whole day, from 10 a.m. until 10-30 p.m.

I think that this is a reasonable charge, seeing that an ordinary bicycle can be stored for a whole day for 2d. and a motor cycle takes up but little more room, and usually the rider buys petrol or oil before leaving. F.A.H.

Insurance.

Sir,—For some years I have been insured with a prominent accident insurance company against accidents generally, and in May last I wrote them specially asking if my policy covered me against accidents whilst motoring, and was informed that I was covered against any accident whatever (no mention being made that it was necessary for me to be disabled).

In July last, whilst on holiday in Keswick, I had the misfortune to have a spill with my motor cycle and sidecar, in which I injured my shoulder and knocked out two of my front teeth, which latter I have been obliged to have replaced. I notified the company on the day following the accident, and duly received a formal acknowledgment of my letter, but nothing further until last month, when I sent the dentist's account for £5. I then received a letter from the company's agent, stating that they could not admit liability because I had not been disabled, but, "as an *ex gratia* payment," they enclosed cheque for £1. This I refused to accept, and subsequently the company sent a representative to see me, who finally offered £2 2s. to settle the matter, and stated that if I could find a company that would admit liability under their policy for such an accident, his company would probably re-consider my claim. Although the injury to my shoulder partially disabled me for a fortnight, I did not make a claim for disablement (which would have been £6 6s.), as I did not anticipate for a moment that the company would decline to pay me what the accident actually cost me.

I feel convinced that this is a matter of great interest to motorists generally, and shall be glad to know if any of your readers have had a similar experience. If any accident insurance company exists which will provide in their policy for such a rare accident as this, I am sure that it will be to their advantage to make it known to motorists through your columns. One thing I can assure them of: they will have at least one more who will take out a policy with them.

A. V. CATTERALL.

Why More Air with Benzole?

Sir,—Mr. Gibson seems to be unnecessarily severe with me for having advanced a theory of my own after making a few statements concerning benzole, which, I thought, might interest motorists using that fuel. I admit the wording was rather misleading, but the theory can be justified all the same.

Let me state at the outset I am no expert on carburation, but merely a chemist of long experience who has taken to motor cycling for four years, greatly to his benefit in health and happiness.

Now, as to gaseous carbon—that great absurdity not existing within miles of a motor cycle. I suppose Mr. Gibson is aware that acetylene gas (not many miles off) contains over 92% of carbon, and that, in order to burn it to the best effect and prevent deposition of carbon on the burner and lamp, the burner makers find it necessary to make special air-inlets in the burner: this is not necessary with burners containing less carbon and more hydrogen. Again, benzole or petrol is distilled at a temperature below that of boiling water—completely converted into gas (the fact of its being combined with hydrogen does not make it not a gas, and it is necessary, first, to gasify your motor spirit before you can ignite it by the sparking plug in the cylinder). What becomes of the carbon if it is not gasified?

Although there is much to be said for and against my theory, I fail to see that my argument is a loose one. I say in effect A contains 8% more carbon by weight than B, and showing that when gasified carbon requires four times as much oxygen or air as hydrogen does for complete combustion, I say A must require more air than B.

I have worked out many formulæ, some showing for and some against my view, and, on consideration, I am inclined to agree that the heavier weight of benzole has most to do with the extra air or smaller jet required. There are, however, several physico-chemical problems involved, apart from the mere weight of fluid passing the jet.

I put down the greater difficulty of starting up on benzole in cold weather to its higher boiling point, but once the engine is thoroughly hot and kept at high speed, the need of extra air becomes evident in practice.

With regard to the action of benzole on tanks, I have not been troubled that way, but it may be due to the fact that I am using a very high grade benzole, produced in the works at 100% commercial purity, and afterwards diluted down. Probably that obtained from an ordinary gasworks or tar distillers would have more action on the soldering of tanks.

CHEMIST.

The Oversize Single.

Sir,—Our attention has been called to the article appearing on page 1627 of your issue of December 4th.

We quite understand that it is difficult, nay, almost impossible, for a conscientious writer like "Ixion" to put together a candid article week by week without "treading on the toes" of somebody.

As there are two sides to every question, we shall be glad if you will permit us to make a few comments upon "Ixion's" article, as this, in our opinion, is likely to mislead prospective motor cyclists who lack technical knowledge.

Your contributor's concern for competitions of the future need not be taken seriously: if a manufacturer has to choose between building machines for the public or for competitions, he will certainly adopt the former course.

Again, sidecar enthusiasts, as a whole, do not crave for the last notch of speed. Any modern big single sidecar combination will reach the safe limit of road speed with power in hand. The average rider wants power to climb steep gradients under full load. This condition is not usually found in racing engines. Arduous reliability trials are still open to all passenger vehicles, with little or no restriction as to capacity. After all, if nobody breaks away from what is regarded as standard practice at the moment, we may well ask, "Whence comes progress?"

The complaint that big singles cannot be made to run "quite so sweetly" as 500 c.c. singles is true. It is also true that 500 c.c. singles cannot be made to run as sweetly as 350 c.c. singles, and that big twins approaching 1,000 c.c. cannot be made to run so sweetly as a medium twin of, say, 700 c.c., and that V twins, as a whole (except, perhaps, the very few 90° V twins), cannot equal the horizontal twin for sweetness in running; and so on *ad lib.*

This superiority of one type over another is merely a question of degree. In a modern well-designed big single the advantages of the type outweigh any small disadvantages there may be due to vibration and unequal torque. We venture to ask by what right or rule does "Ixion" lay it down that 500 c.c. is the ultimate limit for a single?

When, however, he asserts confidently that the big single cannot represent finality as a sidecar hauler, we are once more in agreement with him. The same remark applies equally well to any other type of engine on the market.

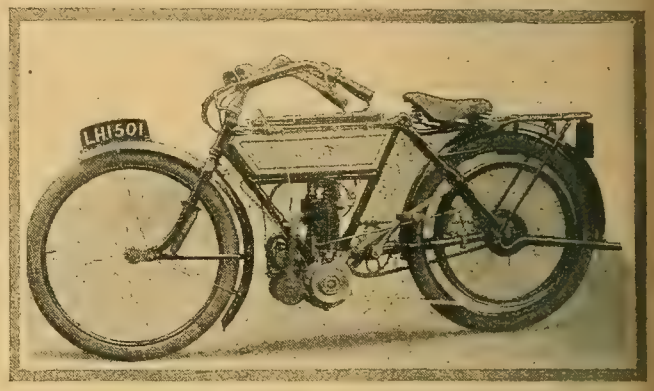
Time and experience have proved the practicability of the big single, and, in our opinion, it is destined to have a big future. As pioneers of this type, we are gratified to see other makers, and makers of repute at that, coming forward with singles of larger capacity than the accepted standard. It must be abundantly evident to the thinking individual that these manufacturers have not embarked on the big single proposition without making every trial and test.

BAYLISS, THOMAS AND CO.

W. H. CARSON.

A Cheap Mount.

Sir,—Being a constant reader of your valuable paper since its inception, and knowing that there are many would-be riders if they could get a reliable cheap mount, I am enclosing a photograph of an old 1¾ h.p. Werner generally renovated and modernised. The work was carried out by a local man. The frame has been cut down, tank altered, new silencer, frame and wheels enamelled, and engine taken down and tuned up. The result is that the machine is quite up-to-date, very safe on greasy roads, because of its low position, and it will do thirty miles an hour on level country. The total outlay has been £15.



An old Werner, modernised by H. E. Thomas.

H. E. THOMAS.

Miniature Four-stroke Engines.

Sir,—We note in an otherwise admirable article that your contributor, Mr. B. H. Davies, comments upon what he is pleased to term the "toy" four-stroke engine, with its dollar-diameter belt pulley.

Lest this may by some of your readers be imagined to refer to our own lightweight, because we have in the first place pinned our faith to the well-known four-stroke principle, we would like to say that the O.K.-Junior has neither a dollar-size belt pulley nor direct belt drive.

The transmission is by chain from engine to breakfast plate size belt pulley, and we trust that this slight information will modify the views of Mr. B. H. Davies on the four-cycle type of engine.

His trouble seems to be that some manufacturers are fitting direct drive to the engine with a small size belt pulley. We want it clearly understood that this does not apply to the O.K.-Junior.

Further, we would point out that the big ends and valves on this engine are as large as found on some engines of 3 h.p.

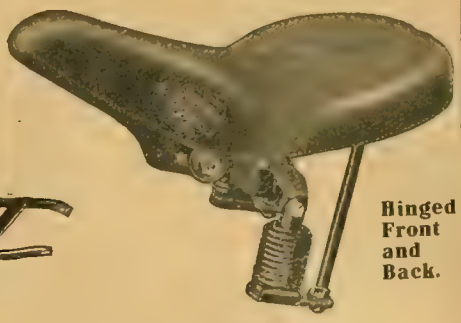
HUMPHRIES AND DAWES, LTD.

Sir,—We feel that it is necessary to express our disagreement with the sudden conclusion arrived at by some of your contributors in the issue of December 4th, that a small four-stroke engine must soon lose its "tune." This may have been true of certain types of engines which have been marketed in the past, not because they are four-stroke engines, but because designers in producing lightweight engines went to extremes in weight reduction, and provided inadequate wearing surfaces, and consequently the engine suffered from sheer wear and tear.

In the "Junior Precision" engine all wearing parts are as substantial as though the engine were four times its horse power. If the cycle of operations affects tune at all then the balance of merit lies with the four-stroke engine, as on account of its higher thermal efficiency it does not have

Lycett's
"V.A." Pan Seat.

Lycett's "SWAG-BAG."



Hinged Front and Back.

Lycett's "LYCO" Pan Seat.

Ask for "LYCETT'S"

— when buying EQUIPMENT—and you'll get the BEST that's made.

¶ "LYCETT'S LINES" are exceptionally well-made of highest quality materials *only* - and embody many valuable patented features which combine to ensure the highest utility and comfort of the rider awheel.

— chiefly to be noted are the famous "LYCETT" Saddles — the "Seats of Comfort" — two of which we illustrate here, viz. :—

Lycett's "V.A." Pan Seat. Our New Improved Saddle. Gives exceptionally LOW RIDING POSITION. Anatomically-shaped Top with strong metal base covered with selected Pig-skin and padded with best Felt. Its VERTICAL ACTION SPRINGS *absolutely kill all vibration* — no bouncing is possible. Price **27 -**

Lycett's "LYCO" Pan Seat. Hinged at front and top of rear swinging tension springs — allowing a straight pull in action. Top is anatomically shaped having a strong metal base, covered with selected Pig-skin and padded with best Felt. This saddle completely isolates the rider from all vibration and bouncing. Price **27 -**.
— Did you notice the predominance of LYCETT'S Saddles at OLYMPIA? quite 60% of the saddles fitted were LYCETT'S!

Lycett's "RELIABLE" Belt. Built of Rubber and Leather - expressly designed to afford greater grip, flexibility, strength, speed, long life, and absolute reliability under all conditions. Prices ¾in. **2 -**, ⅞in. **2 4**, 1in. **2 7**, 1¼in. **3/-** per foot. FASTENER **1/-** extra.

Lycett's "SWAG-BAG." Extremely useful handy bag — capacious and adjustable to size of space contents take up. Dust and Waterproof. Made in two sizes and three qualities. Prices **5/7** to **15/-**

Lycett's Armour-plated Tool Bag. Made of best quality leather, hand-sewn, and lined with Flaxite. Encased in stout metal. Full front and Patent Spring Lock. Made to clip or strap on carrier. Three sizes. Prices **3/9** to **6/9**.

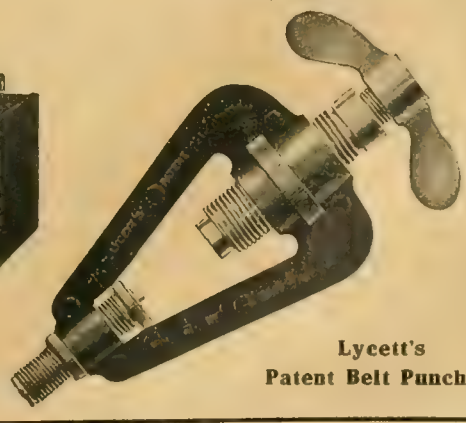
Lycett's Patent Belt Punch. Adjustable to any size of Belt, pierce hole and inserts Pin *dead central* at *one* operation. No material is cut away and the Fastener cannot pull out; thereby greatly increasing the life of the Belt. Price, complete with Leather Case and Spare Washers, **4.-** each.

— "LYCETT'S LINES" are obtainable of all Agents, or supplied direct if any difficulty. Ask for "The Saddle Book" — it describes a host of good things, and is an invaluable aid in buying efficient equipment.

LYCETT'S "The Saddlery" Birmingham.

Guaranteed for 2,000 miles minimum.

Lycett's
"ARMOUR-PLATED"
Tool Bag.



Lycett's
Patent Belt Punch.

R.H.S.

FLEXIBLE

The flexibility of the B.S.A. Motor Bicycle greatly simplifies control, as a wide range of speed is always at the service of the driver. Being easier to handle and less expensive to run than a heavy high powered machine, the B.S.A. Motor Bicycle is ideal for side-car work. It starts easily, gives ample power, and when fitted with the B.S.A. Countershaft Three-Speed Gear can be relied on to take a side-car up almost any hill with a reserve of power.

The B.S.A. Motor Bicycle
(as illustrated)

fitted with B.S.A. 3½ h.p. Engine, B.S.A. Three-Speed Countershaft Gear, Chain-cum-Belt Transmission, B.S.A. Semi-Automatic Carburetter, B.S.A. Spring Forks.

Price complete -	£59 15s.
Fixed Engine Model	£49 5s.
Free Engine Model -	£55 10s.
Three-Speed Countershaft Gear & Chain Drive Model with 499 c.c. or 557 c.c. engine - - -	60 gns.
Tourist Trophy Model	£48 10s.

THE BIRMINGHAM SMALL ARMS COMPANY LIMITED,
13, SMALL HEATH, BIRMINGHAM.

A Motor Cyclist's advice:—"Always use B.S.A. Cylinder Oil for your Engine."

In answering this advertisement it is desirable to mention "The Motor Cycle."

to be so abnormally lubricated, and what lubricant is used is not so rapidly converted into carbon, as this type of engine admittedly runs cooler than the two-stroke.

That the latter engine has a range of possibilities is admitted, but to jump to a general conclusion that it has yet equalled the four-stroke engine in all round merit is opposed to the experience of internal combustion engine practice over a wide field, and places your contributors in the same category as the writers they criticise for assuming that other well-known types of motor cycles are rendered obsolete by the introduction of a new type.

F. E. BAKER, LIMITED.
FRANK BAKER, Director.

A Ready-for-the-Road Motor Cycle.

Sir,—With reference to the letter of "G.T.Y." in your issue of the 11th inst., it may interest the writer to know that we list our motor cycles as complete for the road, with Lucas lamp, generator and horn, spare valve, sparking plug, belt fastener, belt punch, and tyre levers. These fittings are, of course, included in the price of the machine.

It is a wonder that more manufacturers have not done this before, as it saves a customer a lot of trouble and worry when purchasing a new motor cycle.

We have been supplying machines like this all through our 1913 season; and it has turned out an immensely popular move, as proved by the numerous congratulations received from our customers for turning out a machine in so complete a manner. BURNEY AND BLACKBURN.

The Effect of Benzole on Valves.

Sir,—I notice a letter in your issue of December 11th from F. W. Wagner *re* effect of benzole on valves. I have a 1912 Bradbury and sidecar, and have had exactly the same experience. After about 400 miles the exhaust valve gets completely burnt out, the inlet valve remains quite perfect and both valve seatings also sound. I have had three exhaust valves this year, all have been trued up and used again. As the cast iron seatings are untouched I think perhaps that at the high temperature of combustion there is something in benzole which attacks nickel steel valves and not cast iron because my seatings do not even pit. I trust this correspondence will elucidate the reason of this effect on valves by benzole. J. CHANDLER.

Sir,—In a recent issue you ask for information *re* the effect of benzole on the interior of tanks. I have seen several peculiar cases of benzole acting on solder and dissolving zinc. Perhaps several users may have noticed small white and yellowish crystals on their petrol tubes and taps. Has it ever occurred to anyone to find out what they are? I fancy they are nitrates of zinc and lead, due to a certain percentage of nitrogen peroxide in the benzole. I have not yet tried the experiment, but I think if a strong solution of caustic soda were added, and the whole solution carefully re-distilled, the first results would be a purer benzole. After treating the distilled liquid carefully with a dryer (sulphuric acid or calcium chloride or dried copper sulphate) it would be ready for use. We would get (1) a pure hydrocarbon, (2) perfect combustion, and (3) no action on tanks. The cost need not be greater than at present, as, if we take Economin Company's prospectus, we find they estimate to make benzole for 5½d per gallon nett. Why not spend another 2d. and turn out a purer product? We will still have a fuel of more power than the present one, and more powerful still than petrol. I have tried pure benzole (benzene, rectified), and have had much better results than either "motor spirit" or petrol, with no crystallisation on my tubes after standing for three or four days. I got a greater mileage, viz., seventy-two on pure benzole, sixty-seven on benzole (motor spirit), and sixty on petrol. My machine is a 4½ h.p. single-cylinder with sidecar, the roads here being nothing but hills from 1 in 20 to 1 in 10. Perhaps some manufacturers will try and experiment. If results prove better there will surely be a far increased sale, as many who use petrol now only use it on account of its cleanliness, and because it does not act on the solder. I saw a new Alldays where the seams and joints were all gone with using benzole.

MOTORIST AND CHEMIST (Oldham).

Signposting.

Sir,—I have read various correspondence on national signposting. Whilst giving attention to the open highways I think a few direction plates would be appreciated in towns and cities. I have always managed to get into large towns all right, but to get out is like trying to get out of a maze. Not many persons can direct you to a place twenty miles away, let alone sixty, and even then it is rather puzzling going down tram roads and keeping a look-out for, say, the seventh turn to the right and fifth to the left.

ROLAND WARD.

Carburetters, other than Standard.

Sir,—I desire to draw attention to a matter, the seriousness of which will be well recognised by those concerned. A large number of gentlemen in various parts of the world order machines fitted with Binks carburetters, and we are constantly getting letters from these gentlemen saying that they do wish that we would supply the carburetter to Messrs. ———, as they say the sole difficulty in delivering the machine rests with us, as they cannot get the carburetter from us. Now in several cases the manufacturers are deliberately deceiving their customers, as they have never ordered the carburetters from us. No doubt, fitting a few odd carburetters does cause a certain amount of disorganisation, but we venture to think that they should tell their customers the truth. Their idea, probably, is that the customer will get tired of waiting and eventually order the stock carburetter.

We trust that other gentlemen who have ordered machines fitted with our carburetters experiencing anything of this kind will acquaint us of the circumstances.

C. BINKS, LIMITED.
CHAS. BINKS, Managing Director.

Do Sidecars Skid?

Sir,—I do not know whether what follows will interest your numerous readers, but during last July my wife and I made a journey to the South and West of England per sidecar. The trip was very enjoyable bar tyre troubles, such as rips, cuts and punctures, but an incident occurred of which I have failed to obtain, to my mind, a satisfactory explanation. It was when returning, and passing along a Worcestershire road, it was raining at the time, when suddenly the sidecar tipped up and I was thrown off the saddle, and my left leg not getting clear of the machine, was dragged many yards along the road before getting free. Fortunately, neither of us was injured with the exception of a fair amount of gravel rash on my right hand which was cured in due course. The combination turned on the grass on the side of the road a few yards from where I was released, and my wife, being fully instructed, raised the exhaust and stopped the engine.

Lighting up time on this date was 9-15 p.m. and the time of our trouble was about 8-45 p.m. I could see distinctly a hundred or one hundred and fifty yards ahead—yet I saw nothing to cause the upset. I ought to say the speed we were travelling was eighteen to twenty miles per hour, and the road had undergone repair, perhaps a couple of months previously, the surface being tar macadam. After examining the wheel tracks, which were distinctly marked on the middle of the road, I failed to discover any obstruction, and am still at a loss to account for what happened.

It will perhaps be as well to say our outfit is a 1912 Clyno and sidecar, coachbuilt, weighing together about 360 lbs. SIDECARIST.

Sir,—I read with greaf interest the letter of Mr. J. W. Newall, and I most certainly say sidecars do skid. I had a very similar experience to his, which also occurred outside a little town in Cheshire. I was driving a 3½ h.p. and sidecar, with my brother as passenger, when the whole turnout skidded across the road, missing a deep pitch, luckily for my passenger and myself, but by only a few inches. The roads were in rather a greasy condition owing to the heavy rain, but the crown of the road was not excessively high. This is my first experience of a sidecar skidding, and I sincerely hope it will be the last, as it is not at all a pleasant sensation to see the sins of a lifetime (although not a long one, fortunately) rise before one.

JOHN ARTHUR HALL

Bicycle as Sidecar.

Sir,—Some months ago a writer mentioned in *The Motor Cycle* that he had a "side bicycle"—that is a pedal cycle minus the front wheel—attached to his motor cycle, and that he was going to give it a good trial, and then he would let us know how it had succeeded. Although I have carefully kept a look out, I have never seen anything mentioned about it, but hope he will let us know how he fared, as I am thinking of trying the experiment myself. C.D.

[We saw such a contrivance on the road at Taunton upwards of five years ago.—ED.]

Large Wheels for the Colonies.

Sir,—Seeing a letter under the above heading in last week's issue of *The Motor Cycle*, page 1663, from Mr. A. W. Hampson, of Toronto, advocating 28in. wheels for colonial use, we think it may be of interest to him and to others to know that we are making a sidecar combination fitted with wheels of this size specially for colonial use, and that we exhibited this model at the recent Show at Olympia, where it created considerable interest.

We quite agree with your correspondent that the larger wheels will prove an advantage over rough roads, and for this reason we are recommending it not only for use abroad but wherever roads have exceptionally bad surfaces.

THE SPARKBROOK MFG. CO., LTD.

Mudguarding,—A Problem of the Future.

Sir,—In your issue of the 4th inst. is an article on the possibility of protecting the rider of a motor cycle in wet weather. I therefore send you a photograph of a splendid protection, put on the market last month, in the form of "Robinson's Registered Covercape." This cape, which is made of high quality mackintosh material, fits in a few moments right over the handle-bar of the bicycle, covers the whole of the front, and at the same time fits round the rider's neck and back; it is held in position by press buttons, so that in case of a fall it would immediately free the rider and he could not possibly be entangled. There are now several motorists round Lowestoft using these capes, and they are all delighted with them, as they can ride in any weather and keep their engine, ignition, belt, and themselves perfectly dry. Several motor cyclists have drawn my attention to your article.

LEO ROBINSON.

L. Robinson's "Covercape" for motor cyclists' wear.

Sir,—*Re* your leading article on weatherproofness. Having ridden to and from business, a distance of three miles each way, two macadam and one tram set, through all weathers, for four years, I claim to have had some experience, and am of the firm opinion that motor cycling is still a fine weather pastime. On arriving at business after a wet journey I must spend an hour wiping the machine down and drying the intricate parts, or else keep it thickly coated with grease, and not touch it further, in which case, after two or three weeks, the mud and grit begin to work their way into the bearings, and proper lubrication of the bicycle parts under these conditions is very difficult. In the spring, on dismantling the machine, many nuts will be found to have rusted up and become immovable, the enamel will be chipping off, and the machine generally will have depreciated something like ten per cent., in addition to the usual depreciation of a well kept machine. In addition to these drawbacks there is the one of sideslips and spills, which are unavoidable, and frequently run up a big bill for breakages, and sometimes doctors' bill as well. So I shall leave the winter riding to those with more time and money than myself, and wait until a machine comes along which can keep a straight line in grease and have a hose-pipe turned on it once or twice a week. R 350.

Sir,—I read with much pleasure your interesting article in the issue of the 4th inst. It is quite evident that no progress has been made by the makers of motor cycles in protecting the driver from the weather.

The accessory maker has doubtless made improvements by providing Hutchinson waders and other similar articles, but this does not do away with the unsightly appearance and inconvenience of wearing such articles. One calls on a friend, but cannot present oneself inside the house until one has gone to the labour of removing one's bespattered outer garments, and then replacing them before continuing one's journey.

I was very pleased to see that one firm at Olympia has made an effort—and I think a successful one—in providing equal protection for the driver as for the passenger. In the U and I sidecar the driver sits side by side with the passenger, and has complete control of the machine from under the hood and storm apron, not requiring to wear waterproof of any description.

I have not had delivery yet of the one ordered at Olympia, but I have ridden in one, and find it most convenient and to have every advantage claimed for it.

Judging from the number of people enquiring about it at Olympia, I feel sure there must be many motor cyclists like myself who are anticipating the pleasure to be derived from the introduction of this sidecar.

ALL-WEATHER RIDER.

The Motor Cycle in the Army.

Sir,—As the writer of the letter signed "Seven Motor Cyclists, Territorial Force," to which your correspondent "R.E.S.R." takes exception, may I be permitted to deal with the matters he brings forward?

1. How does your correspondent make 8s. per day for the motor cycle, with 1s. 1d. lance-corporal's pay, come to 12s.?

2. The 1913 Manœuvres were the third in which I have taken part as a motor cyclist orderly, so that I can claim to know something of the subject. Your correspondent's intelligence must indeed be of a high order if by merely looking round he can find shelter for a motor cycle in a blizzard on the middle of Salisbury Plain.

3. King's Regulations can be read in many ways—they seem to be made with that intention.

I know during 1910 Manœuvres my machine was damaged to the extent of £6 or £7; the War Office said that this was fair wear and tear, and nothing at all was paid.

Does your correspondent think that it is exactly fair in the case of a motor cyclist being killed on manœuvres (and it is only the proverbial luck of the British Army which has prevented this occurring before now) that his wife or dependents should get a pension drawn up on the scale of a private's rank in the British Army, which would, I believe, work out somewhere in the neighbourhood of five shillings per week?

In conclusion, I fail to see how anyone could read contempt of the O.T.C. men into the letter in question. It was necessary to point out that these men could afford to take risks, which men in poorer circumstances (but otherwise no whit inferior) cannot do. Otherwise it might have been said, "The authorities always get plenty of men from the O.T.C., and *they* never want to be insured, or make any stipulation about pay or anything else."

Speaking of my Territorial companions, I may say none of them were shirkers ONE OF THE SEVEN

A SPOILT TRIAL.

Birmingham Club's Cycle Car Trial abandoned owing to the Trail being destroyed.

SATURDAY was the day of the Birmingham Motor Cycle Club's open cycle car and light car trial, an entry of twenty-eight having been received. The course was kept secret until the start, the meeting point being Rose Hill, Rednal. Within three miles of the start Beacon Hill, the most severe climb on the course of thirty-five miles (which was to be covered three times), was encountered, and in some respects the proximity of this hill, on which the stopping and starting test was held, to the starting point was fortunate, seeing that by the time Tanworth-in-Arden was reached, the competitors, who had several times previously gone off the route and managed to regain the right track, were utterly bamboozled by three arrows pointing in different directions, and there was no official present to guide them. The trial was a "non-stop" one, and after careering round in circles the majority there and then decided to give up before completing one circuit, and those who had come from the London district made direct for home. The confusion in the arrowing of the route was in no way due to the officials, for the course was carefully marked on Friday afternoon, and Mr. R. V. C. Brook, the hon. sec., journeyed round the course again in the early hours of Saturday to make sure all was well, and at the same time laid a paper trail. He found several arrows moved and others missing which he reinstated, but the mischievous persons (schoolboys were blamed) must have again interfered with the arrows, and a strong wind blowing the paper trail about made the confusion complete.

J. Guilding (8 h.p. Alldays) charging the water-splash at the foot of Grimes Hill.

The *mêlée* on Beacon Hill. R. Mundy (A.C.), followed by Dr. Rathburn (5-6 h.p. A.C. Sociable).

The course was exceedingly intricate, and passing was impossible on many stretches. As for an average of 20 m.p.h., it was practically impossible; in fact, the honorary secretary told us as much before the start.

Stopping and Restarting Test on Beacon Hill.

To revert to the start, Humphries, who had entered his four-cylinder four-seater (the chassis of which is under 6 cwt.), elected not to compete owing to a broken piston ring, and the remainder were despatched at minute intervals from 9 a.m. We are able to give the official observations on Beacon Hill, which is a moderately severe rise, rendered a good deal more difficult by deep ruts of clay which clung to the driving wheels with remarkable tenacity. The stopping and starting test was held at a point near the top, half

The only lady competitor in the trial.—Mrs. Powell who drove an air-cooled 8 h.p. Humberette.

of the road surface at this point being dry, the other half very greasy and rutty.

F. H. Southam (Humberette).—Re-started well but stopped higher up.
J. T. Wood (G.W.K.)—Good climb and re-start.
H. F. S. Morgan (Grand Prix Morgan).—Good climb and re-start.
J. J. Woodgate (Singer).—Re-started well but stopped higher up.
Rex Mundy (10 h.p. A.C.)—Re-started well but stopped higher up.
J. Woodhouse (Morgan with Quadrant engine).—Good climb and re-start.
W. Guilding (Alldays Midget).—Good climb and re-start.
V. Busby (Morgan).—Good climb and re-start.
B. Buckman (Stag).—Good climb and re-start.
G. R. Day (Morgan).—Stopped before re-starting test and again on brow of hill.
A. Milner (Calthorpe).—Broke differential pinion during the ascent.
B. M. Bailey (Crescent).—Good climb and re-start.
H. J. Miller (Crescent).—Stopped before re-starting test.
Mrs. S. P. Powell (Humberette).—Restarted after some hesitation but stopped higher up.
H. Pearson (Alldays Midget).—Stopped before test owing to slipping clutch.
A. Sale (G.W.K.)—Good climb and re-start.
J. Percox (G.W.K.)—Good climb and re-start.
M. Anderson (Humberette).—Good climb and re-start.
F. Baylis (Perry).—Good climb and re-start.
W. Adamson (Adamson).—Good climb and re-start.
G. Hands (Calthorpe).—Stopped before re-starting test.
L. J. Walker (Crouch).—Claimed that he was baulked by another competitor so long that he withdrew.

The Averies stopped on the hill owing to the gradient preventing petrol flowing into the carburetter. When Woodhouse stopped between the lines his engine was firing on one cylinder, due to a high tension wire resting on the exhaust pipe. W. H. Egginton, the official at this point, promptly used his pencil to lift the wire off the pipe, when the engine fired perfectly and the driver got away well. Query, would this have been counted as an adjustment?

A Long Wait.

The officials had a long tiring wait for the competitors on the second round, and no wonder in view of what the competitors were going through. The course plotted was *via* Woodville, Lickey Rock, Burcot, Cobley Hill, Rowney Green, Weatheroak (check), Earlswood, Gorcot, Holt End, Beoley, and Alvechurch. A water-splash near Weatheroak was over a foot deep and caused some fun. The low-built Adamson appeared to float through it. Trouble even on the first lap was not absent. We heard of two punctures and two broken chains.

"No freak hills or abnormal surfaces," the regulations stated. Certainly Beacon Hill is not a freak climb, but the surface at times is most abnormal, and Saturday was one of those days. The climb was not too severe, however, for we ascended it with consummate ease on a new standard-geared Humberette, passing several stranded competitors on the way.

Only four continued on the second circuit, and it is doubtful whether they covered the course properly. First, Woodhouse made another clean ascent of Beacon Hill, followed fifteen minutes later by Woodgate (Singer), his water boiling and causing a stop at the top of the hill; then W. Guilding (Alldays), who made a very neat climb, another long wait, and Busby (Morgan) went up well.

It was clear that something was wrong, and the officials returned to the starting point to find a group of competitors having given up the chase in disgust.

An Impromptu Event.

Many adjourned to the Bilberry Tea Rooms for luncheon, where it was announced that in the afternoon a to-and-fro race would be held on a by-lane at the top of the Lickey Hills.

This impromptu event proved very interesting to participants and onlookers. Competitors were timed

J. Woodhouse and T. Silver on an 8 h.p. Morgan fitted with twin-cylinder Quadrant engine in the stopping and restarting test on Beacon Hill.

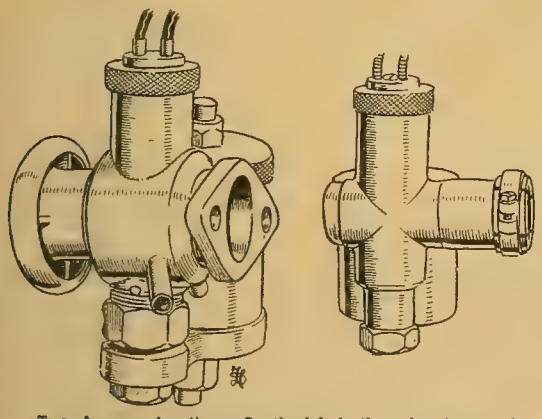
A Spoilt Trial.—

from a line at the foot of a rise about 60 yards long, and, after passing the flag at the top, turned round and sped down the hill again, when the time was taken at the moment of crossing the line. The three-wheelers with no reverse gear had to resort to skidding methods. Morgan shot up the hill, suddenly ported his helm, and so caused the driving wheel of his machine to slew round. He emerged from the bracken with long streamers of grass and bracken trailing from his machine—time, 38s. Woodhouse did the same thing, but reduced the time to 35⅗s., and won the 10s. first prize. After crossing the tape he burst a front tyre, which came off and caused the machine to wobble dangerously. Rex Mundy handled his four-cylinder A.C. very dexterously, and was first of the four-wheelers in 42⅘s., P. J. Evans (Calthorpe) being next in 44⅖s. Other good times were by Woodgate (Singer) and Powell (Humberette).

Subsequently a vote was taken of the competitors and officials remaining as to the re-run trial, when it was resolved to hold the event in January over another course, most probably in connection with the club's open trial on January 31st, in which case the entry list will be reopened.

J. Woodhouse (Morgan-Quadrant), the winner, doing a lightning turn by skidding the rear wheel. In the photograph the front tyre can be plainly seen off the rim. It burst a few minutes later.

NEW TYPE AMAC CARBURETTERS.



Two Amac carburetters. On the left is the exhaust warmed Douglas type while that on the right is the new lightweight model.

A very neat little carburetter, on the well-known Amac lines, has been produced to suit some of the many lightweights now on the market. The main jet is quickly detachable, and there are three sprayers directly above it. The throttle and air slides are similar to those on the larger models. Another very taking type is a special one that is being turned out for Messrs. Douglas Bros., the outstanding feature of which is the exhaust jacketed mixing chamber. The jacket is cast with the body of the carburetter, and is very neat in appearance. A special flange joint to bolt to the Douglas inlet pipe is, of course, incorporated.

Amac carburetters are now so largely used that an appreciation is scarcely necessary. However, we may add that we have had excellent results from a larger model during the past year, both in respect to flexibility and petrol consumption.

Group of Indian riders at Cape Town, all of whom are prominent motor cyclists in those parts.

Cycle Car Race.

The regulations covering the cycle car race to be held in the Isle of Man on September 24th next will shortly be issued, and a special sub-committee has been appointed to arrange the details.

A.C.U. Spring One Day Trial.

The A.C.U. has decided to hold the Spring One Day Trial on March 7th in Yorkshire, a district abounding in steep hills quite apart from the "freak" variety. This event will be open to motor cycles and cycle cars (A.C.U. definition).

Police Activities at Epsom.

We understand that the police at Epsom have become very active in prosecuting motorists. Our readers are advised to see that their silencers are very efficient when riding in this district, and that their number plates are well lighted.

Roman Road Regulations.

It is interesting to note, in view of the congested state of the roads in many cities, that about A.D. 67 the Roman road authorities did not allow slow moving heavy vehicles to occupy the main arteries of the city. These carts had to be driven at night.

Military Motor Cyclists.

We have evidence that the Special Army Orders of May 20th and June 29th and the Army Form B 210A are hardly acceptable to motor cyclists, and even if they are, the recruiting is very slow. More than one correspondent has recently pointed out that the Army authorities should make these conditions less stringent and increase the monetary allowances, otherwise the support given by motor cyclists to the movement will be very meagre.

We must say that we think the authorities are expecting too much from a class of motorist who is not overburdened with wealth. If they expect to have the full service of motor cyclists in time of need they should offer better inducements for them to volunteer. We are the last to deprecate volunteer service, but motor cyclists run a somewhat expensive machine, and while legislation is what it is in connection with all forms of pleasure motoring it would not be a bad idea, if the authorities really want the services of motor cyclists, to exempt all Territorial riders from taxation both of the machine and the spirit used.

The Six Days Trials in 1914.

This event, fixed for July 5th to 11th, is to radiate from two centres, one in Wales and the other in the Peak District. The framing of the rules has been entrusted to a sub-committee, which will bear in mind that special attention is to be paid to the testing of brakes and acceleration, with a view to improving mechanical efficiency.

Permits Granted.

The A.C.U. has granted permits for the following events:

January 7th.—Bournemouth and District M.C.C. Open Trial.

January 17th.—Essex M.C. One Day Trial.

January 31st.—North - West London M.C.C. Open 24 Hours Trial.

February 14th.—Sutton Coldfield and Mid-Warwickshire A.C. Open Trial for Colmore Cup.

SPECIAL FEATURES:

A PLEA FOR CLEANER MACHINES.

ELECTRIC LIGHTING SYSTEMS EXPLAINED.

SOME NEW DESIGNS.

Result of Motor Fuel Competition.

Readers may remember that last spring the S.M.M.T., Ltd., and the R.A.C. and A.A. offered a prize of £2,000 guineas for the best suggestion for replacing the present motor spirit by a less costly fuel produced from materials entirely available in this country. Thirty-seven communications were received from eight different countries. The report of Sir Boverton Redwood is confirmed by the Council of the S.M.M.T., viz., that "none of the applicants has succeeded in complying with the conditions." Unfortunately for the competitors, certain processes were necessarily ruled out owing to their being known prior to May 1st.

THE ABANDONED BIRMINGHAM M.C.C. CYCLE CAR TRIAL.

Held up at the second bend on Beacon Hill till the congestion in the stopping and re-starting section was over. The competitors in the foreground are Baylis (Perry), M. Anderson (Humberette), and R. B. Adamson (8 h.p. Adamson). The hill was too narrow for a stopping and starting test.

Police Trap in Surrey.

We are informed that the police are very active between Old Malden and Ewell, where they have a police trap on a straight open road.

A Distinguished Motor Cyclist.

Prince Henry of Prussia purchased last week from the N.S.U. works in Germany a 2 h.p. N.S.U. two-cylinder lightweight motor cycle. This machine, we learn, is to be used by His Royal Highness for touring and pleasure purposes.

Further Open Events in 1914.

Since the list of 1914 fixtures was published the following open events have been arranged :

Feb. 7th.—Middlesex M.C.C. Open Reliability Trial.

Sep. 5th.—Middlesex M.C.C. Open Reliability Trial.

A Bit of a Puzzle.

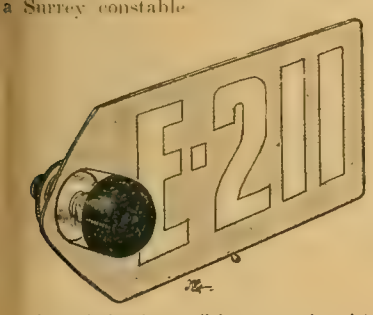
We expected a good many attempts to solve the puzzle contained in the article published last week, but were hardly prepared for the shoal of letters which have reached us by every post since the notes appeared. The correct solution will be published in our next issue, and replies received up to the end of this week will be considered.

Italian Flying Kilometre Record.

A £40 cash prize has been offered by the Italian agent of the N.S.U. Co. to the motor cyclist who covers a flying kilometre on the road in 28 seconds—nearly 80 m.p.h. The offer remains open until October 31st, 1914. The following regulations must be adhered to: The record must be accomplished in Lombardy. Four days' notice must be given and a deposit of £1 paid (which is not returnable).

The Vanishing Motor Cyclist.

A motor cycle figures very prominently among the "mysteries" of the entertainment at St. George's Hall, London. It is intended as a demonstration of the wonderful potency of what are called the "D.D." rays, whereby a fully-equipped 2¾ h.p. Enfield and its rider are made to disappear in such startling fashion that the astonished onlooker can only ask, "How is it done?" The trick appears simple enough. The motor cyclist rides up a plank into a large packing case, open on one side. This being closed, the box is then lifted several feet clear of the ground. Then the "marvellous rays" are brought into play—a flash on the case, and the sides fall out. The motor cycle and its rider have both vanished. Where or how? But that is a mystery no less than the "timing" of a Surrey constable.



A novel electric rear light and number plate illuminator marketed by Benton and Stone

FUTURE EVENTS.

Dec. 26-27.—Motor Cycling Club Winter Run from London to Exeter and Back.

" 26-27.—Bristol M.C.C. Open 24 hour Trial to Land's End and Back

1914.

Jan. 5.—Liverpool A.C.C. Open One Day Trial

" 7.—Bournemouth. M.C. Open One Day Trial.

" 14.—A.C.U. Annual Dinner.

" 17.—Essex M.C. Open One Day Trial.

" 31.—Birmingham M.C.C. Open Trial for Motor Cycles & Cycle Cars.

An Addition to the South Kensington Museum.

At the request of the secretary of the Board of Education, a Wall Auto-wheel, attached to a standard B.S.A. bicycle will be on exhibition at the Science Museum, South Kensington, after the middle of January.

Exhibition of Lantern Slides.

The Motor Cycle series of lantern slides has been in considerable demand at club evenings and social functions lately. On Dec. 4th they were used by Mr. E. E. Beale at a lecture at City and Guilds of London Institute; on the 10th by Mr. Stead at Sedbergh; and on the 11th inst. by Mr. F. H. Dutson at a lecture to the Heywood Municipal Officers.

A Strange Exchange Suggestion.

The following interesting exchange was suggested to one of our advertisers who offered an Ariel motor cycle and sidecar in our miscellaneous columns. The offer was a level exchange of "a secret racing system which cleared over £1,500 in a year and a half," or, as the applicant wrote in reply to the advertisement, "seventy-one winning weeks out of eighty-two." "No tips or wires required, and cycle to be carriage paid." The offer was not accepted.

An Open Christmas Trial.

The Bristol Motor Cycle Clubs' twenty-four hours' Christmas open trial promises to be well supported. Entries are coming in well, and it is expected that nearly eighty will start from the Queen's Hotel, Bristol, at 5 p.m. on the 26th inst. Among other well-known trial riders both Frank Smith and W. B. Gibb will take part, whilst another entrant will endeavour to take a 2¾ h.p. Douglas and sidecar through the 400 mile trip. Entries close to-day (Thursday) and may be wired to Mr. P. Grout, Keynsham, Bristol.

Red Rear Lights.

Apropos of the rear light question, it is worthy of note that as far back as April 7th, 1904, the *R.A.C. Journal* quoted a case where a motor cyclist was prosecuted at Wallasey (Birkenhead) Petty Sessions for riding a motor bicycle without a rear red light. The magistrates imposed a fine of 5s., and the club thereupon took up the matter, and contested the decision, with the result that the magistrates wrote stating they had come to the conclusion that the club's contention was right, and that a motor bicycle only required the ordinary pedal bicycle light

Ignition on Indians.

Mr. W. H. Wells tells us that it has been decided to equip all 1914 Indians with magnetos, including the Hendee Special, which, as our readers know, has a starting and lighting dynamo.

The Rear Light Question.

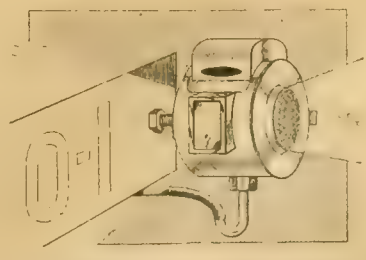
The Local Government Board regulation on the matter of rear lights for motor cycles is still anxiously awaited but its publication cannot be delayed much longer. Meanwhile, owners of sidecars are fitting rear lamps to their machines, as most seem to agree that rear lights on two-track machines are desirable.

We are informed on excellent authority that the official L.G.B. order is on the point of going out, and that it is almost certain that there will be no alteration in what we announced exclusively in these columns a month ago, viz., that motor bicycles need not exhibit rear red lights, but that two-track machines, such as sidecars, will, in future, be required to carry a rear warning light.

A.A. and M.U. Notes.

BIRMINGHAM OFFICE NOTE.—On several occasions there have been allusions in the press (mainly *The Motor Cycle*) to the hopeless condition of that part of the Coleshill-Stonebridge Road which had been made and maintained by the Earl of Aylesford, under an Act of Parliament passed in the latter part of the eighteenth century. Nearly a year ago the Automobile Association approached Lord Aylesford's agent, and put forward a scheme, which, being accepted by the owner and the county and district councils, has resulted in the road being put in thorough order to be maintained in future as a county highway. Considering the importance of this short length of road as a link in the communication between the north and the south and west, the gain to motorists and cyclists, not to mention other traffic, will be considerable.

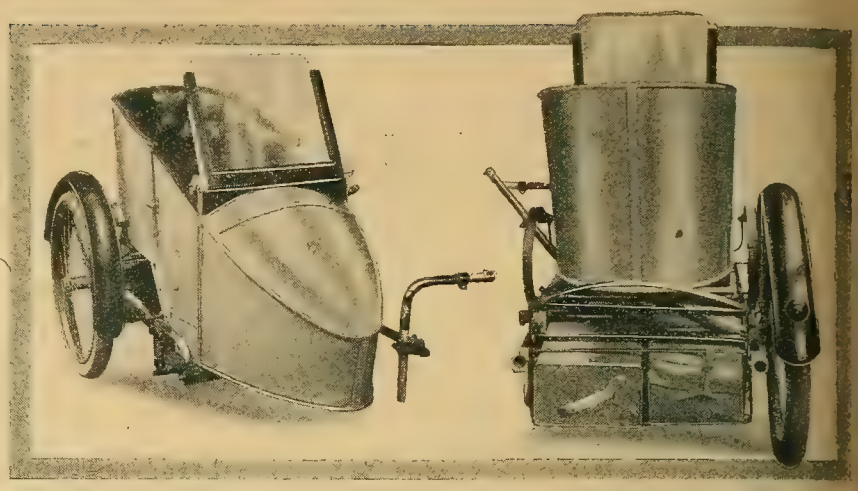
SAFE ROADS AT NIGHT.—During the past month the Association has got into touch with a number of local authorities, railway and other corporations, with regard to roads covered with stones and left unrolled until the next morning, badly lit railway and canal bridges, and dangerous cross roads, which could be made much safer for night travellers driving at reasonable speed, were the corners properly rounded off. The Secretary of the Association will welcome all such reports and suggestions, and take the necessary action thereon.



A type of rear light by H. Miller and Co. Ltd. Birmingham. It is of the acetylene pattern with a rear red glass and a white light showing on to the numbers. As we have already pointed out there is no need to illuminate the front numbers if a lamp such as the Miller "Rearlite" is adopted.

AN ALUMINIUM SIDECAR.

Our illustration shows the Burnsley sidecar, which is of interesting construction. The body consists of a light wood framing panelled with sheet aluminium, behind which is a very thin sheet of steel to prevent denting. A feature is that the panelling is polished, and because of the use of a special polish the coating retains its brilliance in spite of rain and mud—in fact, it can be washed down just as a coachbuilt sidecar. The chassis is stoutly constructed, and is fitted with a large folding carrier, below which provision is made for a petrol can and a fair amount of luggage, in addition to the space afforded by the top or folding portion. Several models will be placed on the market, that illustrated being merely a model to show the construction and general design. A luggage grid is a standard fitting on this sidecar, which is made by the Burnsley Motor and Aluminium Sidecar Co., 62, Branston Street, Birmingham.



The Burnsley aluminium coach built sidecar for fixing to the offside of the machine.
(1) Threequarter front view showing wind screen and side door (2) Rear view. Observe the method of carrying luggage and spare can of petrol.

M.C.C. London-Exeter and Back Run.

Review of Regulations.

The arrangements for the winter run have been very thoroughly carried out by the club officials, and it now only remains for the competitors to fulfil their part of the programme—to ensure a most successful event. We are glad to note that special attention will be given to the question of silence, and give below the special regulations issued.

SILENCER REGULATIONS.

When presented for examination by the Judges, every machine fitted with a cut-out, or other movable device for freeing the exhaust must have the cut-out, or other movable device for freeing the exhaust, sealed with wire, in such manner that it cannot be used.

Every machine will have to pass the Judges for silence. Noisy machines will not be allowed to proceed.

Machines will be subject to re-examination at any point of the course.

To avoid accidents and congestion, competitors are requested to pass and re-pass as little as possible, and to proceed directly after signing on at the checking stations.

Numbers must be obtained at the Bridge House Hotel, Staines, not later than 5.30 p.m., and competitors will be started in the order of the programme at one minute intervals, in pairs.

The numbers, which are varnished to exclude wet, must be fixed on each side and not front and back.

There will be a stop of an hour at the Angel Hotel, Salisbury, on both outward and homeward run.

Chard Hill and Trow Hill must be climbed without stops. Traffic stops, though they do not count against a competitor, must be reported to a responsible official before leaving the hill. The checker will not remain later than fifteen minutes after the last man's schedule time.

A stop of 1½ hours will be allowed at Exeter. Machines will remain at the Exeter Motor Company's garage, and breakfast will be provided at the Bude Hotel. Hot refreshments may be obtained at the Mermaid Hotel, Yeovil, on the outward journey, and arrangements for replenishments have been made with Messrs. Schards at Basingstoke and Messrs. Moffats at Yeovil.

The course will be carefully marked, but the onus of finding the way rests with the entrant.

Competitors must sign sheets at start, in and out of each control at the top of Chard and Trow Hills, and at finish.

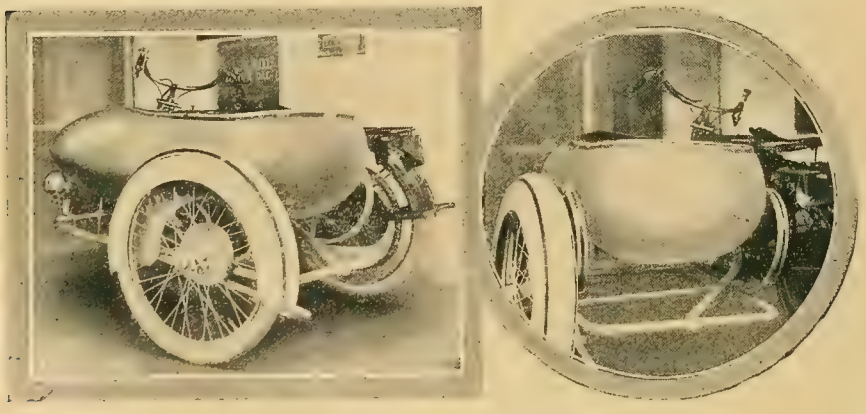
Competitors requiring accommodation at Staines should write at once to Mr James Brown. Hot dinner will be ready at 6.30 before the start for those who have arranged for it.

Riders are warned to keep their number plates clean, particularly between Salisbury and the finish. Anyone found fifteen minutes ahead of time at any point on the route will be disqualified.

Starting Times.

The first competitor, H. Karslake, the organising secretary, will lead off with George Brough at 8 p.m. prompt, and they are due to start from Exeter on the return journey at 6.50 a.m. The first cycle car driver (A. B. T. Bashall Morgan) will leave at 9.23 p.m., and will be timed away from Exeter at 8.13 a.m.

With the exception of the team trial the number of entries received for the Exeter Run is the largest secured in the history of this enterprising organisation. The awkward turns will be arrowed by illuminated box signs made of three-ply wood; the arrow will be cut out of the box and the illuminating agency will be inside. Twenty-four of them will be used. The order of starting will be motor bicycles, sidecars, cycle cars, and cars. The two first-named will probably be intermingled to some extent. The M.C.C. has decided that all four-wheeled vehicles shall be classified together for the purpose of this event; in other words there will be no weighing to determine which are and which are not cycle cars. It is worthy of note that any competitor who arrives at Staines on the return journey after about 5.15 p.m. on the night of December 27th cannot qualify for a gold medal.



AN ATTRACTIVE SIDECAR BODY.

A novel type of streamline sidecar body is that designed by P. J. Scarlato, which is made of welded sheet steel on a wooden frame, and we understand scales only 45 lbs. finished. The mudguard is worthy of notice.

The Manufacture of Endless Rims.

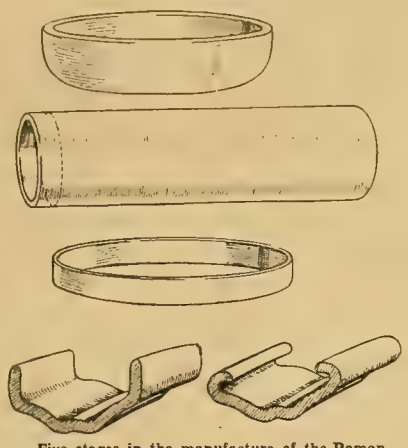
An Interesting Process adopted by the Roman Rim Co.

IT puzzles many people to understand how the endless rim construction of the Roman Rim Co., Ltd., is carried out, and accordingly we made a call on Mr. Dawes at the company's offices at Upper Priory, Birmingham, to see if he was willing to enlighten us. Mr. Dawes was most willing, and proceeded to explain to us practically every process, many of which we actually witnessed.

It is perhaps as well to explain the usual method of steel rim construction before dealing with the Roman process, as it will form a contrast and show how unusual is the construction of the latter. In the steel rim construction a band of strip steel is fed under a series of rollers which gradually form it into the desired shape and pass it out in a series of spirals. These spirals are cut to correct length and the ends welded together. This system gives excellent results in practice, as every motor cyclist knows. However, many of us have had badly damaged rims when riding on rough ground, and it is not uncommon to see rims knocked altogether out of shape by a comparatively slight accident. It is claimed for the Roman rim that it is absolutely rustless, and that it will withstand any shock within reason without losing its shape. In support of this last claim, a rim was shown to us which had been used by Mr. C. R. Collier, and, though the tyre had burst when travelling at 72 m.p.h. on Brooklands, the rim remained a perfect circle but proves the stresses it had withstood by the roughness on the edge from its contact with the track.

The Process of Manufacture.

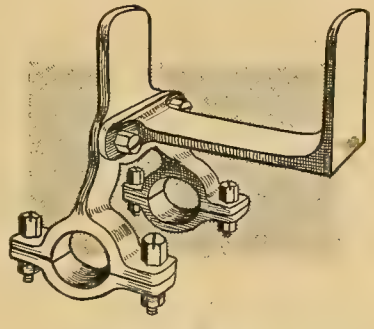
The first form of the Roman rim is a circular disc about 2ft. in diameter and ½in. thick, made of a special aluminium alloy known as Romanalium. This is first of all formed into a bowl about 20in. in diameter and 5in. deep, and from this form is drawn out by successive processes to a cylinder about 3ft. long, 10in. in diameter, and ¼in. thick.



Five stages in the manufacture of the Roman rustless rims.

Rings about 2½in. wide are now cut from the cylinder, and each of these is a complete rim in chrysalis form.

Each rim, in turn, is now placed between rollers on an automatic machine and, the rollers being brought together under a pressure of 1,650 lbs. on both sides of the ring, expand it to a circle of much larger diameter and, at the same time, compress the metal.



A new lamp bracket supplied by Brown Brothers Limited, designed to be attached to the handle-bar of a motor bicycle for the purpose of carrying the lamp and generator.

The next process is somewhat similar, but the rim is given its first shape, being made the correct diameter and having the sides turned up. After this it is placed on a very simple and ingenious little machine which gives a lead to the edges and so prepares it for the next rolling. Now comes the final process which turns over the edge to its final form. The rim is next checked and gauged and finally is put into the lathe, and the edges of the bead are made perfectly round and smooth by a touch of a hand tool.

From this description it will be seen that the rim is of a highly compressed metal alloy and has absolutely no joints; also that each process is done cold so that there is no fear of destroying the nature of the metal.

The thought and money expended on the machinery must have been enormous; indeed, we were told that though the first machine was constructed in 1899 it was not until recent years that the device was perfected.

Rustless Rims.

Motor cyclists will realise what a blessing it would be to have bright rims which will not rust and damage tyres, and of such a nature that even after severe shocks they return to their perfect form. We were challenged to smash up a rim with a sledge hammer in ten minutes, but as better men have failed we did not take it on. The rim of course can be sererely damaged in this way but not broken.

We are informed that Roman rims can be fitted by any manufacturer at 15s. above the list price of the machine. In the foregoing description approximate sizes only have been given for obvious reasons. It may be asked why the metal (which is in its early stages approximately the same size as the rim) should be reduced and then expanded again, but it is claimed that it is in this compressing and rolling process that the rims obtain part of their wonderful strength.

The Toronto Motor Cycle Club recently held their annual hill-climb at High Park toboggan slides. The surface was about three inches thick with loose sand and the distance an eighth of a mile, with an average gradient of 1 in 5.
The photographs show: (1) H. Kipp (7 h.p. Indian), the ultimate winner, near the top. (2) A competitor approaching the bad portion of the hill.

The Choice of a Cycle Car.

By "ROAD RIDER."

THE man who has plenty of money, lots of leisure, a keen sense of humour, and very few important engagements may do a great deal worse than invest in a rank bad cycle car—there are plenty of them about, you know. The most enjoyable month's motoring I ever had centred round the most atrocious tricar that was ever designed. A state of complete uncertainty as to what will happen next furnishes a sportsman with a succession of the most delicious thrills, and I was genuinely grieved when at the end of the month that tricar dissolved into relics of its component parts, and I could neither afford to have it repaired nor to invest in a duplicate. However, the ordinary man has to take his motoring rather more seriously. He is compelled to insist upon comfort, economy, and reliability, and I should advise such to study the records of those 1913 competitions in which cycle cars have figured. There are over one hundred different makes of cycle car on the register, but the solemn and earnest type of cycle carist will have whittled his interview list down to very small proportions by the time he has digested the aforesaid competition results. The survivors, whose name, as I have indicated, will not be Legion, will all show a tolerable level of reliability, and the final choice must depend upon the suitability of the several machines to our individual needs, and upon questions of extravagance or economy. As all the favoured candidates will evince very similar capacities in the way of speed, climbing pace, climbing power, and petrol economy, financial considerations must enter very closely into our decision.

Depreciation.

Here let me say quite frankly that depreciation is usually the heaviest item in a cycle carist's balance sheet. I say "usually," because I have known cases where depreciation was absurdly trivial. If a club member, for instance, buys a sound vehicle, and every motor cyclist in the vicinity sees it running daily, never stalled by the road side, romping up hills, and developing no unwonted noise or rattles as it ages, the probability is that the happy owner will be embarrassed by the number of pals who desire its reversion. *Per contra*, a solitary rider who has few motor cycling pals may have to unload through an advertisement upon a stingy and sceptical public; he will drop from 20% to 50% of his outlay. The good rider who owns a bad machine, the bad rider who owns a good machine and manhandles it, alike pay the penalty when selling time comes.

But a glance down the advertisement columns of second-hand machines will show that very low prices are asked for many 1913 cycle cars, and in some cases far lower prices were finally accepted, while in extreme cases the machines remained unsold; this would apply only to rank bad machines in rank bad condition. However, we may cheer up as regards 1914, for the bad machines have nearly all been eliminated by stress of competition, the demand is growing keener, and designs are settling down; all these factors tend to reduce depreciation losses to reasonable figures. Of course, the genuinely successful cycle cars of 1913 fetch good prices everywhere, as they deserve to do.

Running Costs.

When we have narrowed down our range of selection to the machines which we can rely on selling should we wish to do so, we must remember that the cost of running depends on five main factors: (1) Luck, (2) original quality, (3) skilled handling, (4) weight, and (5) simplicity.

The first we must chance. The second we have taken careful steps to ensure. The third we are conceited enough to be sure of. The fourth and fifth we must now take into account. Chassis weights vary very considerably. A stripped Morgan chassis with the air-cooled engine scales a bare 2¼ cwt. Many of the "miniature car" type of chassis have a rare struggle to get down within the 6 cwt. limit allowed for the A.C.U. competitions; this is true of their special light Brooklands models, and I know that some of their stock touring chassis considerably exceed the limit. Other vehicles, loosely termed "cycle cars" in general parlance, have been known to weigh as much as half a ton; and even the Morgan, when burdened with coachwork de luxe, and a full kit of bulky accessories, may be brought up to 7 cwt. All this weight, to the last grain, makes its presence felt in the tyre and petrol bills; and, other things being equal, the economist must select the lightest machine that will do his work, whereas the bijou millionaire may let his fancy rove freely over every machine on the list that will go, even though it should cost him 6d. per mile to run.

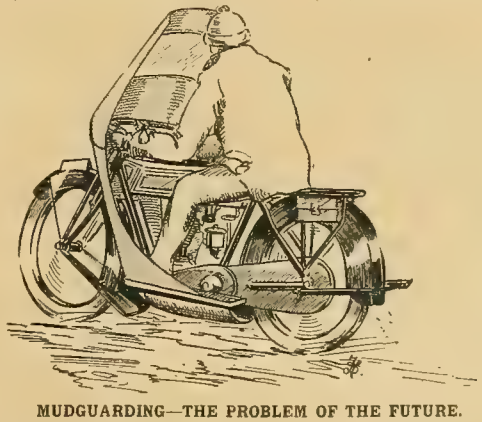
The Economy of Simplicity.

The final factor is complexity. We may reduce the contrast to its extremity. Picture a belt-driven machine with an air-cooled engine carried well back on an ash plank chassis with wire and bobbin steering (though I admit that such machines have yet to achieve real prominence). It is plain that repairs and replacements will cost a mere nothing. The specification is so simple that no breakable item is listed at more than a pound or so at the outside. On the other hand, picture a four-cylinder bijou car with a three-speed sliding gear, etc., etc. The radiator is concertinaed in a collision; the crankshaft is seized up through a lubricating mischance, and strains or snaps half a hundred tiny engine details; the back axle is bent in a side-slip; and so forth. These things may not happen, but then again they may; in four years' running one of the larger mischances is tolerably certain to occur. Or take repairs or adjustments. You may not have the time or the knowledge to do everything for yourself. It is one thing to overhaul, clean and tune a single-cylinder air-cooled engine, or even a V twin; it is quite another job to overhaul a wee four-cylinder *monobloc*. The path of the economist is clear, while the man who is not particular to £5 or £10 on his annual outlay may safely invest in the more luxurious specification, knowing that no accident and no repair can land him in the huge bills presented to unlucky owners of big cars. Expenses are proportionate to complexity and weight. These principles, coupled with a reference to the annual margin available, and with a thorough digesting of the 1913 competition results, should easily solve the problem of selecting a 1914 cycle car.

A Plea for Cleaner Machines.

FOR the past two years I have been allowed a grumble on the subject of mudguarding and protection of both machine and rider for winter riding. Once again I am turning to my pet hobby, but this time standard machines have improved so much in the matter of weather-proofness that my growls are consequently greatly curtailed. There is, however, still room for improvement in detail work. On the whole, mudguards are wider, and are more frequently fitted with side flaps of a sensible depth. There are still a few manufacturers who dispense with this flap at one of the most important points (inside the fork springs), but the majority have seen the error of their ways and have widened their forks so as to accommodate proper guards. Manufacturers do not seem to take kindly to that excellent type of sloping flap employed by the P. and M., B.S.A., Ariel, Swift, and a few others, though those who have tried them will seldom wish to be without again.

To avoid a pile of letters being forwarded to me by the editor, explaining that I have left out the name of the so and so, "which was undoubtedly the feature of the recent Olympia Show," I should like to state that examples have been taken here and there to illustrate the type under discussion, and it would be tedious and unnecessary to enumerate a list of machines coming under each category. Still further to reduce the postman's load, I would add that machines as exhibited at Olympia are being dealt with, for I have no grumbles against the many excellent weather-proofing devices on show (many of which I have tried with great satisfaction), but rather against machine designers who do not fit them or their equivalent.



MUDGUARDING—THE PROBLEM OF THE FUTURE.

In the leading article in our issue of December 4th, we suggested some form of protective shield with a transparent insertion, for use in bad weather. One of our artists has put on paper what he thinks our idea would look like.

Accessibility Combined with Protection.

Rear guards have improved very considerably, and are either very large and domed as on the Premier and A.J.S., or have flat wings to catch the mud thrown by belt and brake rims. A few machines, especially chain driven ones, have side flaps for the full length of the rear guards. It has become almost standard practice to make some part of the rear guard detachable so as to render the tyre and wheel more accessible, and many and wonderful are the means employed. Except when the wheels are of the quickly detachable type, the whole of the guard behind the back stays should be easily removable with the carrier, for when this part merely swings it only renders one part of the tyre rather more easy to get at, but does not expose any greater surface for handling.

Chain guarding has improved enormously, and it is not uncommon to find the front chain running in an oil bath. With regard to the total enclosing of the rear chain, my views have been somewhat modified, and considering the wonderful absence of trouble experienced with the modern low speed chain, it is rather doubtful whether the increased chain life counterbalances the increased difficulty in reaching or adjusting the wheel. Of course, the detachable wheel gets over the difficulty and the makers of such machines as the Clyno, Lea-Francis, Sunbeam, etc., are to be congratulated on the efficiency of their transmission protection.

Guarding the Belt.

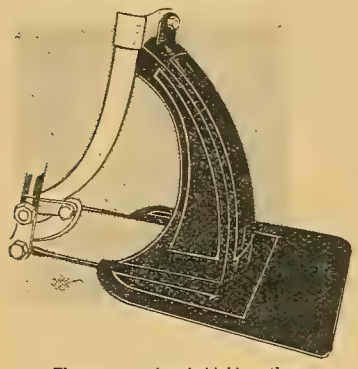
Belt protection has not progressed nearly so much, and this is disheartening, for if half the attention were given to this subject that is given to chain guarding we should not hear grumbles about slipping and breaking belts. Without raising the much-discussed transmission question, I am one of that large army who like a belt somewhere between the engine and rear wheel, even if a chain be employed for the primary drive. Belts are admittedly not without defects, but, all the same, are not nearly so black as they are painted. Protect the belt where it passes round the engine pulley, and produce the front end of the rear guard below the belt, and belt slip disappears, except under unusually severe conditions.

The Value of Undershields.

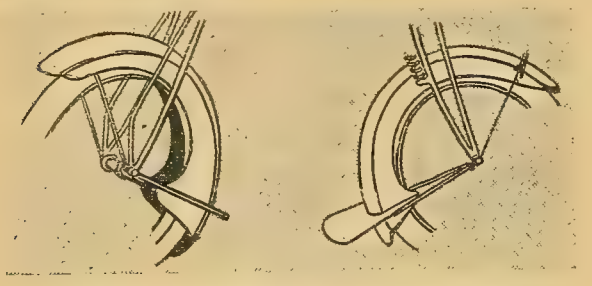
Long and comfortable footboards are steadily coming into fashion, and these form an excellent protection from the mud thrown up when the front wheel passes through a puddle, but a light, quickly detachable undershield as fitted to the Lea-Francis front stand completes the job and saves endless cleaning at the end of a winter run. The same machine has a low guard running across the front of the boards which forms a good protection, and was among the four examples of machines shown fitted with large and sensible leg guards. The mudguarding of the Scott is admirable in every way, and the Rex and Sparkbrook also shine in this respect. Williamson and Douglas machines were shown with really complete front wheel guards calculated to protect the rider in almost any weather.

A Plea for Cleaner Machines.—

In a very large number of cases fork springs have been blacked. Here is a tip for the winter rider whose springs are not blacked. Go to your local saddler and ask him to make you a leather cover for each spring. First cover your springs thickly with grease and then get the cover firmly sewn on and you need not worry about your springs for the rest of the winter. I have tried this, with most satisfactory results, but would rather see the springs enclosed by the makers in telescopic tubes.

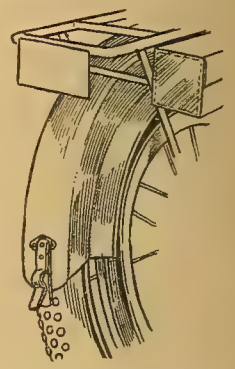


The mudguard and shield on the 1914 P. and M.



TWO TYPES OF EFFICIENT FRONT MUDGUARDS.
(1) As fitted to the Matchless machines. (2) The Sparkbrook pattern.

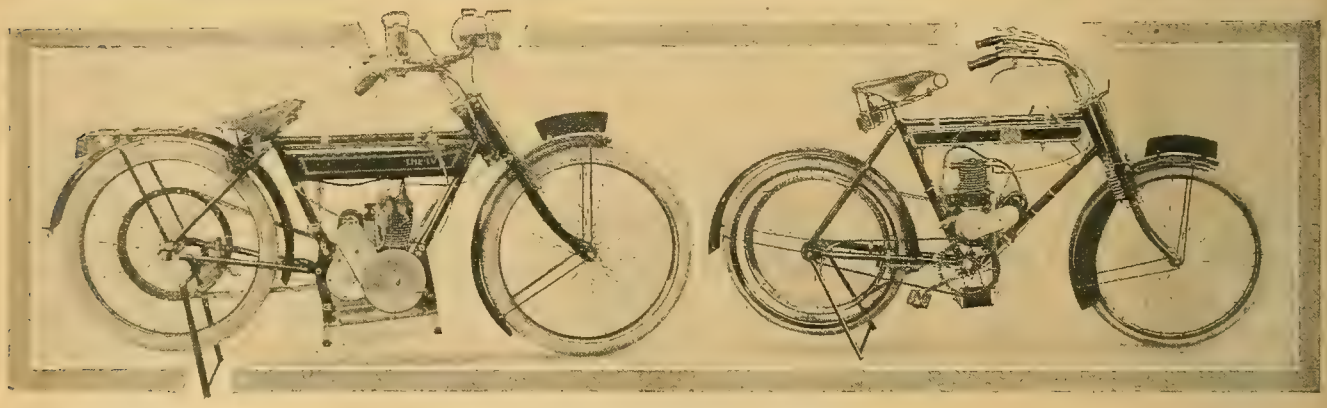
All practical riders will commend the increase in all-black machines, though I was told at the Show that agents do not care to handle them as they are not sufficiently smart. Surely this can not be the case. For the all-black machine usually looks infinitely better than its plated brother after six months' hard work on the road. Another burning question, which is at last beginning to receive the attention it deserves, is the matter of weather-proofing front hubs. All those who ride hard in bad weather know that hubs require adjustment much too frequently, but a few firms have made a careful study of this point and are turning out a satisfactory article.



Rear guard on the Douglas machines, which extends over the belt pulley.

Sidecar guards are infinitely improved, and are, as a rule, much larger and better stayed, and in many cases have deep valances. Though mudguarding has considerably improved in the main, there is still plenty to be done, and let us hope to see something approaching perfection by next year. UBIQUE.

Foot protectors fitted to the A.J.S.



TWO TYPES OF LIGHTWEIGHTS FOR 1914.
The 2 h.p. single-cylinder two-speed Ivy with belt drive and four-cycle engine. The two stroke single-cylinder single geared Dayton—a real lightweight.

SOME OLYMPIA STATISTICS.

Few would have believed that there was a less number of motor cycles in Olympia in 1913 than in 1912. Cycle cars were also fewer as a whole, though three-wheelers were five or six more than last year; but four-wheelers were fourteen less, for last year ninety-nine cycle cars were shown, while this year there were ninety-one.

The most surprising feature of all is that there were nearly forty fewer sidecar combinations than in 1912, when 132 were shown; but the number of detached sidecars was very great.

Curious h.p. rating was another point, there being little attempt to explain the exact difference between a 7-8, a 7-9, and a 7-10, or between a 5-6 and 5½. The 3½ was equal to one-third of the whole number. There were no less than 19 of 1 h.p., the other limit was reached by a single "nine."

In 1912 there were 409 singles to 219 twins. This year the twins increased to 250 and the singles (despite the number of very low power) fell away to 343. Direct belt dropped by almost exactly 100 from 411 in 1912, and chain drive gained 25% from last year's 162. The three-speed gear has increased by about 30%.

M.C.C. Twelfth Annual Dinner.

Distribution of Prizes by the President.

THE Motor Cycling Club's twelfth annual dinner and prize distribution took place at the Trocadero Restaurant on Saturday last. Those present numbered 137, and included several ladies. Mr. Charles Jarrott, the president of the club, occupied the chair, and the vice-chairmen were Messrs. E. B. Dickson, L. A. Baddeley, R. H. Head, W. H. Wells, and H. G. Bell. Among those who supported the chairman were Major Lindsay Lloyd, Messrs. Robert Todd and T. W. Loughborough (A.C.U.), H. B. Karslake, Southcomb May (M.C.C.), and F. T. Bidlake. Other motor cycle clubs were well represented, and many had travelled long distances to the function, notably the representatives of the winners of the team trial, the Sheffield and Hallamshire M.C.C., who were there to take possession of *The Motor Cycle* trophy. The prominent trade members included Messrs. J. K. Starley, F. J. Jenkins, R. M. Brice, R. M. Banks, O. C. Godfrey, E. H. Mayes, and F. A. Applebee.

Following immediately on the toast of "The King," proposed by the Chairman, Major Lloyd gave "The Motor Cycling Club," and explained that a club could even be too popular, for it became a question of great difficulty for those who wanted to join to enter its ranks; that position the M.C.C. had now reached. What they wanted was an ever open door, and he thought that the executive had arrived at a scheme by which it would be possible to achieve this. Major Lloyd referred enthusiastically to the "open road," and certainly there are no keener exponents of it than the M.C.C. The sporting nature of the club was proved, said the speaker, by the increase in the entrants for the Exeter run; his reference to what he had noticed at previous dinners, viz., how bald-headed veterans, without a shadow of shame, came to the dais to receive gold and silver medals won in competitions, provoked much amusement. Major Lloyd concluded with a word of praise for the M.C.C. organisation and the manner in which the executive managed to run off all their events without exceeding the legal limit—remarks which caused a few merry twinkles in various parts of the room.

Only Two Speeches.

Mr. Charles Jarrott, who was welcomed with loud and long applause, announced to the delight of all present that there would be only two speeches. He continued by saying that the M.C.C. undoubtedly held the premier position as the sporting motor cycling club, the pastime was growing and with it grew the M.C.C. However, the limit had been reached and something had to be done. Major Lloyd had said that the executive had arrived at a brick wall, so the M.C.C. had decided to adopt its usual method and climb over it. (Applause.) Alterations in regulations would allow for this.

The Chairman's reference to the various important events proved that he was closely in touch with them all. "So far as the Exeter run is concerned," said Mr. Jarrott, "I feel that a car appeals to me more forcibly than a motor cycle. When I rode a motor cycle I was always kept so occupied. Machines, of course, have altered a little since that time."

The popularity of the M.C.C. events is proved by the following figures:

ENTRIES FOR EXETER RUN.

	1912.	1913.
Solo machines	64	67
Sidecar machines	68	100
Cycle cars and cars	31	64
Total	163	231

Mr. Jarrott said he welcomed the ladies who had graced the proceedings with their presence, and said his opinion was that the sidecar had much to do with the increase in the number of entries in their various runs. He explained that Mrs. Jarrott had been ill for some weeks and was not sufficiently recovered to attend and present the prizes as usual.

The Prize Distribution.

Then followed the prize distribution by the President: no light task when the numbers are taken into account. Mr. Southcomb May's task of checking the medals and keeping all straight must also occupy some considerable time.

Mr. Robert H. Head proposed the health of their president, and pointed out that they had a president who took a keen personal interest in their doings. He asked Mr. Jarrott to accept the sympathy of the members with regard to his wife's illness, and expressed their regret that she was unable to be present.

Mr. Jarrott, in replying, offered another cup for next year's London-Land's End-London Run.

The musical programme was of excellent quality, and the whole proceedings, like everything undertaken by the M.C.C., went with a swing. Although dinners are often wearying owing to the duration and quality of the orations, that criticism cannot apply to the M.C.C. dinner of 1913, as we have seldom spent a more enjoyable evening.

GORE PRIME MOVER.

Self-starting and Reversing Motor Cycle Oil Engine; Forced Gas Supply.

WE give below some particulars of a very interesting motor cycle engine, which is on new lines so far as motor cycles are concerned, but the principle has been successfully tried on six-cylinder marine engines of no less than 1,115 h.p. One great advantage is that it will run on paraffin. The engine is controlled through its valve gear.

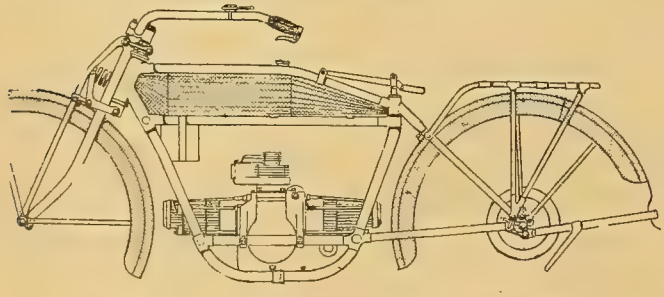
The mechanically-operated valves are of the usual construction and bear on seats formed in the valve chamber. They are retained on the seating by springs acting on the stems of the valves in the usual manner. The stems of the valves, instead of sliding in the usual guides, work in sleeves or pistons, the latter also being arranged to slide in the guides. Owing to the method of mounting the inlet valves, the pressure in the valve pockets cannot open the valves, but they offer no resistance to the action of the cam.

The body of the gas-generating device contains two cones and a fuel jet, below which is mounted an automatic non-return valve and an adjustable needle feed. The fuel pipe is attached to this body.

The action of the gas-generating device is as follows: On opening the main air valve, the air rushes into the first cone at a high velocity, creating a vacuum below the fuel jet and lifting the non-return valve. There being a vacuum, the atmospheric pressure forces the fuel through the jet. This fuel, on entering the gas-generating body, is caught by the inrushing air and is atomised; as this air is at a different temperature the fuel is also vaporised. This action is instantaneous and simultaneous, and this combination is made under pressure.

Valve Gear Control.

Two cams are provided for each valve. The cams form an inclined plane, giving a variable cut-off in either rotation. The engine is controlled by the valve gear.



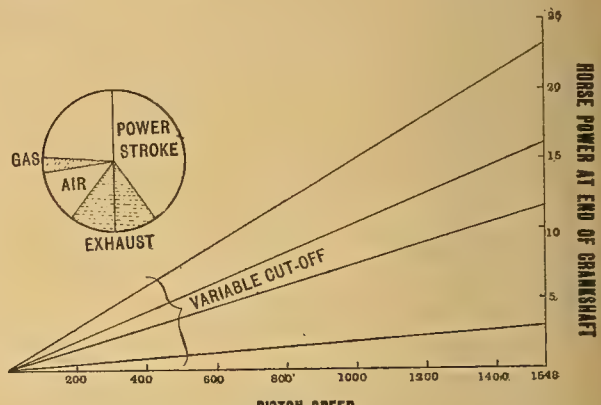
Diagrammatic sketch of Gore engine fitted to motor cycle frame.

The gas supply is independent of the cycle of operation, therefore the power output is not limited by the rate of speed of the piston. This permits of an increased supply of gas under pressure to an engine labouring under an increasing load, and at the same time making the motor self-starting. As the rate of the revolution decreases, the bulk of the gas can be increased and so maintain a steady torque at a low piston speed.

All working parts are lubricated by air and oil in combination under pressure by a device similar in construction to the gas generator, the oil sump having a capacity of one and a half gallons.

As the engine is reversible, a fifty watt generator furnishes the requisite current for ignition and electric head light. Ample supply of air for tyre inflating and pneumatic brake is provided for.

The engine is said to work on any fuel fluid enough without any alteration. This effectively solves the fuel problem, which is of importance for military and colonial work.



Gore motor cycle oil engine: 498 c.c., two pistons, and two power strokes per revolution. The diagrams show the cycle of strokes and the power curves. There is a forced gas supply independent of piston speed, and the consumption is ·45 pint per horse power hour.

The engine is geared down 4 to 1; the multiple disc clutch acts on the crankshaft, and the clutch control is by means of an inverted lever on the left handle-bar. The pneumatic brake is brought into action by an inverted lever on the right handle-bar; on top of this bar the engine control is fitted; this small lever starts, stops, and reverses the engine.

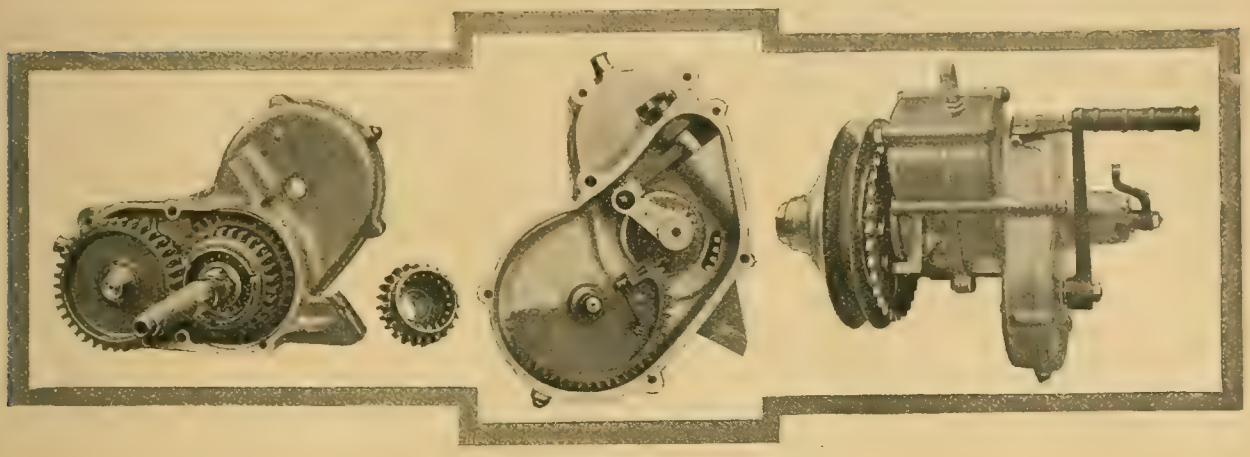
A NOVEL SIDECAR BODY.

We recently paid a visit to the works of the Light Car Body and Fittings Co., Coventry, and saw there a carrier sidecar body of ingenious and unusual type. It was made in the form of an ordinary boot, and it is interesting to note that the linear dimensions are only five times greater than the boot from which it was copied, though it looks much more. As will be seen in the photograph on this page, the finish is extraordinarily good. This body is made without frame work by a special process invented by Mr. H. S. Harvey. It is now on its way to Egypt.

A novel method of advertising—a sidecar in the form of a boot made by the Light Car Body and Fittings Co., Coventry.

A Premier Three-speed Gear.

No Dog Clutches; Gears always in Mesh; a Smooth-acting Plate Clutch.

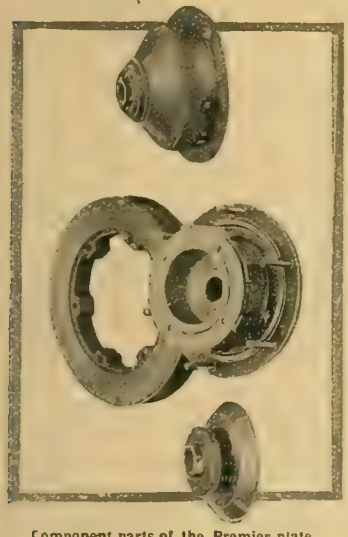


DETAILS OF THE PREMIER COUNTER-SHAFT GEAR.

(1) Gear box partly stripped to show internally toothed wheels which take the place of dogs. (2) Kick starter and gear control. Note the first spring touth in the quadrant. (3) Exterior of gear box showing control levers, kick-starter, and large diameter pulley.

FOR some time past the Premier Cycle Co., Ltd., of Coventry, has been experimenting with a three-speed counter-shaft gear, the construction of which is somewhat unusual and very neatly carried out, and from a short run on a machine fitted with the gear we can testify that the changing of speed is wonderfully easy, and that the gear box is extremely quiet on all speeds

On the layshaft are fixed three gear wheels, which are in constant mesh with corresponding wheels, free to revolve on the main shaft. Within each of these last-mentioned wheels is an internally toothed ring, the centre wheel or middle gear taking its bearings on outside extensions of the high and low gear wheels. Thus a clear passage is left inside the gears for a small gear wheel to slide on the central squared portion of the main shaft. This sliding wheel takes the place of the usual dog clutches, and meshes with each of the internally toothed rings in turn, thus locking any one of the gears to the driving-shaft and producing the required reduction in ratio. The sliding wheel is operated by a tubular sleeve working inside the main shaft and controlled by suitable means from a substantial striking lever and quadrant placed on the right hand side of the tank.



Component parts of the Premier plate clutch enclosed in large pulley

The ratios obtainable are 5, 7½, and 13 to 1, and the box can be fitted to any existing two-speed counter-shaft gear Premier.

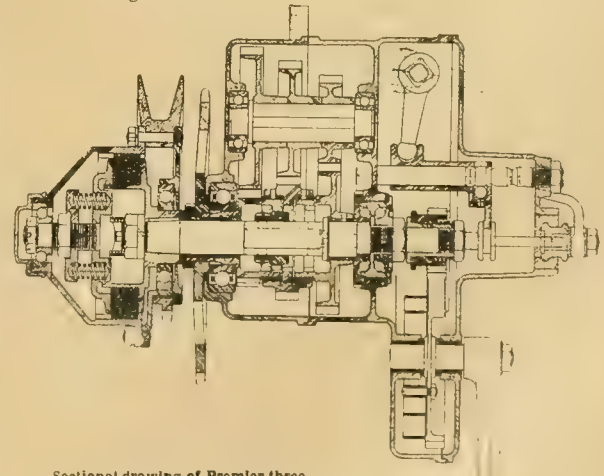
An Excellent Plate Clutch.

A plate clutch, having forty-five steel plates, is enclosed within the 8½in. diameter driving pulley, and is actuated by a rod controlled by a quick thread screw. The plates are of large diameter and the action of the clutch is beautifully smooth. On the right hand side of the gear box, and mounted within an extension of the casing, is a pinion and quadrant kick-starter, the teeth of which are so formed that there is no fear of them over riding. The quadrant when out of use is carried clear of the pinion by the action of a clock spring, so that no part of the starting gear is at work once the engine is running.

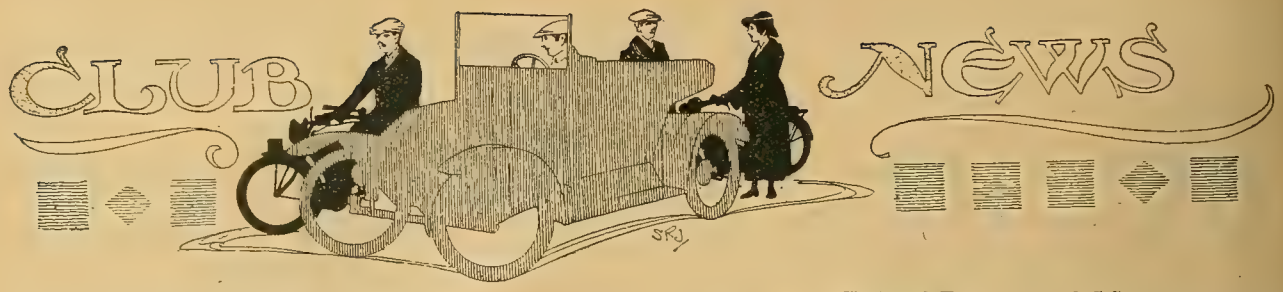
A special 3½ h.p. model will be equipped with this gear, and may be obtained with either chain and belt drive or with chain drive throughout. The big 7-9 h.p. twin can also be supplied with the new three speed.

The box which we examined, and from which our illustrations are taken, has been undergoing most severe tests, and yet there are no signs of wear or damage. All the chief features of the device have been patented.

The Premier Co. were among those firms who were quick to take up the counter-shaft two-speed gear, so that it is no surprise to find them keeping well up with the latest practice. The new box should render a 3½ h.p. Premier and sidecar an absolutely "go anywhere" mount, with the advantage of a medium ratio for moderately bad hills.



Sectional drawing of Premier three-speed counter-shaft gear showing clearly the method of construction.



Southampton and District M.C.C.

The annual dinner took place on the 3rd inst. at Scullard's Hotel, Dr. Alderson in the chair.

Cyclecar Club.

On Jan. 3rd there will be a run to Wisley (tea at the Hut Hotel).

Essex M.C.

A one day open trial will take place on January 17th. For particulars apply to Mr. E. J. Bass, Bishops Stortford, Herts.

Islington and District M.C.C.

The first annual dinner, concert, and prize distribution was held on the 11th inst., at headquarters, Camden Head Hotel, Islington Green, N. Mr. Lionel Harris, who was in the chair offered a cup for competition. About sixty members and friends were present.

Birmingham M.C.C.

The following are the most important club fixtures for next year:

April 11th-14th.—Sangster Cup Run, Birmingham-Weymouth.

May 30th-June 2nd.—Lycett Trophy Trial, Birmingham-Land's End.

August 1st-4th.—Birmingham-Edinburgh Run.

Leicester and District M.C.C.

The fourth quarterly trial for the Edwards Cup was run off on Thursday, December 4th, and the results were as follow: 1, W. H. Chapman (6 A.J.S. sc.), total error 3m. 40s.; 2, T. Green (6 Rex sc.), total error 5m. 31s.; 3, F. J. Yates (7 Indian sc.), total error 8m. 46s.; 4, R. G. Wainwright (3½ Campion sc.), total error 9m. 34s. F. J. Yates, having done the best performance in the four quarterly trials, holds the cup for one year and receives club gold medal. R. G. Wainwright receives club silver medal for second place. W. H. Chapman receives a John Bull belt as first prize in the fourth quarterly trial and T. Green a club silver medal. The club annual dinner will be held on Thursday, January 15th, at the Saracen's Head Hotel at 7.30 p.m. The annual general meeting will be held on Friday, January 23rd, at headquarters.

Public Schools M.C.C. (London).

The first annual dinner was held at the Waldorf Hotel on the 12th inst. Major F. Lindsay Lloyd, R.E., president of the club, was in the chair. After the loyal toasts Mr. Clive Preen proposed "The Club." He stated that it had only been established eight months and there were already fifty-four members, and many competitions had been held, some of which were of a novel character. Each member would find on the table a paper on which he would be asked to make suggestions for competitions for the coming year. Mr. E. M. P. Boileau, chairman of the committee, in reply, congratulated the club on its excellent officers, and said how pleased he was to have followed the success of the club during its first season, and that they had to congratulate themselves on the novelty of their competitions, and the manner in which they had been run. A musical programme followed.

At the race meeting held on the 29th ult., at Brooklands, A. J. Luce (8 Zenith) was third in Class III., with a speed of 66.97 m.p.h.

Hull and East Riding A.C.C.

The annual dinner took place on the 11th inst. at the London Hotel, Hull, when about forty members and friends attended, followed by the distribution of the prizes won during the year. The president of the club, Dr. W. H. Coates, C.C., occupied the chair.

Surrey M.C.C.

A penalty run will be held on Boxing Day, starting from the Angel Hotel, Guildford, at 10.30 a.m. Route: Godalming, Chiddingfold, Petworth, Duncton, Chichester, Lavant, Petersfield, Greetham, Farnham. The annual general meeting will take place at the Angel Hotel on January 13th at 8.30 p.m. The Marians Cup trial will be run off on February 7th.

Cheltenham M.C.C.

The last of the series of trials for the Williams Challenge Bowl was held on the 13th inst.; a prize was also presented by Mr. F. W. Corbett for the best performance by an amateur; silver awards were offered for all who obtained full marks and for the best performance with a single-geared machine. The route included Dowdeswell, Elkstone, and Birdlip Hills. The following were successful:

Silver award for full marks.—T. R. Trotter (3½ B.S.A.) and W. N. Tettery (2¾ Sunbeam).

Prize for best performance by an amateur.—P. W. Ford (3½ B.S.A.) and W. H. Littley (3½ B S.A.) tied.

Silver award for best performance on single gear.—W. H. Littley (3½ B.S.A.).

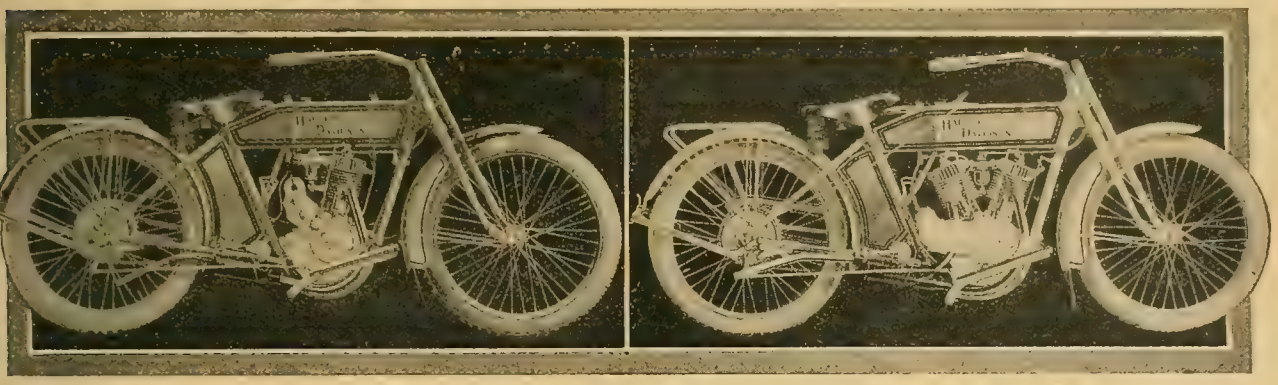
This results in a tie for the Cup, W. B. Gibb (2¾ Douglas) and T. R. Trotter (3½ B.S.A.) standing equal.

A dance will be held at the Montpellier Rotunda on Wednesday, Feb. 4th, 8.30 p.m., at which the prizes will be presented.

Members of the Sheffield and Hallamshire M.C.C.—winners in 1913 of "The Motor Cycle" Challenge Cup in the M.C.C. Team Trial. In the foreground are seen the cup and six medals which were presented to them at the M.C.C. dinner on Saturday evening.

The Harley-Davidson Motor Cycle.

A High-class Powerful American Production. Singles and Twins with Loop Frames.



TWO TYPES OF HARLEY-DAVIDSON MACHINES.

(1) The single-cylinder 5 h.p. model with chain drive, footboards, overhead inlet valve, and separate petrol and oil tanks. (2) Valve side of the 8 h.p. two-speed model, which is on the same lines as the 5 h.p.

THE firm of Harley-Davidson, whose factory is at Milwaukee, U.S.A., is very well-known in America, but up to the present we have only seen an occasional specimen over here. All this is to be altered, however, for the firm has secured premises in Great Portland Street, W., whence it will handle the sale of the two Harley-Davidson models, the 8 h.p. chain-driven twin, with or without two-speed gear, and the 5 h.p. single inclined cylinder, on which transmission is also by chain.

The 8 h.p. twin has a capacity of 815 c.c., and the carburetter is fitted between the cylinders. Two chains are employed for the drive, both being on the left side. The two-speed gear is fitted in the hub, and is, to all intents and purposes, a bevel type balance gear (on the lines of the early quad gears of about 1900 to 1902), one of the large pinions being locked by a dog clutch to produce the low speed action. This hub illustrates the barrel of the hub being cut away to show the bevel pinions and the sliding portion of the clutch.

The brakes are a feature of the Harley-Davidson models, and the 1914 brake has a drum nearly 7½in. in diameter by ⅞in. wide. These brakes have been in use on all the three-wheeled delivery trucks made by this firm for a year, and have given every satisfaction. The brake band is operated by pedal, conveniently placed for the right foot.

Clutch Mechanism.

The clutch control is arranged so that it can be brought into action either by a pedal on the near footboard, or by the clutch lever, operated by hand, also fitted on the near side.

Another feature of this American model is the folding footboards, which permit of several different positions for the feet, thus avoiding cramping on long rides. These footboards are covered with rubber.

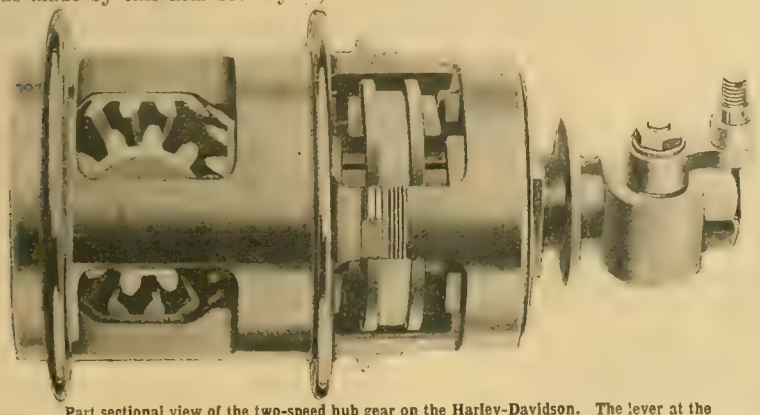
The frame is extremely strong, and lined throughout with steel liners, and is not designed in the usual manner, but the seat tube and down tube are one continuous member, passing right underneath the crank case : an extremely strong method of building the frame. The wheels of the Harley-Davidson are 28in. in diameter, and the tyres 3in. back and front.

The single-cylinder model, with the exception of the engine, is practically identical with the one we have just described.

The Tricar Goods Truck.

The three-wheeled goods truck, as it is termed in the States, is a type with which British riders have not had very much to do of late. It is a tricar which can be fitted with a front seat for a passenger or a box for carrying goods. The frame of the truck is constructed of channel steel, tapered fore and aft, and in it is fixed the bicycle minus the front wheel and fork. The steering details of this machine are excellent, and although it is difficult to imagine the revival of the tricar type of motor cycle in this country, it is just possible that as machines of the Morgan and A.C. type give such excellent results, a considerable measure of popularity may fall to this model.

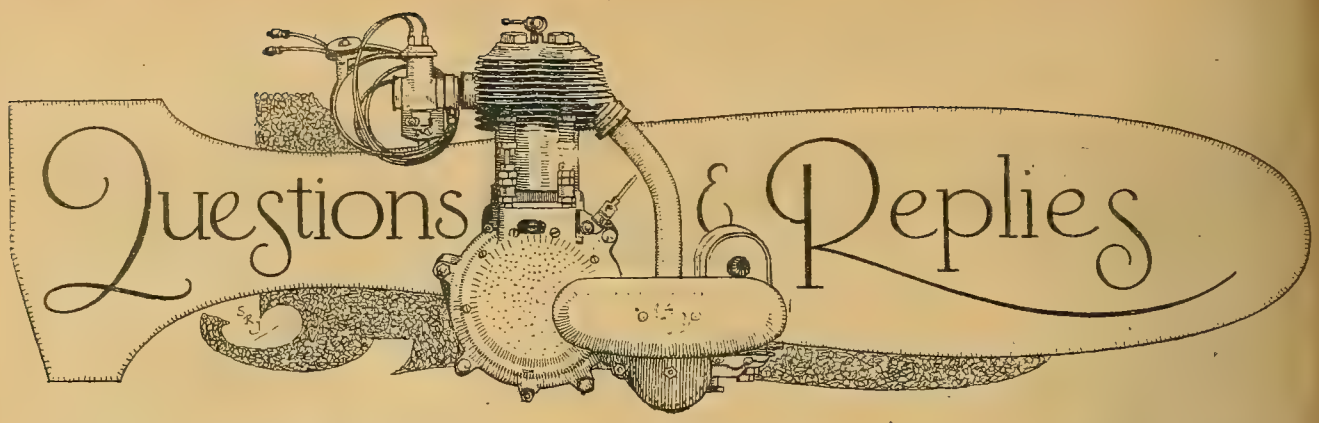
Double band brake on the Harley-Davidson models. One brake is of the internal expanding type, while the other is of the external contracting pattern.



Part sectional view of the two-speed hub gear on the Harley-Davidson. The lever at the end operates the dog clutch.

While on the subject of Harley-Davidson machines, it may be interesting to mention the history of this company. The four members of the firm—three Davidsons and one Harley—commenced operations in a very small way some years ago, and now have one of the largest purely motor cycle factories in the world, employing 1,500 hands, and in 1913 they manufactured 20,000 machines and expect to turn out 25,000 in 1914.

We hear that it is the intention of this firm to take part in British competitions in 1914.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rigid or Flexible Sidecar.

I should be glad if you would tell me what advantages (if any) a rigid sidecar possesses over one of the flexible variety, and which type is the better for cornering. We have rough roads in Victoria, Australia, and opinion seems sharply divided on which is the better type.—C.B., Victoria, Australia.

The rigid type of sidecar is now practically universal. It is simpler to fit and lighter, and probably stronger for its weight. It steers more easily and is much easier to detach. It also allows of a much more simple frame construction. Its disadvantage is that on a highly cambered road the whole outfit has necessarily to lean a little to one side. Taken altogether, we should advise you to have a rigid type of sidecar, even if your roads are very bad.

Big Bore Twins.

Will you please advise me what advantages a 90 × 77½ side by side valve 8 h.p. engine has over an 85 × 85 mm. model? I understand that it is slightly faster and runs more sweetly.—E.B.

The 90 × 77½ mm. engine is designed to run at a far higher speed as regards revolutions per minute than the 85 × 85 mm. model. As the engine is essentially a high-speed one better results will be obtained with it if a slightly lower gear ratio is used than with the 85 × 85 type. With regard to the smoothness of running, we should not think that there is very much difference between the two, but, provided that it is not over-geared, the big bore engine may perhaps be the smoother.

Fitting a Kick Starter.

I am desirous of fitting a kick starter to my three-speed T.T. Roadster Triumph. Could you kindly give me any names of makers of these, and would you recommend such a fitment?—C.P.

We have never seen a kick starter fitted to the machine in question, but provided the clutch operating rod is not in the way there is no reason why a kick starting pedal connected to a free wheel sprocket on the back wheel should not be fitted to the back fork, though it would probably disfigure the machine as regards appearance. As you are probably aware, the engine in question is fitted with an admirable half-compression device, which renders starting on the low gear literally a matter of a slight push, and we do not think that you would find a kick starter any material advantage on a T.T. model.

Automatic Inlet Valve.

I am writing as a novice to ask if you would give me your opinion of an engine with automatic inlet valve, and would you explain how it works? The reason I ask is that I have had offered to me a motor cycle with an engine with automatic inlet valve, and as I understand this kind of valve is not as good as the mechanically operated, I should be glad to know if this is a drawback to my purchasing.—A.C.V.

Generally speaking, automatic inlet valves are a thing of the past, except for very small engines. Far more power can be obtained with mechanically operated inlet valves, and a better range of engine speed. For easy starting, with an automatic valve you require a weak spring, but for power and pace a strong one is wanted. Thus it is obviously impossible to combine both virtues in one spring. At the same time quite good service may be obtained with an engine fitted with an automatic inlet valve, especially if the engine is not large. The action of the valve is governed by the suction of the piston, which causes it to open, and the spring closes the valve when the piston has reached the end of the stroke.

Dressing a Slipping Clutch.

I have experienced a good deal of trouble with the clutch on my 1913 8 h.p. machine. Leather wore very quickly, and I have now substituted Ferodo, which operated very well at first, but with time the surface became very hard. Ferodo is undoubtedly the best material, but owing to its great strength and hardness will stand a much greater pressure. So I am fitting a much larger additional spring to the clutch. I should also like to know if there is a suitable dressing for Ferodo, to prevent slipping. Up to the present I have applied varnish and resin.—C.H.

The dressing of resin and varnish, which you say you are using to dress your Ferodo clutch, is about as bad a substance as you can possibly use, and is bound to make the clutch very hard and very fierce, with the result that slipping is bound to occur very shortly. Ferodo should be dressed with ordinary engine oil and only requires a few drops a week. You will find in all probability that it will be necessary for you to scrape the surface of your clutch in order to remove all traces of the varnish and resin before you can get good results.

A NEW FEATURE.

"LOOKING BACK." *In the course of our work we frequently have occasion to refer back to old numbers of "The Motor Cycle," and invariably find our excursion into the past a task of extreme interest. These old numbers extend back over a period of more than ten years, and it is only by a perusal of these past volumes that it is realised vividly how complete a history of the motor cycle movement our pages provide. And if a perusal of the doings of the "old brigade" are of interest to ourselves, who live and move and have our being among motor cycles and those interested therein, and thus may be said to be taking a "busmen's holiday" by such dips into the past, it has occurred to us that our readers may also like to share in the pleasure. We therefore propose for the next few months to review briefly week by week the position of the motor cycle in the corresponding week exactly a decade ago. The comparisons and reminiscences will, we feel sure, prove of absorbing interest alike to new motor cyclists as well as riders of the old brigade. Valuable old prints will be used for illustration purposes.*

"The Birmingham Daily Mail"

(Dec. 8th, 1913)

states with regard to the new

LODGE

WEATHER-PROOF PLUG

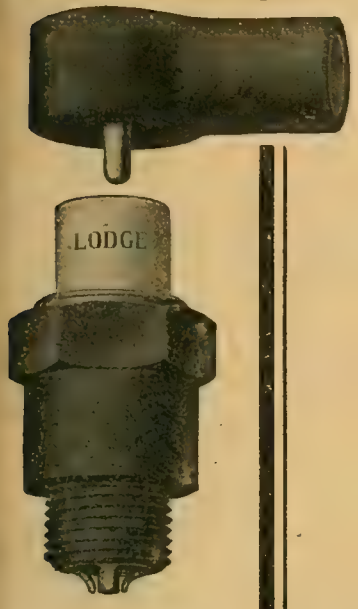
"Very effective in every way, and certainly the only real water-proof plug I have yet come across."

—Fire-proof, Shock-proof, and Weather proof—

No screw terminal. All high-tension metal parts completely enclosed and protected from wet and mud. The ideal plug for motor cycles.

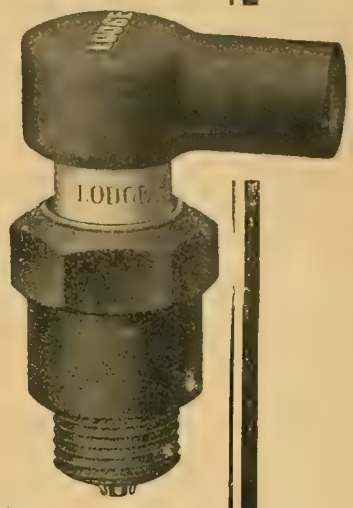
Price 5/- each

(complete with quick detachable cable connector, as illustrated).



Note how conveniently spark may be tested by raising insulated terminal from plug.

Illustrations actual size.



Showing quickly detachable and insulated cable terminal in position, overlapping plug insulator.

1914 *LODGE PLUG LIST IS NOW READY.*

London Showrooms: 57, Holborn Viaduct, E.C., and 157-158, Sloane Street (close to Sloane Square), S.W.

TRANSMISSION

N.S.U. RECORDS

On November 20th, Lieut. R. N. Stewart, riding a two-cyl. N.S.U. (54½ x 75 mm.=349 c.c.), established new records in Class B for the following distances and times:

350 miles ..	8 hrs. 32 min. 4⅘ sec.=41.01 m.p.h.
8 hours ...	328 miles 184 yards=41.00 m.p.h.
9 hours ..	369 miles 1,454 yards=41.09 m.p.h.

Of this performance, "The Motor Cycle," 27th Nov., says: "This ride was noteworthy as it was a genuine amateur attempt to verify Stewart's ability to ride nine hours at Brooklands to settle a sporting bet made by Stewart with his fellow officers in his regiment. He had no trade assistance whatever, and had his own orderly and servant to assist him. He ran most consistently from start to finish, and would doubtless have done much better but for the very high wind which prevailed all through the ride."

On Nov. 27th, Mr. Max Heinzel, riding a 2 h.p. N.S.U., at Brooklands, accomplished the following fine performance:

3 hrs. — 135 miles — 1,101 yards

averaging

Over 45 miles per hour.

MODELS FOR 1914

3½ h.p.
Twin-cylinder, 498 c.c., two-speed gear and free engine, belt drive.

6-7 h.p.
Twin-cylinder, 830 c.c., chain drive, three-speed countershaft gear, 26in. by 2½in. tyres.

7-9 h.p.
Twin-cylinder, 996 c.c., chain drive, three-speed countershaft gear, 28in. by 3in. tyres.

THE N.S.U. MOTOR Co., Ltd., Offices and Showrooms: 186, Great Portland Street, London, W. Goods and Repairs: 83-85, Bolsover Street, London, W.

A daring feat during the performance of the Klein troupe.

Carburetter Adjustment on a Big Twin.

I ride a 6 h.p. 1911 twin with B. and B. carburetter and sidecar attached, and I find that I cannot open the air at all except at very high speeds, *i.e.*, about 40-50 m.p.h. For all ordinary running, from 7 m.p.h. to 30 or so, I have the air lever closed and ride on the gas lever, and even at 30 m.p.h. do not open the gas more than a quarter. On any stiff rise, such as the Macclesfield-Buxton Road, over the Cat and Fiddle, I can take sidecar and passenger up on top gear (N.S.U. two-speed) with gas about half open and no air. The cycle, sidecar, passenger, and self weigh something over 500 lbs. I have never cared to run "all out," as the speed gets too much of a good thing on bumpy roads, even with gas half out. As my benzole consumption is about 50-60 m.p.g. only, it seems to me that the carburetter is at fault, although it is very handy—picks up at once and is easy to control. At the same time for traffic it seems a little too powerful. When running slowly on little gas only the rear cylinder fires; it seems that what is too thin a mixture for the front cylinder is all right for the rear one.—F.S.G.

It seems as if one of the following troubles occurs: (1.) The jet you are using is too small, or, contrariwise, the *main* air inlet is too large. An air funnel around the jet is the remedy in the latter case. (2.) Air is being sucked either in the neighbourhood of the slides or somewhere in the induction pipe. (3.) If the jet is large a small particle of grit or other foreign matter may have become wedged in the orifice, thus reducing the amount of petrol that passes through it, and so minimising the amount of gas that the engine will not take any air. This, however, seems very improbable, since you clearly state that you can attain a speed of over thirty-five miles an hour, also your petrol consumption is large enough to eliminate the possibility of your running on a small jet. Therefore we come to the conclusion that there is an air leak in your carburetter or induction pipe, yet at the same time it must be fairly minute, otherwise the engine would not pull so well on hills. The fact that only the rear cylinder fires when the engine is running slowly may be due to several things—either the contact points on the magneto are dirty and should be polished, or the sparking plug points of one cylinder are foul or have too wide a gap. What this seems to point to is that the air leak takes place where the induction pipe joins the front cylinder, and this air leak would naturally prevent your opening the air lever when running at medium speed.

READERS' REPLIES.

A Curious Complaint.

I should like to advise "E.M." (who writes in *The Motor Cycle* of November 27th) to take out his exhaust valves and carefully to examine the cylinder seatings for cracks facing the piston. The running of his machine fits my own case and another here exactly. In both cases it was found to be cracked seatings in both cylinders. The machines are the same year and make, excepting these are 7 h.p. The reason of this wholesale cracking is very simple, I think; the exhaust valves practically overlapping the piston top, there being next to no wall in between.—J.T.

Air Leaks.

Your correspondent "Twincy" in your issue of Dec. 4th, like others, has experienced difficulty in getting the front cylinder of his 6 h.p. twin to fire at less than about 20 m.p.h., and many suggestions have been brought forward at different times as to the cause. Some time ago I experienced the same trouble, and although the magneto had been overhauled by the makers the trouble continued. After much research I discovered that the platinum points did not separate equally for each cylinder, and that when breaking for the front cylinder there was not sufficient clearance, and consequently no spark at the plug at low speeds. I removed the metal block inside the contact breaker ring that operates the front cylinder and placed beneath it a piece of thin brown paper, screwed it again in place and the difficulty at once disappeared. Unless the armature and the contact breaker ring are absolutely dead centre this difficulty will arise. A hair's thickness will make all the difference to sparking at low speeds. This often accounts for difficulty in starting, I think. —Twin Spark.

EXPERIENCES WANTED.

"C. Cook" (Leeds).—Efficiency of the Levis and Connaught machines.

F.H." (Lower Walton.)—Oildag in motor cycle engines. Douglas in particular.

"J.A.D." (Essex).—Armstrong and other three-speed hubs for a 6 h.p. twin and 3½ h.p. single.

"H.W." (Glasgow).—5-6 h.p. Clyno sidecar combination. General reliability, consumption, and durability.

"A.A.B." (Finchley).—Running costs for about 5,000 miles of a 2¾ h.p. twin motor cycle, especially the Douglas; everything included.

"A.R." (Hull).—Duo cycle car, 1913. Reliability, petrol consumption, speed, whether able to keep the road at high speed, repairs, and wear and tear.

We have letters from the following readers unaccompanied by stamped addressed envelopes. If the senders will forward envelopes in accordance with our regulations their queries shall have attention: W. C. Pepper (Liverpool), J. Hanoer (Barry Dock), J. F. Sutcliffe (Littleborough), B.G.L.G. (no address), Thos. Miller (Duns., N.B.), and V. D. Dennis (Uppingham).

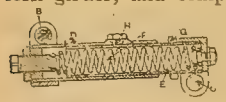
A group of motor cyclist trick riders, the Klein family, who are now appearing at the Alhambra Theatre, Leicester Square. The lightweight N.S.U. used by the troupe has to withstand exceptionally rough treatment.

PATENTS

By ERIC W. WALFORD, F.C.I.P.A.

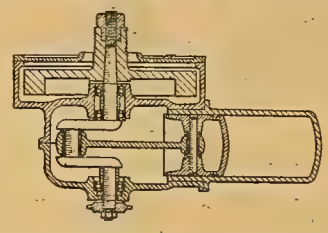
A Spring Fork Improvement.

This fork is of the well-known Druid type, but the upper links A are designed to afford a slight longitudinal movement in addition to the ordinary up and down motion. Each link is pivoted at B to the ball head clip, and at C to the fork girder, and comprises two telescopic parts D E connected by a tensional spring F. It will be readily seen that this construction affords the advantage stated, whilst in case of fracture of the spring F the link may be rendered rigid by tightening up the locking ring G against the outer telescopic member D, which will draw the inner member E to its limit position against the stud H.—O. Filkin, No. 23,400, 1912.



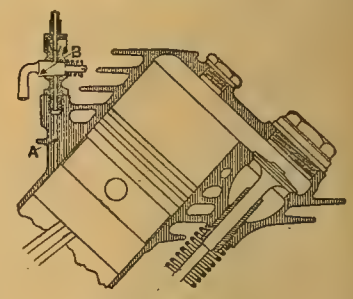
An Outside Flywheel Engine.

To overcome the chief objections to engines of this type, this inventor locates the flywheel in a special housing which carries the engine attachment lugs. The flywheel therefore lies in the central plane of the machine with the cylinder on one side and the pulley on the other. The flywheel is therefore out of the way of damage in the event of a side-slip, and cannot throw mud and oil. Further, the air supplied to the engine passes through the housing in order that it may be purified by centrifugal separation. As the air is rotated rapidly in the flywheel housing, dust, etc., is thrown outwards and passes away through outlets in the flywheel housing. Various bearing arrangements of the crank chamber are described. There may be one bearing between the crank and the pulley, or one on each side as shown, and there may be a third on the outer side of the flywheel housing.—J. E. Wilks, No. 6,988, 1913.



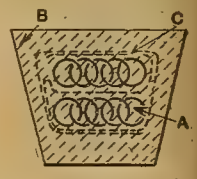
A Cylinder Priming Arrangement.

The ordinary injection tap in the cylinder head has the disadvantage, when used with a flat top piston, that a relatively large amount of petrol has to be injected before enough of it runs around the sides to free the piston. By the construction illustrated the injection orifice A is situated at some distance down the cylinder wall, so that the fuel injected comes directly upon the side of the piston. A cut-off tap is fitted at B.—Soc. Anon., H. and A. Dufaux et Cie., No. 5,882, 1913.



A Wire and Rubber Belt.

Instead of a core of canvas and a rubber casing this belt is formed of helical wire coils A, surrounded by a rubber casing B. In addition, the actual core of the belt may be wrapped in a canvas sheath C.—J. P. Higgins, No. 24,317, 1912.



Carburetter Atomisers.

The price of the motor cycle "Vapo" atomiser, which was described in our last issue, is 10s. 6d.

Well-known Rider's Appointment.

Arthur G. Fenn, who has been so well known as a competition rider on Humber and B.S.A. machines in the past, has been appointed sales manager to the Dew Engineering Co., Eynsford, Kent, makers of the D.E.W. cycle car.

Tyres in Ireland.

The Spencer-Moulton depot of 19, Crow Street, Liverpool, is being closed down, and the makers of this well-known tyre have appointed Mr. C. E. Jacob, of Dublin, Belfast and Cork, to be their managing agent in Ireland.

The G.N. Cyclecar in Spain.

In a recent Reliability Trial held by the Moto Club Deportivo in Spain, Senor J. Teixido, driving a G.N., secured a gold medal. It is interesting to note that he only took delivery of his machine the day before the trial.

Company Report.

The directors' report of the Palmer Tyre Limited, for the twelve months ended Sept. 30th, is to hand.

The 19th annual general meeting of the company will be held at the offices, 106, Cannon Street, E.C., to-day, the 18th inst., at 2 p.m. The accounts show a profit for the year of £13,044 2s. 8d., to which is to be added the balance brought forward from last year—£365 13s. 5d., making an available total of £13,409 16s. 1d. The directors recommend a dividend at the rate of fifteen per cent. per annum, and to carry forward £3,000 to reserve.

SPARKLETS

Montgomery Sidecars in London.

Owing to the greatly increased demand for Montgomery sidecars in the London district, this firm will shortly be making arrangements with the principal agencies to carry a stock of their sidecars. In the meantime Mr. A. P. Rey, of Great Portland Street, has a selection of Montgomery sidecar models in stock.

Auto-wheels in America.

A. L. Garford, who some years ago was a large saddle manufacturer in Ohio, but who has more recently been engaged in motor car manufacture, has, we hear, acquired the sole rights for the United States of America of the well-known Wall Auto-wheels, and will shortly commence making them in quantities in Ohio.

American Duty Tariffs.

Messrs. Davies, Turner and Co., Ltd., 52, Lime Street, London E.C., who are foreign carriers, inform us that they are still receiving enquiries from motor cycle makers and others concerning the new American duty tariff which shows that there are still many business firms unfamiliar with the duties payable. The firm still have a number of copies of a leaflet which gave particulars of these new duties on motor cycles, etc., and will send one to anyone interested so long as the stock lasts.

The Stag Cycle Car.

The Stag Co. inadvertently made a slight omission in giving us the price of the Stag cycle car described in last week's issue of *The Motor Cycle*. With spare wheel and cape cart hood the complete price is £95 11s.

Catalogues Received.

"Hutchinson Tyres, 1914, for Motor Cycles and Cycle Cars." An illustrated booklet of all the Hutchinson specialities, including a full range of clothing.

"J.A.P. Models, and List of Some Successes gained on J.A.P. Models." (Messrs. J. A. Prestwich and Co., Northumberland Park, Tottenham, N.) A well illustrated catalogue of all the latest J.A.P. engines with diagrams showing the new system of lubrication, etc.

Ariel motor cycles are splendidly described in an attractively got-up catalogue, which reaches us from Ariel Works, Bournbrook, Birmingham. In addition to well illustrated descriptions of the 1914 models, many interesting photographs are given of events during 1913 in which Ariels have figured successfully.

Messrs. Wait and Co., Ltd., Belgrave Gate, Leicester, send us a catalogue of the well known Clyde motor cycles, which are made in three models for 1914, viz.: 2¾ h.p. single, 4 h.p. single, and 6-8 twin. Mr. Wait is one of the pioneers of the motor cycle movement, and, we believe, was the first manufacturer in this county to standardise magneto ignition on motor cycles. It follows, therefore, that great experience goes to making the latest Clyde a thoroughly reliable and workmanlike machine.

Wholesale Agent for London: A. P. REY, Great Portland Street.

You can't drive a knife through the tread.

Tyres go wrong only in two places

—The tread and the "walls."

Use Stelastics, which alone have absolutely cut-proof and practically puncture-proof treads.

Stelastics are the only tyres holding the R.A.C. Certificate for 5,000 miles without cut or puncture.

You can't drive a knife through the tread of a Stelastic. Use Stelastics, keep them pumped up to the pressure stated by the makers, and the walls will not break.

Whatever tyres you use, give them a chance —keep them pumped to pressure.

Special Tyre for Cyclecars, 650 × 65 to fit 2½ rims, Price £2 19s. 6d.

Special 26 × 2½ Motor Cycle Tyres to fit 2¼ rims, Price £2 16s. 6d.

26 × 2¼ £2 12s. 6d.
28 × 3 £2 19s. 6d.

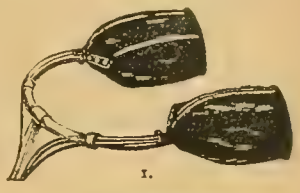
GIFT SUGGESTIONS FOR YOUR MOTOR CYCLING FRIENDS

6 more shopping days in which to solve the Christmas Present Problem.

The following list offers a few suggestions for gifts to your motor cycling friends.

If you are unable to call, our Letter Order Dept. will promptly execute your instructions. Our offer to pay carriage throughout the British Isles is specially advantageous now.

1. Motor Cyclists' Hand Muffs, self supporting and flexible. Cover all levers, but do not interfere with free access to them. In Tan waterproof leather, a pair **22 6**; in best Black waterproof lined Tamo, a pair **15 6**; in Black waterproof lined Grey Cloth, a pair **9/6.**



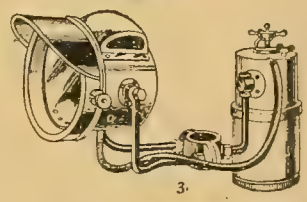
1.

2. Carrier Cushion for fitting over carrier, to provide a comfortable seat for a passenger. Made of leather, with Japanned top, and filled with Doe Hair. Size 15 x 7½in., and complete with four straps .. Each, **4/6.**

2.

3. The "Sovereign" Motor Cycle Lamp Set (as sketch)—Lamp Generator, and Bracket. Special price, complete.. **20/-**

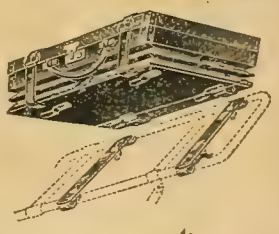
4. Expanding Valise for Motor Cycle Carrier. Size 16 x 11 x 5½ins., expanding to 16 x 11 x 8ins. .. .. .. Each **26/6** Better quality **48/-**



3.

5. 30 Hour Motor Cycle Watch and Case (as sketch), lever movement. Dust and weather-proof. With guarantee .. **9/6.**

6. Jack for Sidecar, very light in weight and convenient for travelling, taking up little space **3/6**



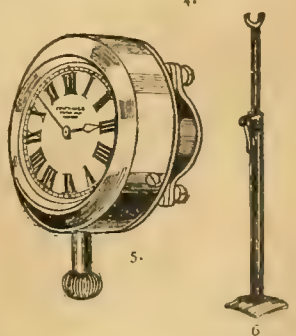
4.

7. Double-twist Motor Cycle Horn (as sketch). Powerful deep note. In nickel, with adjustable clip fastening .. .. .. **9/6.**

Acetylene Rear Light, complete with tubing and Y pieces for attaching to lamp generator. Price each.. .. .. .. **3/6.**

Watford Speedometers 4 guineas and **3** guineas. Fitting extra.

Lucas Handle Bar Mirror, 7/6. Cheaper quality, ... **5/11.**



5.

6.

If you are unable to call, write for list of reduced prices of (1913 Model) Motor Cycles.

BURST TYRES & BROKEN BEADS

HOWEVER BAD, WE CAN SUCCESSFULLY REPAIR.

In the case of a torn away bead we use Chrome leather, and this, with our special method of repairing, ensures the bead never tearing away again at the repaired portion.

In repairing a badly burst tyre we employ our patent vulcanising process, and the repaired part is actually stronger than any other part of the tyre. Such is the thoroughness of our methods.

The CANN MOTOR CYCLE TYRE is unequalled for reliability. It is fitted with our PATENT CHROME LEATHER BEAD and proof against deadly rust. Ask for prices, and our system of exchanging new tyres for old.

Levis.

1913 Baby Levis, little ridden, perfect condition, accessories, spares; £27.—Loughton, Southwell. [X173

2¼h.p. Levis, cost over £35, with extras, done 600, one puncture; £25.—Brown, 56, Bewsey St., Warrington. [X9941

2¼h.p. Levis, nice running condition, go practically anywhere; trial, appointment, seen any time: must sell, sacrifice, £21.—Ruston, 4, Minehead Rd., Streatham Common. [X187

Matchless.

1911 Matchless, 3½h.p. J.A.P. engine, tyres, engine excellent; £25.—Robinson's, Green St., Cambridge. [5034

MATCHLESS, 1914 models.—Quick delivery from the largest Lancashire agent, Cordingley, Haslingden. Tel.: 2Y. [X7864

7h.p. Matchless, 3-speed, chain drive, the very latest, with Hercules coachbuilt sidecar; £88.—Cordingley, Haslingden. Tel.: 2Y. [X7873

£25.—Matchless, 3½h.p., Armstrong 3-speed; good reason for selling; photo, particulars.—Smith, Wye Villa, Bridge St., Hereford. [X176a

6h.p. Matchless, 1913, 6-speed model, dropped bars, Lucas lamp, Jones speedometer, horn; £50.—Hoffmann, 34, High St., Haverhill. [4861

1912½ 6h.p. 2-speed Matchless, Montgomery sidecar, new Cowey, P. and H. lamp, horn, etc.; £55.—Hilton, Foxhall Sq., Blackpool. [X107

MATCHLESS, 6h.p., 1913 Gradua gear, excellent condition, not done 5,000, accessories, 2 belts; what offers?—Dr. Mackenzie, Millken, Johnstone. [X9945

MATCHLESS, 1914 model, 8h.p., 3-speed, silent chain drive, with coachbuilt sidecar, only used in competitions; a bargain, £70.—Guest, 89, New Rd., Woolwich. [X27

MATCHLESS, 1912½, 6h.p., 2-speed, Montgomery sidecar, lamp, horn, Jones speedometer, new Dunlop tyres, perfect condition; £55.—Raffel, Bowling Green Hotel, Carlisle. [X9859

MATCHLESS 1913 Motor Cycle, 8h.p., 2-speed gear, double belt drive, with Mills-Fulford cane sidecar, Lucas lamp, horn, spares, etc.; £65.—Morgan, 18, Herbert Rd., Plumstead. [X28

1913 Matchless, 3½h.p. twin, Armstrong counter-shaft 3-speed, free engine, lamp, horn, spare belt and bag, condition almost as new, complete; £47/10.—Robinson's, Green St., Cambridge. [5031

MATCHLESS, 1913, 3½h.p. twin, 3-speed, free engine, kick starter, counter-shaft, ridden 1,500 miles, excellent condition demonstration machine; £47/10; with accessories.—Apply, F. Dew, Heyford, Banbury. [X119

8h.p. Matchless, 1912, 2-speed, just returned from makers completely overhauled, tank, etc., re-enamelled, Cowey, King of the Road, 20 gn. Gloria sidecar, new 70/- tyre and spare tubes, etc.; £60, or nearest offer during the week Dec. 4th-11th.—Shorthouse, Hampton, Middlesex. 'Phone: 247 Molesey. [0565

1913½ Matchless Combination, 8h.p., double belt drive, 2-speed, kick starter, heavy Kempshall cycle car tyres all wheels, 2 lamps, horn, done about 1,000, unscratched, special trials machine, with picked engine, 3 gallon tank, etc.; £65 cash; consider exchange.—'Phone: 244 Gerrard.—Gayford, 20, Woodside Rd., South Norwood. [5004

Minerva.

4½h.p. Twin Minerva, h.b.c., Bosch, Druid forks, Roc 2-speed gear, B. and B.; £20.—Mitchell, 14, Highfield Villas, Kendal. [X9948

MINERVA, 2¾h.p., perfect condition, all accessories, B. and B. carburetter; £11.—Kal Ellis, Terrington St. Clement, King's Lynn. [X9585

3½h.p. Minerva, m.o. valves, Senspray, accumulator, low built, splendid order, accessories; £9.—Miller, boot merchant, Linlithgow, N.B. [X188

M.M.C.

TWIN M.M.C. Mag. Machine, perfect running order; £17, bargain.—Rich, Shifnal, Salop. [X9950

Moto-Reve.

MOTO-REVE 2½h.p. Twin, mag., B. and B., engine, belt, tyres as new; £14/10, genuine bargain.—Tooth, 12, Winchester Mews, Swiss Cottage, N.W. [X45

Motosacoche.

1912 Motosacoche, 2½h.p., capital condition; £17/10.—Sharples, 36, Bolton Rd., Walkden. [X169

New Hudson.

NEW Hudson, 1912, 2¾h.p., 3 speeds, good order; £26.—P. J. Evans, John Bright St., Birmingham. [X62

NEW Hudson-Jap, 1912, free engine, 3-speed, new May, 1913, all accessories, perfect condition; £25, no offer.—418, Old Kent Rd. [X9954

NEW Hudson, 4h.p., 1912, 3-speed, new sidecar, fittings, machine guaranteed; £38, or best offer.—60a, Trinity Rd., Balham, Battersea 1528. [4850

NEW Hudson, 6h.p., 1914 models, with Portland sidecar; 74 gns.; exchanges or easy payments.—Maudes, 136, Great Portland St., London, W. [4841

NEW Hudson, late 1913, 3-speed, free engine, kick starter, Canoelet sidecar, Lucas lamp and horn, spare engine chain, spare belt, valve, tools, etc.; £54.—Mallard Motor Co., Ltd., Berry St., Liverpool. [X9990

The Trade and the Trials.

NEXT year manufacturers will not collectively support any particular one-day trial as in the past. This decision is the outcome of a meeting held last week to consider the policy of members of the Cycle and Motor Cycle Manufacturers' and Traders' Union towards competitions in 1914. It will be recalled that in 1913, twelve of the most important events were selected for unanimous support by members of the Union, which body includes nearly all the leading manufacturers in this country. But this scheme did not give general satisfaction in practice. In selecting the events, the main object was to distribute support on a geographical basis over the country, and by so doing districts in which individual manufacturers were particularly interested and would like to have supported open local events were debarred from them by reason of the compact which had been formed. For next year, the members of the Union have agreed to have a freer hand, though still confining their support to twelve events. In other words, it has been resolved that each individual manufacturer may select whichever twelve events he would prefer to support in 1914, and naturally in so doing a manufacturer will give some preference to clubs in districts in which he has strong trade connections.

In some respects we regard it as a retrograde step, as it will have the effect of increasing rather than decreasing the number of open events in 1914, seeing that any new and practically unheard of club may organise an open event, whether competent or otherwise to do so, and, further, may possibly receive trade support. During 1913, the twelve events selected by the manufacturers were generally regarded as the important events of the year, and those who closely followed competitions were thus able to place a relative degree of importance upon them. A club announcement that the event is "trade supported" will convey nothing in 1914, and it will be interesting to see if in twelve months' time the manufacturers revert to their 1913 policy. In view of the repeated grumbles during the passing year as to the large number of competitions it was almost necessary for manufacturers to support, the new decision is bound to cause some consternation, as it is obvious that the effect will be to increase rather than to decrease the number of competitions during 1914.

May Good Luck go with them.

AN eminent Roman lawyer, when analysing a legal case, invariably put the question *Cui bono?* And in modern English that is equivalent to "Who is getting anything out of this?" Now we fancy that among the thousands of persons who on Boxing Night witness the departure of the hardy voyagers from Staines on their way to Exeter and back a good number will put this same question: *Cui bono?* The answer is simple and terse: Nobody. The masses in this country have grown so accustomed to have their sports and games played vicariously that they have largely become lookers-on instead of performers, and thus the prospect of over a couple of hundred stalwarts prepared to suffer a very considerable amount of personal discomfort, and even pay out good money to do so, is one that is difficult of assimilation by the ordinary crowd. For, intrinsically, the rewards are paltry. A gold medal can be picked up almost anywhere at far less trouble and expense—so obviously it is not the awards that they go for. Why, then, do these men go "into the dark," as Mr. W. Cooper (who, by the way, first suggested the Christmas reliability trial in the columns of this journal) describes it on another page? Well, we rather think that all said and done, the real reason is that love of adventure which has gone so far to make our country what it is, and we think it is an excellent thing to find such a spirit so awake and enthusiastic in a time which croakers describe as a "flabby age." As a test of machines this trial pales before its severity as a test of men, but we feel quite confident that, unless actually snowed under, the great majority will come through smiling for their gold medals, and right well will they deserve them.

The Story of a Christmas Present.

TOLD IN SEVEN LETTERS, FOUR WIRES, AND A PRESS CUTTING.

I.

Laburnum Cottage,
Witherington Furze, Herts.
December 18th, 1913.

My Dear Nephew,—I have neither seen you nor wished to see you for the last six years. I trust I can forgive as a Christian should, but I could not forget how you tied Tabby's and Carlo's tails together. Carlo, as your dear mother must have told you, has gone to his last long home, but darling Tabby has never been the same cat since. Often, as she lies meditating by my parlour fire, she lifts her poor scarred head to cast such a pathetic glance at me, and I am sure, if she could talk, she would say, "Why, oh why, dearest mistress, did you invite that Monster of Iniquity to stay with us?"

However, you are a man now, and I trust you have put away childish things. I was delighted to see in to-day's *Morning Post* that you have won a scholarship at Oxford. I hope this means that you are a reformed character, and that you have decided to follow in your departed father's footsteps, and join the ministry. If this is so, I shall be happy to make up to you for the birthday and Christmas presents which I felt it my duty to withhold after your cruelty to my cat. At the rate of two five pound notes a year the sum would amount to £50, and I believe this would buy the very fine theological library left by our late vicar, besides coming in very useful for his widow and orphans, who are left in deplorable poverty. If you have no special plans for Christmas, will you spend it with me, when you can also view the library?

With my love to your dear mother,

Your affectionate Aunt,
PRISCILLA HOPKINS.

II.

St. Ambrose College, Oxon,
Dec. 19, 1913.

Dear Auntie,—Always said you were a sport. Hope Tabbie bears no malice really. Sorry cannot come for Christmas. Jenkins and several other men are going down home for Mabel's coming-out dance. Will look you up some time during the vac. per motor—Jenkins has a racer. You've made one bloomer. Haven't decided yet which profession to adorn. Little premature to buy the reverend's library under the circs. Jenkins says marriage is the only profession I'm fit for, but fear quality of wives procurable at £50 is low. I really want to be an engineer, and Mother thinks a motor bicycle would give me splendid practical experience. Oh, auntie, make it a motor bicycle, do! and I'll buy you two new cats—the long woolly sort with green eyes!

Yours till we need remagnetising,
AUBREY HOPKINS.

P.S.—Go easy with the wassail this Yuletide!

III.

Laburnum Cottage,
Dec. 20, 1913.

Nephew,—The flippancy of your lamentable epistle has made me perfectly ill. Your gibes at the holy estate of matrimony, your unnatural callousness towards my deep affection for my faithful four-footed companion, your suggestion that a respectable spinster like myself could be guilty of carousal, compel me to recognise that your old Adam is still rooted deep. I shall carry out my intention of purchasing our late vicar's library, but I shall present it to the local cottage hospital; nor shall I add to your sins by providing you with funds which you would obviously waste in riotous living. As for motor bicycles, I cannot sufficiently express my detestation of those malodorous, tympanum-perturbing engines of Satan.

PRISCILLA HOPKINS.

P.S.—If you bring the person Jenkins, Florence will inform you that I am "Not at Home."

IV.

Malcot Grange, Hants,
December 21st, 1913.

Dear Auntie,—We'd much better kiss and be friends—isn't that what Christmas means? We won't say another word about the motor bicycle, and by all means buy the vicar's library, and present it to the cottage hospital—daresay the patients will digest more of it than I should. But the Mater agrees with me that we're not going to let you spend another lonely Christmas. Jenkins and I are going to motor over to-morrow to fetch you down here for the festive season. Pack a ball dress, and foot it with the best at Mabel's dance; get your thickest ulster out of camphor; for the old Mercédès can move, and it'll be a long cold drive.

Your penitent nephew,
AUBREY.

motorist.

MIDNIGHT MOTOR RAID ON SURPRISED BURGLARS.

The gang of burglars who have lately spread panic among the wealthier residents of Herts., and have so successfully baffled the determined efforts of the local police, met their Waterloo in the picturesque village of Witherington Furze just after midnight this morning. Among the residents of that charming rural fastness, Miss Priscilla Hopkins, a wealthy maiden lady, has long been eminent for deeds of piety and philanthropy. Attracted doubtless by rumours of her domestic treasures the gang effected a successful entrance into Laburnum Cottage, via the pantry window, shortly after 11 p.m., and having gagged and bound the helpless lady and her sole attendant, Miss Rebecca Smithers, proceeded to ransack the house. By a fortunate mischance, an undergraduate nephew, Mr. Aubrey Hopkins, of St. Ambrose College, Oxon., and a friend, Mr. Jenkins, of the same college, were delayed in a surprise motor visit by a mechanical breakdown, and arrived at Laburnum Cottage shortly after midnight. They surprised the thieves at their nefarious work, and after a violent fracas succeeded in securing the three ruffians, who are well-known to the police as desperate criminals. After the miscreants had been transferred to the custody of the county constabulary, Mr. Hopkins and Mr. Jenkins took the unfortunate lady down to the former's home in Hampshire for a family Christmas

Malcot Grange, Hants,
December 26th, 1913.

To the Managing Director,
Blizzard Motor Cycle Co., Coventry.

Dear Sir,—I desire to present my nephew, Mr. Aubrey Hopkins, with a motor bicycle, and I am credibly assured that you make a safe and reliable type. As he is young and reckless, it should not be speedy, and in the interests of the public it is obviously desirable that the engine should run very silently, and that the brakes should be exceedingly substantial. Will you kindly inform me of your terms for a machine not exceeding one horse power? I should add that when I mention one horse power, I have in mind a quiet cob, not a thoroughbred racehorse.

Yours very faithfully,
PRISCILLA HOPKINS.

IX.

Malcot, December 26th.

T. S. Brooklands, Esq., Managing Director,
Blizzard Motor Cycle Co., Coventry.

Dear Tom,—You mayn't know I have an aunt who's simply rolling? Well, old Jenkins and I saved her from some burglars this week, and I guess from sundry hints that she's writing to you about a motor bike for me as a reward. She's sure to ask for one that won't go more than a Six Days' schedule crawl. Well, *you* know that the 6 h.p. Brooklands model is the tip for me, but when you get her enquiry, paint it as a motor sausage, there's a pal.

Yours till our jets choke,
AUBREY.

X.

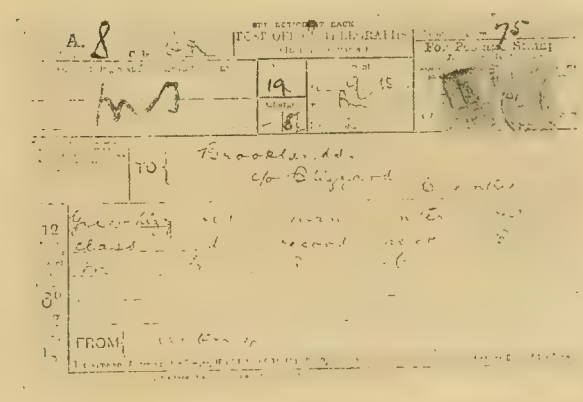
Blizzard Motor Cycle Co., Coventry,
December 27th, 1913.

Dear Madam,—We are overburdened with orders just at present, but we are always anxious to oblige so distinguished a client as yourself, and esteem ourselves fortunate in having at this moment in stock a ¼ h.p. runabout, designed expressly for my own daughter, and thrown on the market because my wife has decided to buy her a Shetland pony instead. It is extremely silent and docile, and has never been known to exceed five miles an hour on the road. I shall be happy, under the special circumstances, to accept the sum of sixty pounds (£60) for this machine, and I am sending it down per passenger train to-morrow for your inspection and approval. Hoping to be favoured with your esteemed order, I am, dear Madam, yours faithfully,

T. S. BROOKLANDS, Managing Director.

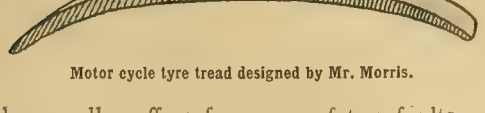
P.S.—I may add a little technical information for Mr. Aubrey Hopkins's information. The engine is of our 1914 1,000 c.c. type, equipped with overhead valves, which produce a marked improvement in silence and docility.

XI.



NARROW THICK TYRE TREADS.

"Ixion" writes as follows: "Mr. Morris, of Sherrard Street, Melton Mowbray, has sent me a section of a new tyre tread which he proposes to place on the market, a sketch of which I append. He is in full sympathy with the demand for stouter and more durable tyres than the old 2¼in. standard type, but considers that the real desideratum is *depth* of tread rather than *width* of tread. He points out that a 3in. tyre, as applied to a motor



Motor cycle tyre tread designed by Mr. Morris.

bicycle, usually suffers from one of two faults; either the bulk of its cross section is out of contact with the road, in which case it might as well be narrower—the user is paying for non-effective rubber, in fact; or else the whole cross-section is in road contact, which implies that the tyre is under-inflated and will roll, or that the walls of the casing are too nearly vertical, and the internal strains will soon break them up. His section indicates an alternative ideal—the very thick tread with a narrow road contact and tapered walls. His idea is scarcely as new as he fancies. To quote a single instance, I once had a pair of tyres made by a small maker at Henstridge (whose name I have stupidly forgotten) which were identical with his, except that they were far more substantial, and that the tread had cross grooves like the Dunlop car patterns, to ensure a better longitudinal grip. These tyres were the most durable pair I ever possessed, and I cannot think why I never repeated the order—unconscious insanity, evidently. Possibly some of the larger tyre firms have corrective ideas on the subject, if that is so, I have no doubt readers would be glad to hear what they are."

OCCASIONAL COMMENTS

BY "IXION"

Golf Bag Clips.

Apropos of a recent query anent carrying golf bags on a motor bicycle, the professional at a Midland clubhouse showed me some ingenious fittings sold by Halkin and Co., of 8, Portland Street, Southampton, which effect their purpose quite neatly. The links garage incidentally reminded me of certain Show critiques on the lack of luggage accommodation in cycle cars and light cars. The shed housed eight cycle cars and light four-wheelers, ranging from a Morris-Oxford to a Morgan, and all of them had plenty of weighty articles lying in the hood, on top of the mica window!

Dull Driving.

The other day I rolled up to a certain hostelry in a brand new light car, disfigured—I use the word advisedly—by an automatic carburetter and a fixed-point magneto. Several motor cyclists, engaged in personal lubrication, evinced obvious envy of my borrowed vehicle, and inspired me to denounce its monotony. It was no fun to drive—nothing to do but press a pedal, hard for speed, gently for a ladylike purr of the sort that lets your non-skids sizzle gently over wood paving. Even on a freak hill there is little to be done but engage lowest gear, see that the oil is circulating, and wrench the wheel at corners; whether she goes up or not, the chauffeur hardly feels responsible—he is unashamed by failure, unthrilled by success, unless, indeed, he has gone all out at a hair-pin and conquered it by double-skidding without loss of way. As I was thus descanting, a very grimy individual clad in fawn paramatta and carbon smears launched a similar diatribe against the standard 3½ h.p. roadster bicycle. Driving, he considered, was a dying art; the modern motor cyclist (speaking of tourists, of course) simply tugs back his lever to the last notch in the quadrant, and lets his engine "rev." These 12 to 1 gears have deprived driving of its joys, and so forth. The orator, on being challenged, confessed that he lived in the hilliest heart of Devon, and owned a 6 h.p. T.T. Bat, normally geared 3½ to 1. I watched him trickle through a mile or so of the thickest parts of Birmingham on a Saturday night, and the spectacle revived penitent memories of days when I could have done the same, and enjoyed it. But I fear me much that free engines and three-speed hubs have robbed my hand of its cunning. I should not care to cross London from Bromley to Stanmore on a single-geared racer as once I used to do. I think I must buy some pre-historic relic to get my hand in again.

Rear Rim Brakes.

Messrs. Rudge-Whitworth, Ltd., remind me that they have not withdrawn their original belt rim brake, which is mounted outside the belt rim; it is still fitted to the fixed and free engine roadsters, two models which I have not ridden recently; but it is so mounted that the whole surface of the brake floats into place, in lieu of one end being jerked rigidly into the V flange. Speaking of the Rudge, I should not be surprised if the refinement illustrated on page 1678 (issue of December 11th) proved just what is wanted to steady the powerful engines of the "oversize" single-cylinders, especially when they have ultra-long piston strokes. The sketch shows that the top of the cylinder is anchored to the frame by two short bracing clips. The cylinders of big engines on cars enjoy a certain amount of bracing together from the water and exhaust connections, whereas some lofty motor cycle engines are only anchored at their base. The idea is likely to be imitated, and may remove the reproach of a slight additional vibration from the 500-750 c.c. singles.

Cycle Car Tyres and Belts.

All I hear tends to suggest that both belts and tyres are lasting about double the mileage which prophets anticipated on the modern cycle car. 8,000 miles would be a truly phenomenal mileage for either a belt or a cover on any motor bicycle, but my friends do not seem to consider it out of the way on a cycle-car—unless, of course, one belt drops off, when a mileage of 100 is perfectly feasible! Does this suggest any changes in motor bicycle design? Hardly. If we increase the size of motor cycle tyres we shall sacrifice a percentage of our steadiness, for I am sure that a 3in. tyre does not bite through grease so keenly as a 2¼in. In respect of belts, the cycle car which obtains good mileages has belts from 10ft. to 13ft. 6in. long, with belt centres perhaps 5ft. apart, and we cannot increase the distance between belt centres on a motor bicycle unless we copy the new Zenith, and put a counter-shaft where our magnetos usually grow. The two-step drive has already given us the benefit of bigger pulleys and larger contact areas, but I do not see how we can obtain the slackness which long centres permit; here we must envy the cycle car without being able to imitate it.

Warm Feet.

The correspondence on the need of better protection from bad weather has brought cold feet into high relief as the chief bugbear of winter riding. It is easy to keep the rest of one's anatomy warm, for handle-bar muffs provide for the hands, and sufficient jaeger and leather does the rest; but the feet are the very deuce. It is possible to maintain a partial circulation by procuring an abnormally capacious pair of waterproof boots, wearing three pairs of socks inside them and snow boots over all, but this method has two main drawbacks; the feet are too warm during temporary dismounts, *e.g.*, if one stops at an inn for a meal; and the job of removing the overshoes or waders gets the hands (or gloves) into an appalling mess. I believe the only practical solution is to fix

casional Comments.—

e front half of a pair of big gaitered washing clogs the footrests. Some of the accessory dealers sell avy wooden-soled topboots, intended for wear by auffeurs when hosing down a car on a washing floor. the back half of such a topboot were removed d the fore portion attached to the footrests one uld keep one's feet warm without the risk of over-ating them during meals, and without making oneself thily dirty by removing the otherwise indispensable ershoe. Will some stalwart spirit try the tip in the xeter run, or will some accessory dealer try his luck th a sample gross? Nobody seems anxious to anufacture Mr. A. V. Roe's canoe-bodied two-heeler design, as illustrated in these columns eighteen onths ago, and I think the half-boot footrest is the xt best thing. It is rubbish to grumble about the st of one's clothing getting dirty; the portions of iment which cover our trunks and thighs get dirtier summer than in winter, if the back mudguarding any better than so-so. By the way, in winter I ually become inspired by a longing which I have never ard vented by anyone else. I sigh for a hand-erated rear brake. I find myself sliding about on easy smooth paving; down and out go my feet when e back wheel is obviously unequal to the task of keep-g the machine straight; a cart or taxi dashes out and ses the gap in the traffic which I was on the point threading; I dare not use my front brake for fear provoking a tremendous skid, and my left foot has grope wildly back on to the footrest in search of pedal brake. I suppose cleverer men would keep ir feet on the rests. But, personally, I sigh for and-operated rear brake every winter, as ardently I sigh for a handle-bar clutch in the summer when m fooling about on the freak hills of a six day l, and my mount is afflicted with a weeny little tch pedal. I confess—with some shamefacedness hat in the absence of a usable hand brake, I often gotiate really bad traffic over the winter grease on ond gear; my bicycle can do 40 m.p.h. on second r when I let it rev., and the friction on that gear h the throttle shut provides a magnificent stopper. t I dislike the practice.

Some Sidecars Don't Skid.

At last I have received a justification of my own verdict that sidecars don't skid, coupled with an explanation of the contrary opinion, supported by many of my correspondents. No less an authority than Hugh Gibson (who can claim a sidecar mileage of six figures) agrees quite emphatically that the old-fashioned rigid sidecar with three-point suspension *never* skids. He goes so far as to say his own sidecars have never deviated from the straight path except on the six inches of grease which composed the second corner of Porlock Hill in the 1912 Trials, and "skid" is hardly the word to apply to the spectacular gyrations we witnessed there, for few machines ever bit through the grease at all—it was too deep. Mr. Gibson, however, admits that the modern sidecar, equipped with a heavy luxurious coach-built body, with front and rear springing devices, possesses a certain liability to roll and swing, and that these vices are accentuated on hairpin corners, acute cambers, and slimy surfaces. Even so, he questions whether the heaviest and best insulated sidecar ever suffers from a really unprovoked and uncontrolled skid; he thinks nervous and imaginative drivers are apt to exaggerate these rollings and swingings, and the moderate back wheel wobbles they inspire, into genuine skids. He is ready to assert emphatically that the plain old-fashioned rigid sidecar, with a diagonal strut extending from the seat-pillar out towards the sidecar axle, is as skid-proof as ever. This exactly confirms my own experiences. I have never had a sidecar skid, and my experience is limited to the cheap and simple types, so far as ownership is concerned. When I have temporarily adorned the chair of a slap-up £100 outfit, I have felt rather than seen trivial oscillations which suggested that the back wheel was sliding a very few inches, but I have never been alarmed by what could rank as a genuine skid. I have turned once round on bicycles times without number, and I have turned twice round and once over on four-wheelers. I have also slid round at right angles on a tricar with a single wheel astern, but never yet have I sampled a genuine skid either on a De Dion type of tricycle, with two wheels astern, or on its half-cousin, the rigid sidecar.

A group of owners of 6 h.p. Enfield sidecar combinations who campeted in the recent 200 mile trial at the Cape Peninsula. We understand that all the riders were successful. The winner, Mr. Prillevritz, is at the extreme right.

INTO THE DARK.

By W. COOPER.

A Vivid Impression of Riding through the Winter Night.

INTO the dark! You stand on the kerb in the drizzling sleet on Boxing night, and, as we put off into the dark and you wish us "God-speed," you add as an afterthought, "Mad! Absolutely mad!"

A biting nor'-easter, cruel, merciless, and penetrating, strikes us as we set out for the south-west. We leave behind us home and loved ones, warmth, comfort, and even luxury.

Why do we go? There is no compulsion with the amateur—we please ourselves.

The sharp cackle of the exhaust sounds healthy in the wintry blast, and we wonder to what extent the music will have lost its tune 'ere we check in on our return twenty hours hence. Twenty hours! . . . We sometimes feel as if we would rather not go on, yet we continue all the same

It takes some time to settle down to the work before us, and we are well on the way ere we realise the immensity of our self-imposed task. At first the work impels the utmost care, but as time passes we gain more confidence in ourselves. We do not feel so much alone as we did, for are we not in company, mentally, with those we left around the fireside—those whose young eyes peered up into ours and seemed to ask, "Why do you go?"

Outward and onward into the impenetrable darkness. The bright white acetylene lamp lights the highway a fair distance ahead, but no winking beacon light marks the direction of our goal. Care is the watchword, for an error of judgment for one brief second might spell disaster, but tremble not; we feel as secure as you do with your head half-buried in your downy pillow. As the hours roll on, motor and master become knit as one: each seems to sympathise with the other, and the trusted steed's responsiveness echoes "All is well!"

Mile upon mile across the dreary Salisbury Plain. Only the language of the engine denotes whether uphill or down. We left the start one minute before the second man, yet no sound reaches our ears of those who follow in our wake. Apart from the click of the tappets, the only audible noise is the swish! swish! of the snowy slush as the wheels plough through like an ocean greyhound through the spray. The clouds break for a moment, and the position of the moon indicates that it is near midnight.

Through the Slumbering Hamlets.

We pass through many an old-world village, where the heavily-thatched roofs almost kiss Mother Earth, and where, in the night, no sign of life is apparent, except, perhaps, "Robert" sheltering from the elements 'neath the portals of the principal inn.

The main line crosses over the road at the far end of the village, and we enter the archway as the express crosses over the huge span of granite. At other times the modest 3½ h.p. would create sufficient evidence of its presence, but now, as the roaring express rushes on above us, we wonder where the silencing question began, and where it will end.

Into the dark. Round and round. The road seems to have taken a circular course. The engine calls for much more gas. Yes, we know. This is the hill that concerned us most, and at the "S" bend a cruel wall seems as if it were coming right up to the very lamp glass. All out! Surely this is the moment when none but strong nerves need hope for success. Mad—absolutely mad! And accelerating as we grip the bars, we literally force the machine over to the maximum angle.

Safely round, but still ascending, at length we reach the summit, and at this juncture heave a sigh of thankfulness.

A faint streak of grey in the east denotes the approach of dawn. We shall soon reach the outward limit. Every mile brings more light, and yawn follows yawn. Soon the spires of the cathedral city glint through the distance, and our spirits are lifted beyond measure, while we almost grow careless at the certainty of a successful outward run. Over the tramlines, through the gathered concourse; then a graceful curve into headquarters. How heroic we feel, yet we have won no Victoria Cross!

Scarcely out of the saddle ere others arrive. Oh, if we had only known they were so near in the still hours of the night. Refreshment for man and machine is the order of the moment, and soon we toe the line again for the second half.

Homeward Bound.

Outwards and homewards. We are only about 160 miles from home. The young folks have just had breakfast, and their prattle fills the nursery. The large wooden "Humberette" is being loaded up with teddy bears ready for the up and down journey from hall door to kitchen, disturbing everything along the route. It's wonderful how our thoughts revert to home the farther we are away.

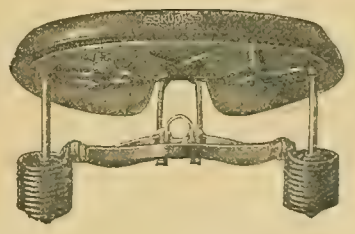
Crackle, crackle! The puddles have a thin crust of ice on the crowns, and the morning is fresh and crisp. Once again through the same old villages, and when we examine the road surfaces we marvel how we rode through the night. Nearer and nearer to our goal as the day wears on. In the afternoon the winter sun tingles our cheeks. This is the most dangerous time of the whole journey, for the call of nature for sleep seems almost irresistible. Bump, bump, we are off the road and must have slept for a second or two.

BROOKS

and the Saddle question.

First—you want a skilfully-made seat—here we show you that portion of the BROOKS B170—anatomically shaped, it is made from the finest selected leather, luxuriously padded, and finished in that style peculiar to BROOKS productions, and meaning perfect wear and perfect comfort.

Then—you require springs, elastic yet steady in their action, and this view shows you one position of the BROOKS PATENT COMPOUND SPRINGS, an exclusive feature of the BROOKS, which absorb both shock and recoil, and, being placed so far apart, ensure an unequalled lateral steadiness.



And then—you'll ask for something simple and strong, with a minimum of weight, and this view emphasizes all these points, and shows clearly the clean and smart construction of the under-framing.

"BROOKS and the Saddle question"—in truth, this model is a perfect answer, and comparison will make that fact still more apparent—and—

When there's a better saddle than the BROOKS B170, well—BROOKS WILL MAKE IT.

Now let us send you the BROOKS BOOK—it's free

MOTOR CYCLE DEPOT: 103, St. John Street, Clerkenwell, E.C.

Into the Dark.—

On and on into the evening, the sun sinks low, and the darkness creeps on once more. We fancy we can already see the crowd assembled to welcome us home.

At length we sight the finish, and "Here's one" we hear someone say, and in another moment we spy you on the kerb side, more convinced than ever that we are "mad, absolutely mad."

The Fruits of our "Madness."

On a bright summer morning when the genial sunshine bathes the countryside, dispelling the dew and calling the butterflies, you set off from home for the whole long day. Hour after hour you ride, and the absence of trouble grows almost monotonous. Whence came this wonderful reliability? Not because of some speed record set up at Brooklands. No, dear reader, you experience this reliability because we went into the dark.

It may be that you ride on after lighting up time, but you can rely upon your lamp. Again, no noonday ride with the butterflies perfected that lamp for you. You may have to return next day over wet greasy roads, yet your non-skids give you confidence, and it was not the tarred billiard table surface that called for the non-skids; it was because we went "outward and onward." And thus we might continue to dwell on the boons that have been brought to thousands by the rough riders who plough the furrow in the night.

Enter the trials yourself, and when you have tasted the glories of "war" you will know how to answer those who ask you, "Why do you go?"

At the watersplash at the foot of Grimes Hill in the Birmingham M.C.C. open cycle car trial. The competitor is Vernon Busby on an 8 h.p. Morgan.

AN IMPORTANT GERMAN WHITSUNTIDE EVENT.

For next Whitsuntide an important reliability trial for all types of motor cycles and passenger machines has been arranged by the Viennese Oesterreichischer Motorfahrer Club and the Berlin Allgemeiner Deutscher Automobil Klub, which will prove one of the most noteworthy Continental events of the year, and will be run over a distance of 439 miles.

There will be no difficulty in crossing the frontiers, as the authorities, both Austrian and Germans, are lending every assistance possible to the promoters of the trial. Competitors will start from Vienna on May 31st and the first trip will be to Breslau, a distance of 257 miles. On June 1st they will travel to Berlin, another 202 miles, where the finish has been arranged, and a great reception held.

The detailed propositions and regulations of the race are not yet ready, but it is certain that it will be run on Federation rules and class limits.

Austrian and German sportsmen hope to see a representative British entry (in which case all possible assistance will be rendered to participants, the Austrian correspondent of *The Motor Cycle* putting himself entirely at their disposal), not only in view of the many handsome prizes, but for the purpose of popularising the pastime in countries which are still far behind England.

The cycle car classes, it is to be hoped, will comprise a very good entry of German and Austrian machines, and it is here particularly that British entries are looked for; especially some of the simpler machines, as Morgan, Dee, G.N. and Dew, would cause great interest in Germany.

A Rescue, An Argument, And a Conversion.

RETURNING home about ten o'clock one night in Christmas week, I felt well satisfied with the world. It was a clear moonlit night, the roads were bone dry, and my machine was running delightfully. As I slowed down for some cross roads and swung round the corner, the beam from my lamp fell on the figure of a woman running swiftly some distance in front of me. I saw her turn to look on hearing the sound of my engine and immediately proceed into the middle of the road, holding out her arm as a signal for me to stop. "Hullo," thought I, "this looks like an adventure," and I halted obediently.

I saw without displeasure that she was a distinctly pretty girl. So much I could discern, although her hat was awry and her hair dishevelled. Her whole aspect, in fact, revealed excitement and agitation, which, together with her breathlessness, seemed to rob her for the moment of the power of speech. So I tried to break the ice.

"Er—can I do anything for you?" I asked, with my most reassuring smile.

"Oh," she panted, "I don't know how to ask you. It seems such an awful thing to ask. But can you—can you take me on your carrier for a little way?"

Here was a congenial task, though personally I prefer a sidecar for passenger carrying. "I'll be very glad indeed to do so—to take you wherever you like," I told her truthfully. "Will you come on now?"

"It's very kind of you," she stated. "I don't know what you must think of me for troubling you in this way. But it's so late—and I had a long way to go—and I got frightened."

At this point I became aware of the sound of running feet behind us, and rustic voices uplifted. I looked round, and a brilliant glow in the sky attracted my attention. I knew there was a village less than a mile away, and surmised that one of the cottages there must be on fire. As I gazed at this phenomenon, the runners came into view. There appeared to be seven or eight of them, carrying lanterns, and they exhorted each other as they came.

"Hullo, there seems to be some excitement," said I. "I suppose there's a fire in the village, and those lads are going for the brigade. I'll ask them what's happened exactly."

My companion unexpectedly gave a little shriek and caught hold of my arm. "Please don't wait," she begged earnestly. "Please let's start now—at once! I mean—I do so want to get home!"

She seemed almost hysterical, and, with a final glance at the rapidly approaching lanterns, I hastened to start the engine and let in the clutch. As we moved off I heard a great shout—of anger, as it seemed—and dimly wondered. Above the healthy bark of the engine others came to my ears until we had left the runners far behind.

A Militant Suffragette.

Presently I turned my head to look at the yellow glow in the sky, now much fainter, and found my passenger also gazing fixedly in the same direction. In reply to my questions, she assured me that she was quite comfortable and not at all cold. Then there was a silence, and an interval of reflection on my part. Just as we passed a group of youths, who shouted "Merry Christmas!" to us, a startling idea flashed into my mind. My companion, incredible as it seemed, was a militant suffragette!

Now, while my opinions on many subjects—such as singles *versus* twins and the problem of Ulster—are uncertain and lack conviction, there is one point on which I had definitely made up my mind, namely, that these ladies who go about burning and destroying property as a means of consummating "votes for women" are dangerous criminals, and should be treated as such, and left to "hunger strike" if they wish. The thought of helping one to escape from the consequences of her misdeeds was decidedly repugnant to me. My righteous indignation struggled with my sense of chivalry. Of course, I argued, it did not follow that my supposition was correct. But the fire and the shouts of the pursuers and her agitation seemed to point very plainly to this conclusion. I was wondering whether the circumstantial evidence was complete enough when her fluttering scarf caught my eye in the moonlight. Its colours, I felt almost sure, were the deadly purple, green, and white. At that I closed the throttle with decision, and we stopped near a little pond, now coated with a thin sheet of ice, by the side of which stood a cluster of tall trees.

"This is as far as you want to take me, isn't it?" she said. She was now quite composed, and smiled at me prettily. "Thank you *so* much for the lift. I've not got far to go now."

"I really stopped because I wanted to ask you something," I answered. "Are you a militant suffragette, and did you cause that fire we saw back there? I should rather like to know."

There was a gasp and a pause. "Certainly I believe in votes for women," she replied in a small voice. "I think they're better fitted to have them than most men. Don't you?"

"Never mind what I think, I said, "that's not answering my question, is it?"

During your Christmas Holidays

—NOW, while you think of it—drop us a postcard for the name and address of our nearest Demonstration Agent, who will give you all particulars of the A.C. Light Car and the A.C. Sociable, and take you for trial runs. We have agents all over the country, so that there is almost sure to be one conveniently near you.

The A.-C. 4-cyl. Light Car

Combines the refinements of a Light Car with the handiness and economy of a Cycle Car. It is the only car coming within the Cycle Car definition that embodies large car practice and *robustness*.

Price £175. (Completely equipped.) (Spare tyre extra.)

The A.-C. Sociable

is the most popular three-wheeler made, and is in use all over the world. It is famous for its great reliability, economy, hill-climbing powers, and easy management.

Price 75 Gns. as shown.

HONOUR FOR THE N.S.U.

Prince Henry of Prussia has just ordered a 2 h.p. Single-cylinder Lightweight N.S.U.

¶ THIS Royal recognition of the superiority of the N.S.U. motor cycle coming as it does on the top of the recent records, establishes the fact that the best machine is an N.S.U.—best for racing and as equally best for private use.

MODELS FOR 1914—ALL TWINS.

3½ h.p Twin-cylinder 498 c.c., 2-speed gear and free engine, belt drive.

6-7 h.p. Twin-cylinder, 830 c.c., chain drive, three-speed countershaft gear, 26 x 3in. tyres.

7-9 h.p. Twin-cylinder, 996 c.c., chain drive, three-speed countershaft gear, 28 x 3in. tyres.

". . . . . we had left the runners far behind . . . . . Presently I turned my head to look at the yellow glow in the sky, now much fainter, and found my passenger also gazing fixedly in the same direction."

A Rescue, an Argument, and a Conversion.—

"I don't see that you've any right at all to ask me," she said coldly. "But if you're so anxious to know, I have struck my first blow for the cause to-night. I cycled over to that village about two hours ago to set fire to an old barn that I had noticed. There were some cows in the same field and I had to wait for them to move away. Then the thatch was so wet that it wouldn't burn until I had used dozens of matches and nearly all my paraffin. At last I got it alight and was spreading about some of our literature when I saw two men coming towards me, yelling. And they came from the direction where my bicycle was, so I had to run away without it chased by the crowd you saw just now —I've never run so fast before. They might have caught me if you hadn't happened to come along. I suppose you're sorry they didn't," she finished defiantly. "You think it's a great pity you stopped when I asked you to!"

I spare the reader the arguments with which I condemned and she defended her action. Any passers-by would have been highly amused to behold at that hour a motor cycle on its stand and two people beside it discussing heatedly the ethics of militant suffragism. "Well," said the girl finally, "what do you want to do with me? Give me in charge at the nearest police station?"

I said that I intended, having suitably admonished her, to fulfil my original intention of taking her home. But she would not hear of this. Now that she knew what I thought of her, she said, she refused absolutely to come with me. My expostulations had no effect except to make her angry.

"But your people—surely they'll be expecting you before this?" I ventured.

"Yes," she admitted, "they will. But I can't help that. I've quite made up my mind to walk. Good-night, and thank you again for the lift—and your lecture."

"Well, if you're determined," I said, with a sudden feeling of disappointment, "it's no use my saying anything more. So good-night, and a merry Christmas, and a pleasant walk."

Once in the saddle I opened the throttle wide and shot off down that road like a projectile, but I felt far from easy in my mind. Suffragette or not, I did not like the thought of leaving her to walk some four miles alone at that time of night. It occurred to me that perhaps she had enough to worry her in the loss of her bicycle without needing my lecture, as she had called it, and that I might have "slated" her overmuch. In any case, I was sorry we had quarrelled. Could I go back and tell her so, with apologies, and try to induce her to finish her interrupted "joy-ride"? I pondered the point so deeply that I was nearly running into the hedge. Probably I should get severely snubbed for my pains. Still there was the chance that after walking a little way she had changed her mind, or would at least be amenable to persuasion. I decided to risk it.

Reconciliation.

So I turned and sped back again, while the waning moon seemed to smile satirically. And as I approached the spot where we had parted I saw her, and a man walking by her side. Obviously she was trying to escape from him, and for a moment I wondered if he might be one of the pursuing villagers. But as I drew nearer his unsteady gait declared him a belated reveller who had emerged, I presumed, from one of the side lanes. So extreme was his condition that he did not even seem to be aware of my arrival till I took him gently but firmly by the coat collar and ordered him to depart solo. This he presently did, after an ineffective and unscientific attempt at resistance.

"So perish all poltroons!" I said to the girl. "Did he annoy you much?"

"Oh!" she cried indignantly, "he—he wanted to kiss me, I think. Aren't all men brutes?"

"Present company excepted, I hope?" I suggested.

"Oh, I suppose so," she said, after a not very complimentary pause. "Did you come back to try and persuade me to come on your carrier again? Because, if so, I will, in spite of what I said. I want to get home as soon as I can and try to forget all that's happened this evening."

"Then that's all right," I said. "Take a seat, please. I'm awfully glad I came back." And I was. With difficulty I restrained an inclination to sing as we moved off once more. Somehow the evils of incendiarism had receded quite into the background. I have seldom known four miles pass so quickly, although I purposely kept the speed low. When we arrived at her home, she said good-night very graciously, and consented to see me again, "but not," as she said, "to argue about militancy—please!"

. . . . . .

Really, there is nothing else to write, except that she now takes, as I have good opportunities of knowing, only a lukewarm interest in "the cause," and certainly would not set anything alight in order to further it; and that a few days later our leading local weekly "rag" contained this paragraph:

"A suffragette outrage was perpetrated in the little village of —— on the night of Christmas Eve, resulting in the partial destruction by fire of a barn belonging to Mr. ——, a local farmer. One of the women concerned in it was alarmed by two passers-by, who had noticed the flames and were proceeding to investigate. With a number of other inhabitants they gave chase for half-a-mile, and would doubtless have captured the incendiary if she had not been met by a male accomplice with a motor cycle, who rode away with her. Meanwhile, other helpers had succeeded in getting the fire under control. A number of suffragist pamphlets were found near the scene of the outrage. Later, a lady's bicycle was also found under an adjacent hedge, but with no clue as to its owner. We understand that Mr. —— intends to keep this machine as some little compensation for the damage done, unless (as is not likely) a personal application is made for its return."

. . . . . .

No; we both agree he may keep the bicycle!

"The Motor Cycle" Photographs.

MOTOR CYCLISTS—PLEASE NOTE ! ! !

Copy of Letter from Chairman of Competitions Committee A.C.U.

November 13th, 1913. Carew, Walton-on-Hill, Surrey.

Sirs,

Having used a "Watford" Speedometer during the past year, fitted to three different makes of motor vehicles, a "Bayard" light car, a "G.W.K." cycle car and a "Premier" motor bicycle, I should like to say that I have found your speed indicator the most reliable, accurate, and generally satisfactory that I have ever used.

For steadiness of the needle as well as for the silence and lasting qualities of the gear box and transmission I do not think it can be surpassed

I am, yours faithfully

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Tip for Winter Riding.

Sir,—Some time ago I noticed an enquiry in your columns *re* keeping a motor cycle in the winter. I have been shown a 1911 Bradbury which looked as if it had just been bought from the makers. I have now tried the same method on my Triumph, which I am using daily, and, after six weeks' trial, I cannot speak too highly of this "winter tip." It is a shilling tin of cylinder Robbialac applied over the cylinder, exhaust, silencer, and all bright parts; it gives the metal a gunmetal finish, and does not wear off. Mud, grease and wet have no appreciable effect on such a surface.

M. HARWOOD.

Do Sidecars Skid?

Sir,—The opinions which have been expressed on this subject are of a somewhat contradictory nature, and the real solution, I venture to suggest, can only be arrived at by taking into consideration the weight of machine and sidecar, width of wheelbase, and type of tyre used.

From my own extended experience with a 3½ h.p. free engine Triumph and light sidecar attached to the machine as closely as possible, and shod with a smooth tyre, I have no hesitation in stating that on roads in a certain condition the combination will skid on the slightest provocation, and on slimy wood-paved roads may be made to skid perceptibly by swaying the body to and fro. I have not experienced skidding whilst riding down hill, though when making a frantic rush at a hill with loose and wet surface the machine has performed most extraordinary gyrations in a vain endeavour to take the hill broadside on. On the other hand, a machine and sidecar with wide wheelbase, low body, and shod with a non-skid tyre, is practically immune from skidding, assuming, of course, the sidecar is correctly adjusted.

In every case the personal factor must be considered, for a machine which is quite docile and tractable in the hands of its owner may give good food for thought to the person who might unwarily venture upon it without being acquainted with its little idiosyncrasies. D. NICHOLLS.

Ice in the Carburetter.

Sir,—A few days ago whilst I was riding in the country, and after I had covered some fifteen miles at about twenty-five miles an hour, my mount (Douglas R, with standard carburetter) began quite suddenly to lose power, showing marked symptoms of engine starvation. Opening the throttle caused the engine to flag still more; closing it slightly caused the engine to pick up again for about a hundred yards, when it again began to fall off.

On dismounting to examine the carburetter I found to my astonishment that the upper part of the jet chamber had become almost filled by a cylindrical piece of ice firmly adherent to the lowermost coil of the throttle spring and extending down into the chamber to a distance of about three-quarters of an inch. So firmly was it attached that I had to cut it out with a knife, after doing which I proceeded on my way rejoicing.

The morning was cold and raw and damp, but not frosty, nor had there been any frost for some days previously. I had had no trouble whatever in starting up in the morning, and the machine is in daily use.

The fuel I was using was Birchenwood spirit, which, I believe, is benzole 90%.

I should be glad to receive any enlightenment as to the cause of the phenomenon. JAS. M. SCOTT.

Bent Sparking Plug Points.

Sir,—Whilst riding my 3½ h.p. single the other day with the throttle almost full open, the belt pulled through at the fastener, the result being that the engine raced for a few seconds. When I had mended the belt, imagine my surprise, when the engine refused to fire. On removing the sparking plug I found that the points had been bent all out of shape. When I put the plug in there was quite ⅛in. between the plug and the inlet valve at the top of its stroke, and the inlet spring is quite as strong as the makers advise.

The only solution I can give is that with the abnormal speed of the engine, the inlet valve must have bounced off the tappet, and so hit the plug.

I wonder if any other of your readers has experienced this trouble? R.S.

Two-stroke Lubrication.

Sir,—In reply to "Two-stroke's" letter, I am sorry that I cannot give the details of how Mr. Garrard lubricated his four-stroke engines. The subject was described and discussed in the press at the time, and I was interested and wrote Mr. Garrard as to whether any special oil was necessary. He very kindly sent me a tin of that which he used to try, but pressure of business prevented the experimenting which I had promised myself. Mr. Garrard, however, is too practical an engineer not to have considered all the conditions, and I have no doubt he had provided for the lubrication of the big end, etc.

He is still doing good service to the motor world, and it would be interesting if he would throw some light on the subject. There would, however, not seem to be any great objection to drawing the mixture through the crank case, failing other methods, and so gain just the same result in one type as in the other. A. C. DAVISON.

The Bantamweight Class.

Sir,—I have read with interest "Ixion's" remarks on small four-stroke engines, published in your issue of the 4th December.

I would inform "Ixion" that, having ridden a 2½ h.p. New Hudson fitted with 70 × 76 J.A.P. engine, I have found none of the evils he mentions.

I have ridden this machine for two and a half years and covered upwards of 12,000 miles.

For the first eighteen months I ran the machine *without* a speed gear, and after twelve months' wear undertook a Welsh tour. With the aid of the adjustable pulley and a worn belt, giving me a 7½ to 1 gear, I used to climb daily the long Dinas to Dolgelly Hill; I also climbed the mountain road from Maentwrog to Llandilocs, and succeeded in reaching the top of the famous Bwlch-y-Groes Pass by taking it in sections and hard pedalling. As a result of this tour I eventually fitted a three-speed gear, in view of future tours in mountainous country. It was only when nearing the 10,000th mile that the power began to fall off; and in July last I had the engine re-bushed and a new piston fitted.

At the present moment the engine is going better than ever and develops its usual power. I can average twenty miles per hour, and on several occasions have covered the hundred and seven miles from Bath to my house in five hours exact.

As I use my machine for touring and long distance riding I should have a more powerful machine next time, to enable me to increase my average speed and also for occasional sidecar work.

To sum up I would state that (1) the power *is* absolutely maintained over satisfactory mileage; (2) little piston ring wear, valve pitting, etc., do not affect the power on the 2½ h.p. any more than on other types—I grind in valves about every 1,000 miles; and (3) overheating, valve trouble, and plug troubles are nil.

The disadvantage of a small engine pulley is shown by my using up two belts a year, the approximate life of a belt being just over 2,000 miles.

A second disadvantage is that for touring and long distance riding, a higher average speed would be desirable.

Since fitting the three-speed gear there is only one hill I have failed on, and that is Arms Hill, Henley. Such hills as Kop, Whiteleaf, and Pink Hill, near Princes Risborough. I can take on the run. I have no interest in either the J.A.P. or New Hudson firms. S. W. H. TURNER.

The Effect of Benzole on Valves.

Sir,—Having been a constant user of benzole for six months I am interested in other people's views of it, and notice that F. W. Wagner has, apparently, had a disheartening experience For the exhaust valve to be so badly burnt after using only four gallons is extraordinary, and indicates that the benzole was exceedingly badly washed. I have not examined my exhaust valves, but the compression and running are as good now as six months ago, and I am using the bicycle daily on a very heavy road. I may state that I have not had my plug out for two months. In view of the statements that benzole makes starting difficult in cold weather, I may mention that, during a recent snowstorm in which I was forced to ride, the engine—which is a 4¼ h.p. Precision single-cylinder—started up on the second revolution.

If I am not taking up too much space, I should like to make a suggestion as to why more air is required for benzole. My suggestion is this. Benzole has a higher viscosity than petrol, and, consequently, would form a larger bead on the jet, thus offering a greater surface for evaporation, and, unless the throttle were eased off or the air increased, the percentage of benzole in the mixture would be higher than the upper limit for explosion, thus causing a deposit of carbon through incomplete combustion. I do not advance this as a reason, but merely throw it out as a suggestion. If any of your readers know the explosive limits of benzole and petrol I should like to hear what they are.

F. J. POPHAM.

Sir,—I have had a similar experience with benzole to your correspondent Mr. F. W. Wagner. I filled up the tank of my 3½ h.p. Rudge-multi with one gallon of benzole, there being already nearly half a gallon of petrol in the tank. The benzole was of a well-known brand, bought at a large garage, and cost as much as second-grade petrol.

At first the running of the engine was decidedly smoother, and it would not knock, but after some forty miles at an average speed of about twenty-five miles an hour the engine showed all the symptoms of bad overheating and loss of compression. This was not due to an over rich mixture, as the best results were obtained with the air supply of the 1913 pattern Senspray carburetter partly closed.

On arriving at my destination, after covering a total distance of sixty miles on this fuel, I removed the valves, to find the exhaust valve so badly burnt as to be of no further use, three large chips having disappeared from its face. The thin flat ends of the electrodes of the Bosch plug had also disappeared. The exhaust valve had been used previously for 5,000 miles with petrol, and was in excellent condition before the benzole was used.

Another curious effect of benzole was that it dissolved the soap used in one place to secure a petrol-tight joint, and caused choking of the jet.

I have not used any benzole since, and should like some assurance that trouble with valves and plugs is not a usual consequence of its use before trying it again.

F. C. C. KENNEDY.

Engine-shaft Gears.

Sir,—May I endorse the remarks made in your issue of Nov. 27th by "AF 274." Until I got my present machine a few months ago I used an N.S.U. gear and always found this most satisfactory.

The only renewals in 3½ years were one new belt pulley, a set of new pinions and bushes, and one low gear clutch plate. The first item would have been necessary in any case, and the two latter together cost about five shillings. I did not find that the weight of the gear had any appreciable effect on the engine bearings; in fact, they were never renewed while I had the machine, and were in fair condition when I sold it. The only grumble I had about the whole thing was the "coffee grinding" lever for changing the gear, and when I was able to get over this by obtaining a set of handle-bar control fittings I considered that I had found my ideal gear for solo and occasional sidecar work. So much so that I am ordering a new gear and control for my new mount, as I did not see anything at Olympia to improve upon it. I am certain that anyone who has once used a handle-bar controlled gear would never go back to either foot or tank control.

May I add the usual disclaimer. EPICYCLIC.

Tyre Luck.

Sir,—Now that modern machines are so absolutely reliable, motor cyclists probably experience more trouble with their tyres than with any other part of their mount. This being the case, a few hints from a hard road-rider may not be out of place.

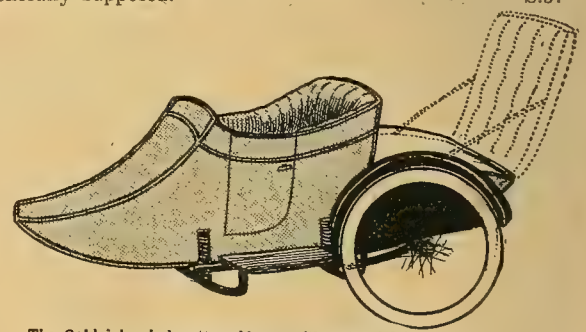
I first take the tubes, and make sure that they are air-tight, replacing any suspicious looking patches. Then I pour about a wineglassful of water into each of them through the valve hole. I have never seen this recommended before in these columns, but it is really a splendid plan, as it keeps the tube in fine condition. Water is a well-known preservative of rubber, and tubes with a little water in them will, barring accidents, last for years. It keeps them soft and pliable, and they are therefore much less likely to be pinched. The idea has one other advantage, as when the tube is punctured, the water is immediately forced out through the hole, and it is thus an easy matter to locate the spot which requires attention. Moreover, a little water put in any spare tubes will effectually prevent them from perishing.

At the end of about every three or four hundred miles running, I examine the outer covers very carefully, pick out any flints which may be embedded in the rubber and fill up all the cuts.

By taking these measures, and with a reasonable amount of good fortune, I think any motor cyclist may count on being able to avoid any serious tyre trouble.

A ROUGH RIDER.

Sir,—Being interested in tyre wear, I have always read correspondence about this in *The Motor Cycle*, and am surprised at the different accounts given of mileage done, the divergence of distance being so great. I took to motoring two years ago, and after reading "Ixion's" advice, advising heavier tyres, I ordered the heaviest 3in. tyre that could be fitted to driving wheel in place of the two-inch cover which was standard. A Clincher Dreadnought was put in at an extra cost of 26s. My machine is a 2½ h.p. A.J.S. chain drive. I rode it nearly 7,000 miles and then had it retreaded. The ridges on the retread were worn off in 1,000 miles, but the tyre itself seems as good as new. I hope to ride it another 5,000 miles. As far as one can see the beading and lining are intact. The studs on my front Hutchinson hardly show any sign of wear after 8,000 miles. Even allowing for the different h.p. and weights, there must be something wrong to get such poor results. I have always read that chain drive is very destructive to tyres, but I begin to doubt if the chain is such an evil factor as generally supposed. S.J.



The Oakleigh wind cutter sidecar with extra folding seat at the rear.
(It is referred to on page 1742.)

Speedometer Drive.

Sir,—In your issue of December 11th there is a letter by "Wheelslip." I had a curious experience about a year ago. I was running fairly fast over Northumberland and Durham roads on a Triumph solo. Although the machine did not tend to skid unusually on the greasy roads, yet whenever I came to a dry patch under trees, the beat of the engine noticeably slowed, showing that there must have been a considerable amount of back wheel slip when on the wet portions. This shows that under certain conditions a rear-driven speedometer flatters one's pace. J. REED.

Benzole.

Sir,—I found my exhaust valve burned away a few weeks ago, but traced it, not to the benzole, but to the adjustable tappet having unscrewed, and so prevented the valve seating. I have just looked at the valve and find that it is slightly pitted after 300 miles running. The seating is perfect. Benzole is so much nicer to run on than petrol that it will take more than pitted valves to stop me using it. I have found no other drawbacks in some thousands of miles.

Can anyone help me here? I have just had fitted to the 1913 P. and M. carburetter a pilot jet, advertised in your paper. It gives very slow running in free engine and traffic, but (using benzole) thick, black smoke pours from the silencer at every explosion when ticking over on the pilot jet in "free." How can I prevent the smoke? It soots up the valves, but the soot is easily wiped off with a rag, leaving a clean surface. STUMPED.

[We think that other readers, who have suggested that their valves have been burnt out by benzole in an incredibly short mileage, will find the true explanation to be on the lines of the above letter.—ED.]

A Cornish Reader's Sidecar.

Sir,—Having been a constant reader of your valuable paper for the past three years, I thought the enclosed photograph of myself, with my son, and my 3½ h.p. Bradbury sidecar combination might interest you and your readers.

I have been a motor cyclist for the last five years, but have not ridden a more reliable machine than my present mount, "the Bradbury" (which, by the way, is my third

steed). During nine months every-day use in all weathers I have not had the slightest trouble with regard to the power of my machine, the only involuntary stop being a choked jet. It takes two of us anywhere, which is saying a good bit considering the hills we encounter in Cornwall. I find the sidecar combination a boon to me in my professional duties. I might state I have no interest whatever with the Bradbury Co., other than a satisfied user.

ALFRED WORTH.

Rear Lights.

Sir,—The present chaotic state of affairs is most dangerous to every one who has to move about the country at more than six miles per hour. Let me give one instance from my own personal experience. I was riding a motor cycle early one evening along a main road in the vicinity of Hereford when I saw in front of me a white bare light which appeared to be carried by someone approaching in an open trap. In two or three seconds I found myself running into the tail of an empty timber carriage. By a stroke of luck only was I able to avoid the vehicle, the ditch, and the man leading the shaft horse—one of three hitched to the waggon. On the fore part of the vehicle was perched a man holding in his right hand a hurricane lamp showing white all round, at a distance of a good many feet from the pole tail. For such a state of things as this to be permitted anywhere, especially on main roads, is atrocious. If the police were to insist on every vehicle showing a red rear light instead of prosecuting motor cyclists unnecessarily, as they have been doing lately in Herefordshire, all sections of the travelling public would be able to move about the country after dark in safety. CJ 1363

Weatherproof Finish.

Sir,—As I wandered about the Show, through avenue after avenue of machines that—however perfect their mechanism—looked more suitable for a glass case than the road, I wondered why makers did not finish their machines with some view to the work that would be expected from them. In fact, some machines were so brilliantly "got up" that we might suspect their makers of pushing "side lines" in metal polish or plate powder.

Nickel plating, nickel plating, everywhere, hubs, rims, spokes, footrests, and engine parts, all must be nickel plated; but why? It seems like sending navvies to work with patent leather boots and silver plated picks. These "all highly polished" might suit the merchant who goes for a five mile walk to see that there is no mud about before he ventures out with his crock, but there must be a large number of people like myself, who use their motor cycles chiefly for professional or business purposes, and to them nickel plating and the cleaning of it is the greatest nuisance.

Makers are usually keen on showing the economy in the upkeep of their productions, but they never take into consideration that not most insignificant item on the balance sheet, viz., cleaning.

The really serviceable mount should be impervious to weather conditions, and the cleaning of a motor cycle should be done, as is the case with a car or a trap, with a hose pipe.

W. F. BURTLE.

Colonial Models.

Sir,—*The Motor Cycle* of the 30th October is perhaps the most interesting publication, from a colonial point of view, that has come before the public for some time. Not only does it give many illustrations and detailed descriptions of 1914 models, but it gives splendid illustrations of machines specially constructed for use in the Colonies. The Ariel, Arno, Rudge, Bradbury, New Hudson, Premier, and Triumph are amongst the machines dealt with in your paper, yet to the colonial rider they have all the same fault. The silencer, and in the case of some of the models the magneto, is placed in such a position that in traversing rough rocky ground like that met with in this district, and I might say in most parts of South Africa, these fittings are sure to get damaged. When travelling over bad roads at a slow pace the front wheel drops into a sluit made by a recent rainstorm, and the silencer and magneto have to stand the full brunt of the knock, with the inevitable result. One rider in this district who rides a well-known and reliable British machine has had his silencer smashed three times in the last four months. Needless to say, his next mount must have the silencer and magneto elsewhere, and surely our manufacturers can find some other position for these parts, especially in machines destined for oversea.

I am speaking from experience and write this letter after having discussed the subject with many riders.

There has been some discussion in your paper *re* the prices charged for British machines in New Zealand. In Johannesburg the Triumph and B.S.A. free engine and three-speed models cost £77 10s., and the 6 h.p. Royal Enfield £95; the latter fitted with sidecar £112 10s.

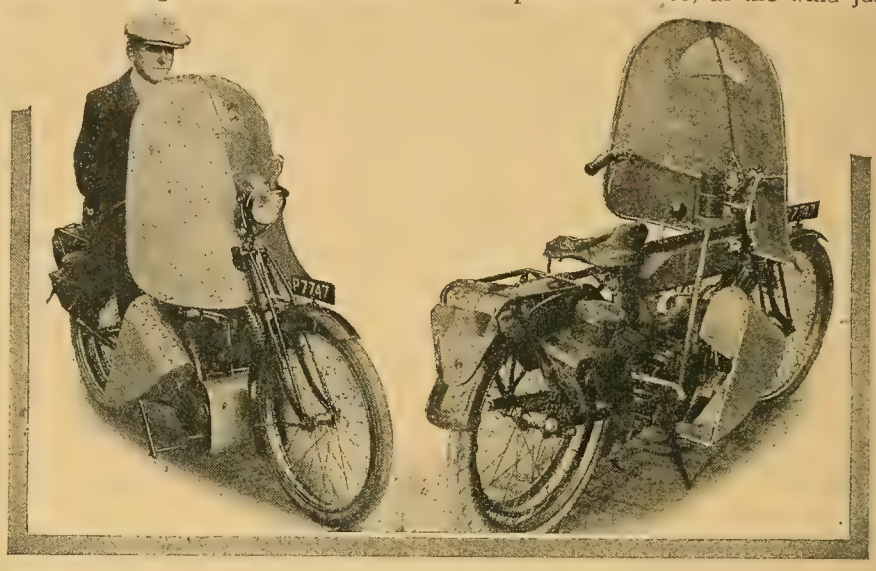
Ermelo, Transvaal, S.A. AN AFRICANDER.

Weatherproof Motor Cycles.

WITH the advent of the winter season, and its consequent bad weather, many motor cyclists give up the idea of using their machines, owing to lack of protection from the elements.

There are, however, a large number of motor cyclists who find their machines far too useful and so use them all the year round in all weathers, and the necessity for adequate protection is keenly felt.

Having occasion to use a motor cycle fairly extensively in the winter, the writer has recently been experimenting with the weather-protecting device, shown in the photographs, fitted to a 3½ h.p. Zenith. It consists of a ⅜in. steel tube framework with fabric drawn over it; the fabric is drawn tight like an aeroplane wing.



Screens to protect the rider from wind and rain as fitted to A. V. Roe's 3½ h.p. Zenith.

It would appear that the head-resistance must be great and so slow up the machine, but at normal speeds in a calm, its slowing effect is practically unnoticeable. As a matter of fact, the shield and rider together form a streamline body, as the air carries on to the rider's side, that is to say, the head-resistance of the screen is less with a rider sitting some two feet behind than it would be for the screen alone. Strong head winds certainly slow the machine, for without the shield most riders would bend down and plough through. One has naturally to be ready for side winds at windy corners, but the disturbing effect on the steering is not so bad as one would imagine.

Since the photographs were taken, a detachable top piece with a round glass window has been fitted to protect the face, as the wind just caught the forehead, but this could be avoided by sitting further back and bending down slightly. Altogether, the writer has done about 1,000 miles with this protective device, chiefly in the Manchester, Kent, and Surrey districts.

By bending down, one can completely hide behind the screen and see through the Cellon window. It must be rather a curious sight to see this unusual combination bowling along, judging from the puzzled expressions of approaching motorists. Some look over or round their glass wind screen to make sure the glass is not deceiving them, with an expression as much as to say, "What in the world is this coming along."

It seems to cause as much curiosity as the first motor car must have done. Being new, it is naturally looked upon by many as some foolish freak. One wise man said, "Well, I suppose it is some use." Another thought it was put there for racing purposes.

One perhaps appreciates the screen most when it is pouring with rain or when it is bitterly cold.

A. V. ROE.

BRISTOL-LAND'S END TRIAL.

CONSIDERING that there are many other important Christmas events, the Bristol Motor Cycle Club must be congratulated on an excellent entry of forty-five riders, whose names will be found below. The start will take place on the 26th from the Queen's Hotel, Clifton, at 5 p.m., and the competitors will ride to the Land's End and return, the first man being due at the starting point exactly twenty-four hours later. This is the first Christmas trial organised by the club, and the results will be watched with interest by a large number of motor cyclists.

18 M.P.H. SCHEDULE.

P. Grout (6 A.J.S. sc.)
M. S. R. King (Morgan c.c.)
E. A. Davies (3½ Premier sc.)
C. R. Selman (Morgan c.c.)
F. G. Cox (A.C.)
P. H. A. Stone (Enfield Autolette)
J. A. King (Morgan c.c.)

TIME TO LIGHT LAMPS.

Dec. 25	... ...	4.55 p.m.
,, 27	... ...	4.54 ,,
,, 29	... ...	4.56 ,,
,, 31	... ...	4.58 ,,

To our Readers at Home and Abroad.

The Editor and staff wish all readers of *The Motor Cycle* a happy Christmas and a prosperous New Year.

Belgian Motor Cyclists' Winter Run.

The Liège Motor Club will hold a run on Christmas Day over a distance of 125 kilometres. The announcement mentions that the run will be held no matter what the weather.

The Cannes Week.

What is known as Cannes Week will be held from the 17th to the 22nd of March, 1914, inclusive. The week's events include a gymkhana, paperchase, dinner, distribution of prizes, and speed trials.

Inventor of the Bollée Tricar.

Monsieur Léon Bollée, the inventor in 1894 of the original Bollée tricar, died at his native town of Mans in his forty-third year on Tuesday of last week, and was buried on Thursday last. The Bollée tricars took part in the Emancipation All Day Run to Brighton in 1896, and were built by the M.M.C., Coventry, and also in a modified form by Humber, Ltd., Coventry. This tricar was a most practical vehicle, albeit somewhat erratic. The inventor was only twenty-four years of age when he brought out this machine.

A.A. and M.U. Notes.

CUT-OUTS.—The Executive Committee of the Automobile Association and Motor Union have recently given a great deal of serious consideration to the question of the use of cut-outs on public highways. Complaints are being received from many quarters that the order prohibiting cut-outs is not being observed, or that its provisions are being evaded. Questions have been asked in Parliament on the subject, and the Association is aware that the Local Government Board is considering whether further and more drastic action may not be necessary if the annoyance continues. The Association has on many occasions expressed its disapproval of the use of cut-outs, and it has now been decided that in future members of the A.A. and M.U. shall not be defended by the Association in any proceedings which may be instituted in respect of the use of cut-outs on public highways, unless the committee shall be of opinion that there is a possibility of substantial injustice being done.

The Two-stroke Engine.

We believe we are right in saying that three leading firms of motor cycle manufacturers have on the drawing board or in course of manufacture small two-stroke single-cylinder engines. It is a curious fact that the small-sized two-stroke motors are a great success, whereas the larger sizes of single-cylinder engines have hitherto been found wanting.

Ladies' Lightweights at Moderate Prices.

Mrs. M. C. Cooke, who recently wrote an article in our pages commenting on the "Ladies' Motor Cycles at Olympia," mentioned that there were one or two manufacturers willing to build lightweight open framed machines at moderate prices.

The names of these firms have been asked for by several readers, so that it is reasonable to suppose that there are many who would like to know the names but have not communicated with the Editor. We have ascertained from Mrs. Cooke that the firms who expressed their willingness to build these machines at an inclusive price of from 25 to 30 guineas are: Messrs. Butterfields, Ltd., Stechford, Birminghom; The Wilton Cycle and Motor Co., Wilton Road, Victoria, S.W.; and the Veloce Co., Fleet Street, Birmingham.

SPECIAL FEATURES:

SEASONABLE ARTICLES AND ILLUSTRATIONS.

A Christmassy Issue.

This number being issued on Christmas Eve, we have reverted to our usual custom and included a number of seasonable articles written in lighter vein.

Christmas Flying.

Monsieur Chanteloup, a famous French aviator, who is said to be the first man to "loop the loop" on a biplane, is to give demonstrations on Boxing Day and the following Saturday, the 27th, at Hendon at 11-30 a.m. and 3-30 p.m. each day (weather permitting).

Monsieur Chanteloup's evolutions are reported to be most extraordinary and impressive, particularly the "pancake" descents, which are made almost vertically, with the planes of the biplane horizontal, a method which makes it possible for a pilot to land on a very small space, not much larger than the area of his biplane.

A STRIKING DEMONSTRATION OF HILL-CLIMBING POWERS.

W. H. Carson on his 5-6 h.p. Excelsior climbing Netherhall Gardens, Hampstead, a gradient of 1 in 7.2 During Show week six passengers were carried, but seven have since been taken up the hill—a combined weight of 88 stones, or, including the vehicle, a load of three-quarters of a ton

Streamline Bodies Two Years Old.

The daily papers last week credited a Frenchman with the idea of a streamline (or torpedo as it was called) body for increasing the speed of cycles and motor cycles. The credit, however, is due to *The Motor Cycle*, as will be seen by the extracts in this issue from an article which appeared in January, 1912.

English Statistics from Paris.

A French contemporary publishes the following figures concerning the expansion of the city of Coventry. We cannot vouch for the accuracy of the figures, but they are nevertheless interesting: The population is given as about 120,000. The salaries paid to motor staffs, during the past twelve months £1,500,000, to workpeople £3,000,000, and the business done £4,750,000.

Trade Supported Contests in 1914.

An important decision was arrived at by the Motor Cycle Manufacturers' Union last week in connection with competitions in 1914. The idea of selecting twelve events for their collective support as in 1913, has been discarded; instead, manufacturers will choose any particular events they like to the number of twelve. We deal with the matter editorially.

A Steady Increase in Motor Cycles.

Since the motor cycle has come into its own the annual increase in number has been startling, and of recent years has become more and more marked. Statistics go to prove that there are now 179,926 motor cycles registered in the United Kingdom, and that the increase during the year ended Oct. 31st, 1913, amounts to 38,770, a truly wonderful figure.

Dividing up the total into the three countries we find that England and Wales have an enormous lead, with a total of 158,120 machines. Scotland comes next with 13,280 and Ireland last with 8,526. The reason for these wide gaps are, of course, obvious, for besides the difference in area and population the question of roads is an important factor.

There are more motor cycles (26,318 to be exact) registered in London alone than in Scotland and Ireland together, and Birmingham comes next with 7,011. Middlesex (5,395) is the only other county to exceed 5,000, but Kent and Essex have 4,595 and 4,383 respectively.

There are only 45 motor cycles registered in Waterford, and this is the smallest number on record.

The Accuracy of the Figures.

It is unfortunately almost impossible to obtain with absolute accuracy the number of machines on the road, as some machines are constantly being laid by. This has been proved in the past by the discrepancies existing between the official returns and the amounts published as Inland Revenue returns from this source.

However, failing a definite statement from the Revenue Offices, the figures published above, for which we are indebted to *The Car Illustrated*, may be considered as the most accurate obtainable. Our contemporary publishes a detailed list of the motor vehicles registered in each county and borough.

FUTURE EVENTS.

Dec. 26-27.—Motor Cycling Club Winter Run from London to Exeter and Back.
,, 26-27.—Bristol M.C.C. Open 24 hour Trial to Land's End and Back.

1914.

Jan. 3.—Liverpool A.C.C. Open One Day Trial.
,, 7.—Bournemouth M.C. Open One Day Trial.
,, 14.—A.C.U. Annual Dinner
,, 17.—Essex M.C. Open One Day Trial.
,, 31.—Birmingham M.C.C. Open Trial for Motor Cycles & Cycle Cars.

Scottish Trials in 1914.

We hear from Mr. Campbell McGregor that the Scottish Six Days Trials, promoted by the Edinburgh and District M.C., will be held next year during the week 15th to 20th June. Thus, it will be seen that the idea of holding the trials in two weeks with a Sunday intervening has come to nothing, which we consider a pity, as we feel sure that many competitors would have welcomed the plan, and would also have been glad of a free day among the splendid Highland scenery.

A.A. and M.U. Notes.

Patrols and Christmas Day.—In accordance with the custom which has always been observed by the Association, no A.A. patrols will be on duty on Christmas Day. On Boxing Day the men will be on their beats as usual.

Christmas and New Year Tours.—The A.A. and M.U. Touring Department is daily receiving applications for routes from a large number of members, who will be proceeding by road to various parts of the country for the celebration of Christmas. Members are reminded that the Touring Department is always actively and willingly at their disposal for the issue of international passes and customs triptyques, and the careful preparation of itineraries to meet individual requirements both in the United Kingdom and on the Continent.

A.C.U. Notes.

Affiliation.—The following clubs have notified the Union of their intention to affiliate under the new affiliation scheme:

The Cyclecar Club.
Newport (Mon.) M.C.C.
Surrey M.C.C.
Aspatria College M.C.C.
Liverpool A.C.C.

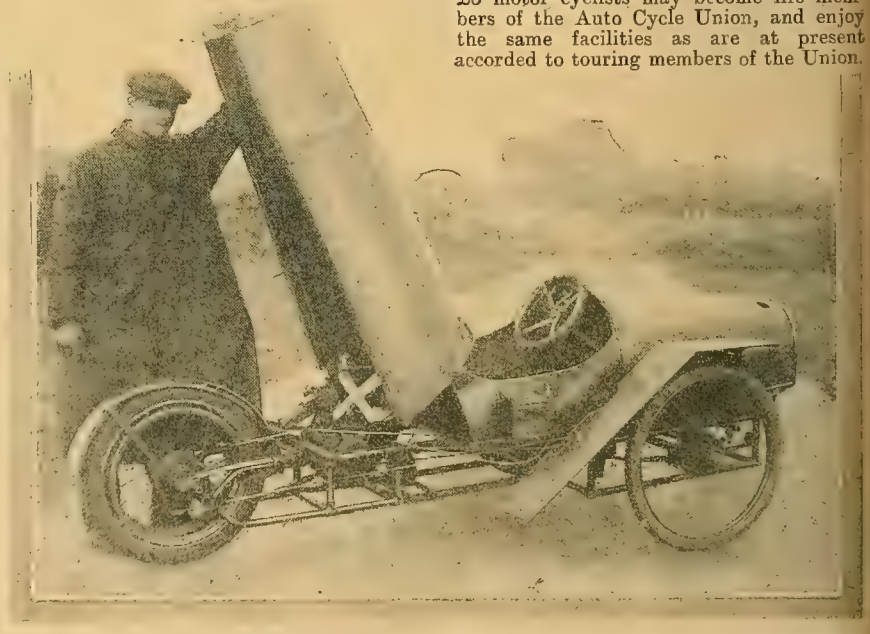
Tourist Trophy Races, 1914.—The regulations for the motor cycle T.T. Races, and the cycle car T.T. Race, are now under consideration by the A.C.U., and will probably be circulated early in the new year.

Red Rear Lights on Motor Cycles.—The A.C.U. has been in close touch with the Local Government Board on this matter. The Board recently submitted a draft of the suggested Amending Order for the consideration of the Union.

Annual Dinner.—The Annual Dinner of the Union will be held in the Great Gallery of the Royal Automobile Club, London, S.W., on January 14th next. The Hon. Arthur Stanley, M.P., M.V.O., will occupy the chair. The dinner will be followed by a first-class musical entertainment.

A.C.U. Competitors Register.—The Auto Cycle Union wishes to remind prospective competitors in forthcoming events to be held in 1914, that it will be necessary to renew their A.C.U. Competitors' Registration. This registration holds good from January 1st to December 31st in any one year.

Life Membership of the A.C.U.—It does not appear to be generally known that upon payment of a subscription of £3 motor cyclists may become life members of the Auto Cycle Union, and enjoy the same facilities as are at present accorded to touring members of the Union.



The above photograph depicts a novel racing cycle car made by E. G. Whelon of Acton. The Whelon—as it is called—is fitted with a twin-cylinder 6 h.p. fan cooled engine and two-speed gear in the back hub. Access to the engine, as may be seen, is gained by raising the hinged rear portion of the body. The complete vehicle ready for the road weighs 3¼ cwt.

A BIT OF A PUZZLE.

THE SOLUTION.

A FORTNIGHT ago there was described a puzzling case of a new motor bicycle which appeared to be quite in order, but which petered out in a few yards. The only thing necessary to make the machine run perfectly was to make a slight adjustment, and it was this. The timing ring, as stated, appeared to be fixed. There was an arm on the ring, but no hole had been drilled through the end of it, and it was not coupled up to any sort of control mechanism, and the contact broke, apparently, at the right point. All that was required to put the machine right was to tap the lever with a light hammer so as to advance the timing a few degrees. It was not necessary to alter the position of the sprocket on the armature-shaft, nor even advance the cam ring to the full amount allowed for by the slot in its wall.

Generally, such moderately retarded ignition merely results in slow progress, but in this case it would seem that the current generated was not much more than sufficient to jump the gap at the plug and cause a spark when the machine was being assisted, but, when it slowed at all, the current weakened as the speed fell off and the firing gradually ceased.

Anyway, the Precision unit—for such it is—now sails along like a bird. DOUGLAS LEECHMAN.

Editorial Note.

The competition has been a great success, many hundreds of riders sending in their ideas of the trouble from which the machine was suffering. An enormous number of readers thought that an air-lock in the petrol pipe or a wrong level of petrol in the carburetter was the cause, but Mr. Leechman made it abundantly clear that these were not the causes. It will be seen that the real reason was quite a simple one.

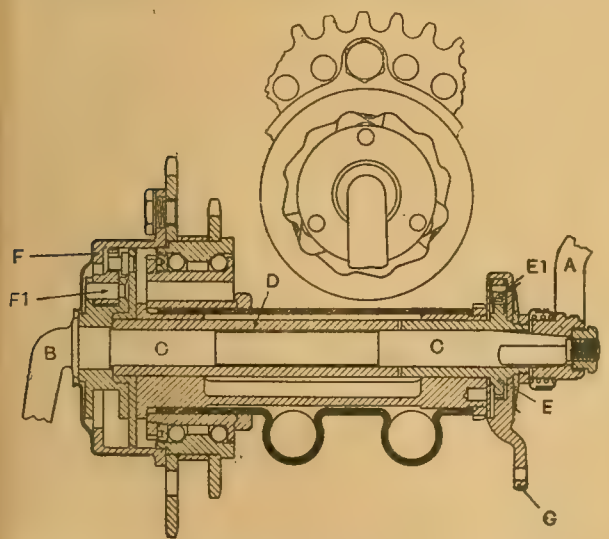
The task of going through the answers is no light one, but the names of the winners will be announced later.

So successful has this little competition proved, and so many have been the expressions of approval elicited from the competitors, that we hope to be able to hold another in the near future.

The confidence of many competitors in their ability to solve the puzzle has been one of the outstanding features of the competition. Almost invariably the most confident were the most in error. Many competitors have been kind enough to state which of our publications they will have as a reward for their skill. Very thoughtful of them, but unfortunately they were invariably wrong. One competitor informs us that as he owns a certain twin-cylinder machine he would like a copy of *Tracing Troubles!* Rather an unkind hit at the manufacturers of his particular machine, which, by the way, does not deserve its owner's subtle sarcasm But even if this particular example of the factory is a little wayward, it has evidently never misbehaved itself as did Mr. Leechman's engine, for its owner's diagnosis is wide of the mark in trying to solve the puzzle.

Novelty in Design.

A NOVEL kick-starter combined with the brake-operating mechanism has been designed and fitted to the Harley-Davidson 1914 models. Its action is quite simple and the working parts few in number—a very commendable point, especially when one considers the stresses to which such a part is subjected. Referring to the sectional sketch, it will be seen that there are two pedal cranks A and B attached to an axle C. Fixed at one end of the tube D, in which the rod C is housed, is a ratchet wheel E engaging with a pawl E^1, whilst at the other end is an internal ratchet ring F, also engaging with a pawl F^1. The ratchet wheels work in opposite directions, so that only one pawl is locked at a time. For engine starting the ratchet F transmits the driving force applied through the cranks to the chain sprockets, giving at the same time a turning movement to the engine. In the meantime the other ratchet E is out of action. On the casing to which the pawl E^1 is attached is cast a lug G for a brake rod connection. When the cranks are rotated in the opposite direction to that of the engine, the pawl F is released, while E^1 takes up the applied force, transmitting it to an internally-operated band brake mounted on the rear hub. Attached to the lug G is another link extending to an operating pedal placed conveniently on the footboard.



A feature of the Harley-Davidson. The letters are referred to in the description on this page.

The bearing of the pedal crank axle is mounted eccentrically, so that chain adjustment is easily performed by rotating the tube D. It should be understood that there are three pawls to each ratchet wheel and that these parts only require lubricating twice or three times a year

SOME BROOKS CYCLE CAR SPECIALITIES.

Messrs. J. B. Brooks have produced some interesting novelties to meet the demands of cycle car users, which include leather and leatheroid goods of all descriptions. One of the neatest of these

The Brooks cycle car spare wheel cover.

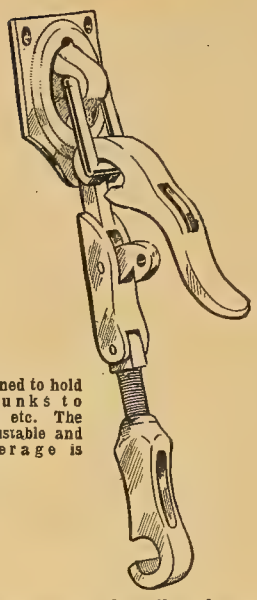
is the spare wheel cover, which is made of leatheroid and divided horizontally. The upper half overlaps the lower part so as to prevent the ingress of rain, and the hub cap and bottom of the case are made of stout leather to resist wear. The footboard is one of the most useful parts of a little vehicle for carrying luggage, and we inspected boxes of all sizes and shapes for fixing in this position. One

A neat leather horn bulb cover to prevent the rubber bulb perishing.

very useful type is constructed to carry golf clubs, and all are stoutly made and rendered dust proof by a special double lid. These boxes may be fitted with aluminium foot plates on the lid, for they are strong enough to be used as steps. Brooks bags are fitted with most ingenious clasps and attachments, which give such convenient leverage that the

The Brooks case for carrying golf clubs on the running board.

lids may easily be shut, even when slightly too full. A neat polished wood tool cabinet may be supplied as a step fitting, and this contains three trays, fitted with compartments, which hinge outwards, so as to give easy access to all parts. The various useful accessories are



Clip designed to hold Brooks trunks to footboard, etc. The clip is adjustable and large leverage is provided.

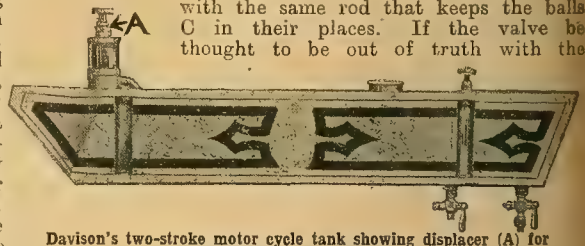
too numerous to describe, but we may mention a horn bulb cover and a spare petrol can case, the latter being a particularly useful contrivance.

DAVISON'S LUBRICATION SPECIALITIES.

Mr. A. C. Davison, 163, Arlington Road, Camden Town, N.W., has recently improved his semi-automatic drip feed for the lubrication of motor cycles. This device, which is illustrated herewith, consists of a pump, the plunger of which is first pulled up and then pressed downwards, filling the glass of the drip with two fluid ounces of oil. The drips can be regulated by the milled nut at the top, but if it is desired at any time to give the engine a full charge of oil, the quantity of oil in the glass may be increased, and the lever at the side pushed over. This raises the needle valve from its seating, and the extra oil is pumped direct to the engine. Mr. Davison also showed us two patterns of pumps with celluloid barrels, in which the celluloid is an eighth of an inch thick.

Another ingenious innovation for which Mr. Davison is responsible is a lubricator for two-stroke machines, consisting of a small displacer which sends one-thirty-second of a pint into the petrol tank for every half-gallon therein. This is, of course, for machines in which the oil is mixed with the petrol.

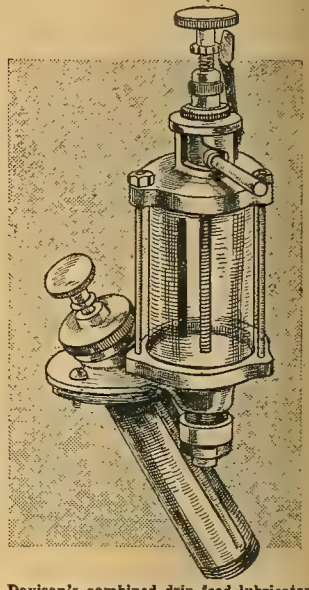
The Davison filler caps can now be had with transparent celluloid tops, both in the hinged pattern and in the ordinary screw-on type.



Davison's two-stroke motor cycle tank showing displacer (A) for forcing oil into the petrol tank.

A NEW VALVE TRUER.

Pearn's patent valve truer, which we illustrate, is called the Rapid. The sectional sketch is self-explanatory, but it may be as well to point out that the valve is inserted by slackening the nut F and pushing the stem through the hole in the centre of the cutter. As the stem goes in it will push out the wooden rod provided with the truer, which tends to keep the balls in place. When the valve is in position, some oil should be applied to the valve face before pressing it against the cutter. The nut may then be tightened, so that the stem is held firmly but not too



Davison's combined drip feed lubricator and pump.

tightly. Then, with a screwdriver or brace, the valve should be turned in a clockwise direction. The light pressure on the valve is all that is necessary to ensure a true face and a high finish. When the operation is completed, the valve can be pushed out of the truer with the same rod that keeps the balls C in their places. If the valve be thought to be out of truth with the stem, the cutter part A should be removed and the valve replaced and turned round or spun.

It is claimed that the ball races ensure the stem being perfectly concentric with the body of the tool.

The price of the device is £1, and it is obtainable from Brown Brothers, Ltd., Newman Street, Oxford Street, W.

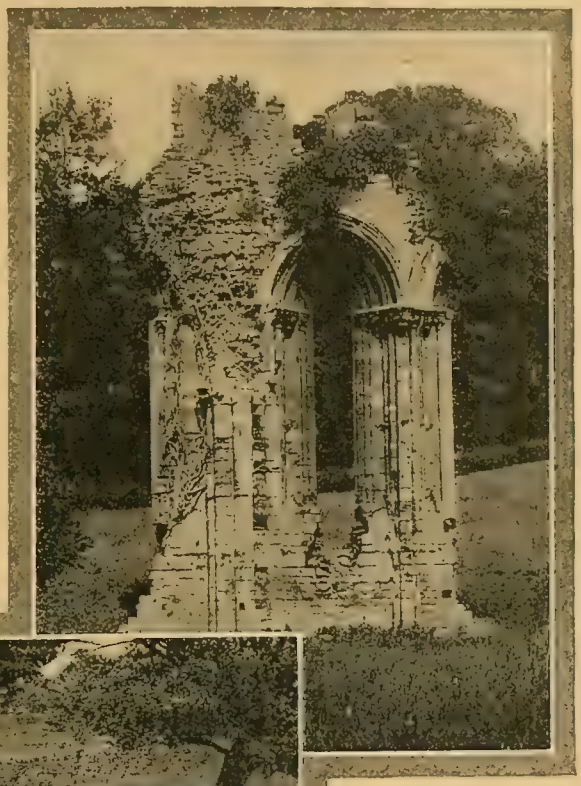
TOURING TOPICS.

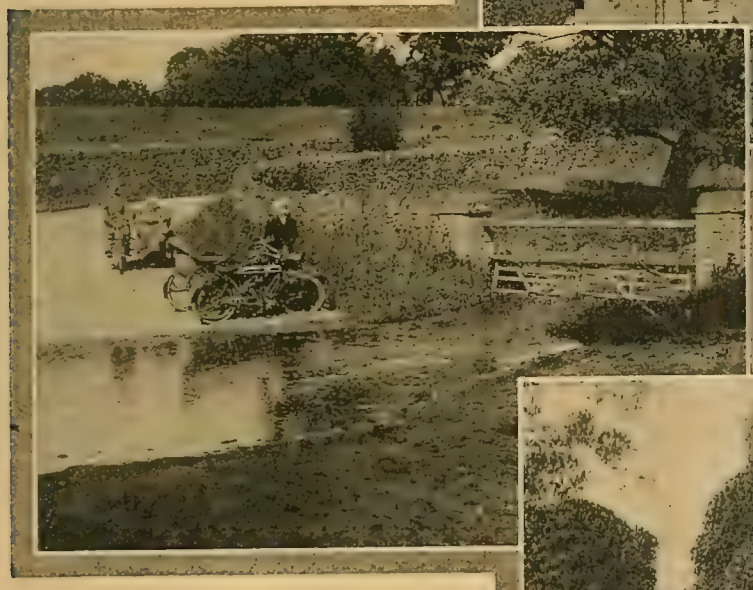
YORK, KIRKHAM ABBEY, AND CASTLE HOWARD.

A FINE centre for the tourist is the ancient city of York. It stands on the banks of the River Ouse and on the tableland known as the Plain of York, and for miles north, south, east, and west good roads are encountered.

This city might be called the hub of a circle of country rich in archæology and ancient lore, but in an article of this description it is only possible to touch slightly on its beauties. Should, however, any readers be in its vicinity, we recommend them to spend a day in the company of a local guidebook, covering the ground which years and years ago was trodden by the hoofs of prancing steeds carrying gallant knights of old clad in shining armour to the fray, or to their lady fair.

The chief features of York are the Minster, Castle, St. Mary's Abbey, and the fine old city walls with the well preserved bars of Micklegate, Bootham, Monk, Walmgate, and Victoria. There are also numerous peculiar streets, old churches, etc., but no doubt you are by this time pining for the open road, so I will take you for a run, and we will make through Monk Bar and on to the Scarborough Road for nearly six miles, when shortly after the Four Alls Inn we turn right at the signpost for Stamford Bridge.





TO YORK, KIRKHAM ABBEY AND CASTLE HOWARD.

(1) A beautiful architectural study. Probably the finest piece of the ruins of Kirkham Abbey.

(2) A dangerous watersplash which nestles round a sharp corner on the road between Westow and Malton.

(3) A glimpse of a portion of the ruins of Kirkham Abbey on the banks of the River Derwent.

The road now runs through lovely wooded country, beautiful trees overhanging the route on both sides, and we soon pass through the little village of Sand Hutton, and by taking the first turn right after the village we pass through the beautiful woods of Buttercrambe; this road is a little bit twisty and narrow, but all too soon we reach the T roads, and here we diverge a little, and, by turning to the right, run down into the village of Stamford Bridge, the scene of the famous battle of that name, during which fight it is said that one gallant Norseman single-handed held the old wooden bridge against the whole of the English army until

Touring Topics.—

one of the opposing side took it into his head to approach the Norseman by means of the river, and when under the bridge this worthy stabbed the warrior from below—a very unsportsmanlike action!

Returning once more to the T roads we take the road marked for Malton, crossing over the river Derwent at what, I believe, is called Buttercrambe Bridge. Now bearing slightly right and then left we encounter rough roads for a mile or two, including a couple of small watersplashes which must be negotiated. After the second splash we proceed up a hill called Gally Gap, and a mile or so on is the village of Westow. The road is now good once more, and just after leaving Westow we again diverge by turning left, and run down to that beautiful bit of country surrounding the few ruins of Kirkham Abbey. An hour or so should be spent here, visiting the ruins, or rambling in the woods by the riverside.

Returning again to our correct route we continue for Malton and soon reach another watersplash which nestles round a corner, and is a trap to the unwary. This watersplash must be surveyed before being taken. Shortly after this we notice the old-fashioned market town of Malton down in the valley on our left, and a longish descent soon brings us to its narrow streets.

We cross over the railway and take the first turn left and on to the cross-roads, where usually a rather strict policeman is on duty. It is a very dangerous and busy crossing, and one must slow down to nearly a walking pace, for our road here turns left, and at the top of the next incline right, at the signpost for Castle Howard. We continue for nearly five miles to the little rustic village of Coneysthorpe, where we must pass through a gate, and just before the next gate we turn left and are generally confronted by some youngsters holding open a large iron gate. This is the entrance to Castle Howard Park, and immediately on our left is a superb view of a fine lake with the castle in the background.

The Splendours of Castle Howard.

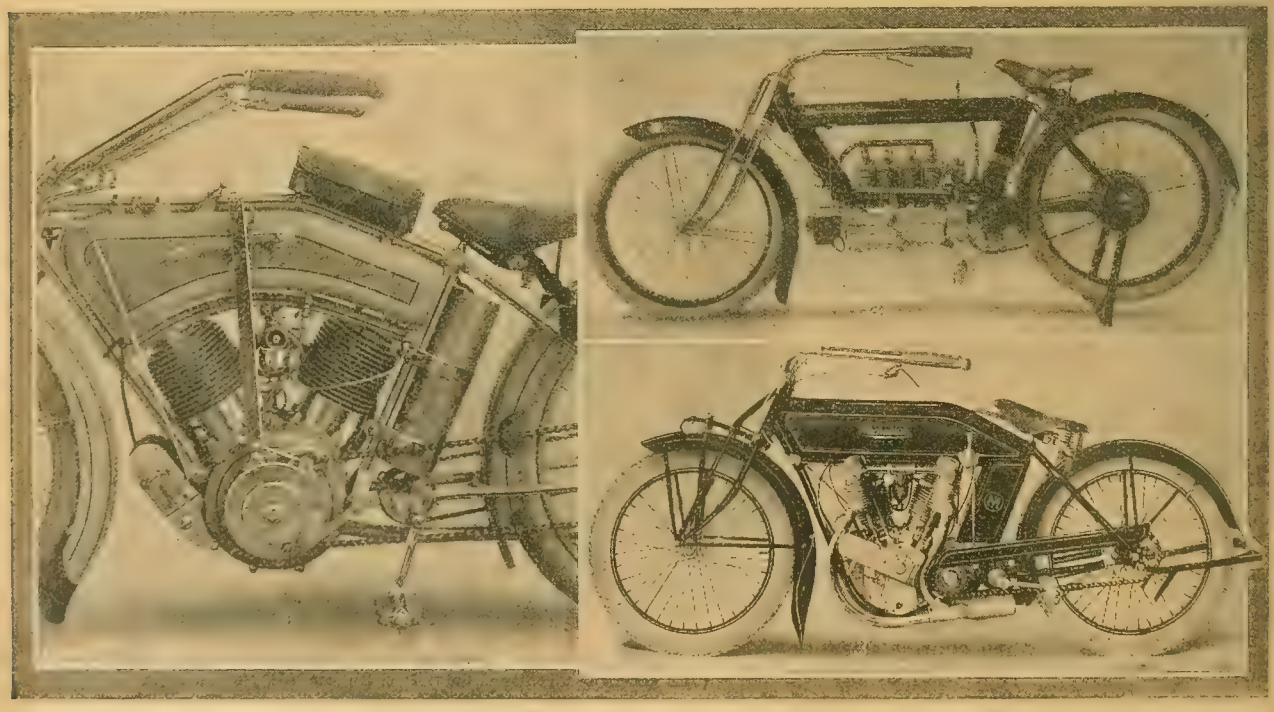
Castle Howard is, of course, world-renowned, and requires no mention from me of its architectural beauties, fine and rare collections of china, books, pictures, etc., and its splendid grounds and statuary. I am given to understand that the house itself is now closed to visitors owing to the turbulent suffragette times we live in, but nevertheless we can run through the park, passing under the shadows of the obelisk, and further on the huge monument erected in memory of the seventh Earl of Carlisle. This road is really splendid and on no account should be missed.

Shortly after leaving this grand place we join the main York and Scarborough road, and by turning right have a good run back to York. Except for a few miles the roads are in good order, and practically void of stiff hills. The distance is approximately fifty miles. H.W.F.

SPECIMENS OF LATEST AMERICAN MODELS.

On the evening of Saturday, January 3rd, the New York Motor Cycle Show opens its doors to the public. The 1914 American models are now making their appearance, and we illustrated a selection of them below. The big multi-cylinder motor bicycle holds sway in the States, where speed seems to be a natural craving. Those who wish to consider the conditions of motor cycling in America, through English spectacles, are referred to the article on pages 1740 and 1741.

1. Power unit of the 7½ h.p. twin-cylinder Iver-Johnson showing clutch operation and stays bolted to the cylinder head and brazed to the tank tube.
2. The four-cylinder Pierce. Note the large tubular members of the frame used for storing oil and petrol.
3. Side view of the "10-13 h.p." Michaelson, which is fitted with overhead valves, two-speed gear, and chain transmission.



STREAMLINE BODIES.

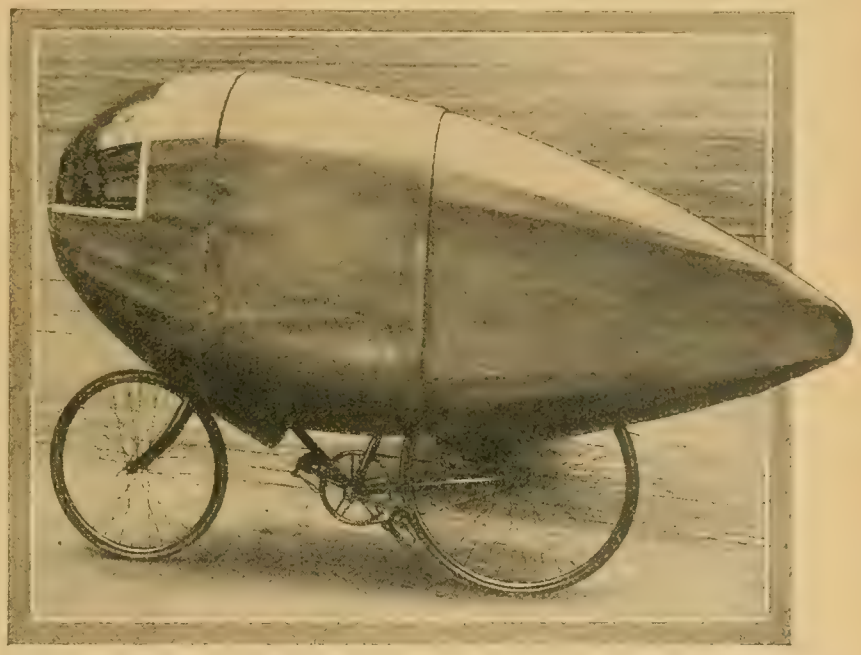
A Suggestion of "The Motor Cycle" adopted Two Years Later.

IN *The Motor Cycle* of January 18th, 1912, we published an article over the initial "G.S." suggesting the possibilities of the streamline body for racing motor cycles, and several imaginary types were shown in sketches. It was pointed out that, temporarily, engine design seemed to have come to a standstill, and that if more attention were paid to wind resistances and eddies, also loss of energy due to discontinuity of surface, the pace of machines would be greatly increased without other alterations. The following extracts from the article are particularly interesting at this stage in view of the fact that the opinions expressed were written two years ago. "So much experimenting has been done with special compression, ratios, valve timing, cam design, carburetter fakements, etc., that it would appear strange that track racers have not turned their minds to wind cutting devices to envelop their body . . . . . as the veriest novice knows how he must huddle himself up along the top tube to get the maximum speed out of his machine."

Bound to Improve Speed.

"It is, therefore, easy to realise that a streamline covering to envelop the rider's body is bound to effect a considerable improvement in the matter of speed, and when records have been made by the aid of such bodies, it is unlikely that a rider on a machine of orthodox design could recapture them. The shape which has been found to require the minimum power to drive is a long fish-like surface with the blunt end pointing in the direction of motion. It was found that when the same body was placed with the thin end opposed to the wind, that the driving force had to be greatly increased."

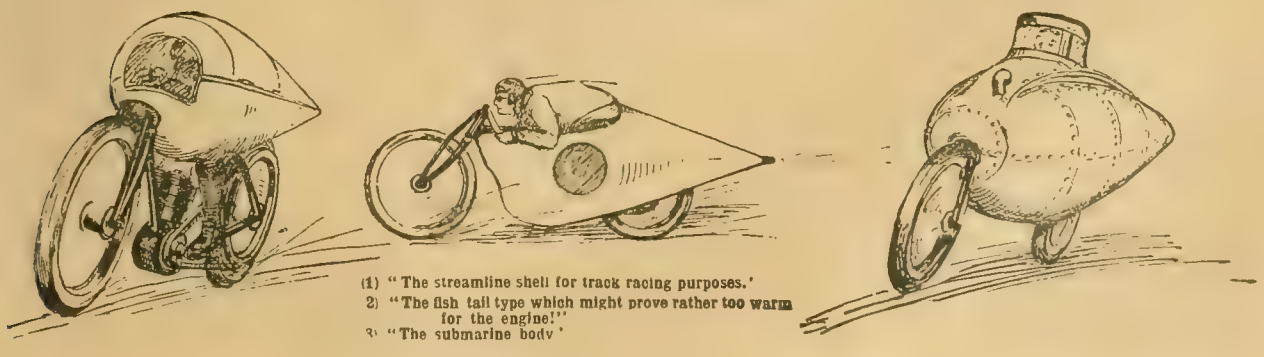
It is almost impossible to gauge the wind resistance accurately, but a table was given showing the resistance at various speeds, calculated on the Eiffel Tower formula, which shows that the h.p. absorbed is terrific—as much as 7.944 h.p. at 60 m.p.h. The article wound up as follows: 'It has been estimated by one of our leading riders that almost as soon as the streamline body is tried on a motor cycle, the speed will increase at least 10 m.p.h. Who will be the first to adopt this plan?'"



VELO TORPILLE.—With the aid of the above "Streamline" body, Berthet, a French racing cyclist, last week broke records in Paris by exceeding 36 m.p.h. Berthet is the first we have heard of who has tried our suggestion made two years ago

As far as track work is concerned, we get the first answer from the *Daily Mail* of December 19th, 1913, where under the heading of "The Torpedo Cycle" we find that Berthet, a well-known racing cyclist, broke records on a pedal cycle fitted with a streamline body "made in the shape of a cigar." It apparently has a wicker framework and a covering of canvas. The covering, it is pointed out, practically obviates wind resistance. And certainly Berthet, who rode a lap at at Velodrome d'Hiver in Paris, unpaced at over 36 m.p.h., is reported to have broken several other records on the same occasion on his "invention."

SKETCHES REPRODUCED FROM "THE MOTOR CYCLE" JANUARY 18th, 1912 WHEN OUR SUGGESTION OF A STREAMLINE BODY FOR RACING FIRST APPEARED.



(1) "The streamline shell for track racing purposes."
2) "The fish tail type which might prove rather too warm for the engine!"
3) "The submarine body."

CLUB NEWS.

The Cycle Car Club.

An illustrated circular relating to this club can be obtained from the Hon. Sec., Mr. A. C. Armstrong, Meadows, Hook, Surrey.

St. Margaret's-on-Thames M.C.C.

It has been decided to form a club as above. Those who wish to join should send in their names to Mr. A. Thoroton, 2, Avenue Gardens, St. Margaret's, Twickenham, the honorary secretary *pro tem.*

Sheffield and Hallamshire M.C.C.

A reliability run will be held on Friday, December 26th. Route: Sheffield, Doncaster, Selby, Market Weighton, Middleton, and Driffield, returning the same way. The first competitor starts at 7 a.m. from Queen's Memorial. Competitors will be timed by their own watches, which will be carried sealed in case provided by the club.

Birmingham M.C.C.

The winter run to York and back will take place on the 27th inst. The start will be from the Birchfield Garage, near Perry Barr, at 6 a.m., and the route as follows: Sutton Coldfield, Tamworth, Ashby-de-la-Zouch, Beeston, Nottingham, Mansfield, Worksop, Doncaster, Ferrybridge, Tadcaster, York, where lunch will be served at the Royal Station Hotel.

Liverpool A.C.C.

The two reliability trials for the P.B. Challenge Trophy were run off during the present month.

The first trial was in North Wales, and was the more severe, principally on account of the very bad weather conditions, no rider coming through with a clean sheet—in fact, only five finished the course.

The second trial was in the Peak District, but the weather conditions being very favourable practically no marks were lost.

The winners were:

1. G. A. Gregson (6 h.p. Bat), trophy and gold medal.
2. Mrs. Baxter (6 h.p. Rex), silver medal.
3. E. F. Baxter (6 h.p. Rex), bronze medal.

H. Gibson (6 h.p. Bradbury sc.) receives special bronze medal presented by Mr. A. J. Jenkins.

The third annual dinner took place on the 17th inst. at the Hotel St. George, Liverpool, Mr. F. Sellars being in the chair. Mr. T. W. Loughborough, the secretary of the A.C.U., was the principal guest, and in the course of his speech he announced that the A.C.U. had decided to start the new scheme of local centres in the Liverpool district with a local man as paid secretary, provided that every club in the centre became affiliated to the A.C.U. and agreed loyally to support the central organisation. This announcement was received with great applause. Mr. Vance, of Chicago, proposed the toast of "The Club," and said that the greatest danger to the motor industry lay in the inflated price of petrol; he remembered buying better spirit for fivepence a gallon. The President (Mr. F. Sellars) responded. Messrs. Baxter and Phillpott also spoke. The evening terminated with a musical programme, during which Mr. Hugh Gibson showed his proficiency with a violin, our correspondent adding, "the 'extra air' he gave being in (or at) the right time."

South Birmingham M.C.C.

The Christmas reliability trial will take place on the 27th inst. The route has been arranged as follows: Gun Barrels Hotel (start at 9 a.m.), Bristol Road, Rose Hill, Worcester, Gloucester, Birdlip, Cheltenham, Evesham, Alcester, Birmingham, approximately 100 miles. Route cards will be provided. Competitors will be timed by their own watches in sealed cases. No adjustments will be allowed at controls. Petrol, oil, and water may be taken under observation at the lunch stop. Competitors will be awarded 200 marks at the start, and will be penalised as follows: Failure on any hill 50; any other stop 10; each complete minute early or late at a control 1. Pedalling or assistance will count as a stop. First prize: Silver cup, value £3 3s., presented by Mr. P. J. Evans. Entries close first post Monday, December 22nd, 1913.

THE POPULARITY OF THE MOTOR CYCLE IN THE COLONIES. Above are seen twenty-two Premier riders and their machines photographed recently at Durban.

THE M.C.C. CHRISTMAS RUN.

Complete List of Motor Cycle Competitors in the London-Exeter Run with Starting Times.

IN the list of entries for the winter run, which is given below, motor bicycles, sidecars, and those light cars, which conform to the capacity limit laid down for cycle cars by the A.C.U., are included. In addition there are seven cars and light cars which exceed this limit. This run was inaugurated in 1910, when seventy-eight entries were received, mainly motor bicycles. In 1911 the entries had increased to 119, and the number of sidecar outfits had largely increased. Last year, to make the test most difficult, and to add interest to the journey, the return was made *viâ* Lyme Regis and Dorchester, and the whole journey was scheduled at 20 m.p.h. The entries in this year numbered 163. The cycle car entry in the three years was respectively one, four, and twenty-seven. For the benefit of those readers who wish to see something of this event we give the times of the first pair at the principal points *en route* and the distances from the start.

Route and Timetable.

OUTWARD.

	Distance from start.	Time due.
Staines ...	0	8 p.m.
Bagshot ...	9½	8.30 ,,
Basingstoke ...	29	9.34 ,,
Andover ...	47½	10.37 ,,
Salisbury ...	65	11.30 ,,
Shaftesbury ...	86½	1.42 a.m.
Yeovil ...	108½	2.55 ,,
Crewkerne ...	117¾	3.23 ,,

Andover ...	263	1.16 p.m.
Basingstoke ...	281½	2.12 ,,
Bagshot ...	301	3.10 ,,
Staines ...	310½	3.40 ,,

There will be a stop of one hour at Salisbury both on the outward and return journeys.

Competitors must prepare themselves, especially if solo riders, for the three miles from Egham to Sunningdale level crossing. We hear from a correspondent that the surface of this road is like a ploughed field—thick, heavy mud; ruts and furrows—far harder to steer over than was Applecross in Scotland. After the level crossing, when the road is in Surrey, the surface is good hard tarmac.

The two test hills, Chard and Trow, have to be ascended non-stop. The silencer regulations, printed in our last issue, will be very strictly enforced.

The M.C.C. Christmas Run.—

The arrangements were completed last week for the above run, and with the particulars published last Thursday and the list of entries in the previous issue readers should be fully acquainted with the best points from which to view the competitors, etc., but doubtless all classes of readers, both competitors and otherwise, will be interested to know the names of different hotels at important places on the route. We give below the names of the principal stopping places and a list of hotels. The official hotel is in all cases given first.

STAINES.—Bridge House Hotel; Angel, High Street. Garage: T. E. Taylor, Bridge House.

BASINGSTOKE.—Red Lion; Station, Station Hill. Garage: Scard's.

SALISBURY.—Angel Hotel; County, Bridge Street; Old George, High Street; White Hart, St. John Street; Crown, High Street; Red Lion, Milford Street. Garages: The Salisbury, Friary Road; S. and E. Collette, Catharine Street.

YEOVIL.—Mermaid, High Street; The Three Choughs; Pen Mill, Sherborne Road. Garage: Moffat's.

EXETER.—Bude Hotel, Sidwell Street; Rougemont, Queen Street; New London, Eastgate; Royal Clarence, Cathedral Close. Garage: Exeter Motor Co.

The exact distance of the outward and homeward journeys is 310½ miles. The old course of the year before last from Hounslow was 322 miles, when the average speed was slightly slower.

Mr. Frank Hansford will have charge of the timing arrangements on Chard Hill, while those at Trow Hill will be in the hands of Mr. E. L. Herring, of the Bournemouth M.C.C.

THE REAR LIGHT QUESTION SETTLED.

Definite Orders now issued by the Local Government Board. Motor Cycles Exempted; Sidecars and other Two-track Machines to exhibit Rear Red Light to take immediate effect.

ALL motor cyclists know that the decision of the King's Bench Division of the High Court last October made the law as to the necessity of carrying lights on motor cycles an exceedingly vague one. The Local Government Board, therefore, have been urged to issue an official statement on the subject, and at the end of last week made this statement public. *The Motor Cycle* has taken the liveliest interest in these proceedings, and in our issue of November 20th we made the following statement:

"We are in a position to state that the old order of things will most probably be reverted to. Although this exclusive announcement is in no sense official it is authoritatively believed in Government circles that the foregoing will be the outcome of the deliberations of the committee of Local Government Board.

"It will thus be seen that while there is a strong possibility that motor bicycles will be exempted from carrying red rear lights, it would appear that two-track motor cycles will in the near future be required by law to show some form of rear warning light."

Others, less well informed, affected to laugh at us, and motor cyclists were informed that remarks such as these might be accepted with the proverbial grain of salt. However, "he who laughs last laughs loudest," and the laugh is on our side, for the orders issued by the Local Government Board are actually and literally exactly as foretold in *The Motor Cycle*, viz., that motor cycles need not carry a rear light, but that it was incumbent upon sidecars to do so.

The L.G.B. New Regulation.

After referring to the old condition under which by the Act of 1896 cars were required to show a red light to the rear, and the term cars was held to include motor cycles, the L.G.B. new circular states that the 1896 Act is now amended, and the following proviso substituted for the former condition:

Provided also that—

"*(a)* so much of this condition as requires any lamp attached to the motor car to exhibit a red light visible in the direction contrary to that towards which the motor car is proceeding shall not apply to a motor bicycle, unless there is attached to the motor bicycle a sidecar or other vehicle;

"*(b)* so much of this condition as requires the lamp exhibiting a white light visible in the direction in which the motor car is proceeding to be placed on the extreme right or off side of the motor car shall not apply to a motor bicycle or to a motor bicycle having attached to it a sidecar or other vehicle unless such sidecar or other vehicle is attached to or projects beyond the off side of the motor bicycle; and

"*(c)* for the purposes of the application of this condition to a motor bicycle having attached to it a side car or other vehicle, the lamp exhibiting a red light visible in the direction contrary to that towards which the motor car is proceeding may be attached to the sidecar or other vehicle, and, in the case of a motor bicycle having a sidecar or other vehicle attached to or projecting beyond the off side of the motor bicycle, the lamp required to be placed on the extreme right or off side shall be attached to the extreme right or off side of the sidecar or other vehicle."

ARTICLE II.—This Order may be cited as the Motor Cars (Use and Construction) Amendment Order (No. II.), 1913, and the Motor Cars (Use and Construction) Orders, 1904 to 1913, and this Order may be cited together as the Motor Cars (Use and Construction) Orders, 1904 to 1913.

Given under the Seal of Office of the Local Government Board, this Eighteenth day of December, in the year One thousand nine hundred and thirteen.

JOHN BURNS, President.

PRIVATE SHOW IN GLASGOW.

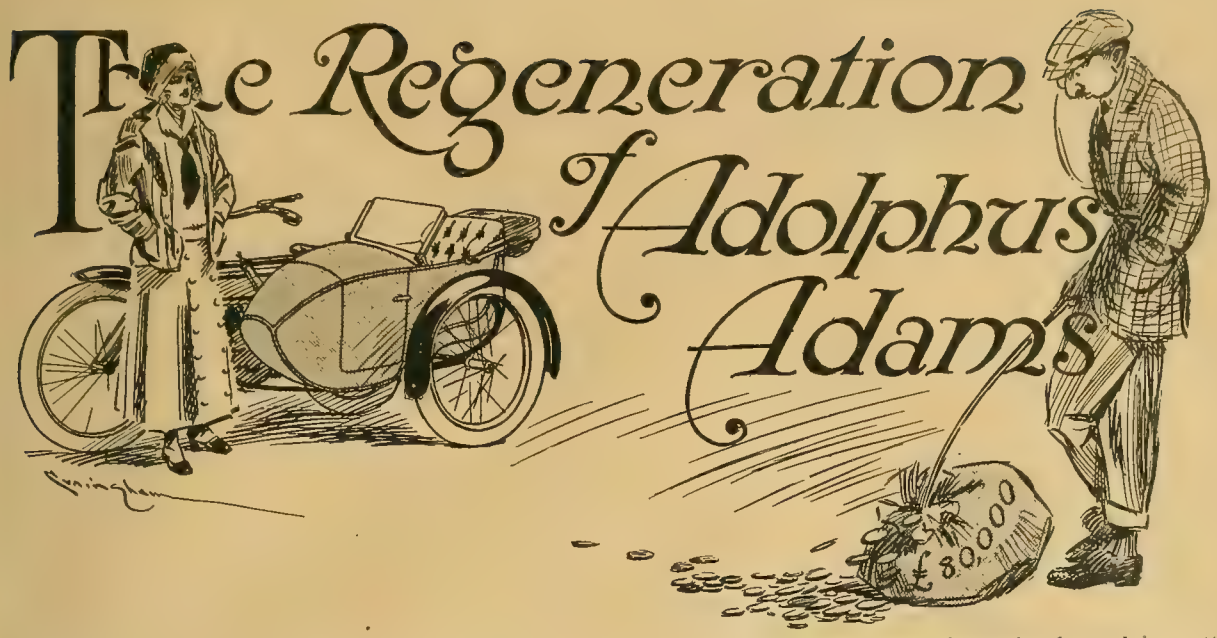
The Glasgow Club held their annual private show of new models, and a smoking concert last week. The show of 1914 models comprised nearly forty machines, representing twenty-four different makes of motor cycle and some half-dozen of sidecars. Prominent exhibits were Tim Wood's Scott and Hugh Mason's Nut-Jap, while the chairman's table was graced by the Tourist Trophy itself. Mr. Norman Macmillan, chairman of the Scottish A.C.U., presided, and a very excellent musical programme was given while a cinematograph display of 1913 events was a feature of the evening.

BIRMINGHAM-YORK RUN.

The following are the entries received for the Birmingham M.C.C. run to York up to the time of going to press. Particulars of this trip will be found on our "Club News" page.

J. Drew (6 Royal Enfield)
J. E. Greenwood (3½ Sunbeam)
L. Newey (5-6 Ariel)
E. Kibble (3½ Triumph)
J. Allday (4¼ James)
G. Davison (5-6 Rudge sc.)
T. Silver (7 Quadrant)
H. Silver (3½ Quadrant)
C. Williams (2¾ A.J.S.)
H. R. Davies (2¾ Diamond)
S. Hill (3½ Rudge)
E. J. Slattery (3½ Triumph)
T. Stevens (4¼ James)
G. H. Ratcliffe (3½ Rover)
H. S. Kershaw (3½ Rover)
H. Hopkins (3½ King Dick)
A. Young (5-6 King Dick sc.)
B. B. Barrow (8 Precision)
H. Newey (2½ Levis)
H. Ball (3½ Triumph)
D. A. Pearson (2¾ Peco sc.)
P. H. Jones (8 Morgan)
B. W. Shilson (8-10 Mathis Babylette)

The Regeneration of Adolphus Adams



ADOLPHUS ADAMS had an aunt. In this he was not unique. Most of us have aunts. His aunt was a rich aunt. Here again many of us share his distinction. But the aunt of Adolphus was unique in other ways. Bred and born in the early Victorian days, when Mrs. Grundy was rampant, she was a real sport. Had she entered this vale of tears fifty years later, she would have been a golf and hockey international, and driven a *type sportive* 38-90 h.p. Métallurgique. She never ceased to regret that she had been brought up on crinolines, poke bonnets, lavender, pot pourri, and other sentimental commodities of a gentle and romantic period; nor did she cease to mock at them. At the age of seventy she bought a small car, and had just learnt to drive it—sitting erect, with her grey hair streaming awesomely from under the tilt of a poke bonnet, a formidable, wiry figure—when she died. Her will did not disguise the contempt she had always felt for Adolphus, a timid little weed of a man, who carefully insured himself against all the ills flesh is heir to, wore white spats, and never left the house without an umbrella. Her final will and testament had been a sore worry to her solicitor, much as he approved its general tenor. She had too much commonsense to leave her handsome fortune to her other nephew, Percy Tallboys. He once remarked in her presence that he never paid small bills because they were too much of a fag, and never paid large bills because he couldn't. This offended her sense of justice. On the other hand, she felt certain Adolphus would only leave her money to rot in Consols. So she bequeathed £100 to Adolphus, and if he proved himself a sportsman within twelve months of her death, the residuary estate was to pass into his hands. But if he remained an incurable weed, smug, slacker, and froust, her fortune was to be divided between eight London hospitals. Her solicitor, an ex-Rugger international, was to be sole judge of Adolphus's sportsmanship; and while he disliked so unconventional a duty, he rubbed his hands at the prospect of much litigation.

Adolphus walked home from the funeral bespatted and unmbrella'ed as usual, and listened to the will in the darkened parlour. Percy Tallboys attended the function without any personal expectations, and cordially approved his aunt's testamentary dispositions. Adolphus, he opined, was "up to the fetlocks in the *consommé*," and he vowed he would watch that covetous youth's efforts to qualify as a sport with huge amusement. Adolphus returned home in great perturbation, even forgetting to notice a crinkle in his carefully furled umbrella, and oblivious of a large splodge of mud on his right spat.

Adolphus in Training.

The next three months were very trying for Adolphus. The solicitor advanced the stipulated £100, and he essayed various branches of sport. The local football team received him with open arms, scenting a glorious rag. They played him at centre forward in their next friendly, and shortly after the kick-off he was escorted to the touchline, after the 14st. full-back of the visiting team had effected a powerful clearance which stubbed the wet ball against the tip of Adolphus's very Roman nose. Returning to the field at the interval, he failed to touch the ball until a rueful moment when he found himself between the two visiting backs, and was violently sandwiched. As he explained to his mother afterwards, the sensation was that of having one's ribs suddenly crushed under a steam hammer. He resigned from the football club, and went in for golf and bowls. During the next month he was informed by the solicitor that bowls could hardly be considered a genuine sport, and that marbles were probably more in his line than golf. Meantime the damsels of his vicinity evinced keen interest in Adolphus. He was not exactly personable, but the local papers had reported the will, the girls all knew of the potential £80,000 awaiting his development, and felt "a man's a man for a' that." Miss Margaret Gordon, impelled by the inherited traditions of a long Scotch ancestry, tuned herself up.

The Regeneration of Adolphus Adams.—

revved fiercely at a few balls and croquet parties, boosted Adolphus up to the proposal point, and roped him safely in before another month was over. Margaret was a shrewd girl of much discernment; there was £80 left of the original hundred, and she meant to qualify Adolphus for the remaining £80,000. She surveyed his lank, muscleless figure, and saw that ordinary sports were not for him. His upbringing had disqualified him for wine, women and song. She was doubtful whether the solicitor, a sensible and strict individual, would rank wild plunging on the turf as "sport," and she finally identified motor cycling as the sole hope of obtaining salvation for Adolphus. Flattered and gratified by the novelty of finding a pretty girl really interested in him, Adolphus was as wax in her hands. She rushed him up to town, and ere they took the evening train back to Little Pedlington, Adolphus's cash balance had dwindled to a bare fiver, but the next week was to bring the happy pair delivery of an 8 h.p. sidecar outfit.

What Maragaret suffered in the long weeks of tuition, during which Adolphus signally failed to master the handling of a powerful twin, must rank among the secret history of forgotten British heroism. He took her into eight hedges, three trams, a traction engine, and one light lorry full of empty aerated water bottles. Nightly she anxiously examined her rich mop of auburn tresses for strands of grey and eke of white. Her cunningest wiles failed to induce the trepidant youth to open his throttle or drive as if the road belonged to him. No 1¼ h.p. Motosacoche could have been driven with more consideration for the traffic which, in the words of the inspired Act of 1903, "might be expected to be" upon an apparently vacant highway.

One day the solicitor of Adolphus's aunt met Margaret, as she cycled down to her golf club, a prey to the keenest forebodings, eying her engagement ring with serious thoughts of returning it on the morrow by registered post. He rallied her genially.

"Madge, my girl," quoth the cynical lawyer brutally, "you've bitten off more than you can chew for once: he's a decent little fellow, but you'll never make a sport of him. Those hospital cheques await my signature at the office!"

Margaret summoned all her reserve energy, and sprang a confident smile which gave the lie to her inmost dreads.

"Have I?" she replied sweetly. "Look here! You know the blind corner on the Stimpson road?"

The lawyer nodded.

"Adolphus always takes that on one wheel at fifty miles an hour! *Don't* you call *that* sporting?"

The lawyer grinned incredulously.

Madge proceeded. "You take a walk that way to-morrow afternoon. Sit on the gate just round the hairpin about three o'clock, and smoke one of your infamous cigars. I'll bring Adolphus along, and if you don't admit I've made a man of him you can send aunt's money to those loathsome hospitals to-morrow night!"

The lawyer agreed, and strolled round to his office smiling.

"The next day . . . . . Margaret paid a nefarious visit to the shed."

Tuning up for the Test.

The next day, before breakfast, Margaret paid a nefarious visit to the shed where Adolphus kept the 8 h.p. twin which had undermined the joy of his young life. Her dainty fingers opened the toolbag, and in two twos, or rather less, she had extracted the throttle piston from the carburetter. A snip of her sharp scissors severed the control wire. Slipping the piston in her skirt pocket, she replaced the cover-plate, and stole silently home. At 2.45 p.m. she and Adolphus wheeled the outfit into the roadway, and settled themselves in their places for a ride.

"We'll take the Stimpson road," she said, coaxingly: "It's a nice broad road, and I want you to practise going a little faster, darling!"

Adolphus depressed the kick-starter rather mournfully. "I don't like that bad corner, sweetheart!" he remarked; "and I've lost heart about auntie's money; I don't think I shall ever be a sportsman—I am too intellectual."

The engine burst into song.

"The engine seems rather lively to-day," murmured Adolphus, nervously, as the outfit swung out into the road on bottom gear; I'll change up at once to-day—the high gear may steady her a little."

It didn't; the powerful engine, deprived of its throttle, devoured the broad open road as a big twin should, and the sidecar bounced and rocked and swayed as they tore down the splendid road with Adolphus trembling on the brink of tears and prayers, and Margaret secretly more than a little frightened. She offered no resistance when he lifted the valve every few yards, and tinkered at his levers, only to find that the acceleration up towards Brooklands speeds was instantaneous when he let the engine in again. Thus they rapidly approached the hairpin corner, beyond which Lawyer Adkins was perched on the gate, sceptically sucking his cheroot; and with every yard Adolphus became more determined to stop the engine and push the outfit home. Margaret clenched her pretty teeth and waited.

At last the dread warning triangle hove in sight, about half a mile away. Adolphus lifted the valve, and began to reason with his imperious sweetheart. Margaret argued and coaxed until the outfit was slowing right down with the corner only a hundred yards ahead. Then she carried out her plan. Clenching her tiny fist so that the spikes of the diamonds in her engagement ring faced outwards, she dealt a tremendous thump on the left hand of Adolphus—the hand nearest her, the hand which was holding up

". . . . . the powerful engine . . . . . devoured the broad, open road."

the exhaust valve with grim determination. Adolphus dropped the valve with a yell, and the 8 h.p. engine took control with a roar. Adolphus lost his head, and the machine screamed on at a cool fifty, and was on the hairpin before he could even think. In this terrible emergency his manhood temporarily asserted itself. He gripped the handle-bars like a drowning man, and threw his feeble muscles into the task of wrenching the sidecar round the fearful bend. Margaret's heart sang with joy and palpitated with terror simultaneously, but the tail of her eye revealed the face of Adolphus convulsed with mortal agony.

"Grin, oh *grin*, Adolphus!" she moaned, mindful of the watchful lawyer waiting on the gate just beyond.

Adolphus continued to look as any sane man would look under such circumstances.

Margaret received the inspiration she deserved.

With a lightning, I might say a Paderewski-ish, movement of her deft fingers, she plucked a long hatpin from her hair and plunged it deeply into the thigh of Adolphus.

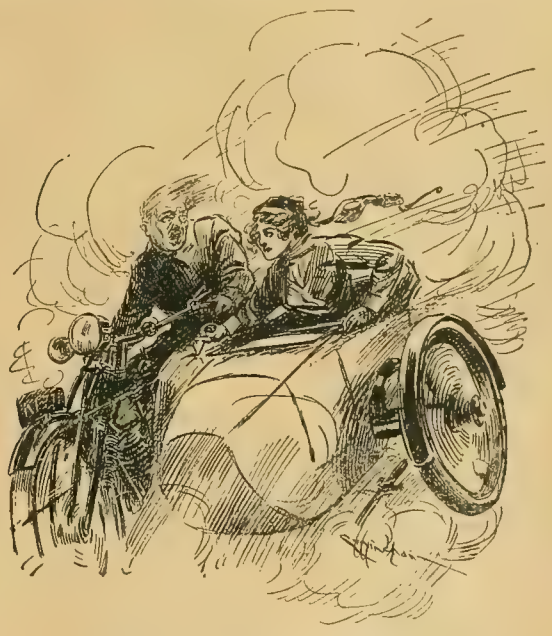
. . . . . .

Adolphus's mother is fond of boasting to other matrons in the seclusion of her drawing room that no bad word has ever passed her son's lips; but the word which escaped them in this moment of cruel agony was—truth compels the admission—a very bad word indeed.

So Lawyer Adkins, seated on the gate, sucking his long cheroot, opened his eyes in horror at what he saw. With a madly bellowing engine lending thrill and horror to the spectacle, he saw Adolphus negotiate a blind corner at fifty miles an hour, Margaret sitting pale and determined in a sidecar which was actually busy tickling her lover's ear; and as the sidecar wheel dropped to earth again when a capsize ceased to be imminent, the lawyer's incredulous ears heard Adolphus distinctly ejaculate "———!"

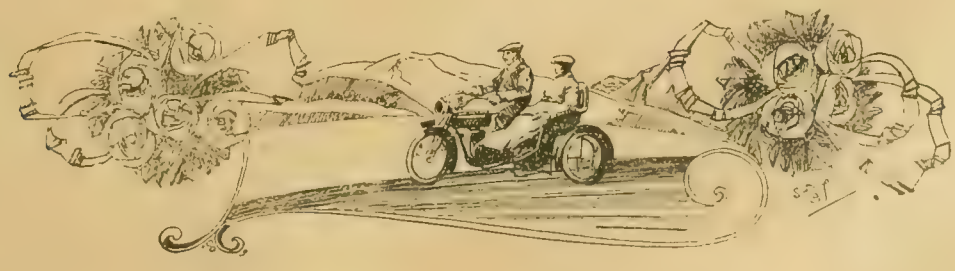
. . . . . .

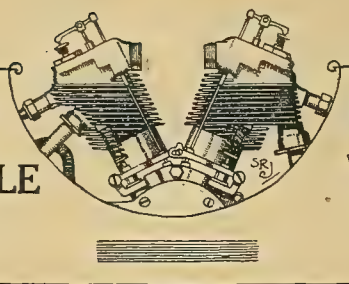
The residuary estate was transferred to Adolphus last week, and the Pedlington gossips whisper with bated breath that next month's wedding will prove unrivalled in the annals of their historic village.



". . . . . plucked a long hatpin from her hair and plunged it deeply into the thigh of Adolphus."

There is only one fly in the ointment of Adolphus's bliss. Margaret is adamant in insisting they shall take the sidecar on their honeymoon; but it is only fair to add that the throttle piston has been replaced.





THE MOTOR CYCLE IN AMERICA.

Where Powerful Machines, Rough Riding, and High Speed Prevail.

IT is difficult to convey to English riders how different is the pastime of motor cycling in America from motor cycling as they know it here. The roads are different, the machines are different, and the men are different.

The roads vary remarkably in even a short distance. At their best they are unsurpassed by any I have seen in a long experience in England, at their worst they are unapproached by anything we can produce or soberly imagine. Even in New England, where the roads are reputed the best in the Continent, one may have covered five or six miles in little more than as many minutes only to come suddenly upon an unrideable mud pond, which may apparently extend to the horizon or until the road disappears from view round a bend. It is impossible to rush such things as these—my only attempt to do so ended in sudden and instant disaster—and it is impossible to crawl through them on first speed, as the back wheel soon commences to slip.

I imagine that these places would be rideable during or immediately after heavy rain, when the mud would be soft; but when I struck them they were merely damp and sticky, and then one's only course is to ride between the tramlines. These run at the side of almost every road in Eastern America, and are laid on sleepers ("ties" in the local parlance). Usually they are ballasted about half-way up the "ties," and in some lines the "ties" are nearly covered. In any case one can ride over them on first speed and make better progress than on the alleged roads, even allowing for repeated dismantlings and removing oneself and machine from the track while a car passes.

I cannot say what was my longest distance covered in this way without any road riding; it seemed like five miles, but probably it was much less; at all events it was a trip that I would not willingly repeat.

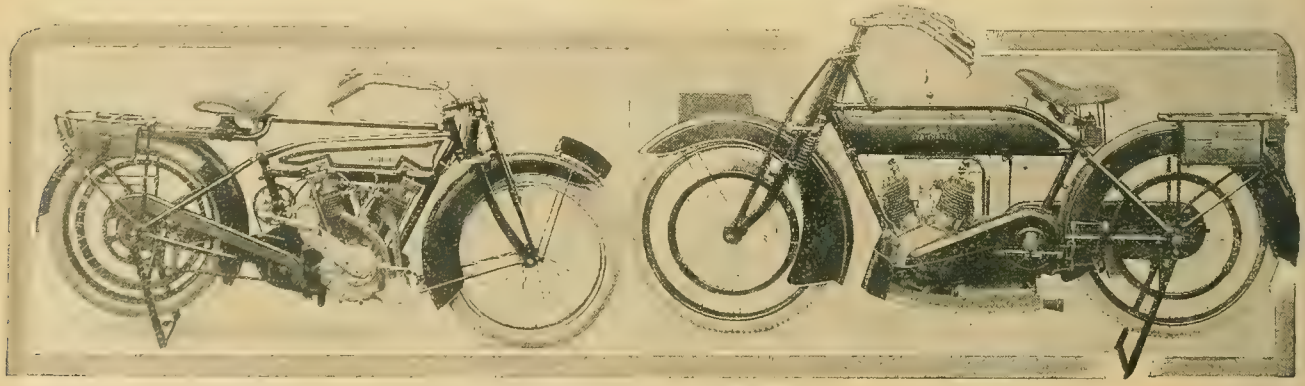
One Way of Road Making.

A prominent manufacturer with whom I discussed the question of the roads informed me that it is not uncommon to see farmers and householders in parts of the country remote from main thoroughfares working out their Poll Tax, *i.e.*, doing two days' work on the road instead of paying hard cash. I enquired what they would do. "Just dig it up," he said!

A species of obstacle I heard of but did not see is a sand road. It is described as a bed of soft sand ten to twelve inches deep and possibly a hundred yards long. I was told that experts overcame these things by going at them all out, and I was assured that if, when I should meet one, I would do that and cling fast to the machine, I would probably come out at the other end in safety.

When one has seen the American expert out touring it is not difficult to conjecture how this treatment of sand roads came to be known. Doubtless the expert came touring along at seventy miles an hour and was into and out of the sand bed before he fully realised its imminence. Afterwards he would smile in a superior way at the novices pushing through it and would show them how it should be done, without breathing a word of the awful fright he had when, *malgré lui*, he learnt the method.

To turn now to the good American roads, I have already said that they may be compared with the best roads we have here, and so they may. Furthermore, in two respects they are superior to ours. They are not closed in by hedges, and they are, for the greater part of their length, straight. What bends there are are gradual, and acute corners are rare, and when they occur are not obscured by trees or hedges. Such roads as these have to be not only seen but ridden over before one can realise their value for speed. No matter what unconscious resolutions as to



TWO MEDIUM POWERED TWINS.

BAYLISS, THOMAS & CO.,
Excelsior Works (Founded 1874), Coventry.

The Motor Cycle in America.—

speed one may have set out with, it soon seems absurd to ride at anything less than the best pace one's machine can do. One may commence a journey over a road known to be good and may allow oneself two minutes per mile, but very soon one is doing forty miles an hour and is still edging the throttle open, until presently the machine is doing all it can, and one is thinking how quickly it has lost the splendid form it had in England.

American Craze for Speed.

In these excellences and defects of the Yankee roads, and in the fundamental instinct of the motor cyclist for speed, lie most of the reasons for the present design of American machines. Not all of them, however, lie there; one other remains to be mentioned when we come to refer to the American rider.

The machine that is selling in the States to-day is the big twin, and I was informed that the sale of anything else must normally be attributed to an insufficient supply of big twins. At first glance this seems strange to us in England, who have seen the big twin phase give place to the small lightweight and the 500 c.c. machine, and are now seeing the development of the small twin in all possible forms. But it is in reality the natural result of the causes mentioned above.

In the execrable patches which are to be found on even the best roads the heavy 7-9 h.p. machine has more chance than the lightweight. It seems to reach the solid earth through the many inches of mud, it does not so easily skid out of control, and it can be got through some of these places where the English 350 or 500 c.c. machine would be hopeless. True, when it has to be put inside the tram rails it is heavier to lift, but once there it does very well, by reason of its long wheelbase. And when the morass is passed and one is again on a good road, one is ready for some speed work, and let no one imagine that the American 7-9 h.p. twin won't do it.

Readers will perhaps have heard of the proposed "Lincoln Highway," a through road from New York to San Francisco, for which many million dollars have been subscribed by various towns through which the road is to pass. This, when finished, should offer plenty of attraction to the speed merchant.

No Middle-aged Riders.

I must here apologise to the American motor cyclist himself for so long delaying mention of him, and must hasten to assure him that no slight is intended. The natural arrangement of these notes seemed to demand that the roads should first be referred to and the machine next.

I suppose it would be correct to say that half the motor cyclists in England are middle-aged men—amongst whom I am compelled to include myself. So excellent are our roads, and so reliable our machines, that the pastime no longer demands a juvenile athlete for a rider. If the above notes have conveyed anything to the reader they will have conveyed the impression that in America motor cycling is a pastime essentially for the young. One sees only young men riding. It is necessary to remember that the number of cars per capitum in America is far greater than in England, that the prices of cars are not only relatively but absolutely less there than here, and that the average income of a business man there is far greater than it is here—hence the middle-aged man who would here ride a motor cycle has in America his car. Even were cars less cheap I question whether any but young men would motor cycle. The portages call for too much exertion for any but a young man.

These things being so it will cause no surprise when I say that the American motor cycling public comes from a younger generation than ours, and consists of men relatively less prosperous, although actually, it is probable, more so. They seem to be for the most part men who ride only on Saturday afternoon or Sunday, and who desire speed and nothing else. To "trim" another man, or all other men, is the one object in motor cycling there. Reliability, durability, and comfort are not asked for—none of them is a point a selling agent pays much heed to; speed is all he wants, is the only quality that will sell machines.

I do not wish to imply that American machines are unreliable, indurable, and uncomfortable, but they could be, and no particular comment would be raised, so long as they were fast.

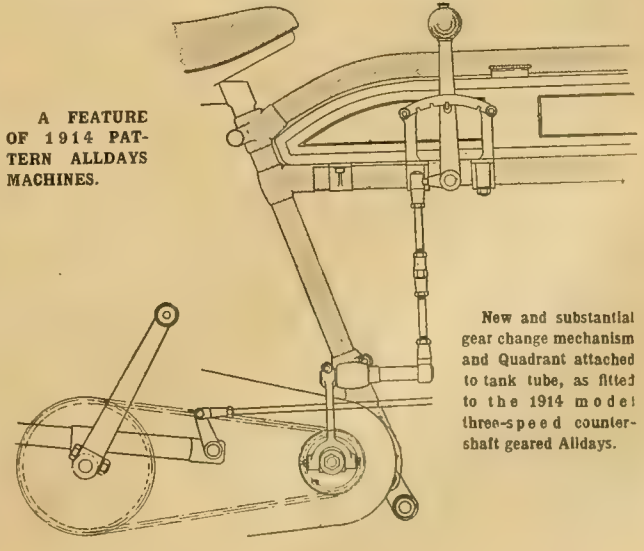
Pay as you Enter America.

A word in conclusion to intending motor cycling tourists in the States. There is to be had a thing called a Tourist Bond, under which anyone not connected with the motor trade, and not intending to use his machine for business purposes, may take it into the country duty free for six months. If it be not re-exported within that time he must pay the duty.

This seems attractive, but I would say to an intending tourist, unless you can spare a week at your port of entry don't apply for a Tourist Bond. It will take you a week to get it, perhaps more; there are almost endless formalities for you to go through, and you must deposit the value of the tariff—25%—with a surety company and pay them five or ten dollars, and must spend another week when you leave the country. If time is of any object take your machine as personal luggage and pay the duty on landing.

To obtain an idea of motoring in Canada delete from the above all mention of good roads, and the residue will apply fairly accurately. I saw only the vicinities of Quebec, Montreal, and Toronto, and the roads there could scarcely be said to exist, by reason of the mud and water.

A. W. PIMM.

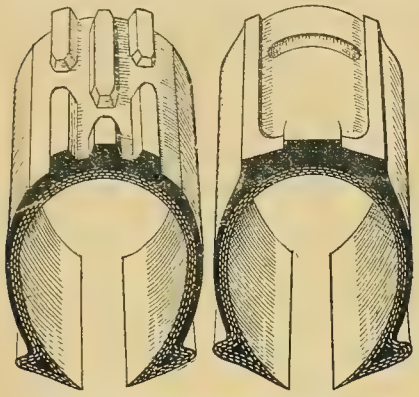


A FEATURE OF 1914 PATTERN ALLDAYS MACHINES.

New and substantial gear change mechanism and Quadrant attached to tank tube, as fitted to the 1914 model three-speed countershaft geared Alldays.

THE LATEST "JOHN BULL" TYRES.

The Leicester Rubber Co., Leicester, have achieved an enviable reputation for the excellent results given under hard use in the hands of both the public and competition riders. They have now produced a new pattern of tyre known as the Rib-Stud, which takes its name from the shape of the elongated rubber studs moulded on the tread. The tyre is a beautifully made article, and long life

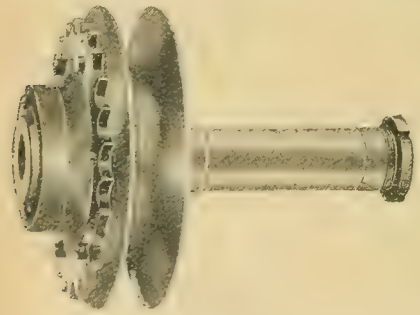


Two types of John Bull motor cycle tyre. On the left is the Rib-Stud pattern, while that on the right is the Cross-Groove type.

and anti-skidding propensities should be a feature of this cover. The firm is preparing to manufacture this tyre in various sizes for solo, sidecar, or cycle car use. 26×2¼, 2⅜, or 2½, and 70 mm. for 650×65 mm. voiturette rims will be leading sizes for 1914. These tyres are made by precisely the same process as the tyres which recently did so well in the "John Bull Mileage Competition."

A NEAT TWO-STEP DRIVE.

The Endrick Engineering Co., Olton, Birmingham, have already achieved considerable success with their two-speed and free engine counter-shaft gear. Now, however, they have brought out a fresh counter-shaft appliance in the shape of a device applicable to all standard machines

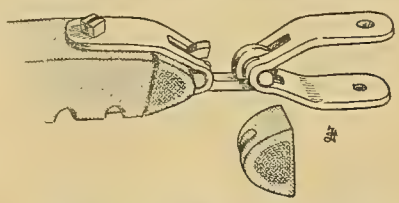


A plain counter-shaft introduced by the Endrick Co.

fitted with direct belt drive and pedalling gear. This serves the purpose of converting from direct belt to chain-cum-belt drive, and is particularly suitable for machines with hub gears. The whole fitment is very neat and the price is moderate. The sprockets may be obtained in different sizes and the belt pulley may be obtained as large as 8in. diameter.

A BELT TIP.

Messrs. Rudge-Whitworth have drawn our attention to a method of making a fastener end which is said greatly to increase the life of belts. It consists of fitting a small "end" or cap, which covers the exposed end of the belt and lies in the V of the fastener, thus more nearly approaching the ideal endless belt. The caps are made of moulded rubber with a canvas core in exactly the same



A simple tip recommended by the Rudge-Whitworth Co. for making a belt practically endless.

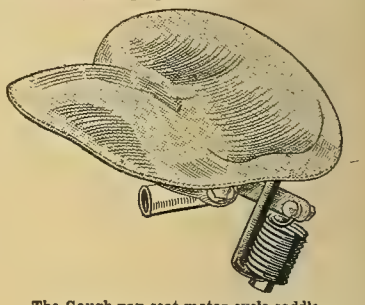
manner as the belt itself, and are grooved at the end, so that the hook prevents their working out sideways. These little packing pieces are slightly wider than the belt, and serve to take the shock from the belt ends, and also prevent the scoring of the Rudge Multi pulley when fully expanded for low gear work. It is claimed that with this device belt mileage is considerably increased. At first sight it would seem reasonable to expect that similar results could be obtained by bevelling the belt ends and pushing them further into the fastener, but this method does not protect the end of the belt, the rubber of which is soon worn off, and permits the fastener to score the pulley.

A MOTOR CYCLE WIND SCREEN.

In view of our present agitation for better protection of machine and rider, the photographs which we publish herewith are particularly interesting. The illustrations are self-explanatory, and the device is the idea of Mr. Mawson, of Olton, who had the work carried out for him locally. The wind screen is made of transparent celluloid and is mounted in a pivoted frame so that it can be set at any convenient angle; the height is also adjustable by means of the telescopic vertical support. The leg shields are also noticeable, and are arranged in such a manner as to keep the rider's legs clean and dry, while they also protect the machine from much of the mud thrown up by the front wheel. Mr. Mawson is a P. and M. rider of long experience, and tells us that these fittings are the greatest comfort to him in rough weather.

OAKLEIGH TWO-SEATED SIDECAR.

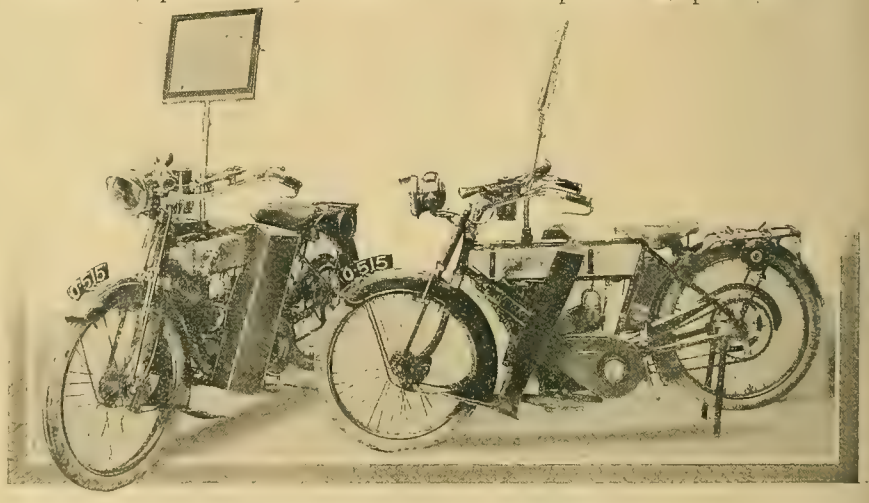
This sidecar is a two-seated pattern intended to carry two adults. When the seat is closed the compartment under it forms a tool box which is not at all unsightly. The additional weight of the back portion is only 10 lbs., the body being made throughout of three-ply wood. The price of this outfit complete is 15 guineas, but the body can be had separately, if desired, from the Oakleigh Sidecar Co., 65A, Rosendale Road, West Dulwich. (See page 1724.)



The Gough pan seat motor cycle saddle.

A NEW PONCHO.

We hear that several riders in the M.C.C. winter run will wear the "Moffat Poncho." This is a lightweight oilskin, specially strengthened in the seams. It does not button up at the front, but is pulled on over the head, the only opening being at the neck, where it is secured by a leather strap. The maker, Mr. Jas. Moffat, Yeovil, claims to have produced a garment which will not split with hard use. The price is 15s. post free.



PROTECTION FROM THE WEATHER.
A novel face screen attached to the top tube of a P. and M. machine, and wind cutting leg guards fitted to the footrests.

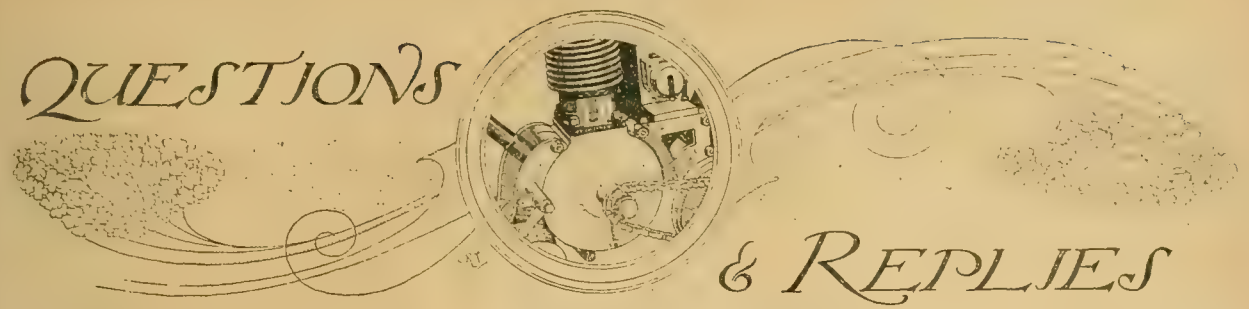
Telegrams : "Rex, Coventry."



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Hiring a Motor Cycle.

Can you let me know if it is possible to hire a motor cycle, and if so, what is a fair rate to be charged? I feel sure that there are many like myself who would greatly appreciate an occasional run, but who cannot afford to buy a machine, or if able, have no facilities for keeping it.—S.G.C.

Very few firms let out motor cycles on hire. Those that do usually require to know the hirer, and also require a reasonable deposit. You must appreciate that the firm hiring out the machine would run great risks. It is not like letting out a car on hire, for then the firm have their own driver in charge. It would be almost impossible, also, for any firm to allow really good machines out on hire, as there is a constant market for a sale of such machines.

Horse-power Formulæ.

As an old reader of *The Motor Cycle* I am taking the liberty to ask for a little information. All formulæ I have seen for getting at the approximate horse-power of motor engines puzzle me, as I have not seen one fully worked out and explained. Can you give me a simple example? It must be an easy problem in simple arithmetic, as I am not versed in algebra and higher arithmetic. I have asked several motor cycle travellers of good firms and none can enlighten me; some admit they do not know, others make a start to solve my question, but finish up with a bad excuse. Please give me the full working examples of the following: (1.) An engine is 349 c.c. How do you get the 2¾ h.p. (maker's list)? (2.) An engine is 75 × 79 = 2¾ h.p., and again, 70 × 90 mm. = 2¾ h.p. (3.) An engine is 2½in. stroke, 3in. bore (my own figures). Please explain what is the h.p.—W.E.C.

The catalogue horse-power is only approximate. It is customary to call a machine of about 290 c.c. 2½ h.p.; 350 2¾; 490 to 560 3½. A motor cycle in good order should be capable of giving 1 h.p. for every 100 c.c. of its capacity; thus a 500 c.c. engine will give 5 h.p., a 350 3½ h.p., and so on. An engine of 75 × 79 mm. bore and stroke has a capacity of 349; 70 × 90 346, and a 2½ × 3in. = 244 c.c. The first two would therefore be called 2¾ and last 2 or 2¼. You can obtain a cubic capacity table from this office, price 3d. You could then easily apply the rule of 1 h.p. for each 100 c.c.

Belt Trouble on Lightweight.

I ride a 1 h.p. auxiliary motor attachment to an ordinary pedal cycle. The belt is made of leather with a rivet in each end. It is joined up by a hook. The great trouble that I find is that, after a few miles riding, the rivet tears through the leather. Could you let me know of any other means of transmission? Could I lower the engine in the frame and thus do away with the jockey pulley in order to use an ordinary §in. motor cycle belt?—P.H.D.

The trouble with the belt is that as it is so small there is not sufficient room for the belt hook. You cannot very well lower the engine in the frame and do away with the jockey pulley, and if you do we do not think the results will be any better. You can certainly use a belt of the ordinary V type, but as the engine pulley is extremely small and the back wheel belt rim rather large, there would possibly be trouble with belt slip if used without the jockey pulley.

Taking a Machine to India.

I am shortly going out to Bombay, and am undecided whether to take my machine out with me. Can you help me? (1.) Do you know anything of the state of the roads? (2.) Are motor cycles at all frequent there? (3.) What are the import duties? (4.) Would the hot climate have a deleterious effect on tyres and belts?—H.H.B.

We certainly advise you to take your motor cycle to India, where the roads are frequently excellent, especially the main trunk roads. Considering the number of the European population, motor cycles are very largely used, and there is a strong sporting side to the movement in India, some exciting races having already been held. The import duty is 5% *ad valorem*. The heat is bound to have some effect on tyres and belts, but most of the big tyre companies make special tyres for tropical climates. Take one or two spares with you, such as a spare valve and carburetter float, plug, etc., for instance. It may save waiting for some time if you were in want of them in an out of the way part.

AN INCIDENT OF A SIDECAR TRIP IN THE TRANSVAAL.

Crossing a drift near Kimberley with three Rex-Jap sidecars. As may be imagined, chain drive is practically essential in these parts, as drifts are by no means uncommon.

Driving on the Exhaust Lifter.

I was always under the impression that with the valve lifter completely raised, and consequently no compression or explosion of any kind occurring, no possible damage could happen to the valve, the only disadvantage to the above practice being waste of petrol. Yet I see you said in a recent issue that such a practice is harmful, and your answer conveys to me the impression that the stream of unignited gas passing the valve weakens it: is this so?—E.P.H., M.D.

With the valve raised (thus releasing compression) and the throttle open, there is, you admit, a flow of gas past the valve. Therefore, unless the spark is "cut out," this flow of gas is ignited in the usual way, and therefore a stream of flame has to pass the valve; in course of time, this weakens and "pits" the seatings. If unignited gas were to pass the valve, it would be beneficial rather than harmful, for the flow of gas would materially help in cooling the valve, but as comparatively few riders use a cut-out switch, the practice in a general way is harmful.

A Collision in the Dark.

I shall be obliged if you will kindly answer the following legal point: I was travelling along a suburban road on my light car on a recent evening. The road is very badly lighted. A van was standing on the near side of the road; a cyclist was in front of me, and turned out to pass this van. I wanted to pass the cyclist at the same time as he passed the van, and as it was a slippery night and a bad road I thought it best to give the cyclist plenty of room, so went right to the off side, as the road was not very wide. Just as I was passing the cyclist I saw a yard away from my front wheel a baker's barrow without any light, and unattended (this, of course, I ascertained after the accident), and; of course, I could not swerve enough to miss the barrow, thus damaging the barrow and also my front mudguard. Am I liable for all this damage, as the barrow was unlighted and unattended, and I could not see it until I was about a yard away?—E.A.C.

We have submitted your query to our legal adviser, who has replied as follows: "Your correspondent does not say at what rate he was going on this dark slippery night, but apparently he was going faster than the cyclist. The question he raises is rather difficult to answer. Your correspondent would not be liable for any damage unless it could be shown that if he had been going at a reasonable speed having regard to the darkness of the night he could have avoided colliding with the barrow. There is, of course, no obligation for the barrow to be lighted. It seems to me, however, that the owner was negligent in leaving the barrow unattended on a dark night, but this contributory negligence would not prevent him from recovering damages if your correspondent, by being ordinarily careful, might have averted the consequence of such negligence."

Sidecar out of Line.

I have an old 6 h.p. Rex with sidecar. The front wheel leans very much towards the sidecar when loaded, but when unloaded it is quite straight. The machine has a tendency to lean inwards towards the sidecar. The front forks are the Rex old pattern, with the double springs on each side. The front wheel goes very much on one side when loaded. The sidecar is rather lower in front than at back.—E.G.P.

Provided that your machine and sidecar have been carefully lined up, the trouble is obviously in the front forks. The type of forks mentioned are not now built, and were somewhat liable to develop sideplay after prolonged use. This would probably account for the trouble you mention. The height of the sidecar at the front would not cause the trouble unless there is also undue weight at the front.

Taxation of Three-wheelers.

I have seen it stated that in certain counties, provided a cycle car has not more than three wheels, it is possible to register it for the Inland Revenue tax as a motor cycle, sidecar combination, or tricar, and thereby avoid considerable expense. Can you inform me in (1) what counties this obtains, and (2) whether an A.C. Sociable or Morgan runabout could be registered thus while keeping within the law?—J.W.B.M.

(1.) If the registration authorities in your district or in any other district will accept the machine as a motor cycle, it can carry motor cycle number plates. If registered as a car it must carry car number plates, but the authorities cannot demand more than £1 licence, as it is a three-wheeled vehicle, *i.e.*, a tricycle. (2.) With three wheels the machine can be registered in many instances as a motor cycle, but if it be refused as a motor cycle the taxation licence is still £1.

Correct Alignment Essential.

I have a 3½ h.p. 1913 sidecar combination, and in order to protect my passenger from the weather have fitted a hood and screen. This sidecar is fixed very closely to the machine and when the hood is up I find great difficulty in steering the machine past other vehicles, the tendency being for the sidecar to push me into the channel of the road. The hood overhangs the body of the car by half an inch, but is so close that it brushes my shoulder and I cannot lean over; this is especially bad when rounding corners. Both back attachments are adjustable, but the front one is fixed. If I lengthened the back one, say two inches, it would throw the sidecar wheel out of the parallel with the machine. Would this matter very much? I may add the steering is perfect with the hood down.—J.H.R.

Yes, it would matter most decidedly if you spoilt the alignment of the machine and sidecar. It would cause rapid wear of the sidecar tyre and rear tyre, as well as laying additional strain upon the axle and chassis in general. Also it would materially affect the steering, and cause side drag. The only remedy is to have the sidecar body moved if that is possible.

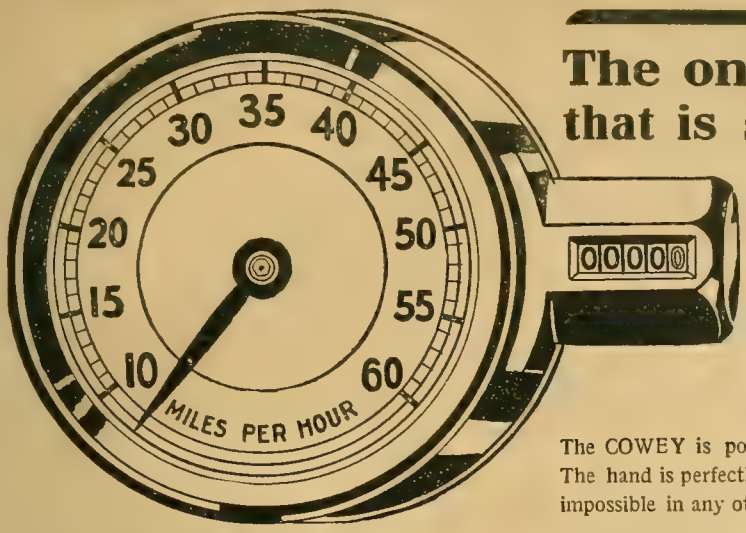
EXPERIENCES WANTED.

"J.J.M." (Manchester).—3½ h.p. Rudge Multi and sidecar. Reliability of gear, life of belts and tyres, and consumption.

Readers asking for routes should give the nearest town to their residence, as it is difficult to trace the exact locality of small villages, and the local roads to the nearest town are best known to those who reside in the district.

LADIES AND THE MOTOR CYCLE.

A keen lady motor cyclist is Miss Mary Blaynay shown above with her 2 h.p. Hobart, which make of machine she has ridden for several years.



The only Speed Indicator that is steady and accurate.

Note the clear, open dial (actual size) which is attached to the handle-bar and can be read at a glance.

With so many speed limits in force a reliable indicator is a necessity.

Instruments built on Centrifugal or Magnetic principles cannot possibly give satisfaction on a motor bicycle, and only end in disappointment and failure.

The COWEY is positive throughout and is therefore reliable always. The hand is perfectly steady at all speeds, a feature which is absolutely impossible in any other indicator.

The COWEY Patent SPEED INDICATOR

is BRITISH MADE and Guaranteed against Repair Charges for 12 months.
Can be fitted to any type of Spring Fork and to the right or left-hand side of wheel.

PRICE COMPLETE **£4 - 4s.** Registering from 5-40 or 10-60 m.p.h., with Mileage Recorder, as illustrated.

Or with Trip, **£5 - 5s.** Registering from 10-80 m.p.h., **£5 - 5s.** Maximum Speed Hand **10/6** extra.

Or with Trip, **£6 - 6s.** Cycle Car Fittings, **10/6** extra.

Write for Copy of Cycle Indicator Booklet, which will interest you.

BRAMPTON VARIABLE GEAR

FITTING & FIT

Fitting your machine with Brampton Variable gear is to make it fit for any hill and for all round better service on any road. The Brampton

GIVES SEVEN SPEEDS AND A FREE ENGINE.

It gives unending satisfaction, too. It never slips, even on bottom speed, and it never disappoints even when being used under adverse conditions.

For practically all engines where boss does not require a recess pulley flange of more than $\frac{7}{16}$" deep.

PRICES: 3½ h.p., £4/4/0; 2½ h.p., £3/10/0

The "SUCCESS" Carbon Removing Tools

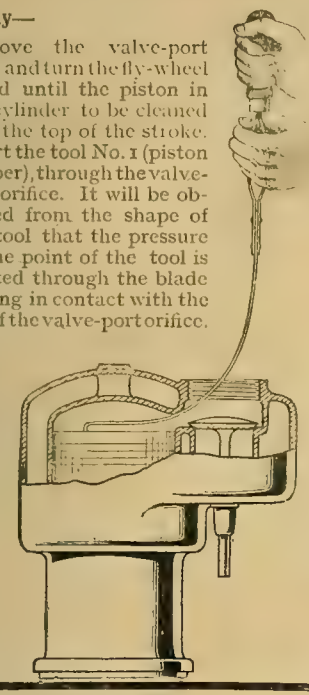
Patent No. 4851 12.

The simplest and most economical method of rapidly and effectually removing the carbon deposit from an engine yet devised.

The possibility of cheaply and easily cleaning the cylinders and pistons by a simple set of tools which ensures the removal of every particle of carbon from a four-cylinder engine in the short space of one hour, will, we are sure, be welcomed by thousands of motorists, *and such facilities are afforded by the use of the "Success" Carbon Removing Tools.*

Firstly—

Remove the valve-port caps, and turn the fly-wheel round until the piston in the cylinder to be cleaned is at the top of the stroke. Insert the tool No. 1 (piston scraper), through the valve-port orifice. It will be observed from the shape of the tool that the pressure on the point of the tool is exerted through the blade coming in contact with the top of the valve-port orifice.



What the "Success" Carbon Removing Tools are :—

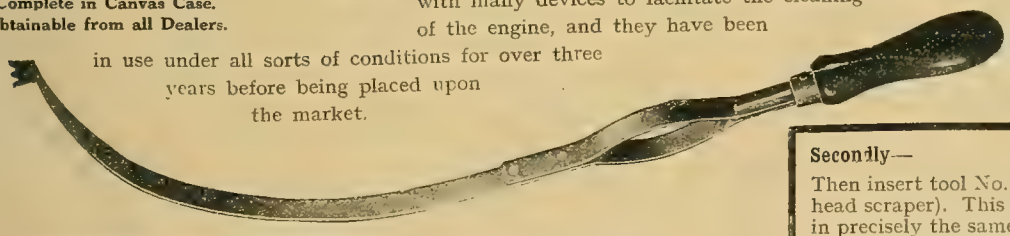
These tools consist of two hardened and tempered flexible steel scrapers; one for the piston and the other for the head of the cylinder, with a short scraper for clearing out the ports and orifices, and a stiff bristle brush for taking out the particles of carbon from the ports. The whole of the operations are effected by merely removing the valve port caps. It will be observed that these scrapers are tapered both ways towards the point, that is to say, in thickness as well as in width, but with the point sufficiently hard to resist wearing.

These tools are the invention of a motor engineer who has experimented with many devices to facilitate the cleaning of the engine, and they have been in use under all sorts of conditions for over three years before being placed upon the market.

Price

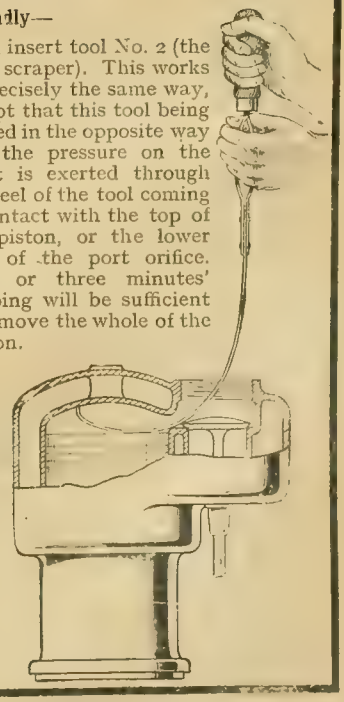
7/6

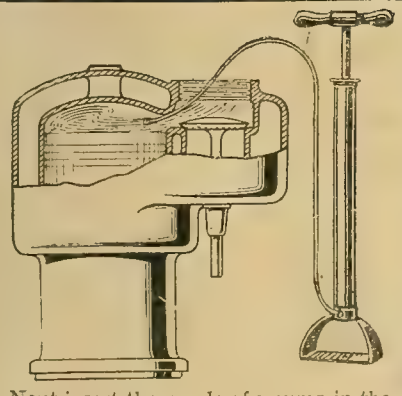
Complete in Canvas Case.
Obtainable from all Dealers.



Secondly—

Then insert tool No. 2 (the head scraper). This works in precisely the same way, except that this tool being curved in the opposite way and the pressure on the point is exerted through the heel of the tool coming in contact with the top of the piston, or the lower part of the port orifice. Two or three minutes' scraping will be sufficient to remove the whole of the carbon.





Next insert the nozzle of a pump in the port orifice facing to one side of the interior of the cylinder and giving one or two vigorous strokes, the swirl of the air induced brings all the carbon out of the cylinder and deposits it at the back of the pump nozzle, just over the valves, where it can be spooned out readily with the port scraper.

OUR NEW Supplementary —Motor List—

of New Motor Goods, Motor Clothing, etc., is now ready. Write for a copy.

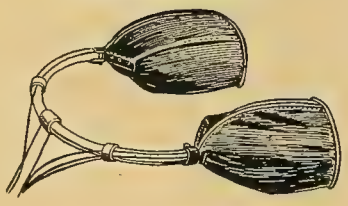
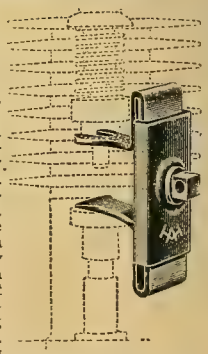
NOTICE—We are having a special Demonstration of Drummond's Special Lathes all through the month of December in our Motor Department. A skilled demonstrator will answer any questions.

HANDLE-BAR MUFFS.



A great comfort to winter riders. These muffs are so arranged as to give perfect freedom for manipulating the control levers on handle-bar. Best quality brown leather, **22/6** per pair. Best quality black waterproof **15/6** per pair. Cheaper quality, **9/6** per pair. Carriage paid.

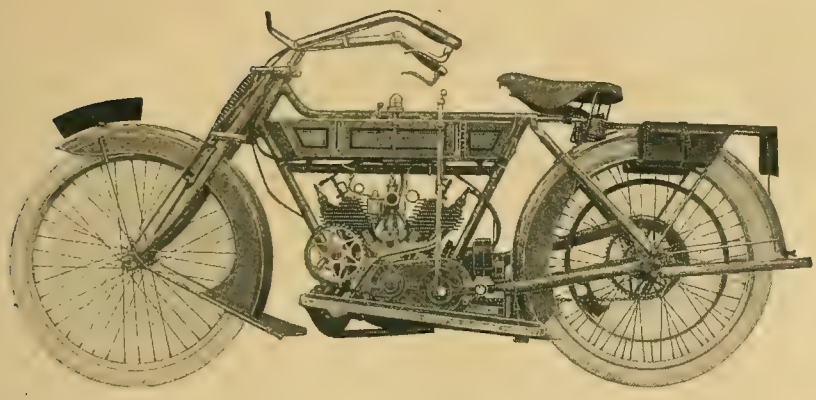
PATENT VALVE LIFTER.



This year's invention. Lifts any weight, and is exceedingly strong. Measures only 2¼in. over all, and can be conveniently carried in the waistcoat pocket. The mode of operation can be easily seen by a glance at the accompanying illustration. The lifting movement is obtained by turning the square head with a wrench or piece of wire, the latter being placed through the hole provided. Price **2/6** Suitable for all engines. Post Free.

A. W. GAMAGE, Ltd., HOLBORN, LONDON, E.C.

ROYAL ENFIELD



THE FIRST INDIAN TOURIST TROPHY RACE WAS WON ON A 2¾ h.p. ROYAL ENFIELD—exactly like this one.

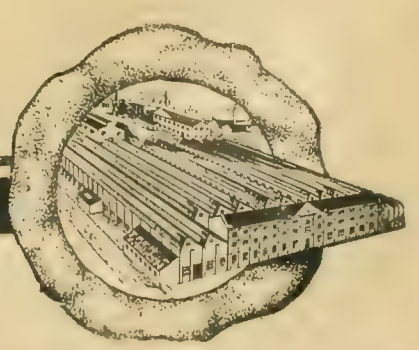
The 2¾ h.p. Royal Enfield is a magnificent motor cycle at a reasonable price. Originally it was £52 10s.; now it is £45. This price is possible because the enormous demand for this machine has called for a larger supply—and the larger supply means a lessened cost of production.

NOTE THE SPECIFICATION. Enfield Patent Two-speed and Free-engine Gear, Chain Drive, Enfield Patent Cush Drive Rear Hub; Automatic Drip-feed Lubrication, comfortable Foot-boards, improved Spring Forks, Royal Enfield Handle-bar, Dunlop Tyres. All the luxury of chain drive and reliable Royal Enfield Gear at a popular price.

£45

Write for the new Royal Enfield motor catalogue. Also booklet "Something Done." Please mention "The Motor Cycle."

THE ENFIELD CYCLE CO., LTD., REDDITCH,
And 48, Holborn Viaduct, London, E.C. **Agents everywhere.**
Manufacturers of the 2¾ h.p., 3 h.p., and 6 h.p. (sidecar combination) Royal Enfield models.



Wonderful wear!

The altogether exceptional nature of the JOHN BULL MILEAGE COMPETITION and the altogether exceptional result justifies our frequent reference—

In this connection it cannot be too clearly stated that our first and only object in organizing this competition was to prove the unique value of the COMPRESSED RUBBER TREAD—an entirely exclusive feature of the

JOHN BULL CROSS GROOVE AND RIB-STUD TYRES

And the result was that out of the hundreds of Cross Grooves used continuously during the period of the competition—January to September, 1913—and used on back wheels only and in all sorts of weather, 95% were still in use on the closing date, and the average mileage of all competitors on that date stood at

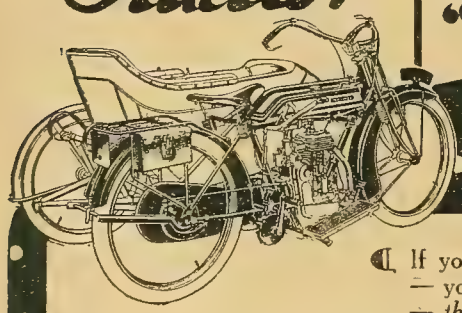
SOLO 2,774 —— **SIDECAR 2,024!**

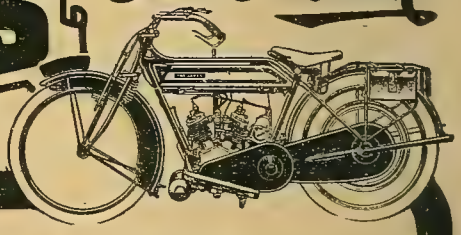
"Wonderful wear"! and note that each competitor estimated the distance his tyre was still capable of covering, and the average of those estimates came out at SOLO 2,222, and SIDECAR 1,645!

And it means wonderful economy—you try it! First ask for latest booklet.

LEICESTER RUBBER CO., LEICESTER.

For Sidecar "JAMES" or Solo work





If you want a mount that will afford "perfect service" under all conditions — you want a "JAMES ALL-ENCASED CHAIN-DRIVE Model" — *the perfect Motor Cycle.*

The JAMES "BIG SINGLE" *The* original and only *perfect* "Big Single" Sidecar combination, embodying every up-to-date practice. It embodies a Big Single-cylinder engine, 600 c.c., "JAMES" Patent Countershaft Three-Speed Gear Box, Multiple Disc Free Engine Clutch, Kick-Starter, All-encased Weatherproof Chain Drive, and Spring Drive on rear Chain Wheel. Built expressly for SIDECAR work — but not being overpowered or unwieldy is quite suitable for solo use if desired. **73 Gns.**

The JAMES "TWIN" is the *ideal* Solo mount. It embodies a 3½ h.p. Twin Engine 500 c.c., "JAMES" Patent Countershaft Three-Speed Gear Box, Kick-Starter, All-encased Weatherproof Chain Drive, Gate Change with Handlebar Control Clutch, Spring Drive (shock absorber) on Rear Wheel — the very features that the highest Press Authorities have since laid down as being *ideal* for SOLO work. **60 Gns.**

— For efficiency, reliability, economy in upkeep, and all-round excellence you can't surpass "The JAMES." Write for "The JAMES Manual" and see the marked advantages "The JAMES" offers you.

REG. TRADE MARK

We leave the following testimonial to tell its own story:

E. LONGLEY, Sergt.-Major R.E.
Instructor to Cambridge University Officers' Training Corps,
Market Street, Cambridge, *8th Nov.*, 1913, writes:

Sirs,—I am running a 1912 Triumph with a pair of your tyres, and write to say what entire satisfaction they are giving; at this moment they are away on my bike at the Triumph factory, where my machine is being overhauled, and it needed it after this year's manœuvres, but one thing I can say, the tyres came back after three weeks' hard riding in all sorts of weather, and if you have any idea of the country in which the manœuvres were carried out this year, you would be surprised at the condition in which the tyres came off; I never had a tyre go down, much less a puncture, in fact they are almost the same as when they left the shop of "Haywoods, King's Parade, Cambridge."

We were continually off the main road, up lanes, and frequently to and fro on bad roads cut up by cavalry and artillery over the Bledlow Ridge of the Chiltern Hills.

I have been five years in succession to manœuvres and not till this year have I realised the joy of feeling "puncture proof," which is what it amounts to.

I would like you to see the tyres, you would be surprised.

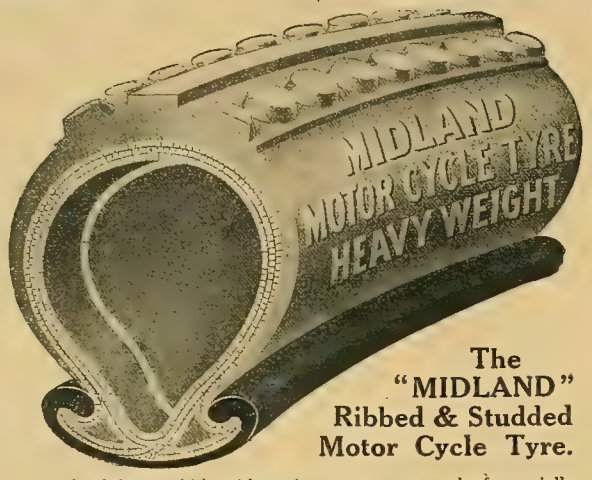
MIDLAND

MOTOR CYCLE TYRES AND BELTS



The "MIDLAND" Ribbed & Studded Motor Cycle Tyre.

A splendid anti-skid with a heavy centre tread of specially toughened rubber which is practically puncture-proof. A very resilient and long-wearing tyre. Guaranteed 3,000 miles.

Prices: 26 × 2¼in. 37/6 .. 26 × 2½in. 40/-.

The "MIDLAND" Belt. Of great durability.
PRICES: ⅝in. 1/5, ¾in. 1/7, ⅞in. 1/11, 1in. 2/2, 1⅛in. 2/7.

The new 'WIRE-CORE' Belt
A striking departure in Belt construction

Of the usual V section but made of rubber with a special core of steel wire of high breaking strain, coiled spirally and interwoven into a fabric, moulded under enormous hydraulic pressure. This combination of special wire fabric and rubber does away with all the disadvantages of belts made of rubber and cloth alone, and eliminates stretching and pulling through of fasteners. It is pliable, affords perfect drive, and gives large mileage.

You can't drive a knife through the tread

Take a sharp, strong knife. Try to drive it through the tread of a Stelastic tyre. The blade will break or bend, but it will not go through.

Stelastic tyres are unique. Absolutely cut-proof and practically puncture-proof. A wonderful combination of spiral steel "meshes" and pure Para (*and not Plantation*) rubber working in perfect harmony

Stelastic Tyres are the only Tyres holding the R.A.C. Certificate for 5,000 miles without cut or puncture

And for these 5,000 miles the Stelastics carried a two-ton Daimler

Of course, even the walls of a Stelastic will eventually break if you drive with the tyres insufficiently inflated. Your tyre should be kept pumped to the pressure stated by the makers. That solves half your tyre troubles. The Stelastic solves the other half. Even if you *don't* use Stelastics, but use other makes, *keep them up to prescribed pressure.* If you do not keep your tyres up to pressure the *walls* have to do the work—hence the bursts.

Special Tyre for Cycle Cars, 650 x 65, to fit 2½ rims, price £2 19s. 6d.

Special 26 x 2½ Motor Cycle Tyres to fit 2¼ rims, price £2 16s. 6d.

A Dual Triumph

THE FAME ACHIEVED BY THE N. U. T.

In Winning The JUNIOR T.T. RACE
In Creating TEN WORLD'S RECORDS
In Winning The SCOTTISH Lightweight CHAMPIONSHIP

and other important events, including the brilliant performance of the N.U.T. team in the A.C.U. Six Days' Trial, all in one Season, the N.U.T. achieved a triumph so complete as to place it in the very front rank of motor cycles. In these events, the N.U.T. challenged a formidable array of first-class machines and proved its immeasurable superiority in a definite and brilliant manner.

HENDEE MANUFACTURING CO.

PERFECT COMFORT AWHEEL

—for rider and passenger

—is always assured when the machine is fitted with the world-famous "DRUID."

¶ THIS Spring Fork, by reason of its *scientific design and perfect springing principle*, completely absorbs vibration—every obstacle is met with a "*velvety*" touch—no shock, no jar, no bouncing—the machine runs with a "*silky-smoothness*" of motion, always.

—The "DRUID" also ensures perfectly true steering—admits of no side-play—decreases wear on tyres—and increases the life of the machine.

—The "DRUID" is the *only* Spring Fork that makes possible these *ideal* riding conditions—hence its world-wide popularity—and adoption on the leading machines of the day.

—Hence, be sure and see that your mount is "DRUID-equipped"—and ensure *perfect comfort awheel.*

—Ask for "Explanatory Booklet."

40 letters
3 cheques
10 Enquirers
= **The Result**
of a small advertisement in
THE MOTOR CYCLE

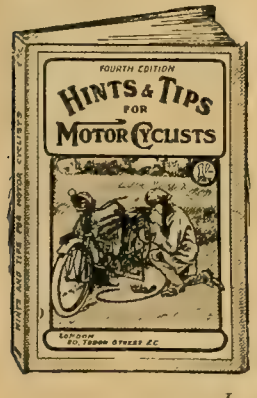
Ivy Dene, Midland Road,
Leagrave, Luton,
November 24th, 1913.

Dear Sirs,

I have had 40 letters and postcards, 3 cheques, and 10 enquirers at my house, for the magneto advertised in your paper. I have sold it to a gentleman near home.

You can make use of this if you care to, as it speaks very highly of "The Motor Cycle."

Yours respectfully,
M. W. CLAYSON.



A Useful Little Pocket Companion.

Every motor cyclist should make use of this book. It is brimful of sound advice respecting the care, management, and repair of motor cycles. Every hint and tip is numbered, and reference is made very simple by a very exhaustive alphabetical index.

Fourth Edition, Revised and Enlarged. Now Ready.

Obtainable from—

TRACING TROUBLES

New Edition NOW READY.

MOTOR CYCLE FAULTS, THEIR IDENTIFICATION AND THEIR REMEDIES SIMPLY AND FULLY ∴ ∴ EXPLAINED ∴ ∴

THIS handy little volume deals with all the faults to which motor cycles are liable, explains how they can be easily diagnosed, and shows how they can be rectified. Every conceivable cause of trouble is dealt with, and the remedy for it carefully explained. It is written in simple language by a practical motor cyclist of long experience, and fully indexed for ease of reference.

The new edition has been carefully revised by the author and new material added, including

a new section on two-stroke engines.

BEACON (Regd.) OILSKINS

NEVER GO STICKY OR LET IN THE WET

Money back in full if they fail on any point.

Authorities in every branch of Sport praise Beacon Oilskins. "Ixion," of "The Motor Cycle," says they are the only things which have kept him dry; "Kuklos," of "The Daily News and Leader," never rides without them; and they will give **you** the same sure freedom from weather-worries, though you ride all day against the cutting wind-driven rain and sleet.

The complete suit in Black or Yellow Oilskin **21/-**

In Tan or Grey-Green .. **25/-**

Send chest measure over jacket, jacket length, and inside leg measure (fork to heel), with remittance.

ILLUSTRATED LIST POST FREE, showing wet weather wear for Motorists and Sidecarists. Send a postcard for it now

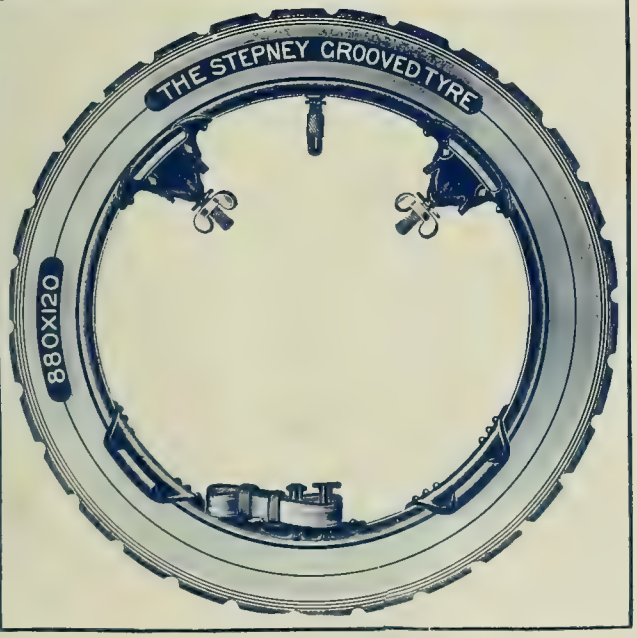
STEPNEY WHEELS



Every owner of a Cycle Car needs a Stepney Wheel. It really acts as a mascot against punctures. Because you have had no punctures is no reason why you should not carry a Stepney, as the day will soon come when you will get a punctured tyre, just where you wish it would not have happened.

Therefore insure yourself now against punctures by equipping your car with a Stepney.

The Stepney is fitted in one minute and there are over 400,000 in use.

We have supplied Stepney Wheels for Humberettes, G.W.K., Swift, Enfield, A.C. Cycle Cars, etc., etc.

PRICE, 650 x 65. **£2 2 0.**

AN IDEAL CHRISTMAS PRESENT.

The
Stepney Spare Motor Wheel, Ltd.,
Llanelly, Wales.

LONDON SHOWROOMS: 168, Ct. Portland Street, W.

GOING HOME AT XMAS!

Why not travel on the 2½ h.p. F.N. LIGHT WEIGHT?

The Car on two wheels

You feel at home

in a few minutes on the

2½ h.p. F.N. LIGHTWEIGHT

It is so delightfully easy to manage—even by the novice,

And you get home

much quicker, simply for the reason you have no trouble en route; no messy belt annoyances; no continuous chain adjusting. Weather conditions do not affect the 'F.N.' With its shaft and bevel drive it is the only machine upon which you can defy the elements.

Then why delay investing, especially when by placing your order now, delivery before Xmas can be given—certain.

Enclosed shaft drive (like a car). Two-speeds; free engine; multiple disc clutch; are but a few features. **£49.**
